How to use the MICROPAEDIA

The 12 volumes of the MICROPAEDIA contain tens of thousands of shorter articles on specific persons, places, things, and ideas, arranged in alphabetical order. The MICROPAEDIA can be used as an information resource on its own; and it can function as support for the longer articles in the MACROPAEDIA (to which it refers whenever appropriate). The MICROPAEDIA in turn is supported by references in the INDEX and by the lists of suggested readings in the PROPAEDIA. Finally, the MICROPAEDIA is the portion of the *Encyclopædia Britannica* best suited for the reader who wishes to browse among the countless subjects in all fields of human learning and history in all times and places.

Alphabetization

Entry titles are alphabetized according to the English alphabet, A to Z. All diacritical marks (such as in ö, ł, or ñ) and foreign letters without parallels in English (such as ayin [ʿ] and hamza [ʾ]) are ignored in the alphabetization. Apostrophes likewise are ignored. Titles beginning with numbers, such as **1812, War of**, are alphabetized as if the numbers were written out (**Eighteen-twelve, War of**).

Alphabetization proceeds according to the "word-by-word" principle. Thus, **Mount Vernon** precedes **mountain**; any **John** entry precedes **John Henry**, which in turn precedes **Johne's disease**. Any character or string of characters preceding a space, hyphen, or dash is treated as a word and alphabetized accordingly. Thus, **De Broglie** precedes **debenture**, and **jack-o'-lantern** precedes **jackal**. Titles with identical spellings are arranged in the following order: (1) persons, (2) places, (3) things.

For many rulers and titled nobility, chronological order, as well as alphabetical order, governs placement. Rulers of the same given name (*e.g.,* William) may be grouped together, separate from other entries, and indicated by the symbol •. They may be subgrouped alphabetically by country and, within each country, arranged chronologically (**William I, William II**, etc.). Nobility or peers of the same titled name (*e.g.,* **Essex, EARLS OF**) are similarly grouped together, separate from other entries; they are indicated by the symbol • and arranged chronologically.

Places with identical names are arranged in the alphabetical order of the countries where they are located. Identical place-names in the same country are alphabetized according to the alphabetical order of the state, province, or other political subdivision where they are found.

Entry arrangement

The titles of entries are arranged according to the forms commonly found in indexes and dictionaries, with some special conventions.

Entry titles for certain physical features, institutions, structures, events, and concepts are ordinarily inverted to place the substantive word first. Thus, the Bay of Bengal is entered as **Bengal, Bay of**; the Bank of England as **England, Bank of**; the Tower of London as **London, Tower of**; the Siege of Vienna as **Vienna, Siege of**; and the balance of power as **power, balance of**. If the name of a physical feature, institution, structure, event, or concept has two or more descriptors, it is entered under the descriptor appearing first. Thus, the Episcopal Church in Scotland is entered as **Episcopal Church in Scotland** (not **Scotland, Episcopal Church in**); the Leaning Tower of Pisa as **Leaning Tower of Pisa**; and the kinetic theory of gases as **kinetic theory of gases**.

The entries for most Western persons are arranged so that one can read a name in correct order by beginning after the first comma, proceeding to the end of the boldface type, returning to the beginning word or words, and proceeding forward to the first comma. Thus, the entry **March, Patrick Dunbar, 2nd Earl of**, is read "Patrick Dunbar, 2nd Earl of March"; the entry **Orléans, Louis, duc d'**, is read "Louis, duc d'Orléans." Names of Far Eastern origin are given in Oriental order, with the surname preceding the personal name (*e.g.,* **Tōjō Hideki, Deng Xiaoping, Nguyen Cao Ky**).

Cross-references

Some cross-reference entries appear in the MICROPAEDIA for the purpose of leading a reader from names that are familiar to alternate names that may not be. Cross-references also appear frequently within or at the ends of standard entries, where they are identified by *see, see also, see under, q.v.* (*quod vide,* "which see"), or *qq.v.* (*quae vide,* "which see," plural).

Certain entries serve both as relatively brief essays on general subjects and as cross-references to the same subjects treated at greater length and in greater depth in the MACROPAEDIA. Such an entry (*e.g.,* **igneous rock**) begins with a definition of the subject and then provides the following cross-reference: "A brief treatment of igneous rocks follows. For full treatment, *see* MACROPAEDIA: Minerals and Rocks.

Entries on certain broad subjects (*e.g.,* **music**) direct the reader to several relevant articles in the MACROPAEDIA and also to the PROPAEDIA for listings of related articles in the MICROPAEDIA.

Abbreviations

Abbreviations used in the MICROPAEDIA are given in a list that appears at the end of every MICROPAEDIA volume.

Territorial boundaries

In articles and maps indicating disputed geopolitical boundaries and territories, the attribution of sovereignty or administrative subordination to any specific area does not imply recognition of the status claimed by an administering power.

Ménage, Gilles (b. Aug. 15, 1613, Angers, Fr.—d. July 23, 1692, Paris), French scholar and man of letters known for philological works as well as for the *mercuriales,* Wednesday literary meetings, he sponsored for a period of over 30 years.

A lawyer's son of strong and often controversial personality, Ménage practiced at the bar and frequented Mme de Rambouillet's circle of *précieuses,* who cultivated wit and the art of polite and elegant conversation. He subsequently abandoned law for the church, becoming prior of Montdidier.

The *mercuriales* began in 1656 and were attended by poets and critics. The great French letter writer Mme de Sévigné and the early novelist Mme de La Fayette enjoyed his society. Ménage was both humorous and quarrelsome and made many enemies, such as the playwright Jean Racine, who prevented his entry to the Académie Française in 1684. His *Requête des dictionnaires* criticized the academy. He wrote a history of woman philosophers (1690) and numerous critical works, including two studies of the French language. The pedant Vadius in Molière's play *Les Femmes savantes* is said to be a caricature of him. *Menagiana* (1693–1715) was a publication of his jokes and judgments, assembled by his friends after his death.

Menahem, also spelled MANAHEM (fl. mid-8th century BC), king of Israel whose 10-year reign was distinguished for its cruelty. Events of his rule are related in II Kings 15:14–22. In about 746 BC, Shallum ben Jabesh assassinated Zechariah, king of Israel (the northern kingdom of the Jews, as distinguished from the southern kingdom, Judah), and established his throne in the region of Samaria. One month later, Menahem advanced from his headquarters at Tirzah, the old royal city of Israel, against Shallum and killed him. Menahem assumed power but was not accepted by the district around the city of Tappuah; in revenge Menahem slaughtered the city's inhabitants, including pregnant women.

Toward the end of Menahem's reign, the Assyrian king Tiglath-pileser III (identified in the Bible as King Pul) advanced against Israel; he was deterred only by a large bribe, which Menahem extorted from his wealthy subjects. Israel remained subjugated to Assyria under Menahem's son and successor, Pekahiah, who was forced to continue tribute. The 19th-century Jewish historian Heinrich Graetz speculated that Menahem introduced licentious religious rites from Assyria into Israel.

Menahem ben Saruq, in full MENAHEM BEN JACOB IBN SARUQ, Saruq also spelled SARUK (b. *c.* 910, Tortosa, Independent Moorish States—d. *c.* 970, Córdoba?), Jewish lexicographer and poet who composed the first Hebrew-language dictionary, a lexicon of the Bible; earlier biblical dictionaries were written in Arabic and translated into Hebrew.

After travelling to Córdoba, a city in Moorish Spain, Menahem became a protégé of Isaac, the father of Ḥisdai ibn Shaprut, (*q.v.*) who was to become a powerful Jewish statesman in Córdoba. After Isaac's death, Ḥisdai employed Menahem as his literary secretary. Menahem composed the historic letter Ḥisdai sent to Joseph, king of the Khazars, inquiring about the Khazars' conversion to Judaism.

Ḥisdai also encouraged Menahem to compile his famous dictionary. It was severely criticized by a rival philologist and poet, Dunash ben Labrat, who, by his bitter attacks, succeeded in turning Ḥisdai against Menahem. Menahem probably died not long after his fall from favour. Dunash's attack provoked a counterattack by Menahem's pupils, one of whom, Judah ben David Ḥayyuj, was a major Hebrew grammarian.

Menahem's dictionary, the *Maḥberet* (from *ḥaber,* "to join"), despite its faults, did have many virtues and remained in use for many years. He established that Hebrew is a language with definite, discoverable rules, and he illustrated his principles with many elegantly phrased examples. His dictionary was an invaluable aid to Bible study for European Jews who could not read Arabic.

Menai Bridge, suspension bridge spanning the Menai Strait from Bangor, Wales, to the island of Anglesey, a distance of 580 feet (176 metres). Designed and built (1819–26) by Thomas Telford (*q.v.*), it was the first important modern suspension bridge. The deck, designed for two carriageways, was suspended by iron chains from masonry towers at either end. Sixteen chain cables were each composed of 935 iron bars, a total of 2,000 tons of wrought iron. Though damaged by storms, the bridge survived because of the addition of transverse bracing and trussed railings. In 1939, to accommodate increased automobile traffic, the chains were replaced by steel cables. *See also* Britannia Bridge.

Menai Bridge, Wales
BBC Hulton Picture Library

Menai Strait, channel of the Irish Sea separating the Isle of Anglesey (Ynys Môn) from the mainland of North Wales. It extends 15 mi (24 km), from Beaumaris to Abermenai Point, varying in width between 200 yd (180 m) and 2 mi. The strait comprises an eastern and a western reach, both trending northeast–southwest, linked by a short, north–south central section. These all originated in preglacial valleys, the two reaches forming part of a system of parallel northeast–southwest valleys; in late glacial times the north–south valley was enlarged as an overflow channel for an ice-dammed lake to the northeast. Postglacial subsidence created a continuous marine channel from the three sections.

Since the 19th century two famous bridges have spanned the strait: Thomas Telford's suspension road bridge (1827) and, two miles to the west, Robert Stephenson's Britannia tubular railway bridge (1849). They carry the modern ground transportation lines from London to Holyhead and Ireland.

Menam Khong (Southeast Asia): *see* Mekong River.

Menander (b. *c.* 342 BC—d. *c.* 292 BC), Athenian dramatist whom ancient critics considered the supreme poet of Greek New Comedy—*i.e.,* the last flowering of Athenian stage comedy. During his life, his success was limited; although he wrote more than 100 plays, he won only eight victories at Athenian dramatic festivals.

Comedy had by his time abandoned public affairs and was concentrating instead on fictitious characters from ordinary life; the role of the chorus was generally confined to the performance of interludes between acts. Actors' masks were retained but were elaborated to provide for the wider range of characters required by a comedy of manners and helped an audience without playbills to recognize these characters for what they were. Menander, who wrote in a refined Attic, by his time the literary language of the Greek-speaking world, was masterly at presenting such characters as stern fathers, young lovers, greedy demimondaines, intriguing slaves, and others.

Menander's nicety of touch and skill at comedy in a light vein is clearly evident in the *Dyscolus* in the character of the gruff misanthrope Knemon, while the subtle clash and contrast of character and ethical principle in such plays as *Perikeiromenē* (interesting for its sympathetic treatment of the conventionally boastful soldier) and *Second Adelphoe* constitute perhaps his greatest achievement.

Menander's works were much adapted by the Roman writers Plautus and Terence, and through them he influenced the development of European comedy from the Renaissance. Their work also supplements much of the lost corpus of his plays, of which no complete text exists, except that of the *Dyscolus,* first printed in 1958 from some leaves of a papyrus codex acquired in Egypt.

The known facts of Menander's life are few. He was allegedly rich and of good family, and a pupil of the philosopher Theophrastus, a follower of Aristotle. In 321 Menander produced his first play, *Orgē* ("Anger"). In 316 he won a prize at a festival with the *Dyscolus* and gained his first victory at the Dionysia festival the next year. By 301 Menander had written more than 70 plays. He probably spent most of his life in Athens and is said to have declined invitations to Macedonia and Egypt. He allegedly drowned while swimming at the Piraeus (Athens' port).

Menander, also spelled MINEDRA, or MENADRA, Pāli MILINDA (fl. 160 BC?—135 BC?), the greatest of the Indo-Greek kings and the one best known to Western and Indian classical authors; he is believed to have been a patron of the Buddhist religion and the subject of an important Buddhist work, the *Milinda-pañha* ("The Questions of Milinda").

Menander was born in the Caucasus; but the Greek biographer Plutarch calls him a king of Bactria, and Strabo, the Greek geographer and historian, includes him among the Bactrian Greeks "who conquered more tribes than Alexander." It is possible that he ruled over Bactria, and it has been suggested that he aided the Seleucid ruler Demetrius II against the Parthians. His kingdom in the Indian subcontinent consisted of an area extending from the Kābul Valley in the west to the Rāvi River in the east, and from the Swāt Valley (in modern Pakistan) in the north to Arachosia in Afghanistan to the south. Ancient Indian writers indicate that he probably led expeditions into Rājputāna and as far east along the Ganges Valley as Pāṭaliputra, in the present-day Indian state of Bihār.

Menander was probably the Indo-Greek king who was converted to Buddhism by the holy man Nāgasena after a prolonged and intelligent discussion, which has been recorded in the *Milinda-pañha.* The style may have been influenced by Plato's dialogues. The wheel engraved on some of Menander's coins is probably connected with Buddhism, and Plutarch's statement that when Menander died his earthly remains were divided equally among the cities of his kingdom and that monuments, possibly *stūpa*s, were to be erected to enshrine them indicates that he had probably become a Buddhist.

The only inscription referring to Menander has been found in Bājaur, the tribal territory between the Swāt and Kunār rivers; but large numbers of Menander's coins have been unearthed, mostly of silver and copper, attesting to both the duration of his reign and the flourishing commerce of his realm.

According to Buddhist tradition he handed over his kingdom to his son and retired from the world, but Plutarch relates that he died in camp while on campaign.

Menander PROTECTOR (fl. second half of 6th century AD), Byzantine historian whose surviving works are a valuable authority for the 6th century, especially on geography and ethnography. At the suggestion of the Emperor Maurice (582–602), he wrote a history modeled on that of Agathias. It begins at the point where Agathias left off, and the surviving text includes the period from the arrival of the Kotrigur Huns in Thrace in 558 down to the negotiations with the Avars about Sirmium in 582. Considerable fragments of the history are preserved.

Menard, John Willis (b. April 3, 1838, Kaskaskia, Ill., U.S.—d. Oct. 8, 1893, Washington, D.C.), first black elected to the U.S. Congress, who was denied his seat by that body.

During the Civil War (1861–65) he served as a clerk in the U.S. Department of the Interior. In 1865 he moved to New Orleans, where he became active in the Republican Party, serving as inspector of customs and later as a commissioner of streets. He also published a newspaper, *The Free South,* later named *The Radical Standard.* Elected to Congress from Louisiana in 1868 to fill an unexpired term, Menard failed to overcome an election challenge by the loser, and Congress refused to seat either man. In 1871 he moved to Florida, where he was again active in the Republican Party and published the *Island City News* in Jacksonville.

Ménard, Louis-Nicolas (b. Oct. 19, 1822, Paris, Fr.—d. Feb. 9, 1901, Paris), French writer whose vision of ancient Greek religion and philosophy influenced the Parnassian poets.

Educated at the Collège Louis-le-Grand and the École Normale, Ménard was a gifted chemist (an early investigator of collodion) as well as a painter and historian. He was a socialist republican and was condemned to prison in 1849 for his *Prologue d'une révolution,* which contained radical political opinions and his reminiscences of the June 1848 insurrections in Paris, in which he played an active part. He escaped abroad, returning to Paris in 1852. Thereafter he devoted himself to classical studies. He spent several years painting in Barbizon and exhibited in the Salons (1857–69). In 1871 he supported and defended the Commune and in 1876 published *Rêveries d'un païen mystique* ("Reveries of a Mystic Pagan"), which expounds his philosophy. He later held academic chairs in decorative art and universal history.

Ménard's poetic works pale beside those of Leconte de Lisle and José María de Heredia, both of whom he influenced considerably. His short novel *La Légende de Saint-Hilarion* (1875) inspired Anatole France's novel *Thaïs* (1890), and his long poem *Prométhée délivré* (1843) was a model for Flaubert's story *La Tentation de Saint Antoine* (1874). His importance can best be seen in his historical and critical works.

Menasha, city, Winnebago county, east-central Wisconsin, U.S. It lies along Lake Winnebago and the north channel of the Fox River, just south of Appleton. Menasha, with the adjoining city of Neenah on the south channel of the Fox River, forms a single economic and social unit. Settled in 1843, it took its name from the Winnebago Indian word for "island." The city developed sawmills and flour and paper mills using the river's waterpower and is now, together with Neenah, the nation's leading producer of paper products. Inc. village 1853; city 1874. Pop. (1991 est.) 14,901.

Menasseh ben Israel: *see* Manasseh ben Israel.

menat, in Egyptian religion, protective amulet, usually hung at the back of the neck as a counterpoise to the necklace worn in the front. Frequently made of glazed ware and quite often found buried with the dead, it was a symbol of divine protection. Among women it fostered fruitfulness and health, while among men it signified virility.

Menchik-Stevenson, Vera Francevna, *née* MENCHIK (b. Feb. 16, 1906, Moscow, Russia—d. June 27, 1944, London, Eng.), Russian-born British international chess master who was the women's world champion of the game from 1927 until her death.

Menchik learned to play chess from her father at the age of nine. In 1921 her family moved to England, where she studied with Géza Maróczy, whose style greatly influenced her. The first Women's World Championship, which Menchik won, was held in London in 1927, and she retained the championship until 1939, when World War II brought an end to the tournaments. She also played successfully in several men's tournaments, taking seconds and thirds. Upon marrying R.H. Stevenson in 1937, she became a British citizen. She was killed in an air raid in London during World War II.

Menchú, Rigoberta (b. 1959, Guatemala), Guatemalan Indian-rights activist who was awarded the Nobel Prize for Peace in 1992.

Menchú was a Mayan Indian of the Quiché group. Her father, a leader of a peasant organization opposed to Guatemala's military government, died in a fire while protesting human-rights abuses by the military. Her younger brother was kidnapped, tortured, and burned to death by a military death squad in 1979, and her mother was kidnapped, raped, mutilated, and murdered by soldiers the following year. Menchú fled to Mexico in 1981 and was cared for there by members of a liberal Roman Catholic group. She soon joined international efforts to make the Guatemalan government cease its brutal counterinsurgency campaigns against Indian peasants, becoming a skilled public speaker and organizer in the course of her efforts. Menchú gained international prominence in 1983 with her widely translated book *I, Rigoberta Menchú,* in which she tells the story of her impoverished youth and recounts in horrifying detail the torture-murders of her brother and mother. She received the Nobel Peace Prize in 1992 for her continuing efforts to achieve social justice and mutual reconciliation in Guatemala.

Mencius (Latin), Chinese (Wade-Giles) MENG-TZU, or (Pinyin) MENGZI, original name (Wade-Giles) MENG K'O, posthumous name TSOU KUNG, or DUKE OF TSOU (b. *c.* 372 BC, ancient state of Tsou, China—d. *c.* 289, China), early Chinese philosopher whose development of orthodox Confucianism earned him the title "second sage." Chief among his basic tenets was an emphasis on the obligation of rulers to provide for the common people. The book *Mencius* records his doings and sayings and contains statements on the innate goodness of human nature, a topic warmly debated by Confucianists up to modern times.

Mencius, detail, ink and colour on silk; in the National Palace Museum, Taipei

By courtesy of the National Palace Museum, Taipei, Taiwan, Republic of China

Early life. Of noble origin, the Meng family settled in the state of Tsou, a minor state in the present province of Shantung. Mencius was born there about 372 BC. In several respects his life was similar to that of Confucius. Tsou and Lu (the state of Confucius' origin) were adjacent states. Like Confucius, Mencius was only three when he lost his father. Mencius' mother paid special attention to the upbringing of her young son. A traditional story tells of her moving their home several times and finally settling near a school, so that the boy should have the right kind of environmental influence, and of her encouraging her son to persevere in his studies. Among the Chinese, the mother of Mencius has been for ages upheld as the model mother.

As a young scholar Mencius had for his mentor a pupil of Tzu Ssu, who was himself the grandson of Confucius. Thus, the continuity of the Confucian orthodoxy in all its purity was assured. In due time Mencius became a teacher himself and for a brief period served as an official in the state of Ch'i. He spent much time traveling, offering his advice and counsel to the various princes on government by *jen* ("human-heartedness"), or humane government. The effort was foredoomed because the times were chaotic, and the contending princes were interested not in humane government but in power.

The Chou dynasty (*c.* 1111–256/255 BC) was founded on the feudalistic principle of a sociopolitical hierarchy, with clearly defined prerogatives and obligations between those of high and low status. As time went on, however, ambition and intrigue resulted in usurpations and impositions, eroding the feudalistic system at the root and bringing on a condition of political and moral disorder. This trend, which caused alarm to Confucius, continued to worsen at an accelerating rate, and the age in which Mencius lived is known in Chinese history as the period of Warring States (475–221 BC). Under such conditions, Mencius' preachments to the princes on virtuous personal conduct and humane government fell on deaf ears; yet he continued to speak his mind, even though he knew that he was championing an unpopular cause.

Philosopher for the people. According to Mencius, the ruler was to provide for the welfare of the people in two respects: material conditions for their livelihood and moral and educational guidance for their edification. Mencius had worked out a definite program to attain economic sufficiency for the common people, and it is recorded in the book of *Mencius* three times. He also advocated light taxes, free trade, conservation of natural resources, welfare measures for the old and disadvantaged, and more nearly equal sharing of wealth. It was his fundamental belief that "only when the people had a steady livelihood would they have a steady heart."

While Mencius patiently exhorted the princes to cultivate the way of moral power and to forsake the way of force and intrigue, he also reminded them emphatically of the responsibility that came to them with the mandate of Heaven to govern for the good of the people. With unusual courage, Mencius declared: "The people are the most important element in a nation; the spirits of the land and grain come next; the sovereign counts for the least." He also quoted for all to hear from the *Shu Ching* ("Classic of History"), one of the Five Classics of Confucianism, the saying "Heaven sees as the people see; Heaven hears as the people hear." The outspoken sympathies of Mencius made him a champion of the common people and an advocate of democratic principles in government.

Mencius' sojourn covered several states, but nowhere did he find a prince willing to put his lofty principles of government into practice. His sense of disappointment grew with the years and finally brought him back to his native state of Tsou, where he devoted the remaining years of his life to the instruction of his pupils. The work *Mencius* is a collection of the records of the doings and sayings of the master by his disciples, arranged in seven books with two parts to each book.

Doctrine of human nature. The philosophic ideas of Mencius might be regarded as an amplification of the teachings of Confucius. Confucius taught the concept of *jen,* love or human-heartedness, as the basic virtue of manhood. Mencius made the original goodness of human nature the keynote to his system. That the four beginnings, or "four principles" (*ssu tuan*)—the feeling of commiseration, the feeling of shame, the feeling of courtesy, and the feeling of right and wrong—are all inborn in man was a self-evident truth to Mencius; and the "four beginnings," when properly cultivated, will develop into the four cardinal virtues of *jen,* righteousness, decorum, and wisdom. This doctrine of the goodness of human nature on the part of Mencius has become an enduring topic for debate among the Chinese thinkers throughout the ages.

Mencius went further and taught that man possessed intuitive knowledge and intuitive ability and that personal cultivation consisted in developing one's mind. Mencius said: "He who has developed his mind to the utmost, knows his nature. Knowing his nature, he knows Heaven." Hence, all men could become like the great sage-kings Yao and Shun, the legendary heroes of the archaic past, according to Mencius.

While Mencius has always been regarded as a major philosopher, special importance was attributed to him and his work by the Neo-Confucianists of the Sung dynasty (AD 960–1279). For the last 1,000 years, Mencius has been revered among the Chinese people as the cofounder of Confucianism, second only to Confucius himself.

Among the several translations of the *Mencius* into the English language, the one by James Legge, *The Chinese Classics,* vol. 2, *Mencius,* 2nd ed. (1893–95; 3rd ed., 1960), is the standard one. W.A.C.H. Dobson's translation, *Mencius: A New Translation Arranged and Annotated for the General Reader* (1963), is also worth consulting. (Y.P.M.)

BIBLIOGRAPHY. Studies of his life and thought include Albert F. Verwilghen, *Mencius: The Man and His Ideas* (1967); Fung Yu-lan (Yu-lan Feng), *A History of Chinese Philosophy,* 2nd ed., vol. 1 (1952, reissued 1983); and Philip J. Ivanhoe, *Ethics in the Confucian Tradition: The Thought of Mencius and Wang Yang-ming* (1990).

Mencius (Latin), Chinese (Wade-Giles) MENG-TZU, or (Pinyin) MENGZI, Chinese Confucian text, named for its author, that earned for the 4th-century-BC philosopher Mencius the title *ya sheng* ("second sage"). Though the book was not generally recognized as a classic until the 12th century, a doctoral chair was established as early as the 2nd century BC to teach the *Mencius.* When Chu Hsi, a great Neo-Confucian philosopher, published the *Mencius* together with three other Confucian texts (1190), he created the classic known as *Ssu shu* ("Four Books").

The book concerns government and maintains that the welfare of the common people comes before every other consideration. When a ruler no longer practices benevolence (*jen*) and righteousness (*i*), the mandate of Heaven (*t'ien ming*) has been withdrawn, and he should be removed. Mencius also declared filial piety (*hsiao*) to be the foundation stone of Chinese society. For him, the greatest act of *hsiao* was to honour parents, the greatest lack of *hsiao* was to have no offspring (thus ancestral rites were not perpetuated).

The fame of the *Mencius* is largely based on a doctrine novel in Chinese thought, namely, that because man is endowed by Heaven his nature tends toward good as naturally as water flows downhill. As proof, Mencius cited the natural love of children for their parents, man's universal sense of right and wrong, and the spontaneous alarm one experiences when one sees a small child in danger.

This doctrine of man's natural goodness was vigorously attacked in the 3rd century BC by Hsün-tzu who taught (in a work called *Hsün-tzu*) that man is selfish and evil by nature and must learn goodness through proper education. Mencius's philosophical position has long been accepted as an orthodox interpretation of Confucianism. *See also* Ssu shu.

Mencken, H.L., in full HENRY LOUIS MENCKEN (b. Sept. 12, 1880, Baltimore, Md., U.S.—d. Jan. 29, 1956, Baltimore), controversialist, humorous journalist, and pungent critic of American life who powerfully influenced U.S. fiction through the 1920s.

H.L. Mencken

By courtesy of the Enoch Pratt Free Library, Baltimore; photograph, Robert Kniesche

Mencken attended a Baltimore private school and the Baltimore Polytechnic. He became a reporter for the *Baltimore Morning Herald* in 1899 and in 1906 joined the staff of the Baltimore *Sun,* where he worked at intervals throughout most of his life. From 1914 to 1923 he coedited (with George Jean Nathan) *The Smart Set,* a witty, urban magazine influential in the growth of American literature, and in 1924 he and Nathan founded the *American Mercury,* which Mencken edited until 1933.

Mencken was probably the most influential American literary critic in the 1920s, and he often used his criticism as a point of departure to jab at various American social and cultural weaknesses. His reviews and miscellaneous essays filled six volumes aptly titled *Prejudices* (1919–27). In literature he fought against what he regarded as fraudulently successful writers and worked for the recognition of such outstanding newcomers as Theodore Dreiser and Sinclair Lewis. He jeered at American sham, pretension, provincialism, and prudery, and he ridiculed the nation's organized religion, business, and middle class (or "booboisie").

Mencken's caustic view of life remained with him throughout his career, and in the 1930s and '40s he altered considerably less than the world around him, with the result that his influence almost disappeared. Few people found the Great Depression a subject for satire of any sort, yet he was as satirical about President Franklin D. Roosevelt and the New Deal as he had been about President Herbert Hoover and Prohibition. Similarly, when the German culture that he had enjoyed was marred by Adolf Hitler and Nazism, Mencken was slower than some of his public to recognize it and to take the fact seriously.

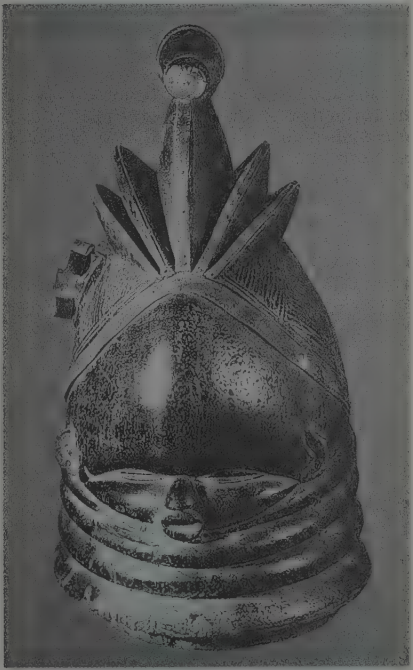
Mencken made still another contribution to American culture. In 1919 he had published a solid volume, *The American Language,* an attempt to bring together examples of American, rather than English, expressions and idioms. The book at once attracted attention. It grew with each reissue through the years, and in 1945 and 1948 Mencken published substantial supplements. By the time of his death, he was perhaps the leading authority on the language of his country.

Mencken's autobiographical trilogy, *Happy Days* (1940), *Newspaper Days* (1941), and *Heathen Days* (1943), is devoted to his experiences in journalism.

BIBLIOGRAPHY. Carl Bode, *Mencken* (1969, reprinted 1986); Douglas C. Stenerson, *H.L. Mencken* (1971); and Charles A. Fecher, *Mencken* (1978), are biographies. Criticism includes George H. Douglas, *H.L. Mencken, Critic of American Life* (1978); and Douglas C. Stenerson (ed.), *Critical Essays on H.L. Mencken* (1987).

Mende, people of Sierra Leone, including also a small group in Liberia; they speak a language of the Mande branch of the Niger-Congo family. The Mende grow rice as their staple crop, as well as yams and cassava. Cash crops include cocoa, ginger, peanuts (groundnuts), and palm oil and kernels. They practice shifting agriculture, with the heads of families allocating land to individual households, which perform most of the work. Men fell trees and clear the fields, and women weed.

The Mende occupy small towns and villages. Groups of towns and villages form sections, and several sections make up the modern chiefdom. Each section is headed by a subchief, who is the eldest suitable descendant in the male line of the founder of the area; the chiefdom is headed by a paramount chief chosen on the same basis.



Bundu (ritual mask) of the Mende peoples, from Sierra Leone

Marc and Evelyne Bernheim—Woodfin Camp and Associates

The chief is a secular leader only; ritual power is in the hands of the secret *poro* society. Membership in the *poro* is necessary for anyone in a position of authority. In addition to enforcing Mende law, the *poro* and other secret societies educate boys and girls, regulate sexual conduct, and concern themselves with agricultural fertility and military training; men masked as spirits are prominent in these activities. The women's secret society is the *sande.*

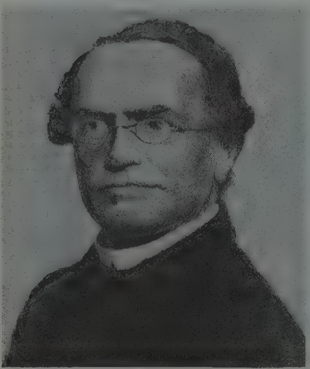
The traditional religion of the Mende includes belief in a supreme creator god, ancestral spirits, and nature deities. Diviners are consulted in times of illness or ominous experience, and the Mende believe in the power of witches. Many Mende are now Muslims or Christians, however.

Mende, town, capital of Lozère *département,* Languedoc-Roussillon region, southeastern France, lying south-southeast of Clermont-Ferrand. It is situated at 2,425 feet (739 m) above sea level in the Massif Central, on the left bank of the Lot River at the foot of a limestone plateau. With practically no industry, the town depends primarily on the tourist trade, being favoured by its position, which is 17 miles (28 km) from the magnificent Gorges of the Tarn. Surrounding mountain areas have been developed for winter sports.

The town's cathedral (restored in the 17th century) was built mainly in the 14th century, and a narrow 14th-century bridge over the Lot still stands. The seat of a bishopric since the 10th century, the town was sacked in 1579–80 by the Huguenots and was rebuilt early in the 17th century. Pop. (1990) 11,286.

Mendel, Gregor (Johann), original name (until 1843) JOHANN MENDEL (b. July 22, 1822, Heinzendorf, Austria—d. Jan. 6, 1884, Brünn, Austria-Hungary [now Brno, Czech Republic]), Austrian botanist and plant experimenter, the first to lay the mathematical foundation of the science of genetics, in what came to be called Mendelism.

Education and early career. Mendel's interest in natural science developed early. After two years' study at the Philosophical Institute at Olmütz (now Olomouc, Czech Republic), he entered the Augustinian monastery at Brünn, Moravia (later Brno, Czech Republic), in 1843, taking the name Gregor. He was ordained a priest in 1847. During the period of his monastic training he taught himself a certain amount of science. From 1849 he acted for a short time as a substitute teacher of Greek and mathematics in the secondary school at Znaim (Znojmo), near Brünn. In 1850 he took the examination for certification as a regular teacher but failed, his lowest marks being given, ironically, in biology and geology. He was then sent by his abbot to the University of Vienna, where he studied physics, chemistry, mathematics, zoology, and botany (1851–53). In 1854 Mendel returned to Brünn and taught natural science in the technical high school there until 1868, although he never succeeded in passing the examination for a teacher's license. In that year he was elected abbot of his monastery.



Gregor Mendel, etching by August Potuczek

The experiments that led to his discovery of the basic principle of heredity and, subsequently, to the science of genetics were begun in the small monastery garden in 1856. He worked for himself but in an atmosphere conducive to scientific interests. Among his colleagues at the high school were several men engaged in science, some of whom founded in Brünn, in 1862, the Natural Science Society, in whose meetings Mendel took an active part. The libraries of both monastery and school contained essential scientific books, especially on agriculture, horticulture, and botany, subjects in which Mendel's interest had been aroused by experience in his father's orchard and farm. That Mendel himself bought new books in these fields as they appeared is shown by his marginal notes in the works of Charles Darwin that appeared in the 1860s and 1870s. But it is also certain that he had begun his experiments before Darwin's first book was published and before the essential role assigned to heredity as the basis of evolutionary change had been widely recognized. In fact, when he reported the results of his experiments to the Brünn Society for the Study of Natural Science on Feb. 8 and March 8, 1865, he referred to his field of interest as "plant hybridization," and, after indicating his familiarity with the work of his predecessors in this field, he boldly stated that

> among all the numerous experiments made [by them], not one has been carried out to such an extent and in such a way as to make it possible to determine the number of different forms under which the offspring of hybrids appear, or to arrange these forms with certainty according to their separate generations, or definitely to ascertain their statistical relations.

It was this formulation by Mendel of the essential requirements for the experimental study of heredity and his provision of experimental data satisfying these requirements—both original achievements—that led him to the solution of a problem that underlies not only the understanding of heredity and of evolution but of biological processes generally.

Discovery of laws of heredity. Mendel crossed varieties of the garden pea that had maintained, under his observation, constant differences in such single alternative characters as tallness and dwarfishness, presence or absence of colour in the blossoms and axils of the leaves, and similar alternative differences in seed colour, seed shape, position of the flowers on the stem, and form of the pods. He theorized that the occurrence of the visible alternative characters of the plants, in the constant varieties and in their descendants, is due to the occurrence of paired elementary units of heredity, now known as genes. The novel feature of Mendel's interpretation of his data, amply confirmed by subsequent observations on other organisms, including man, is that these units obey simple statistical laws. The principle of these laws is that in the reproductive cells of the hybrids, half transmit one parental unit and half transmit the other. This separation of alternative characters in the reproductive cells, now known as Mendel's first law, or the principle of segregation, adequately accounts for the results when single pairs of alternative characters are observed through several generations and serves reliably as a basis of prediction. Mendel showed, moreover, that when several pairs of alternative characters are observed, the several pairs of elements enter into all possible combinations in the progeny. In the pea varieties at his disposal he observed that the seven pairs of differentiating characters recombined at random, according to the law, or principle of independent assortment, and he worked out the statistical consequences of this principle and confirmed them by experiment.

It is known now that Mendel's second principle (independent assortment) applies only to genes that are transmitted in different "linkage groups" or chromosomes in which genes are organized. Likewise the appearance (or dominance) in the hybrid of one of the alternative characters, which was true of all seven pairs observed by Mendel, proves, on wider experience, not to be true of all alternative characters. But neither of these limitations affects the fundamental truth of the system of particulate heredity by units or genes, which he was the first to prove. In the early years of the 20th century, while it was being tested and confirmed, this system was called Mendelism; it proved to be of general application and is one of the basic principles of biology.

This theory and the description of the experimental results from which it was deduced were presented in two papers that Mendel read at meetings of the Natural Science Society early in 1865 and published in detail in the transactions of the society in 1866. The article, entitled "Versuche über Pflanzenhybriden" ("Experiments with Plant Hybrids"), seems to have had no effect whatever on the biological thinking of his time in Brünn or elsewhere, although his publication reached the major libraries in Europe and America. Perhaps typical of the reception given Mendel's monumental publication was that of the eminent botanist Karl Wilhelm von Nägeli, at the University of Munich; from his correspondence with Mendel it appears that Nägeli neither fully understood the spare, mathematical logic of Mendel's paper nor adequately appreciated the implications of the monk-scientist's revolutionary discoveries.

Nevertheless, Mendel continued his research, attempting to test his theory by experiments with other plants. He published one further paper in 1869, but the plant he chose to investigate—the hawkweed (*Hieracium*), which Nägeli encouraged Mendel to work with—was inherently unsuited to serve as test material and no corroboration of Mendel's principles was obtained because in this genus the embryo is formed from the ovum without fertilization (somatic parthenogenesis). Although Mendel's interest and work in botany, bee culture, and meteorology continued almost until his death, science ceased to occupy the central position in his life, for his election as abbot of his monastery in 1868 brought with it a host of administrative duties and a protracted struggle with the Austrian government over the taxation of the monastery.

Mendel was respected and loved by his fellow monks and townsmen but unknown as the great biological scientist that he was. Fame came to him only after his death. In 1900 three other European botanists, Carl Erich Correns, Erich Tschermak von Seysenegg, and Hugo de Vries, independently obtained results similar to Mendel's and in searching the literature found that both the experimental data and the general theory had been published 34 years previously. What followed is now a part of the history of genetics: confirmation and extension of his theory by biologists in many countries and its incorporation as the basis of a rapidly developing science with primary influence on the understanding of evolution, development, physiology, biochemistry, medicine, agriculture, and social science.

Mendel, Lafayette Benedict (b. Feb. 5, 1872, Delhi, N.Y., U.S.—d. Dec. 9, 1935, New Haven, Conn.), American biochemist whose discoveries concerning the value of vitamins and proteins helped establish modern concepts of nutrition.

A professor of physiological chemistry at Yale from 1903 to 1935, he worked with the American biochemist Thomas Osborne to determine why rats could not survive on diets of pure carbohydrates, fats, and proteins alone. Simultaneously with the American biochemists Elmer McCollum and Marguerite Davis, he discovered a fat-soluble factor in cod liver oil and butter (1913; now known to be vitamin A) and a water-soluble factor in milk (1915; now known to be the vitamin B complex), both necessary to life. These researchers also proved that the nutritive value of proteins is determined by the amounts of essential amino acids they contain. Mendel wrote *Changes in the Food Supply and Their Relation to Nutrition* (1916) and *Nutrition: the Chemistry of Life* (1923).

Mendele Moykher Sforim, also spelled MENDELE MOKHER SEFORIM, pseudonym of SHALOM JACOB ABRAMOWITSCH (b. Nov. 20, 1835, Kopyl, near Minsk, Russia [now in Belarus]—d. Dec. 8, 1917, Odessa [now in Ukraine]), Jewish author, founder of both modern Yiddish and modern Hebrew narrative literature and the creator of modern literary Yiddish. He adopted his pseudonym, which means "Mendele the Itinerant Bookseller," in 1879.

Mendele published his first article, on the reform of Jewish education, in the first volume of the first Hebrew weekly, *ha-Maggid* (1856). At Berdichev in the Ukraine, where he lived from 1858 to 1869, he began to publish fiction both in Hebrew (a short story, 1863; the major novel *ha-Avot ve-ha-vanim* ["Fathers and Sons"], 1868) and in Yiddish (first story, "Dos klein mentshele" ["The Little Man"], 1864, in the Yiddish periodical *Koyl Mevasser,* which was itself founded at Mendele's suggestion). He also adapted into Hebrew H.O. Lenz's *Gemeinnützige Naturgeschichte*, 3 vol. (1862–72).

Disgusted with the woodenness of the Hebrew literary style of his time, which closely imitated that of the Bible, Mendele for a time concentrated on writing stories and plays of social satire in Yiddish. His greatest work, *Kitsur massous Binyomin hashlishi* (1875; *The Travels and Adventures of Benjamin the Third*), is a panorama of Jewish life in Russia. After living from 1869 to 1881 in Zhitomir (where he was trained as a rabbi), he became head of a traditional school (Talmud Torah) at Odessa and was the leading personality (known as "Grandfather Mendele") of the emerging literary movement. In 1886 he again published a story in Hebrew (in the first Hebrew daily newspaper, *ha-Yom*), but in a new style that was a mixture of all previous periods of Hebrew. While continuing to write in Yiddish, he gradually rewrote most of his former Yiddish works in Hebrew. His stories, written with lively humour and gentle satire, are an invaluable source for studying Jewish life in eastern Europe at the time when its traditional structure was giving way.

mendelevium (Md), synthetic chemical element of the actinide series in Group IIIb of the periodic table, atomic number 101. It was the first element to be synthesized and discovered one atom at a time. Not occurring in nature, mendelevium (as the isotope mendelevium-256) was discovered (1955) by Albert Ghiorso, Bernard G. Harvey, Gregory R. Choppin, Stanley G. Thompson, and Glenn T. Seaborg at the University of California, Berkeley, as a product resulting from the helium-ion bombardment of a minute quantity (1,000,000,000 atoms) of einsteinium-253 (atomic number 99).

In about a dozen repetitions of the experiment, the team of scientists produced 17 atoms of mendelevium, which were identified by the ion-exchange adsorption–elution method (mendelevium behaved like its rare-earth homologue thulium). Other isotopes of mendelevium, all radioactive, have been discovered. The stablest is mendelevium-258 (two-month half-life). Studied by means of radioactive tracer techniques, mendelevium exhibits a predominant +3 oxidation state, as would be expected by its position in the actinide series; a moderately stable +2 oxidation state is also known.

atomic number	101
stablest isotope	258
valence	2,3
electronic config.	2-8-18-32-31-8-2 or $(Rn)5f^{13}7s^2$

Mendeleyev, Dmitry Ivanovich, Mendeleyev also spelled MENDELEEV (b. Feb. 8 [Jan. 27, Old Style], 1834, Tobolsk, Siberia, Russia—d. Feb. 2 [Jan. 20], 1907, St. Petersburg), Russian chemist who developed the periodic classification of the elements. In his final version of the periodic table (1871) he left gaps, foretelling that they would be filled by elements not then known and predicting the properties of three of those elements.

Mendeleyev

By courtesy of the Mendeleyev All-Union Research Institute of Metrology, Moscow

Early life and education. Mendeleyev was the 17th and last child of the director of the gymnasium at Tobolsk. In the same year his father became blind, and, in order to support the family, his mother leased and operated a glass factory in a town 20 miles (32 km) away. At school Dmitry excelled in mathematics, physics, and geography but fared badly in the compulsory classical languages.

In 1847 his father died, and the next year fire destroyed the glass factory. Faced with these disasters, his mother made a brave decision: she turned her back on Tobolsk and, with her only two dependent children (Dmitry and his sister), set out for Moscow to place her son in the university.

Notwithstanding her good connections, she could not prevail in the face of the inflexible regulations that restricted admission according to place of origin: Siberia was outside the academic pale. She pressed on to St. Petersburg, but the university there, too, was closed to her son. Dmitry was also refused admission to the medical school, but, 10 weeks before her death, his mother finally secured him a place in the Pedagogic Institute.

In 1855 he qualified as a teacher, winning a gold medal for his academic achievements. On account of his health, he was posted, at his own request, to the Crimea, where he continued his chemical studies at Odessa; he returned to St. Petersburg in 1856 to obtain an advanced degree in chemistry. In 1857 he received his first university appointment.

In 1859 the government sent him for further study to the University of Heidelberg. Although Robert Bunsen, the chemist and inventor, and the physicist Gustav Kirchhoff were then the dominant figures in the natural sciences at Heidelberg, Mendeleyev preferred to work independently. His study of molecular cohesion was begun at this time, and while at Heidelberg he attended the celebrated Karlsruhe conference (September 1860) and made valuable contacts with French chemists and with the Italian chemist Stanislao Cannizzaro, whose insistence on the distinction between molecular and atomic weights influenced Mendeleyev considerably.

In 1861 Mendeleyev returned to St. Petersburg. The lack of a permanent position led him to take up editing and scientific writing. In 1864 he became professor of chemistry at the Technical Institute, and three years later he was made professor of general chemistry at the university there. Since he could not find a textbook that met his needs, he set about writing his own: the result was *The Principles of Chemistry* (1868–70), a classic textbook.

Formulation of the periodic law. In the course of writing the book, Mendeleyev probed deeply into the relationship between the properties of elements in an attempt to devise a system of classifying them. Other scientists had also tried to construct such a system of classification. After the English chemist and physicist John Dalton had developed the idea of atomic weights, chemists sought arithmetic connections between them, partly to see whether there was any likelihood of all elements being composed of a simple, common substance and partly to see whether occasional similarities in their properties pointed to similarities in structure. Johann Döbereiner and William Odling, both of whom had also done work with atomic weights, were the most prominent among the chemists who attempted to devise a logical order for the elements. It was Mendeleyev, however, who formulated the periodic law, according to which, when all known elements are arranged in order of increasing atomic weight, the resulting table shows a periodicity of properties and allows one to observe the many types of chemical relation hitherto studied only in isolation. The new system did not win wide acceptance at first, its validity becoming apparent only with time. The table of elements had gaps, but Mendeleyev predicted that they would be filled by elements not yet discovered; three were discovered within 20 years, and they possessed the properties he had predicted. Gradually the table became the framework for a great part of chemical theory and proved to be most useful in the interpretation of the processes of the natural transformation of one element into another, called radioactive decay, more than 20 years after the table's conception.

Although Mendeleyev's textbooks ran to many editions in many languages, the periodic theory remained his chief monument. Mendeleyev's mind, however, was not limited to theory and to classroom teaching. He was also by nature a practical man, aware of the necessity to use science in solving the problems of the world. In 1865 he farmed a small estate and improved the yield and quality of crops by the application of his scientific knowledge, a measure he knew was essential to the improvement of the general agricultural condition of Russia.

Other pursuits. In 1867 he was sent to organize the Russian pavilion at the Paris Exposition of that same year. His study of the French chemical industry during his stay helped him improve the Russian soda industry, and, later, he spent much time working on the problems of the Russian petroleum industry. During a visit to the United States in 1876, he criticized the manner in which American oil interests concentrated on mere expansion of production without giving attention to scientific improvements of either the efficiency of the industry or the quality of its products. At home he was equally critical of the way Russian oil was exploited by foreign interests, and he constantly urged that Russia develop its own oil for its own profit. His interest in aeronautics led him to make balloon ascents for scientific observation and to encourage his colleagues to pursue the possibilities of heavier-than-air flight.

Politically, Mendeleyev held progressive views and was much interested in social reform. The tsarist regime did not approve of his political views, and, although a man of his stature could not be suppressed, he was often snubbed—as, for example, in 1880, when he was ostentatiously refused advancement from corresponding to full membership of the Imperial Academy of Sciences. In 1890 Mendeleyev's transmittal of a request from students at the university for alleviation of unjust conditions led to an open clash between him and the government. For this allegedly improper action he was retired from the university. He held no further major academic post.

He was too useful, however, to be left idle. In 1891 he was officially employed in setting up a new system of import duties on heavy chemicals, and in 1893 he headed the Bureau of Weights and Measures, a post he filled efficiently until his death.

Mendeleyev's last years were saddened not only by declining health but by the political events that preceded the Russian Revolution of 1905. He had been greatly honoured by colleagues of many countries as a guest lecturer and as an honorary member of academies. He was recognized in his day as a leader of the movement to systematize and make cohesive the study of chemistry. He is recognized now as the discoverer of the interrelationship of chemical elements, which not only underlies most of chemistry but also unifies a great deal of modern physics. (F.Gre.)

BIBLIOGRAPHY. The only substantial biography in English is Daniel Q. Posin, *Mendeleyev: The Story of a Great Scientist* (1948), but it is also a fanciful and romanticized version. Studies of Mendeleyev's scientific work are included in J.R. Partington, *A History of Chemistry,* vol. 4, ch. 26 (1964), which also gives biographical notes on and estimates of the work of his principal contemporaries, with many references.

Mendelism, the principles of heredity formulated by the Austrian Augustinian monk Gregor Mendel in 1865. These principles compose what is known as the system of particulate inheritance by units, or genes. The later discovery of chromosomes as the carriers of genetic units supported Mendel's two basic laws, known as the law of segregation and the law of independent assortment. In modern terms, the first of these states that genes are transferred as separate and distinct units from one generation to the next. The two members (alleles) of a gene pair, one on each of paired chromosomes, separate during the formation of sex cells by a parent organism. One-half of the sex cells will have one form of the gene, one-half the other form; the offspring that result from these sex cells will reflect those proportions. A modern formulation of the second law, the law of independent assortment, is that the alleles of a gene pair located on one pair of chromosomes are inherited independently of the alleles of a gene pair located on another chromosome pair and that the sex cells containing various assortments of these genes fuse at random with the sex cells produced by the other parent.

Mendelsohn, Erich (b. March 21, 1887, Allenstein, Ger. [now Olsztyn, Pol.]—d. Sept. 15, 1953, San Francisco, Calif., U.S.), German architect known initially for his Einstein Tower in Potsdam, a notable example of German Expressionism in architecture, and later for his use of modern materials and construction methods to make what he saw as organically unified buildings.

While studying architecture at the Technical Academy in Munich, he supported himself by selling his paintings and by designing decorations for store windows and stage productions. During that period he had close contacts with the Blaue Reiter group of German Expressionist artists in Munich.

While serving in the German army during World War I, he made a series of highly imaginative architectural sketches that attracted widespread attention when they were exhibited in Berlin shortly after the war.

The sketches led to Mendelsohn's first commission after the war, the Einstein Tower, Potsdam (1919–21). This bizarre, highly sculptured structure caused an immediate sensation. He had intended the structure to convey the possibilities of poured concrete, but a shortage of this material necessitated the substitution of brick covered with cement. The hat factory of Steinberg, Hermann & Co. that he designed at Luckenwalde (1920–23) also had a striking appearance, and it was entirely functional as well.

During the 1920s Mendelsohn designed a number of structures that were particularly notable for their prominent and imaginative use of glass in strongly horizontal compositions; outstanding were the Schocken stores at Stuttgart (1927) and Chemnitz (1928).

Mendelsohn was forced to leave Germany in 1933, when the National Socialist (Nazi) Party came to power. He went first to Brussels and then to London. His most important work in England was the De La Warr Pavilion, Bexhill (with Serge Chermayeff, 1933), which had a glass-enclosed, semicircular stairway tower. During the same period, he carried out important commissions in Palestine, notably large hospitals at Haifa (1937) and Jerusalem (1938). In 1941 Mendelsohn went to the United States, and in 1945 he settled in San Francisco, where his important works include the Maimonides Hospital (1946). To his credit also are synagogues and community centres in St. Louis, Mo.; Cleveland, Ohio; Grand Rapids, Mich.; and St. Paul, Minn.

Mendelssohn, Fanny, in full FANNY (CÄCILIE) MENDELSSOHN (-BARTHOLDY), married name FANNY HENSEL (b. Nov. 14, 1805, Hamburg [Germany]—d. May 14, 1847, Berlin, Prussia), German pianist and composer, the eldest sister and confidante of the composer Felix Mendelssohn.

Fanny is said to have been as talented musically as her brother, and the two children were given the same music teachers. Felix readily admitted that his sister played the piano better than he did, and Fanny remained his chief musical adviser until he left home. She is said to have memorized J.S. Bach's complete *Well-Tempered Clavier* by age 13.

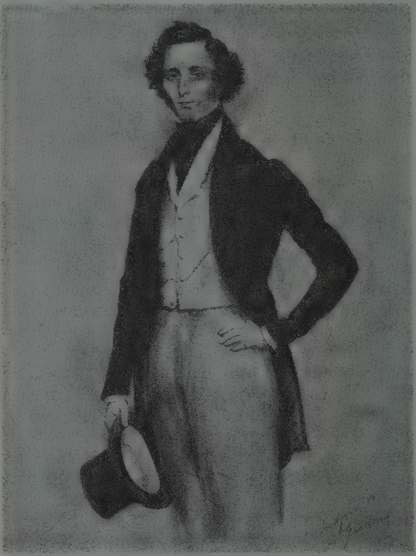
Fanny married the Prussian court painter Wilhelm Hensel in 1829. She traveled in Italy with her husband in 1839–40. Upon her mother's death in 1842 she took over the direction of the Mendelssohn family home in Berlin, in which role she organized local concerts and occasionally appeared as a pianist. Fanny remained very close to her brother, and her death in May 1847 greatly contributed to Felix's own demise six months later.

Fanny wrote about 500 musical compositions in all, including about 120 pieces for piano, many lieder (art songs), and chamber music, cantatas, and oratorios. Six of her songs were published under Felix's name in his two sets of *Twelve Songs* (Opuses 8 and 9), while the few works published under her own name include several collections of short piano pieces, some lieder, and a piano trio. Most of her remaining works exist only in manuscript. Stylistically her music is similar to that of her brother.

Fanny's son Sebastian wrote a biography of the Mendelssohn family based partly on Fanny's diaries and letters, which provide a great deal of information about her brother Felix.

Mendelssohn, Felix, in full JAKOB LUDWIG FELIX MENDELSSOHN-BARTHOLDY (b. Feb. 3, 1809, Hamburg—d. Nov. 4, 1847, Leipzig), German composer, pianist, musical conductor, and teacher, one of the most celebrated figures of the early Romantic period. In his music Mendelssohn largely observed Classical models and practices while initiating key aspects of Romanticism—the artistic movement that exalted feeling and the imagination above rigid forms and traditions. Among his most famous works are *Overture to A Midsummer Night's Dream* (1826), *Italian Symphony* (1833), a violin concerto (1844), two piano concerti (1831, 1837), the oratorio *Elijah* (1846), and several pieces of chamber music. He was a grandson of the philosopher Moses Mendelssohn.

Early life and works. Felix was born of Jewish parents, Abraham and Lea Salomon Mendelssohn, from whom he took his first piano lessons. Though the Mendelssohn family was proud of their ancestry, they considered it desirable, in accordance with 19th-century liberal ideas, to mark their emancipation from the ghetto by adopting the Christian faith. Accordingly Felix, together with his brother and two sisters, was baptized in his youth as a Lutheran Christian. The name Bartholdy, a family property on the river Spree, was held by a wealthy maternal uncle who had embraced Protestantism. When the fortune of this relative passed to the Mendelssohns, his name was adopted by them.



Felix Mendelssohn, watercolour by James Warren Childe, 1829; in a private collection

In 1811, during the French occupation of Hamburg, the family had moved to Berlin, where Mendelssohn studied the piano with Ludwig Berger and composition with K.F. Zelter, who, as a composer and teacher, exerted an enormous influence on his development. Other teachers gave the Mendelssohn children lessons in literature and landscape painting, with the result that at an early age Mendelssohn's mind was widely cultivated. His personality was nourished by a broad knowledge of the arts and was also stimulated by learning and scholarship. He traveled with his sister to Paris, where he took further piano lessons and where he appears to have become acquainted with the music of Wolfgang Amadeus Mozart.

Mendelssohn was an extemely precocious musical composer. He wrote numerous compositions during his boyhood, among them 5 operas, 11 symphonies for string orchestra, concerti, sonatas, and fugues. Most of these works were long preserved in manuscript in the Prussian State Library in Berlin but are believed to have been lost in World War II. He made his first public appearance in 1818—at the age of nine—in Berlin.

In 1821 Mendelssohn was taken to Weimar to meet J.W. von Goethe, for whom he played works of J.S. Bach and Mozart and to whom he dedicated his *Piano Quartet No. 3. in B Minor* (1825). A remarkable friendship developed between the aging poet and the 12-year-old musician. In Paris in 1825 Luigi Cherubini discerned his outstanding gifts. The next year he reached his full stature as a composer with the *Overture to A Midsummer Night's Dream*. The atmospheric effects and the fresh lyrical melodies in this work revealed the mind of an original composer, while the animated orchestration looked forward to the orchestral manner of Nikolay Rimsky-Korsakov.

Mendelssohn also became active as a conductor. On March 11, 1829, at the Singakademie, Berlin, he conducted the first performance since Bach's death of the *St. Matthew Passion,* thus inaugurating the Bach revival of the 19th and 20th centuries. Meanwhile he had visited Switzerland and had met Carl Maria von Weber, whose opera *Der Freischütz,* given in Berlin in 1821, encouraged him to develop a national character in music. Mendelssohn's great work of this period was the *String Octet in E Flat Major* (1825), displaying not only technical mastery and an almost unprecedented lightness of touch but great melodic and rhythmic originality. Mendelssohn developed in this work the genre of the swift-moving scherzo (a playful musical movement) that he would also use in the incidental music to *A Midsummer Night's Dream* (1842).

In the spring of 1829 Mendelssohn made his first journey to England, conducting his *Symphony No. 1 in C Minor* (1824) at the London Philharmonic Society. In the summer he went to Scotland, of which he gave many poetic accounts in his evocative letters. He went there "with a rake for folksongs, an ear for the lovely, fragrant countryside and a heart for the bare legs of the natives." At Abbotsford he met Sir Walter Scott. The literary, pictorial, and musical elements of Mendelssohn's imagination are often merged. Describing, in a letter written from the Hebrides, the manner in which the waves break on the Scottish coast, he noted down, in the form of a musical symbol, the opening bars of the *Hebrides Overture* (1830–32; also known as *Fingal's Cave*). Between 1830 and 1832 he traveled in Germany, Austria, Italy, and Switzerland and, in 1832, returned to London, where he conducted the *Hebrides Overture* and where he published the first book of the piano music he called *Lieder ohne Worte* (*Songs Without Words*), completed in Venice in 1830. Gradually Mendelssohn, whose music in its day was held to be remarkable for its charm and elegance, was becoming the most popular of 19th-century composers in England. His main reputation was made in England, which, in the course of his short life, he visited no fewer than 10 times. At the time of these visits the character of his music was held to be predominantly Victorian, and indeed he eventually became the favourite composer of Queen Victoria herself.

Mendelssohn's subtly ironic account of his meeting with the queen and the prince consort at Buckingham Palace in 1843, to both of whom he was affectionately drawn, shows him also to have been alive to both the pomp and the sham of the royal establishment. His *Symphony No. 3 in A Minor–Major,* or *Scottish Symphony,* as it is called, was dedicated to Queen Victoria. And he became endeared to the English musical public in other ways. The fashion for playing the "Wedding March" from his *A Midsummer Night's Dream* at bridal processions originates from a performance of this piece at the wedding of the Princess Royal after Mendelssohn's death, in 1858. In the meantime he had given the first performances in London of Ludwig van Beethoven's *Emperor* and *G Major* concerti. He was among the first to play a concerto from memory in public—Mendelssohn's memory was prodigious—and he also became known for his organ works. Later the popularity of his oratorio *Elijah,* first produced at Birmingham in 1846, established Mendelssohn as a composer whose influence on English music equaled that of George Frideric Handel. After his death this influence was sometimes held to have had a stifling effect. Later generations of English composers, enamoured of Richard Wagner, Claude Debussy, or Igor Stravinsky, revolted against the domination of Mendelssohn and condemned the sentimentality of his lesser works. But there is no doubt that he had, nevertheless, succeeded in arousing the native musical genius, at first by his performances and later in the creative sphere, from a dormant state.

A number of new experiences marked the grand tour that Mendelssohn had undertaken after his first London visit. Lively details of this tour are found in his long series of letters. On Goethe's recommendation he had read Laurence Sterne's *Sentimental Journey,* and, inspired by this work, he recorded his impressions with great verve. In Venice he was enchanted by the paintings of Titian and Giorgione. The papal singers in Rome, however, were "almost all unmusical," and Gregorian music he found unintelligible. In Rome he describes a "haggard" colony of German artists "with terrific beards." Later, at Leipzig, where Hector Berlioz and Mendelssohn exchanged batons, Berlioz offered an enormous cudgel of lime tree covered with bark, whereas Mendelssohn playfully presented his brazen contemporary with a delicate light stick of whalebone elegantly encased in leather. The contrast between these two batons precisely reflects the violently conflicting characters of the two composers.

In 1833 he was in London again to conduct his *Italian Symphony* (*Symphony No. 4 in A Major–Minor*), and in the same year he became music director of Düsseldorf, where he introduced into the church services the masses of Beethoven and Luigi Cherubini and the cantatas of Bach. At Düsseldorf, too, he began his first oratorio, *St. Paul.* In 1835 he became conductor of the celebrated Gewandhaus Orchestra at Leipzig, where he not only raised the standard of orchestral playing but made Leipzig the musical capital of Germany. Frédéric Chopin and Robert Schumann were among his friends at Leipzig, where, at his first concert with the Gewandhaus Orchestra, he conducted his overture *Meeresstille und glückliche Fahrt* (1828–32; *Calm Sea and Prosperous Voyage*).

Marriage and maturity. In 1835 Mendelssohn was overcome by the death of his father, Abraham, whose dearest wish had been that his son should complete *St. Paul.* He accordingly plunged into this work with renewed determination and the following year conducted it at Düsseldorf. The same year at Frankfurt he met Cécile Jeanrenaud, the daughter of a French Protestant clergyman. Though she was 10 years younger than himself, that is to say, no more than 16, they became engaged and were married on March 28, 1837. His sister Fanny, the member of his family who remained closest to him, wrote of her sister-in-law: "She is amiable, childlike, fresh, bright and even-tempered, and I consider Felix most fortunate for, though inexpressibly fond of him, she does not spoil him, but when he is capricious, treats him with an equanimity which will in course of time most probably cure his fits of irritability altogether." This was magnanimous praise on the part of Fanny, to whom Mendelssohn was drawn by musical as well as emotional ties. Fanny was not only a composer in her own right—she had herself written some of the *Songs Without Words* attributed to her brother—but she seems to have exercised, by her sisterly companionship, a powerful influence on the development of his inner musical nature.

Works written over the following years include the *Variations sérieuses* (1841), for piano, the *Lobgesang* (1840; *Hymn of Praise*), *Psalm CXIV,* the *Piano Concerto No. 2 in D Minor* (1837), and chamber works. In 1838 Mendelssohn began the *Violin Concerto in E Minor–Major.* Though he normally worked rapidly, throwing off works with the same facility as one writes a letter, this final expression of his lyrical genius compelled his arduous attention over the next six years. Later, in the 20th century, the *Violin Concerto* was still admired for its warmth of melody and for its vivacity, and it was also the work of Mendelssohn's that, for nostalgic listeners, enshrined the elegant musical language of the 19th century. Nor was its popularity diminished by the later, more turgid, and often more dramatic violin concerti of Johannes Brahms, Béla Bartók, and Alban Berg. It is true that many of Mendelssohn's works are cameos, delightful portraits or descriptive pieces, held to lack the characteristic Romantic depth. But occasionally, as in the *Violin Concerto* and certain of the chamber works, these predominantly lyrical qualities, so charming, naive, and fresh, themselves end by conveying a sense of the deeper Romantic wonder.

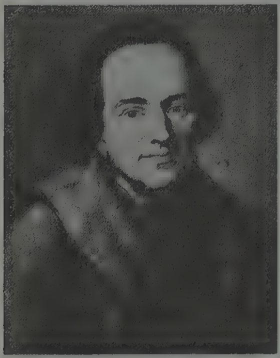
In 1843 Mendelssohn founded at Leipzig the conservatory of music where, together with Schumann, he taught composition. Visits to London and Birmingham followed, entailing an increasing number of engagements. These would hardly have affected his normal health; he had always lived on this feverish level. But at Frankfurt in May 1847 he was greatly saddened by the death of Fanny. It is at any rate likely that for a person of Mendelssohn's sensibility, living at such intensity, the death of this close relative, to whom he was so completely bound, would undermine his whole being. In fact, after the death of his sister, his energies deserted him, and, following the rupture of a blood vessel, he soon died.

Assessment. Though the music of Mendelssohn, stylish and elegant, does not fill the entire musical scene, as it was inclined to do in Victorian times, it has elements that unite this versatile 19th-century composer to the principal artistic figures of his time. In the *Midsummer Night's Dream* music, with its hilarious grunting of an ass on the bassoon and the evocative effect of Oberon's horn, Mendelssohn becomes a partner in Shakespeare's fairyland kingdom. The blurred impressionist effects in *Fingal's Cave* foreshadow the later developments of the painter J.M.W. Turner. Wagner understood Mendelssohn's inventive powers as an orchestrator, as is shown in his own opera *The Flying Dutchman,* and, later, the French composers of the 20th century learned much from his grace and perfection of style.

In recent times the appeal of Mendelssohn's work has not dwindled. It is true that *Elijah* is not so frequently performed as it was and some of his fluent piano works are now overshadowed by the more enduring works of Beethoven and Schumann. But the great pictorial works of Mendelssohn, the *Scottish* and *Italian* symphonies, repeatedly yield new vistas. Mendelssohn was one of the first of the great 19th-century Romantic composers, and in this sense he remains even today a figure to be rediscovered. (E.L./Ed.)

Jacob, *Felix Mendelssohn and His Times* (1959, reissued 1973); George R. Marek, *Gentle Genius* (1972), focusing more on the man and little on his music; Michael Hurd, *Mendelssohn* (1970); and Philip Radcliffe, *Mendelssohn*, rev. ed. (1976).

Mendelssohn, Moses (b. Sept. 26, 1729, Dessau, Anhalt [Germany]—d. Jan. 4, 1786, Berlin, Prussia), German-Jewish philosopher, critic, and Bible translator and commentator who greatly contributed to the efforts of Jews to assimilate to the German bourgeoisie.



Moses Mendelssohn, lithograph after a portrait by Anton Graff

Deutsche Fotothek Dresden

The son of an impoverished scribe called Menachem Mendel Dessau, he was known in Jewry as Moses Dessau but wrote as Mendelssohn, from the Hebrew *ben Mendel* ("the Son of Mendel"). His own choice of the German Mendelssohn over the Hebrew equivalent reflected the same acculturation to German life that he sought for other Jews. In 1743 he moved to Berlin, where he studied the thought of the English philosopher John Locke and the German thinkers Gottfried von Leibniz and Christian von Wolff.

In 1750 Mendelssohn became tutor to the children of the silk manufacturer Issak Bernhard, who in 1754 took Mendelssohn into his business. The same year, he met a major German playwright, Gotthold Ephraim Lessing, who had portrayed a noble Jew in his play *Die Juden* (1749; "The Jews") and came to see Mendelssohn as the realization of his ideal. Subsequently, Lessing modeled the central figure of his drama *Nathan der Weise* (1779; *Nathan the Wise,* 1781) after Mendelssohn, whose wisdom had caused him to be known as "the German Socrates." Mendelssohn's first work, praising Leibniz, was printed with Lessing's help as *Philosophische Gespräche* (1755; "Philosophical Speeches"). That year Mendelssohn also published his *Briefe über die Empfindungen* ("Letters on Feeling"), stressing the spiritual significance of feelings.

In 1763 Mendelssohn won the prize of the Prussian Academy of Arts in a literary contest; and as a result King Frederick the Great of Prussia was persuaded to exempt Mendelssohn from the disabilities to which Jews were customarily subjected. Mendelssohn's winning essay compared the demonstrability of metaphysical propositions with that of mathematical ones and was the first to be printed under his own name (1764). His most celebrated work, *Phädon, oder über die Unsterblichkeit der Seele* (1767; "Phaedo, or on the Immortality of the Soul"), defended the immortality of the soul against the materialism prevalent in his day; his title reflects his respect for Plato's *Phaedo.*

In 1771 Mendelssohn experienced a nervous breakdown as the result of an intense dispute over Christianity with the Swiss theologian J.C. Lavater, who two years earlier had sent him his own translation of a work by his compatriot Charles Bonnet. In his dedication, Lavater had challenged Mendelssohn to become a Christian unless he could refute Bonnet's arguments for Christianity. Although Mendelssohn deplored religious controversy, he felt compelled to reaffirm his Judaism. The strain was relaxed only when he began a translation of the Psalms in 1774. He next embarked on a project designed to help Jews relate their own religious tradition to German culture—a version of the Pentateuch, the first five books of the Old Testament, written in German but printed in Hebrew characters (1780–83). At the same time, he became involved in a new controversy that centred on the doctrine of excommunication. The conflict arose when his friend Christian Wilhelm von Dohm agreed to compose a petition for the Jews of Alsace, who originally had sought Mendelssohn's personal intervention for their emancipation. Dohm's *Über die bürgerliche Verbesserung der Juden* (1781; "On the Civil Improvement of the Jews") pleaded for emancipation but, paradoxically, added that the state should uphold the synagogue's right to excommunicate its members. To combat the resulting hostility to Dohm's book, Mendelssohn denounced excommunication in his preface (1782) to a German translation of *Vindiciae Judaeorum* ("Vindication of the Jews") by Manasseh ben Israel. After an anonymous author accused him of subverting an essential part of Mosaic law, Mendelssohn wrote *Jerusalem, oder über religiöse Macht und Judentum* (1783; "Jerusalem, or on Religious Power and Judaism"). This work held that force may be used by the state to control actions only; thoughts are inviolable by both church and state.

A final controversy, revolving around allegations that Lessing had supported the pantheism of Benedict de Spinoza, engaged Mendelssohn in a defense of Lessing, while he wrote his last work, *Morgenstunden* (1785; "Morning Hours"), in support of the theism of Leibniz. His collected works, which fill seven volumes, were published in 1843–45.

Through his own example Mendelssohn showed that it was possible to combine Judaism with the rationalism of the Enlightenment. He was accordingly one of the initiators and principal voices of the Haskala (*q.v.;* "Jewish Enlightenment"), which helped bring Jews into the mainstream of modern European culture. Through his advocacy of religious toleration and through the prestige of his own intellectual accomplishments, Mendelssohn did much to further the emancipation of the Jews from prevailing social, cultural, political, and economic restrictions in Germany. His son Abraham was the father of the composer Felix Mendelssohn.

BIBLIOGRAPHY. Alexander Altmann, *Moses Mendelssohn: A Biographical Study* (1973), examines the various influences that shaped his thought.

Mendenhall, Thomas Corwin (b. Oct. 4, 1841, Hanoverton, Ohio, U.S.—d. March 23, 1924, Ravenna, Ohio), American physicist and meteorologist, the first to propose the use of a ring pendulum for measuring absolute gravity.

Mendenhall was a professor at Ohio State University, Columbus, in 1873–78 and from 1881 until he was named professor emeritus in 1884, when he became a professor for the U.S. Signal Corps. In 1878–81 he was a visiting professor at the Tokyo Imperial University, where he helped develop the Japanese government's meteorological system, and in 1889 he was appointed superintendent of the U.S. Coast and Geodetic Survey; he served as president of the Worcester (Mass.) Polytechnic Institute from 1894 until 1901, when he moved to Europe for 11 years of work.

Mendenhall developed the state weather service of Ohio, and his work included studies in electricity, seismology, and atmospheric electricity.

Mendenhall Glacier, blue ice sheet, 12 miles (19 km) long, about 1.5 miles (2.4 km) wide, and more than 100 feet (30 m) high at its terminus. It flows from the southern half of the huge Juneau Icefield, which begins in the Boundary Ranges in southeastern Alaska, U.S. A relic of the Little Ice Age that lasted until the mid-18th century, the Mendenhall Glacier is an example of a receding glacier (about 90 feet [27 m] a year), displaying raw glacier moraine with exposed remnants of a long-buried forest. It lies adjacent to the Tongass National Forest and is the only glacier in the region that is readily accessible by highway the year round. Originally named Auke, for the Auke Indians, it was renamed in 1892 for Thomas Corwin Mendenhall of the U.S. Coast and Geodetic Survey. Adjacent Mendenhall Lake began to form about 1900 and has become about 1.5 miles (2.5 km) long, 1 mile (1.6 km) wide, and 115 feet (35 m) deep near the centre of the glacier's face.

Menderes, Adnan (b. 1899, Aydın, Tur.—d. Sept. 17, 1961, İmralı), Turkish politician who served as prime minister from 1950 until deposed by a military coup in 1960.

The son of a wealthy landowner, Menderes was educated at the American College in İzmir and the Faculty of Law at Ankara. Later in life he sold or distributed most of his estates to small shareholders, maintaining only one farm, which became a model of modern agricultural methods. In 1930 he entered parliament as a member of Kemal Atatürk's Republican People's Party (RPP). The RPP was at that time the only legal party in Turkey and was firmly pro-Western. It had broken drastically with many social and cultural traditions of the past and had introduced a rigidly controlled state economy.

In 1945 Menderes was expelled from the RPP, and he and three others founded (1946) the Democrat Party (DP), which became Turkey's first opposition party. The 1950 elections, which were the first free elections held in Turkey in more than 25 years, resulted in a landslide victory for Menderes and his party. Menderes was more tolerant than the RPP of traditional ways of life. While still pro-Western in foreign policy, he tried to establish closer ties with Muslim states. Recognizing the deep-seated religious fervour of the populace, Menderes relaxed much of the official antipathy of Atatürk and the RPP towards some of the more conservative manifestations of Islāmic religious feeling.

The DP encouraged private enterprise as opposed to a planned economy, but it eventually brought the country to insolvency by a policy of heedless importation of foreign goods and technology. While the lot of the average villager did improve, it was done at the sacrifice of national economic integrity.

In spite of Turkey's crushing economic problems, Menderes maintained his popularity with the peasantry, and in the 1954 elections the DP again won by a substantial majority, returning Menderes to office. Always intolerant of criticism, Menderes then set out to silence his opposition. Press censorship was instituted, journalists were jailed at whim, and local elections were rigged. These policies not only angered the intellectuals but alienated the military, a group that saw itself as the guardians of Kemalist ideals and felt that the Atatürk reforms were being directly challenged.

Although the national economy continued to decline, Menderes still had popular support and won the 1957 elections. But the opposition to him was intensifying, and on May 27, 1960, a military coup overthrew his government. Menderes and hundreds of Democrat Party leaders were arrested. During a trial lasting 11 months, Menderes was accused of embezzling state funds, extravagance, and corruption, among other charges. He was sentenced to death and, following a suicide attempt, was hanged.

Menderes River, Turkish BÜYÜK MENDERES NEHRİ, historically MAEANDER, river, southwestern Turkey. It rises on the Anatolian plateau south and west of Afyon and flows westward through a narrow valley and canyon. At Sarayköy it expands into a broad, flat-bottomed valley with a typical Mediterranean landscape, dotted with fig trees, olive groves, and vineyards. Near the town of Aydın the river turns southwest, emptying into the Aegean Sea after a course of about 363 miles (584 km). The ancient port of Miletus, which lay near its mouth, has long been landlocked and abandoned because of silting. The river's classical name, Maeander (whence the English *meander*), is derived from the winding course of its lower reaches.

Mendès, Catulle (b. May 22, 1841, Bordeaux, Fr.—d. Feb. 9, 1909, Paris), prolific French poet, playwright, and novelist, most noted for his association with the Parnassians, a group of French poets who advocated a controlled, formal art for art's sake in reaction to the formlessness of Romanticism.

A banker's son, Mendès founded in Paris *La Revue fantaisiste* (1861), which became a vehicle for the late works of Théophile Gautier (whose daughter Mendès married) and such poets as Charles Baudelaire and Villiers de L'Isle-Adam. Mendès edited *Le Parnasse contemporain* (1866, 1871, 1876; "The Contemporary Parnassians"), which named their movement, and he became their historian in *La Légende du Parnasse contemporain.* He also encouraged members of a younger generation of poets who were to found the important Symbolist movement.

Mendès
Harlingue—H. Roger-Viollet

Mendès' *Poésies* (1892) and *Poésies nouvelles* (1893) imitate many other poets, and it is difficult to tell his verse from theirs. His plays *Les Mères ennemies* (1882; "The Enemy Mothers") and *La Femme de Tabarin* (1887; "The Woman of Tabarin") were more successful. He also wrote several novels and licentious tales, such as *Pour lire au bain* ("Readings for the Bath"). His critical work *Rapport sur le mouvement poétique français de 1867–1900* (1902; "Thoughts on the French Poetic Movement of 1867–1900") is still read.

Mendes, Murilo (b. May 13, 1901, Juiz de Fora, Braz.—d. Aug. 14, 1975, Lisbon, Port.), Brazilian poet and diplomat who played an important role in Brazilian Modernism after 1930, though much of his life was spent as a teacher and as cultural attaché in the Brazilian embassy in Italy.

Mendes' early poems, characterized by ironic good humour and a colloquial vocabulary, illuminated the creative, chaotic forces within Brazilian everyday life. His later works show an increasing Surrealist influence. Following his conversion to Roman Catholicism (1934), he collaborated with Jorge de Lima in the creation of metaphysical poetry (*e.g., Tempo e Eternidade*, 1935; "Time and Eternity"), some of which is couched in allegorical terms.

Much of Mendes' subsequent poetry shows an almost dialectical tension between the worlds of forms and of religious transcendence. In poetry published during the last two decades of his life, he sought to incorporate the austere clarity and "dryness" of traditional Iberian Spanish verse, an influence which he communicated in turn to João Cabral de Melo Neto. He also experimented with certain Concretist techniques.

Mendès-France, Pierre (b. Jan. 11, 1907, Paris, Fr.—d. Oct. 18, 1982, Paris), French socialist statesman and premier (June 1954–February 1955) whose negotiations ended French involvement in the Indochina War. He was distinguished for his efforts to invigorate the Fourth Republic and the Radical Party.

Mendès-France
H. Roger-Viollet

Born into a Jewish family, Mendès-France became a lawyer and was a Radical–Socialist deputy for the Eure *département* from 1932 to 1940. He was undersecretary of state for finance under Léon Blum from March to June 1938. After serving in the air force in World War II and being imprisoned by the Vichy government, he escaped in June 1941, reached London in February 1942, and joined the Free French air force. From November 1943 to April 1945, he served under General Charles de Gaulle, first as commissioner for finance and then as minister of national economy. His austere policies, designed to halt inflation, alienated his colleagues and led to his resignation in April 1945.

A deputy again from June 1946, Mendès-France came to the fore as a severe critic of successive governments' policies on economics, the war in Indochina, and North Africa. After the French were defeated at Dien Bien Phu by the Viet Minh in May 1954, he became premier on the pledge that he would end France's involvement in Indochina within 30 days. His promise was fulfilled at the revitalized Geneva conferences, and an armistice line was drawn between the two halves of Vietnam at the 17th parallel. He then paved the way for Tunisian autonomy and assisted the defeat of the European Defense Community, accepting instead a British plan for German rearmament. Again Mendès-France's policies made him unpopular, and, on Feb. 5, 1955, he was defeated. The immediate cause of his fall was his proposed economic-reform program.

Mendès-France then worked to capture the Radical Party and at first succeeded. He wanted to make the party the centre of the noncommunist left. A leader of the left-centre Front Républicain in the general elections of 1956, he was deputy premier without portfolio in Guy Mollet's government from February to May 1956, when he resigned on Mollet's refusal to adopt a liberal policy in Algeria. Because he opposed de Gaulle's accession to power, Mendès-France was not reelected to the National Assembly in 1958. His influence in the Radical Party declining, he resigned in 1959.

In the presidential election of 1965 he supported François Mitterrand against de Gaulle, and in 1967 he regained his seat in the National Assembly; but he never attracted a substantial group of followers who shared his hostility to the Fifth Republic's presidential government.

Mendès-France published several books on political and economic topics.

Méndez, Aparicio (b. Aug. 24, 1904, Rivera, Uruguay—d. June, 1988, Montevideo), Uruguayan lawyer, legal scholar, and politician and, from September 1976 to September 1981, president of Uruguay.

Méndez was professor of administrative law at the University of the Republic in Montevideo from 1930 to 1955, minister of public health from 1961 to 1964, and member of the Council of State from 1973. He was appointed president by the military junta that overthrew President Juan María Bordaberry in the midst of civil strife between government authorities and the leftist guerrillas known as Tupamaros. Upon taking office Méndez published a decree depriving all politicians who took part in the 1966 and 1971 general elections of political rights for 15 years, a measure that affected several thousand people. Méndez' government was widely accused of the illegal detention and torture of political prisoners in its efforts to suppress the rebellion. In 1977 he announced that elections would be held in 1981, although he indicated that economic recovery took precedence over political liberties. As the announced elections approached, the government conducted a referendum on Nov. 30, 1980, on a new constitution that would have institutionalized the role of the armed forces in a "restricted democracy." This constitution was rejected by the voters.

Mendi, town, central Papua New Guinea. It lies at an elevation of 5,495 feet (1,675 m) in the Mendi River valley on a gentle volcanic slope with mountains to the west and east. The heavily populated area surrounding Mendi remains little-developed. Besides vegetable gardens, a tea plantation is located near Mendi, some coffee is grown nearby, and the town has a sawmill. Most transportation is by air, although a road links Mendi with the town of Mount Hagen and with a highway to the northeast. Pop. (1980) 4,130.

mendicant, member of any of several Roman Catholic religious orders who assumes a vow of poverty and supports himself or herself by work and charitable contributions. The mendicant orders surviving today are the Dominicans, Franciscans, Augustinians (Augustinian Hermits), Carmelites, Trinitarians, Mercedarians, Servites, Minims, Hospitalers of St. John of God, and the Teutonic Order.

The two great founders of the orders of mendicant friars were St. Dominic, who founded the Dominican order in 1216, and St. Francis of Assisi, who founded the Franciscan order in 1210. Within a generation of their deaths, their institutes had spread throughout Europe and into Asia, and their friars could be numbered by tens of thousands. In all the great cities of western Europe, friaries were established, and in the universities theological chairs were held by Dominicans and Franciscans. Later in the 13th century they were joined by the other great mendicant orders of Carmelites, Augustinian Hermits, and Servites.

The idea of poverty was St. Francis' root idea, and there is little doubt—though it has been disputed—that it was borrowed from him by St. Dominic and the other mendicant founders. St. Francis did not intend that begging and alms should be the normal means of sustenance for his friars; on the contrary, he intended them to live by the work of their hands and to have recourse to begging only when they could not earn their livelihood by work. But as the friars soon came nearly all to be priests devoted to spiritual ministrations and as the communities grew larger, it became increasingly difficult for them to support themselves by personal work; and so begging came to play a greater role than had been contemplated by St. Francis. But his idea certainly was that his friars should not only practice the utmost personal poverty and simplicity but that they should have the minimum of possessions—no lands, no funded property, no fixed sources of income.

The maintaining of this ideal proved unworkable in practice. In the Dominican order and the others that started as mendicant it has been mitigated or even abrogated. Among the Franciscans it was the occasion of endless strife and was kept alive only by dint of successive reforms and fresh starts, each successful for a time but doomed always, sooner or later, to yield to the inexorable facts. The Capuchins, a Franciscan offshoot, made the most permanently successful effort to maintain St. Francis' ideal; but even among them mitigations have had to be admitted.

Mendip, district, county of Somerset, southwestern England, occupying 285 sq mi (739 sq km) about 20 mi (32 km) south of the city of Bristol. It is named after the most prominent feature in the district, the Mendip Hills, a limestone tableland with a summit of more than 800 ft (240 m) elevation in the northwest. The Mendips extend for about 25 mi (40 km) from between the parishes (towns) of Frome and Bruton in the eastern part of the district to its northwestern corner and drop steeply to the south, forming many caves and combes (deep narrow valleys), the latter extending to the alluvium-filled easterly extension of the Sedgemoor Basin.

Pigs, sheep, poultry, and large herds of dairy and beef cattle are raised on the fertile lowlands. A variety of local industries are based on the processing of these animals' products; shoes are produced at Street and Shepton Mallet, woollen goods at Glastonbury, and cheese at Wells. Frome, the largest town in the district, has a light industrial base including printing, metal casting, and carpeting. Many of the district's villages, as well as the famous medieval cathedral at Wells and the abbey at Glastonbury, are built of the locally quarried, high-quality Doulting limestone. The district seat of Shepton Mallet is in the centre of a cider-apple-growing area. Pop. (1982 est.) 90,300.

Mendip Hills, range of hills lying mostly in the county of Somerset, England, and extending 23 mi (37 km) northwest from the Frome Valley; its northwestern slopes lie in the county of Avon. The Eastern Mendip is comparatively low, but the Western Mendip forms a plateau 6 mi wide and more than 800 ft (244 m) high. Farther west, the Wavering Down and Bleadon Hill continue the trend of the upland toward the Bristol Channel. Swallet holes and drainage (the sudden disappearance of streams and rivers underground) characterize the easily dissolved rocks of the limestone region. There are many caves such as those at Wookey Hole and at Cheddar Cliffs. Important traces of prehistoric settlement have been found in the area.

Mendocian Stage, lowermost and oldest major division of Lower Cretaceous rocks and time in Chile and Argentina (the Cretaceous Period began about 136,000,000 years ago and lasted about 71,000,000 years). It consists of about 300 metres (1,000 feet) of marine black shales and dark limestones that are rich in the remains of ammonite cephalopods (mollusks). To the east, thick shell beds represent the Mendocian Stage. The Mendocian Stage underlies the Huitrinian Stage.

Mendocino Fracture Zone, submarine fracture zone in the Earth's surface in the eastern Pacific Ocean, extending westward from about 120 mi (190 km) off Cape Mendocino, California, for at least 2,500 mi to latitude 38° N, longitude 175° W. In most places the fracture zone is expressed topographically as the steep southern slope of an asymmetric ridge with a gentler northern slope. Smaller, shorter ridges and scarps parallel the main scarp to the north and south along its length. Off California the main scarp is about 10,500 ft (3,200 m) high; toward its western end the height is only about 8,400 ft. Regional depths of the seafloor north of the fracture zone are consistently shallower than to the south, the difference varying between 2,600 and 3,900 ft.

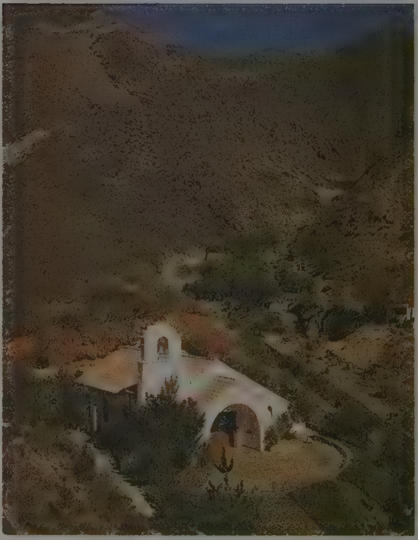
Magnetic intensities of seafloor rocks indicate an apparent lateral offset of 700 mi along the fracture zone; rocks north of the fracture zone are 23,000,000 to 27,000,000 years younger than rocks to the south. This apparent displacement is the scar of transform faulting that accompanied seafloor spreading, a process still going on along the Gorda Ridges north of the fracture zone. This spreading, estimated to proceed at a rate of 1.1 in. (2.9 cm) per year on either side of the Gorda Ridges, results in earthquakes along the fracture zone, from the crest of the ridge eastward to the coast.

Mendovg, also spelled MENDOG (Lithuanian ruler): *see* Mindaugas.

Mendoza, province, western Argentina, extending eastward from the high peaks of the Andes, which form its boundary with Chile. A considerable part of its area of 57,462 sq mi (148,827 sq km) is occupied by arid and semi-arid sections of sub-Andean ranges, foothills, and piedmont. The highest peak of the Andes (and Western Hemisphere), Cerro Aconcagua (22,831 ft [6,959 km]), is in its northwest corner at the Chilean border. The most heavily populated districts of the province are at the base of the cordillera, in the north, where the Río Mendoza, in particular, supplies water for irrigation. Toward the east are sandy plains with extensive saline basins, into which flow all the rivers, with the exception of the Río Grande in the southwest. Dams built on the Atuel and Diamante rivers in the foothills of central Mendoza province have also made the area around the city of San Rafael more agriculturally productive.

Mendoza was settled by Spanish from Chile in 1561. Throughout the colonial period it remained a sparsely populated frontier area, under constant threat of Indian raids, growing small amounts of produce. In 1776 it was detached from Chile to become part of the Viceroyalty of the Río de la Plata, and it attained the rank of province in 1820. Its development was hindered by its remoteness from the Atlantic and the Río de la Plata, but this was surmounted in 1885 by the completion of a railway to the provincial capital, Mendoza (*q.v.*). Subsequently, a trans-Andean railway was completed in 1910 to connect with the Chilean system.

Mendoza produces most of Argentina's grapes grown for wine; and numerous orchards are planted in apples, peaches, pears, apricots, plums, and olives. A major irrigation and hydroelectric project on the Río Diamante was built in the 1970s. Alfalfa is grown to fatten cattle for the Chilean markets, and cereals and soybeans are increasingly cultivated. Mineral resources include deposits of uranium, natural gas, manganese, gold, and copper. In the early 1980s Mendoza was the leading producer of petroleum in Argentina. Tourism is another source of income, based on mountain resorts, notably Villavicencio (thermal springs) and Potrerillos (skiing). An impressive border landmark at 13,450 ft in Uspallata Pass is the statue "Christ of the Andes," sculptured in 1902 by Mateo Alonso as a symbol of peace between Argentina and Chile. Pop. (1983 est.) 1,277,000.



Villavincencio Chapel in the Andes, Mendoza province, Argentina

A. D'Arazien—Shostal/EB Inc.

Mendoza, city, capital of Mendoza province, western Argentina, at an elevation of 2,497 ft (761 m), in the irrigated Río Mendoza Valley, at the foot of the secondary Andean range, Sierra de los Paramillos. The city was founded and relocated several times in the 1560s by Spaniards arriving from Chile. Not until 1776 did control of the region, then known as Cuyo, pass from Spanish Chilean administration to the newly created Viceroyalty of the

Monument to the Army of the Andes on Cerro de la Gloria, Mendoza city, Arg.

Walter Aguiar—EB Inc.

Río de la Plata, governed from Buenos Aires. During the movement for independence from Spain, Mendoza was the headquarters of General José de San Martín, who organized an expeditionary force to cross the Andes and liberate Chile in 1817. A monument commemorating this event is atop Gloria Hill, overlooking the city on the west. In 1861 Mendoza was destroyed by an earthquake, with heavy loss of life. A new city was planned (1863) with broad tree-lined streets, squares, and public parks, close to the ruins. An influx of immigrants, mostly Italians, in the late 19th century stimulated economic development.

Although the climate is dry, irrigation has permitted local cultivation of market gardens, orchards, and vineyards; water was diverted from the Mendoza River at Luján, 15 miles (25 km) south, via a natural channel called El Zanjón, which crosses the city. The wine, fruit-preserving, and petrochemical industries are important in the city and built-up environs. Rail lines and highways link Mendoza to Argentina's principal ports, and the city serves as a gateway to Chile. A major base of the Argentine Air Force is located there. The city has several theatres, a museum of anthropology and natural sciences, the National University of Cuyo (1939), and two other private universities. Pop. (1991) city, 121,739; (1980) Greater Mendoza, 605,623.

Mendoza, Antonio de (b. *c.* 1490, Granada, kingdom of Granada [Spain]—d. July 21, 1552, Lima, Viceroyalty of Peru [now in Peru]), the first and probably the most able viceroy of New Spain, who ruled the conquered Mexican territory with justice, efficiency, and a degree of compassion and established policies that endured until the colonies gained their independence.

Antonio de Mendoza, detail of a manuscript illumination, 16th century; in the Biblioteca Nacional, Madrid

Archivo Mas, Barcelona

The son of a distinguished family of soldiers and statesmen, Mendoza distinguished himself in the service of the Spanish king Charles I, who rewarded him by appointing him viceroy in 1535. In a land recovering from conquest (1519–21), Indian rebellion, and rivalries among the Spanish conquerors, his duties were to increase the royal revenues and regulate the affairs of the Indians.

An able administrator and loyal to his king, Mendoza collected the revenues with honesty and efficiency. In 1542 Charles issued the series of enactments known as the "New Laws," which attempted to limit the powers of the Spanish *encomiendas* (royal land grants) over the subject Indians. Mendoza was both unable and unwilling to enforce these laws but nevertheless tried to alleviate the lot of the Indians by limiting their exploitation in the mines by fixing the hours of work, by ordering payment for the labour of free Indians, and by protecting Indian lands from appropriation. His office was always open to their petitions. He also introduced the printing press, promoted the building of schools and hospitals, and encouraged the improvement of agricultural methods, stock raising, and mining.

The viceroy was the embodiment of the monarch, serving as chief executive, head of the judiciary, patron of the church, commander of the armed forces, and supervisor of the royal treasury. Governing for 15 years, the longest term of any viceroy, Mendoza did much to bring peace and stability to Mexico. As a reward for his effective service, he was promoted to the viceroyalty of Peru in 1551 but lived only long enough to take an extensive tour of the territory and outline the measures to be taken there.

Mendoza, Daniel (b. July 5, 1764, London, Eng.—d. Sept. 3, 1836, London), bareknuckle pugilist, 16th in the succession of English heavyweight champions and the first Jewish champion, the first important fighter to combine scientific boxing with rapid, rather than hard, punching—a great change from the mauling style used until his time. Not a very big man (height, 5 feet 7 inches; weight, 160 pounds), he relied on his courage, strong arms, and excellent physical condition as well as on his revolutionary boxing skill.

In 1791, after the retirement of champion Benjamin Brain, Mendoza was acknowledged as champion because of his victories over Richard Humphries, who had been considered the best heavyweight in England. Mendoza defended the title twice successfully before losing to John ("Gentleman") Jackson on April 15, 1795. Subsequently he became proprietor of a public house in the Whitechapel district of London and opened a highly successful school of boxing. His book *The Art of Boxing* was published in 1789.

Mendoza, Iñigo López de, marqués de Santillana: *see* Santillana, Iñigo López de Mendoza, marqués de.

Mendoza, Pedro de (b. 1487, Guadix, Granada [Spain]—d. June 23, 1537, on shipboard in the Atlantic Ocean), Spanish soldier and explorer, the first governor of the Río de la Plata region of Argentina and founder of Buenos Aires.

Born into a distinguished Spanish family, as a young man Mendoza served as an officer during the Spanish campaigns in Italy. Because the emperor Charles V (Charles I of Spain), spurred by reports of the great wealth of the Incas, wanted Spain to be the first nation to explore the interior of South America, he appointed Mendoza the head of an expedition of conquest and colonization in the Río de la Plata area, with instructions to found three cities and establish rule over an extensive region.

On Aug. 24, 1535, Mendoza sailed with about 2,000 men and 13 ships (three more were added in the Canary Islands, and two were lost during the voyage). Unfortunately, Mendoza was suffering from syphilis and was an ineffective commander. Rivalries ensued among his subcommanders, and one of the ringleaders was executed. The expedition arrived at the Río de la Plata early in 1536 and founded Buenos Aires. At first the Indians were helpful, but they soon turned against the invaders. Suffering from his disease and disheartened by the probable loss of an expeditionary party into the interior, Mendoza decided to return to Spain. The settlers who remained held off the Indians for five years and then moved upriver to Asunción. Mendoza died enroute home and was buried at sea.

Mendoza, Pedro González de: *see* González de Mendoza, Pedro.

Menedemus OF ERETRIA (b. *c.* 339 BC—d. *c.* 265), Greek philosopher who founded the Eretrian school of philosophy.

During a military expedition in Megara, he began attending the lectures of Stilpon and later joined the school founded by Phaedo at Elis. He became the leader of the school and transferred it to Eretria, where it became known as the Eretrian school. An active participant in political affairs, he was forced into exile by his opponents and several years later committed suicide. He is not to be confused with Menedemus of Pyrrha, a member of the Academy in Plato's lifetime.

Menelaus, in Greek mythology, king of Sparta and the younger son of Atreus, king of Mycenae; the abduction of his wife, Helen, led to the Trojan War. During the war Menelaus served under his elder brother Agamemnon, the commander in chief of the Greek forces. After the fall of Troy, Menelaus recovered Helen and brought her home. Menelaus was a prominent figure in the *Iliad* and the *Odyssey,* where he was promised a place in Elysium after his death because he was married to a daughter of Zeus. The poet Stesichorus (fl. 6th century BC) introduced a refinement to the story that was used by Euripides in his play *Helen:* it was a phantom that was taken to Troy, while the real Helen went to Egypt, from where she was rescued by Menelaus after he had been wrecked on his way home from Troy and the phantom Helen had disappeared.

Menelaus OF ALEXANDRIA (fl. late 1st century AD, Alexandria), Greek mathematician who first conceived and defined a spherical triangle (a triangle formed by three arcs of great circles on the surface of a sphere).

Menelaus' most important work is *Sphaerica,* on the geometry of the sphere. In Book I he established the basis for a mathematical treatment of spherical triangles analogous to Euclid's treatment of plane triangles. Furthermore, he originated the use of arcs of great circles instead of arcs of parallel circles on the sphere, a major turning point in the development of spherical trigonometry. Book II covers the application of spherical geometry and trigonometry to astronomical measurements and calculations. Book III, the last, concentrates on spherical trigonometry and introduces Menelaus' theorem. The form of this theorem for plane triangles, well known to his contemporaries, was expressed as follows: if the sides of a triangle are crossed by a straight line (one of the sides is extended beyond one of its vertices), then the product of three of the nonadjacent line segments thus formed is equal to the product of the three remaining line segments of the triangle.

Menelaus modified this theorem and applied it to spherical triangles. This form of the theorem became of fundamental importance in spherical trigonometry and astronomy, and the theorem has since been known by his name. Other notable works have been attributed to him, including one (in six books) on chords in a circle and one (in three books) on elements of geometry, but his only extant work is *Sphaerica.*

Menelik II (Ethiopian emperor): *see* Menilek II.

Menem, Carlos Saúl (b. July 2, 1930, Anillaco, Arg.), politician and lawyer who in 1989 became the first Peronist to be elected president of Argentina since Juan Perón in 1973. He was reelected in 1995.

Menem, the son of Syrian immigrants, was raised as a Muslim. His political aspirations, however, led him to convert to Roman Catholicism, the official religion of Argentina. He joined the Peronist movement in 1956. After obtaining a law degree from the National University of Córdoba in 1958, Menem began a career as a trade union lawyer in the northwestern city of La Rioja. He was elected governor of La Rioja province in 1973 and was expelled from office in 1976 by the military junta that had overthrown the government of

Isabel Perón. He regained his governorship in 1983. As governor, Menem expanded the size of government, gave favourable tax breaks to businesses, and pursued other policies typical of the Peronist movement. Menem was elected president in May 1989, amid the worst economic crisis in the history of Argentina. Inflation was so high that he was forced to abandon his party orthodoxy in favour of a fiscally conservative, market-oriented economic policy. With the aid of many non-Peronist cabinet members, Menem succeeded in stabilizing the economy. As president, he cultivated a flamboyant image and enjoyed great national popularity despite sharp criticism for pardoning convicted human-rights violators connected with the period of military rule (1976–83).

Menéndez de Avilés, Pedro (b. Feb. 15, 1519, Avilés, Spain—d. Sept. 17, 1574, Santander), Spanish sailor and founder of St. Augustine, Fla., who was a classic example of the conquistador—intrepid, energetic, loyal, and brutal.

Menéndez de Avilés, engraving
Archivo Mas, Barcelona

Born into the landed gentry, he ran away to sea at the age of 14. In 1549 he was commissioned by the Holy Roman emperor Charles V (Charles I of Spain) to drive pirates from the coasts of Spain. Five years later he was appointed captain of the Indies fleet. An impatient man who acted with dispatch and reluctantly concerned himself with administrative details, he made numerous enemies, who brought about his imprisonment in 1563. He was freed two years later after he had regained royal favour.

Because King Philip II was disturbed by the potential threat to Spain's possessions from a settlement of French Huguenots on a strategic part of the Florida coast, he sent Menéndez de Avilés to Florida to establish a colony there and deal with the French. The expedition sailed in July 1565, with 11 ships and about 2,000 men. On August 28 he entered and named the bay of St. Augustine and built a fort there. On September 20 he took the French colony, Fort Caroline, and massacred the entire population, hanging the bodies on trees with the inscription "Not as Frenchmen, but as heretics." Menéndez de Avilés then explored the Atlantic coast and established a string of forts as far north as the island of St. Helena (off present South Carolina). He was recalled to Spain in 1567 and later helped organize a squadron of ships against the English. He died while engaged in this task.

Menéndez Pidal, Ramón (b. March 13, 1869, La Coruña, Spain—d. Nov. 14, 1968, Madrid), scholar whose work on the origins of the Spanish language, as well as critical editions of texts, generated a revival of the study of medieval Spanish poetry and chronicles.

Professor of Romance philology at the University of Madrid (1899–1939), he was also director of the Centre of Historical Studies. Among his first notable works were *Manual de gramática histórica española elemental* (1904; "Manual of Historical Spanish Grammar") and the commentary *El cantar de mío Cid* (1908–11; "The Song of My Cid"). Founding editor in 1914 of the *Revista de filología española* ("Journal of Spanish Philology"), he was also twice president of the Spanish Academy (1929–39 and 1948–68).

Menéndez' vast and meticulous research included monographs on folklore, literary history, the stylistics of Theresa of Ávila, Lope de Vega, and others, and on etymology and place-names. Throughout all his works Menéndez Pidal stressed the native roots of Spanish culture, including the Basque, Gothic, and Arabic. *Origenes del español* (1926; "Origins of Spanish") was followed by *La España del Cid,* 2 vol. (1929; *The Cid and His Spain*). His monumental *Historia de España* ("History of Spain"), which he began to edit in the 1930s, was incomplete at the time of his death. Its introduction, however, *Los españoles en la historia y en la literatura* (1947; *The Spaniards in Their History: An Analysis of Spain's National Characteristics*), is one of his most accessible works for the general reader.

Menéndez y Pelayo, Marcelino (b. Nov. 3, 1856, Santander, Spain—d. May 19, 1912, Santander), Spanish literary critic and historian, remarkable for his vast erudition and his elegant and flexible prose. Although some of his judgments are no longer accepted, his studies of medieval, Renaissance, and Golden Age Spanish literature are still invaluable. The range and profundity of his knowledge enabled him to make valuable assessments of the Hispanic contribution to Western literature.

He was professor of Spanish literature at Madrid (1878–98) and director of the Biblioteca Nacional (1898–1912); his private library (of 45,000 volumes), which he bequeathed to Santander, forms part of the Biblioteca de Menéndez y Pelayo. His works are available in the *Edición nacional de las obras completas de Menéndez y Pelayo,* 43 vol. (1940–46).

Menes, also spelled MENA, MENI, or MIN (fl. *c.* 2925 BC), first king of unified Egypt, who, according to tradition, joined Upper and Lower Egypt in a single, centralized monarchy. Manetho, a 3rd-century-BC Egyptian historian, called him Menes; the 5th-century-BC Greek historian Herodotus referred to him as Min; and two native-king lists of the 19th dynasty (13th century BC) call him Meni. Modern scholars have inconclusively identified the traditional Menes with one or more of the archaic Egyptian kings bearing the names Scorpion, Narmer, and Aha.

In addition to crediting Menes with the unification of Egypt by war and administrative measures, tradition attributes to him the founding of the capital, Memphis, near modern Cairo. Excavations at Ṣaqqārah, the cemetery for Memphis, have revealed that the earliest royal tomb located there belongs to the reign of Aha. Manetho called Menes a Thinite—*i.e.,* a native of the Thinite province in Upper Egypt—and, in fact, monuments belonging to the kings Narmer and Aha, either of whom may be Menes, have been excavated at Abydos, a royal cemetery in the Thinite nome. Narmer also appears on a slate palette (a decorated stone on which cosmetics were pulverized) wearing the red and white crowns of Lower and Upper Egypt, a combination symbolic of unification; he is shown triumphant over his enemies, probably an allusion to the wars fought to attain unity. Actually, the whole process probably required several reigns, and the traditional Menes may well represent the kings involved. According to Manetho, Menes reigned 62 years and was killed by a hippopotamus.

Mēness (Latvian), Lithuanian MĖNUO, in Baltic religion, the moon, the god whose monthly renewal of strength is imparted to all growing things.

Mēness, dressed in a starry gown and riding in a chariot drawn by gray horses, displays traits of a war god but is known chiefly as the main suitor of Saule, the sun goddess, or as one of the rivals for the hand of Saule's daughter. In some traditions Mēness marries Saule but is unfaithful to her; for his infidelity he is punished by Pērkons, the Thunderer.

Meng T'ien, Pinyin MENG TIAN (d. 209 BC, China), famous general of the Ch'in dynasty who built the Great Wall of China.

As a general under Shih Huang-ti, the first noted emperor of the Ch'in dynasty, Meng was sent to subdue the nomadic central Asian tribesmen, who were overrunning north China, and to build a wall as a defense against these tribesmen. Other Chinese rulers are said to have built defensive walls in the north before this time, and Meng probably incorporated these lesser walls into his work. After the death of Shih Huang-ti, the minister Li Ssu and the eunuch Chao Kao usurped the government, forcing Meng T'ien and the legitimate heir apparent to take their own lives.

Meng is credited with inventing the *cheng,* a kind of harpsichord, and also a Chinese writing brush made of hair, used as a pen. The latter was almost certainly not his creation, although he may have somewhat improved or modified the standard writing brush.

Meng-tzu: *see* Mencius.

Mengelberg, Willem, in full JOSEF WILLEM MENGELBERG (b. March 28, 1871, Utrecht, Neth.—d. March 21, 1951, Chur, Switz.), symphonic conductor in the Romantic tradition who, during his tenure with the Amsterdam Concertgebouw Orchestra (1895–1945), developed it into one of the world's finest orchestras.

Trained as a pianist at the Cologne Conservatory, he became a conductor at Luzern, Switz., in 1891. He became renowned as an interpreter of Beethoven, Mahler, and Richard Strauss, who dedicated his tone poem *Ein Heldenleben* ("A Hero's Life") to Mengelberg. He toured widely with the Concertgebouw, was regular conductor (1911–14) of the London Symphony and the Royal Philharmonic Society, and was guest conductor (1921–30) of the New York Philharmonic (and of its predecessor, the National Symphony, before the merger of the two), serving for several years as coconductor with Arturo Toscanini.

Near the end of World War II, Mengelberg fled The Netherlands for Switzerland. In 1945 a Dutch council convicted him, in absentia, of having been a Nazi collaborator and sentenced him to exile for life (later reduced to exile for six years).

Mengele, Josef, byname ANGEL OF DEATH, German TODESENGEL (b. March 16, 1911, Günzburg, Ger.—d. Feb. 7, 1979, Enseada da Bertioga, near São Paulo, Brazil), Nazi doctor at Auschwitz extermination camp (1943–45), who directed the operation of the gas chambers and conducted medical experiments on inmates in pseudoscientific racial studies.

Mengele's father was founder of a farm machinery factory, Firma Karl Mengele & Söhne, in the village of Günzburg in Bavaria. Mengele studied philosophy in Munich in the 1920s, coming under the influence of the racial ideology of Alfred Rosenberg, and then took a medical degree at the University of Frankfurt am Main. He enlisted in the SA (German *Sturmabteilung,* "Assault Division") in 1933. Becoming an ardent Nazi, he joined (1934) the research staff of a newly founded Institute for Hereditary Biology and Racial Hygiene. During World War II, he served as a medical officer with the Waffen SS in France and Russia and in 1943 was appointed by Heinrich Himmler to be chief doctor at Birkenau, a supplementary extermination camp near Auschwitz, where he and his staff selected incoming Jews for labour or extermination and where he supervised medical experiments on inmates to discover means of increasing fertility (to increase the German race). His chief interest, however, was research on twins.

After the war Mengele escaped internment and went underground, serving four years as a farm stableman near Rosenheim in Bavaria. Then he reportedly escaped, via Genoa, to South America in 1949. He married (for a second time) under his own name in Uruguay in 1958 and, as "José Mengele," received citizenship in Paraguay in 1959. In 1961 he apparently moved to Brazil, reportedly becoming friends with an old-time Nazi, Wolfgang Gerhard, and over the years living in a succession of houses owned by a Hungarian couple. In 1985 a multinational team of Brazilian, West German, and American forensic experts determined that Mengele took Gerhard's identity, died in 1979 of a stroke while swimming, and was buried under Gerhard's name. Dental records later confirmed the forensic conclusion.

Menger, Carl (b. Feb. 23, 1840, Neu-Sandec, Galicia, Austrian Empire [now in Poland]—d. Feb. 26, 1921, Vienna, Austria), Austrian economist who contributed to the development of the marginal utility theory and to the formulation of a subjective theory of value.

Menger's value theory proceeded from an analysis of the behaviour of the individual to an explanation of economic phenomena; *e.g.,* the demonstration that exchange value can be explained in terms of use value, the concept that goods contribute to consumers' satisfactions. In his most important work, *Grundsätze der Volkswirtschaftslehre* (1871; *Principles of Economics*), Menger tried to show the relationships among utility, value, and price.

Menger received his Ph.D. degree from the Jagiellonian University in Kraków in 1867 and then accepted a position in the Austrian civil service. In 1873 he became a professor of political economy at the University of Vienna, where he remained, with brief interruptions, until 1903. He thereafter devoted himself to the completion of his studies in economics. Menger is widely known as the founder of the "Austrian school" of economists.

Menger, detail of a drawing by F. Schmutzer, 1910

Mengistu Haile Mariam (b. 1937, Kefa province, Eth.), Ethiopian army officer and head of state (1974–91), who helped overthrow the centuries-old monarchy and attempted to mold Ethiopia into a socialist state.

Mengistu received officer training at Holeta and additional training in the United States. Rising to the rank of major, he became one of a group of junior officers and enlisted men who, discontented with their lack of patronage and promotion within the military, plotted rebellion against the government of Emperor Haile Selassie I. In June 1974 he was made chairman of the Derg, a committee of revolutionary soldiers, and, after the arrest of the emperor in September, he was made a vice-chairman of the Provisional Military Administrative Council (PMAC; also commonly called the Derg), which assumed the functions of government. On Nov. 23, 1974, Mengistu ordered the assassination of the PMAC's moderate chairman and urged the killing of 60 aristocrats and former officials of the old imperial regime. By killing selected enemies within the PMAC, Mengistu then became the acknowledged strongman of a regime that proceeded to nationalize industries and farmlands.

In February 1977 Mengistu, now a lieutenant colonel, survived a battle between his supporters and those of rivals on the PMAC. The chairman and several other members were killed, and Mengistu became head of state and chairman. He then unleashed a bloody "Red Terror Campaign" to crush armed opponents among the civilian populace, and later that year he solicited Soviet weaponry and Cuban soldiers to repel an invasion by Somalia of the Somali-speaking Ogaden region. As undisputed ruler of the country, he oversaw the establishment of the Workers' Party of Ethiopia in 1984, the drafting of a constitution for Ethiopia in 1986 (endorsed in 1987), and the election by a new national legislature of himself as president in September 1987. By then, Mengistu faced armed rebellion in the northern regions of Tigray and Eritrea, a series of the worst droughts and famines ever to afflict Ethiopia, an agricultural economy ruined by the forced collectivization of farms and the relocation of entire populations, and occasional coup attempts by enemies within the regime. The withdrawal of Soviet support further weakened Mengistu's power, and in May 1991 he summarily resigned his post and fled to Zimbabwe.

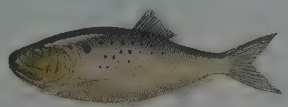
Mengs, Anton Raphael, Raphael also spelled RAFFAEL (b. March 22, 1728, Aussig, Bohemia [now Ústí nad Labem, Czech Republic]—d. June 29, 1779, Rome, Papal States [Italy]), painter who was perhaps the leading artist of early Neoclassicism.

Mengs studied under his father in Dresden, Saxony, and then in Rome. He became painter to the Saxon court in Dresden in 1745 and executed a large number of portraits, most in brightly coloured pastels. Mengs returned to Rome in the early 1750s, and about 1755 he became a close friend of the German archaeologist and art critic J.J. Winckelmann. He came to share Winckelmann's enthusiasm for classical antiquity, and upon its completion in 1761 his fresco "Parnassus" at the Villa Albani in Rome created a sensation and helped establish the ascendancy of Neoclassical painting. Mengs also continued to paint portraits during this period, competing with Pompeo Batoni, the leading Rococo portraitist of the Roman school. In 1761 he went to the Spanish court at Madrid, where he worked on the decoration of royal palaces. From 1769 to 1772 Mengs was in Rome, decorating the Camera dei Papiri in the Vatican, and he returned to Spain from 1773 to 1777.

Mengs was widely regarded in his day as Europe's greatest living painter. He eschewed the dramatic illusionism and dynamism of the Baroque style in his figural compositions, preferring instead to blend quotations from ancient sculptures with stylistic elements of Raphael, Correggio, and Titian. The results are generally cold, insipid, and contrived, however, and Mengs's reputation has declined precipitously since the 18th century. Some of his portraits display a freedom and sureness of touch entirely lacking in his more ambitious works.

Mengzi: *see* Mencius.

menhaden, also called POGY, FATBACK, or MOSSBUNKER, any of several species of valuable Atlantic coastal fishes in the genus *Brevoortia* of the herring family (Clupeidae), utilized for oil, fish meal, and fertilizer. Menhaden have a deep body, sharp-edged belly, large head, and tooth-edged scales. Adults are about 37.5 cm (about 15 inches) in length and 0.5 kg (1 pound) or less in weight. Dense schools of menhaden range from Canada to South America. When feeding, they swim with mouths agape and gill openings widespread to strain out plankton. Menhaden spawn at one place or another throughout the year. Their buoyant eggs hatch in about two days. The young grow rapidly and mature at about three years. Large numbers of menhaden are netted annually. The fish meal, mainly used as animal feed, may someday provide inexpensive and easily obtained protein for humans.



Atlantic menhaden (*Brevoortia tyrannus*)

menhir, megalithic monument erected singly or in formations. *See* megalith.

Menia (Egypt): *see* Minyā, Al-.

Ménière's disease, recurrent and generally progressive group of symptoms that include loss of hearing, ringing in the ears, dizziness, and a full sensation or pressure in the ears. The disease is episodic, with attacks, accompanied by nausea and vomiting, seldom lasting longer than 24 hours. The apparent immediate cause of the disorder is excessive endolymph, the fluid in the cochlear duct of the inner ear. (The cochlear duct is the membranous tube inside the winding passage of the snaillike cochlea.) The reason for the excess of endolymph is not known. Administration of diuretics and a low-salt diet commonly are prescribed to control the symptoms.

Menilek II, also spelled MENELIK, original name SAHLE MIRIAM, also spelled SAHLÉ MARIAM (b. Aug. 17, 1844, Ankober, Shewa [Shoa], Ethiopia—d. Dec. 12, 1913, Addis Ababa), king of Shewa (or Shoa, 1865–89), and emperor of Ethiopia (1889–1913). One of Ethiopia's greatest rulers, he expanded the empire almost to its present-day borders, repelled an Italian invasion in 1896, and carried out a wide-ranging program of modernization.

Menilek II, detail of an oil painting by Paul Buffet, 1897; in the Senate Palace, Paris

J.E. Bulloz

Early life. Menilek's father was Haile Malakot, later *negus* (king) of Shewa. His mother was a court servant who married Haile Malakot shortly after Sahle Miriam was born. His forefathers had been rulers of Menz, the heartland of Shewa, since the 17th century, and it has been claimed that further back they were related to the Solomonid line of emperors who ruled Ethiopia between 1268 and 1854 (alternate dates 1270–1855). The crown name Menilek II was significant: Menilek I was the legendary son of Solomon and the Queen of Sheba (Makeda).

In 1855 the vigorous emperor of Ethiopia, Tewodros II, invaded the then semi-independent kingdom of Shewa. Early in the subsequent campaigns, Haile Malakot died, and Sahle Miriam was captured and taken to the emperor's mountain stronghold, Amba Magdela. In nearly 10 years of captivity, he had opportunity to observe Tewodros' dedication to the unification and modernization of the empire and also the heavy-handed and often violent methods that ultimately led to the emperor's failure and suicide.

King of Shewa. Sahle Miriam contrived to escape from Magdela in 1865 and returned to Shewa, which had remained in a state of sporadic unrest and revolt against Tewodros. Although only 21 years of age, he was able to displace Bezebeh, who had been appointed ruler by the emperor in 1859, and subsequently declared himself *negus* of the province. Sahle Miriam stood six feet tall and had a dark complexion and fine white teeth, but smallpox had left its marks on his face. As a diplomat he made a great impression on the foreign emissaries who visited his court. With their help he imported firearms, the better to equip his armies and the garrisons and settlers that came in their wake.

On the death of Tewodros in 1868, Sahle Miriam, as *negus* of Shewa, aspired to the position of emperor. But he was not the only claimant and had to submit first to Tekle Giorgis (1868–72) and Yohannes IV (1872–89). Before Yohannes died fighting the Sudanese in 1889, he obliged Sahle Miriam to direct his ambitions mainly to the south and east. Sahle Miriam subsequently incorporated Arusi, Harer (Harar), Jima, Kefa (Kaffa), and the several kingdoms and states of southern Ethiopia within his domains. By the time of Yohannes' death, Sahle Miriam had emerged as the strongest man in Ethiopia and was able to assume the imperial crown for which he had waited so long.

During the period of his rivalry with Emperor Yohannes IV and the latter's son, Mengesha, Menilek appeared to befriend the Italians, but a quarrel later developed. The Italians interpreted Article XVII of the Treaty of Wichale (Ucciali), concluded in 1889 by the Italians and Menilek, as giving Italy a protectorate over Ethiopia. It is quite inconceivable that Menilek would have agreed to his historic country becoming a protectorate. When he learned of the Italian interpretation, which was gaining some acceptance in Europe, he at once denied it and, in 1893, renounced the whole treaty.

Defeat of Italy at Adowa. The Italians had established themselves along the Red Sea coast, and the governor of the Italian colony of Eritrea, after much intrigue and several minor military skirmishes, risked a major confrontation. The Italian army was defeated by the Ethiopians in one of the greatest battles in the history of Africa—the Battle of Adowa (Adwa), on March 1, 1896. A settlement after the battle canceled the Treaty of Wichale and acknowledged the full sovereignty and independence of Ethiopia, but the Italians were allowed to retain Eritrea.

After Adowa, Menilek's Ethiopia was at once accepted by the European powers as a real political force. The crushing defeat of a European army greatly enhanced Menilek's international reputation, causing a host of foreign advisers, ambassadors, emissaries, and adventurers to flow into the country.

Menilek's later activities as emperor included the creation of ministries, the initiation of modern education, and the construction of telephone and telegraph systems and of a railway from Djibouti, on the Gulf of Aden, to Addis Ababa, the emperor's new capital in the highlands of Shewa. Beginning in 1906 or 1907, Menilek suffered a series of paralytic strokes, and power passed to his wife, Empress Taitu, to Ras Tesemma, who became regent, and to Lij Iyasu, the grandson who was to succeed him. The stricken emperor finally died in 1913. (Ri.G./Ed.)

BIBLIOGRAPHY. Guèbrè Sellassié, *Chronique du règne de Ménélik II,* trans. from Amharic, 2 vol. (1930–31), was written by a court chronicler, traditionally uncritical of his monarch; this is thus a biased though standard work. Other works include Harold Marcus, *The Life and Times of Menelik II: Ethiopia 1844–1913* (1975, reissued 1995); R.H. Kofi Darkwah, *Shewa, Menilek, and the Ethiopian Empire, 1813–1889* (1975); and Chris Prouty, *Empress Taytu and Menilek II* (1986).

Menindee Lakes, series of reservoirs, part of the Darling River Conservation Scheme, western New South Wales, Australia, near the town of Menindee. Primarily natural features, the lakes are flooded through creeks linking them, at high water, eastward to the Darling River, which has been dammed for back drainage. They include Lakes Menindee, Tandou, Pamamaroo, and Cawndilla and several smaller lakes. The total capacity of the Menindee Lakes Storage Scheme (for domestic and industrial water and irrigation), which was begun in 1949 and completed in 1960, is 2,000,000 acre-feet (2,467,000,000 cubic m). Lakes Menindee and Cawndilla are part of Kinchega National Park. Menindee is an Aboriginal term meaning "egg yolk."

meninges, singular MENINX, three membranous envelopes—pia mater, arachnoid, and dura mater—that surround the brain and spinal cord. Cerebrospinal fluid fills the ventricles of the brain and the space between the pia mater and the arachnoid. The chief function of meninges and cerebrospinal fluid is to protect the central nervous system.

Pia mater. The pia mater is the meningeal envelope that firmly adheres to the surface of the brain and spinal cord. It is a very thin membrane composed of fibrous tissue covered on its outer surface by a sheet of flat, polygonal cells believed to be impermeable to fluid. Pierced by blood vessels that pass through it to reach the brain and spinal cord, the pia mater follows these blood vessels into the depth of the brain.

Arachnoid. Over the pia mater and separated from it by a space called the subarachnoid space is a second meningeal envelope of the central nervous system, the arachnoid, a thin membrane remarkable for its delicacy and transparency. It is composed of fibrous tissue and, like the pia, is covered by flat, polygonal cells also believed to be impermeable to fluid. The arachnoid does not follow the irregularities of the surface of the brain, and so looks like a loosely fitting sac with a variable distance, in certain regions relatively large and in others minute, between its walls and the surface of the nervous system.

In the region of the brain, particularly, a large number of fine filaments pass from the arachnoid through the subarachnoid space to blend with the tissue of the pia mater. These filaments are called arachnoid trabeculae. They are remnants from embryological life of the common origin of the arachnoid and pia mater, and they have the frail structure characteristic of these two of the meninges. The pia mater and arachnoid are called collectively the leptomeninges.

Dura mater. The outermost of the three meninges is the dura mater (or pachymeninx), a strong, thick, and dense membrane. It is composed of dense fibrous tissue, and its inner surface is covered by flattened polygonal cells like those present on the surfaces of the pia mater and arachnoid. It can be regarded as a sac that envelops the arachnoid and that has been modified to serve several functions.

Within the skull the dura mater surrounds and supports the large venous channels (dural sinuses) carrying blood from the brain toward the heart. It also is prolonged into several partitions, or septa, which lend support to the brain. One of these, the falx cerebri, is a sickle-shaped partition lying between the two hemispheres of the brain. Another, the tentorium cerebelli, provides a strong, membranous roof over the cerebellum. A third, the falx cerebelli, projects downward from the tentorium cerebelli between the two cerebral hemispheres. The outer portion of the dura mater over the brain serves as a covering, or periosteum, of the skull bones' inner surfaces.

Within the vertebral canal the dura mater splits into two sheets. These are separated by a space, called the epidural space, which is filled with fat and thin-walled veins. The outer of these two sheets constitutes the periosteum of the vertebral canal. The inner sheet is separated from the arachnoid by the narrow subdural space, which is filled with fluid.

In a few places, however, the subdural space is absent, and the arachnoid is intimately fused with the dura mater. The most important area of fusion between these two meninges is in the walls of the large venous channels of the dura mater. There elongations of the arachnoid, like fingers, penetrate the dura mater and project into the veins. These fingerlike processes of the arachnoid, which are referred to as arachnoid villi, or arachnoid granulations, are involved in the passage of cerebrospinal fluid from the subarachnoid space to the dural sinuses.

meningitis, inflammation of the meninges, the membranes covering the brain and spinal cord. It can be caused by various infectious agents, including viruses, fungi, and protozoa, but bacteria produce the most life-threatening forms.

Among the bacteria that can cause meningitis are the meningococcus (*Neisseria meningitidis*), the influenza bacillus (*Haemophilus influenzae*), and various strains of pneumococci, streptococci, or staphylococci. A bacterial infection elsewhere in the body may be carried to the meninges through the bloodstream itself or from an adjacent infected organ, such as the middle ear or the nasal sinuses. The infectious agents multiply in the meninges, where they produce a pus that thickens the cerebrospinal fluid, thereby causing various symptoms and complications.

Bacterial meningitis usually has three main stages. At first, the bacteria multiply in the nasal passages and throat, often causing no painful symptoms. Next, they invade the blood, introducing toxic substances into the circulation and causing fever; if the infection is caused by *N. meningitidis,* a rash may appear and develop into hemorrhagic spots (petechiae) in severe cases. In the third stage, meningitis develops when the bacteria multiply in the meninges, where they produce intense inflammatory changes and an exudate of pus.

A characteristic of meningitis is the rapid onset of symptoms, which may result in death within only a few hours. The first symptom of meningitis is usually vomiting. A severe bursting headache develops because the meninges have become inflamed and the pressure of the cerebrospinal fluid has increased. Stiffness of the neck then develops, due to irritation of the spinal nerves supplying those muscles. The degree of stiffness varies, but often the head is retracted, and in small children the head and spine may be drawn backward like a bow. Deep reflexes are exaggerated, and convulsions may occur in infants and small children. In more severe cases, the cerebrospinal fluid becomes so thickened by pus that the passages between the ventricles (cavities) of the brain and the spaces in the spinal meninges become blocked, causing fluid to accumulate. The accumulation of fluid in the ventricles may in turn result in internal hydrocephalus, which causes coma and death unless relieved.

A diagnosis of bacterial meningitis is made with certainty by obtaining a sample of cerebrospinal fluid by lumbar puncture and examining it microscopically for the presence of bacteria and for increases in certain types of cells.

The term meningitis most often refers to meningococcal meningitis, which is caused by *N. meningitidis*. Epidemics of this disease occurred at irregular intervals, with death occurring in 40–50 percent of cases, until the use of antibiotic drugs greatly reduced both mortality rates and the incidence of the disease. Meningococcal meningitis is worldwide in distribution and more likely to occur in cold weather. It is primarily a disease of youth and especially of children under age 10, though all ages may be affected. The disease is usually acquired by nasal droplet transmission. Another serious cause of meningitis is *Haemophilus influenzae;* it occurs in infants and young children but only rarely in older persons, and its course and symptoms resemble those of *N. meningitidis.* The bacterium *Streptococcus pneumoniae* is a common cause of meningitis in adults.

The early diagnosis and prompt treatment of meningitis is particularly important in preventing possible permanent damage to the brain, especially in affected children. Meningococcal meningitis is best treated with penicillin. Cases caused by *H. influenzae* are treated with ampicillin or chloramphenicol. These drugs have reduced mortality rates from bacterial meningitis to less than 5 percent in some areas. A vaccine that gives protection against the type b strain of *H. influenzae* became commercially available in the 1980s and has proved effective in safeguarding infants and children from the disease.

Various other forms of meningitis are caused by viruses and ordinarily have a short, uncomplicated, self-limited course that does not require therapy.

meningococcus, the bacterium *Neisseria meningitidis,* which causes meningococcal meningitis in humans, who are the only natural hosts in which it causes disease. The bacteria are spherical, ranging in diameter from 0.6 to 1.0 μm (micrometre; 1 $\mu m = 10^{-6}$ metre); they frequently occur in pairs, with adjacent sides flattened. They are strongly gram-negative. These bacteria enter the nasopharynx; meningococcal infections in the nasopharynx may cause no symptoms—up to 30 percent of the population may harbour them between epidemics—or may enter the bloodstream and produce the symptoms of meningitis.

Menippus (fl. 3rd century BC), Greek philosopher from Gadara (modern Umm Qays, Jordan), who followed the cynic philosophy of Diogenes and who founded a seriocomic literary genre known as Menippean satire. It was imitated by Greek and Latin writers and influenced the development of Latin satire.

Menippus was allegedly a slave by birth who became rich by begging or by usury, afterward being made a citizen of Thebes, in Greece. His writings are lost, but some idea of their character can be gained from his Latin imitators, notably Varro, Seneca, and Lucian. His criticism was an innovation in the presentation of philosophic ideas because it was aimed at reaching as wide an audience as possible. It abandoned the serious form of dialogue or essay and instead conveyed its cynic message in a satiric style, mocking institutions, ideas, and conventions in a mixture of prose and verse. Unusual settings—including a descent into Hades, an auction, and a symposium—were employed with striking effect; they were used also by his Latin successors. The 1st-century-AD *Satyricon* of Petronius, a picaresque tale in verse and prose containing long digressions in which the author airs his views on topics having nothing to do with the plot, is in the Menippean tradition. A later example is the *Satire Ménippée* (1594), a French prose and verse satire on the Holy League, the political party of the Roman Catholics, written by several royalists.

Menkaure, also spelled MENKURE, Greek MYKERINOS (fl. late 26th century BC), fifth (according to some traditions, sixth) king of the 4th dynasty (*c.* 2575–*c.* 2465 BC) of Egypt; he built the third and smallest of the three Pyramids of Giza.

He was the son and probably the successor of Khafre and, according to the Turin papyrus, reigned for 18 (or 28) years. According to tradition, Menkaure was a pious and just king. Although his pyramid and mortuary temple were unfinished at his death, his successor, Shepseskaf, completed the stonework of the mortuary temple in brick. In the funerary complex were found some of the finest sculptures of the Pyramid Age, including a slate statue group of Menkaure and his sister-wife Khamerernebti II and a number of smaller slate triads representing Menkaure, the goddess Hathor, and various nome (district) deities.

Menken, Adah Isaacs, original name DOLORES ADIOS FUERTES (b. June 15, 1835, near New Orleans, La., U.S.—d. Aug. 10, 1868, Paris, France), American actress and poet widely celebrated for her daring act of appearing virtually naked, strapped to a running horse.

Facts concerning her family name and early life are obscure. She was orphaned and left in poverty at an early age and later appeared on the stage in New Orleans and other American cities. In 1856 she married Alexander Isaacs Menken and thereafter bore his name through succeeding alliances, matrimonial and otherwise. In 1864 she appeared at Astley's Theatre in London as Mazeppa in a dramatization of Lord Byron's poem, a performance of an athletic type suited to her fine physique. She had previously played the role in the United States. In England and France she became a close friend of many literary men—Algernon Charles Swinburne, Charles Reade, Charles Dickens (to whom she dedicated in 1868 a volume of verse, *Infelicia*), Théophile Gautier, and Alexandre Dumas *père*. She performed extensively in Paris including a run of 100 nights, as well as in Vienna and London.

Menlo Park, city, San Mateo county, western California, U.S. It lies on the western shore of San Francisco Bay. Originally part of the Rancho de las Pulgas, a Mexican land grant of 1795, it derived its name from Menlough, in County Galway, Ire., and began as a village for railroad and estate workers. Brief incorporation (1874–76) included Fair Oaks (later Atherton). During World War II, Camp Fremont (for U.S. Army engineers) occupied most of the downtown area. Permanently incorporated in 1927, Menlo Park developed after World War II as a residential community with an office-building boom, highlighted by the Stanford Research Institute (1946) and industrial parks. It is also a publishing centre. Pop. (1992 est.) 28,687.

Menlo Park, unincorporated community, Middlesex county, northeast New Jersey, U.S. It lies 15 miles (24 km) southwest of Newark. Menlo Park is the site of the Edison Memorial Tower and State Park (and museum) on the grounds where Thomas A. Edison maintained his experimental laboratories from 1876 to 1887 and where he perfected many of his inventions. The 131-foot (40-metre) Edison Memorial Tower, on the spot where the first commercially practicable incandescent lamp was made, is capped by a light bulb 14 feet (about 4 m) high and 9 feet (about 3 m) across; a perpetual light was placed at the base of the tower in 1929. The laboratories were removed in 1929 by Henry Ford to his Greenfield Village Museum in Dearborn, Mich.

Menlo Park was established as a rural crossroad in the 17th century after the founding of the East Jersey colony in 1676. It was a part of Raritan township, which in 1954 was renamed Edison township in honour of the inventor. Lying approximately midway between Rahway and New Brunswick, Menlo Park has developed as a suburban community since World War II.

Mennecy porcelain, a soft-paste porcelain of a particularly light and translucent quality made at a French factory from the 1730s to 1806. The wares are generally small: vases or coffee- or dressing-table sets. Figures are of good quality. Mennecy has a distinctive greenish yellow and soft brown colouring.

Mennecy soft-paste porcelain group of children, *c.* 1760; in the Victoria and Albert Museum, London

Menninger FAMILY, American physicians who pioneered methods of psychiatric treatment in the 20th century.

Charles Frederick Menninger (b. July 11, 1862, Tell City, Ind., U.S.—d. Nov. 28, 1953, Topeka, Kan.) began practicing general medicine in Topeka in 1889 and became convinced of the benefit of group medical practice after visiting the Mayo Clinic in Rochester, Minn., in 1908. In 1920 Menninger was joined in practice by his son Karl Augustus Menninger (b. July 22, 1893, Topeka—d. July 18, 1990, Topeka), who received his medical degree from Harvard Medical School in 1917 and who spent two years working under Ernest Southard at the Boston Psychopathic Hospital. The two Menningers established the Menninger Diagnostic Clinic in Topeka for the group practice of general medicine. Karl Menninger's strong interest in psychiatry and the Topeka area's lack of hospital care for the mentally ill led him to treat psychiatric patients as well. In 1924 Charles Menninger's youngest son, William Claire Menninger (b. Oct. 15, 1899, Topeka—d. Sept. 6, 1966, Topeka), received his M.D. from Cornell University Medical College (Ithaca, N.Y.) and served his internship at Bellevue Hospital in New York City. The following year, he joined the family practice. The family established the Menninger Sanitarium and Psychopathic Hospital, a 13-bed facility designed to apply group medical practice to psychiatric patients. In this and other facilities that followed, the Menningers linked two concepts: the psychoanalytic understanding of behaviour as applied to the treatment of hospitalized patients, and the use of the social environment of the hospital as an adjunct to therapy. Thus, in the Menningers' attempt to merge the psychiatric treatment of their patients with the local environment, all members of the clinic's staff—nurses, therapists, orderlies, and even the housekeepers—became an attentive and helpful part of the patients' milieu. From the onset, psychiatric research was an important part of the Menningers' total approach. The Menningers' care and treatment of the mentally ill began to draw scientists interested in their ideas and eager to study at the hospital. In 1926 the Menningers opened the Southard school for mentally retarded children, and in a matter of years they were accepting children with all types of mental disorders.

The Menningers' philosophy that psychiatry is a legitimate science and that the difference between a normal individual and a person with a mental illness is but a matter of degree was expounded in Karl Menninger's first book, *The Human Mind* (1930). In 1931 the Menninger Sanitarium became the first institution to gain approval as a training facility for nurses specializing in psychiatric care, and in 1933 it opened a neuropsychiatric residency program for physicians. To fulfill their goal to combine medical practice, research, and education, the family formed the Menninger Foundation in 1941 and four years later the Menninger School of Psychiatry. The foundation has been extensively involved in psychiatric education, training, and research on an international level. In 1974 the foundation established the Center for Applied Behavioral Sciences, an organization to provide current information on human behaviour and motivation to business, industry, and government.

Karl and William Menninger played guiding roles as the Menninger Foundation's activities and institutions grew and diversified. William served as medical director of the Menninger Psychiatric Hospital and as president of the Menninger Foundation. Karl founded and directed the Menninger School of Psychiatry from 1946 to 1969 and served as chairman of the board of trustees of the Menninger Foundation. He also continued to publish books that explored psychiatry's relation to society, as well as writing guides to psychoanalytic theory for laymen.

Menno Simonsz., in full MENNO SIMONSZOON, Simonsz. also spelled SIMONS (b. 1496, Witmarsum, Friesland [Netherlands]—d. Jan. 31, 1561, near Lübeck, Holstein [Germany]), Dutch priest, an early leader of the peaceful wing of Dutch Anabaptism, whose followers formed the Mennonite church.

Life. Little is known about Menno's early life. He was born into a Dutch peasant family; his father's name was Simon. At an early age he was enrolled in a monastic school, possibly at the Franciscan monastery in Bolsward, to prepare for the priesthood. In March 1524, at the age of 28, he was ordained at Utrecht and assigned to the parish at Pingjum near the place of his birth. Seven years later, in 1531, he became the village priest in his home parish at Witmarsum.

Menno Simonsz., engraving by Christopher van Sichem, 1605–08

Though Menno was to become a major spokesman of ethical Christianity, his initial concern was doctrinal. During his first year as priest he began to question the real presence of Christ in the bread and wine of the Eucharist. This was probably owing largely to the antisacramental tendencies prevalent in the Netherlands at that time, tendencies that developed from Erasmian humanism and the ethical concerns of the Brethren of the Common Life. These doubts led Menno to read both the Bible and the writings of Martin Luther for the first time. At first he read the Bible with real fear, for he knew this step had driven Luther and the Swiss reformer Huldrych Zwingli out of the Roman Catholic church, but he soon agreed with them that biblical authority ought to be primary in the life of the believer and in the church. By 1528 he was known as an evangelical preacher, though he continued as parish priest.

From doubts about the Eucharist, Menno moved gradually to questions about infant Baptism and the meaning of church membership. His readings of the New Testament led him to the firm conviction that only persons of mature faith, who acknowledged Jesus as Lord and had counted the cost of following him, could be eligible for membership in the church. Only such persons could be baptized as a seal (sign of guarantee) of the covenant and a witness to all the world. The grace of Christ was sufficient for children until they reached the age of accountability and made a conscious choice either for or against him. The experience of conversion came to be central to all of Menno's life and theology.

Meanwhile, the revolutionary wing of early Dutch Anabaptism continued its agitation. On April 7, 1535, the Olde Klooster near Bolsward, which had been occupied by them as a staging area for aid to Münster, fell before the onslaught of the state militia. Among those killed were members of Menno's congregation and Peter Simons, who may have been his brother. This prompted him to preach openly against the errors of the revolutionaries. In doing so he articulated with increasing clarity what he believed to be the true nature of a believers' church: pure doctrine, scriptural use of sacraments, ethical obedience, love of neighbour, a clear and open witness to the faith, and a willingness to suffer. The fall of Münster on July 25, 1535, increased pressure within him to help those whom he considered to be misguided spirits. This bold and outspoken ministry soon jeopardized his safety, and in January 1536 he went into hiding after a spiritual struggle of 11 years.

In describing his decision he wrote,

> Pondering these things my conscience tormented me so that I could no longer endure it. . . . If I through bodily fear do not lay bare the foundation of the truth, nor use all my powers to direct the wandering flock who whould gladly do their duty if they knew it, to the true pastures of Christ—oh, how shall their shed blood, shed in the midst of transgression, rise against me at the judgment of the Almighty and pronounce sentence against my poor, miserable soul!

Menno spent a quiet year in hiding, finding a sense of direction for his future work. During this time he wrote "The Spiritual Resurrection," "The New Birth," and "Meditation on the Twenty-third Psalm." Late in 1536 or early 1537, he received believer's baptism, was called to leadership by the peaceful Anabaptist group founded in 1534 by Obbe Philips, and was ordained by Obbe. He also married. From this time on his life was in constant danger as a heretic. In 1542 the Holy Roman emperor Charles V (1500–58) himself issued an edict against him, promising 100 guilders reward for his arrest. One of the first Anabaptist believers to be executed for sheltering Menno was Tyaard Renicx of Leeuwarden, in 1539.

From 1543 to 1544 Menno worked in East Friesland, where in January 1544 he had a major interview or debate with the Polish reformer Johannes à Lasco (1499–1560). The next two years, 1544–46, were spent in the Rhineland, after which he travelled from his new home base in Holstein, near Oldesloe, northeast of Hamburg, until his death in 1561. Here he found time for extensive writing and established a printing press to circulate Anabaptist writings. His travels not only took him back to the Netherlands but also to Danzig.

Influence. Menno was not the founder of the Mennonite Church nor the most articulate spokesman of early Anabaptist theology. His greatness lay rather in the leadership he gave to northern Anabaptism during its formative first generation, a leadership maintained through his calm, biblically oriented approach and through his writings, which consolidated the insights of the movement. Though these writings often seem tedious and excessively polemical, they delineated the Anabaptist faith he defended against both Catholic and Protestant attacks on the one hand and distortions by zealots from within the movement on the other. During the last years of his life he was troubled particularly by some of his own brethren who pressed for great rigour in the application of the ban (expulsion from the church) and other measures of discipline. His more than 40 extant writings are all prefaced with First Letter of Paul to the Corinthians 3:11 "No other foundation can any one lay than that which is laid, which is Jesus Christ." (C.J.D.)

Krahn, "Menno Simons," *Mennonite Encyclopedia,* vol. 3 (1957), a major interpretive article by one of the foremost scholars of Dutch Anabaptism; F.H. Littell, *A Tribute to Menno Simons* (1961), a discussion of the significance of the theology of Menno Simons; H.W. Meihuizen, *Menno Simons* (1961), a biography giving particular attention to the place of Menno Simons in the life and culture of his time; Menno Simons, *Opera Omnia Theologica* (1681; *The Complete Writings of Menno Simons,* ed. by J.C. Wenger, 1956), the definitive English-language edition; K. Vos, *Menno Simons, 1496–1561* (1914), the standard work (in Dutch).

Mennonite, member of a Protestant church rising out of the Anabaptists, a radical reform movement of the 16th century Reformation, and named for Menno Simons (*q.v.*), a Dutch priest who consolidated and institutionalized the work initiated by the moderate Anabaptist leaders. Mennonites are located in many countries of the world, with heaviest concentrations in the United States and Canada.

Reformation origins. Among the various Anabaptist groups, the Mennonites trace their origin particularly to the so-called Swiss Brethren, who formed their first congregation on January 21, 1525, in the face of imminent persecution for their nonconformity to the demands of the state church led by the Reformation theologian Huldrych Zwingli. Though these demands centred on infant Baptism, which Anabaptist leaders Conrad Grebel, Felix Manz, and others questioned on the basis of biblical studies, the real issue was the nature of the church. Christ, according to their view, is Lord of the church. Only those who submit to that lordship can be true members of his body. Furthermore, the body of Christ receives its guidance from Christ himself through the Scriptures and the Holy Spirit, not from or through the civil magistracy. Persecution soon scattered the Swiss Brethren across Europe; their doctrinal views found quick response among many people, and for a time the movement grew.

Though Mennonites are the direct descendents of the Anabaptists of the 16th century, the two movements are not identical. Menno Simons, a Dutch priest who joined the Anabaptist movement in 1536, gathered the scattered Anabaptists of northern Europe into vital congregations that were soon called by his name. These congregations led by Menno Simons were similar to another Anabaptist-related group organized in Strasbourg under Melchior Hofmann in 1530. Initially, Menno Simons was not directly influenced by the Swiss Brethren; but with the death of the first Swiss and south German Anabaptist leaders soon after the defeat of the peasant forces led by some radical revolutionary Anabaptists—such as Thomas Müntzer (*c.* 1490–1525)—in the Peasants' War (1525), Simons began to consolidate and institutionalize the work that the moderate Anabaptist leaders of Europe had begun. He represents a second generation of leaders in which the emerging tradition determined basic faith and doctrine.

Another Anabaptist movement flourished in central Germany under the leadership of Hans Hut (died 1527), Hans Denk (*c.* 1500–27), and especially Pilgram Marpeck (*c.* 1492–1556), a major early lay theologian. Still another movement came to be known as the Hutterian Brethren because of the coordinating leadership of Jakob Hutter (died 1536). The Hutterites were soon known for their communal living and for an intense missionary zeal that continued into the 17th century, after all other Anabaptist groups had found relative physical security by withdrawing geographically and socially from the mainstream of European life.

Developments from the 17th century to the 19th. Mennonites found political freedom first in The Netherlands, after their last martyr died there in 1574. Before that date, however, many had emigrated from there to the Vistula River area in what is now northern Poland, where their communities became large and flourishing. By 1700 there were 160,000 baptized members in the Mennonite churches of The Netherlands. Because many of the professions were legally closed to them, they turned to business and in the process became wealthy and urbanized. In matters of faith, they followed the Enlightenment, a 17th- and 18th-century intellectual movement that placed its hope for human betterment on the use of right reason. They became well known as artists, writers, and patrons of social programs; but membership declined to about 15,300 in 1837.

Persecutions that continued in Switzerland into the 18th century drove many Mennonites to southern Germany, Alsace, The Netherlands, and the United States. A major schism occurred (1693–97) when the Swiss Mennonite bishop left the Mennonites to form the Amish Church in an attempt to preserve biblical discipline among the membership. From the 17th to the 20th centuries, most Mennonites in Switzerland, southern Germany, and Alsace lived in semiclosed rural communities with a simple agrarian economy. Religiously, they were influenced by Pietism, a Lutheran-based movement that emphasized personal religious experience and reform.

In 1788 the first of a long stream of Mennonites left the Vistula Delta of northern Poland (Prussia) to settle in the Ukraine, where they acquired land and escaped military conscription. By 1835 about 1,600 families had settled in 72 villages with landholdings amounting to about 500,000 acres. In 1860 a small group within the Mennonite community in Russia underwent a religious awakening and demanded stricter discipline for church members. They founded the Mennonite Brethren Church, some of whose members joined an exodus of Mennonites from Russia in the 1870s that was provoked by the loss of their exemption from military service. Many of these emigrants resettled in the upper Middle West of the United States.

By World War I the Mennonite settlements in Russia included more than 120,000 members living in autonomous communities where religious, educational, social, economic, and even political affairs were under their own control. All Mennonite communities in Russia were either destroyed during World War II or dissolved by the Soviets soon after 1945. Mennonites today live scattered among the Russian population.

Beginning in 1663, Mennonites emigrated to North America to preserve the faith of their fathers, to seek economic opportunity and adventure, and especially to escape European militarism. Until the late 19th century, most Mennonites in North America lived in rural communities and engaged successfully in farming. They retained their German language, partly as a religious symbol and partly as insulation against their environment. Their main concern was to be left alone to worship God according to their conscience and tradition. In 1775 they addressed a statement to the Pennsylvania Assembly that read:

> It is our principle to feed the hungry and give the thirsty drink; we have dedicated ourselves to serve all men in everything that can be helpful to the preservation of men's lives, but we find no freedom in giving, or doing, or assisting in anything by which men's lives are destroyed or hurt.

In 1783 Mennonites in Lancaster County were accused of treason for feeding destitute British soldiers. During the U.S. Civil War, rather than fight, some hired substitutes or paid an exemption fee of $300 in the North and $500 in the South. Those who fought in the armed forces were usually excommunicated for doing so.

After 1850 the transition from the German language to English, the adoption of such institutions and practices as Sunday schools and evangelistic services, together with problems associated with the acculturation process, led to a number of divisions among the Mennonites; some branches were also imported from Europe. The largest single body is the (Old)

Mennonite Church; following are the General Conference Mennonite Church, the Mennonite Brethren, and the Old Order Amish. Most extreme are the Hutterian Brethren, who still live communally and practice community of goods; this relatively small group is concentrated in the upper Great Plains region of North America.

Beliefs and practices. Anabaptist and Mennonite thought has been characterized by a separation between religion and the world. Under the impact of severe persecution in the 16th century, Anabaptism was driven to a strategy of withdrawal from society in its attempt to survive, a strategy that became central in Mennonite theology. Consequently, most Mennonites have possessed a strong cultural cohesion that they maintained externally by withdrawal and internally by rigorous group discipline. This isolation encouraged the sectarian virtues of frugality, hard work, piety, and mutual helpfulness but frequently also led to schism. By the mid-20th century, however, Mennonites were deeply involved in the social, educational, and economic world around them, an involvement that led to revolutionary changes in their life and thought. It also led to a new search for identity as a distinct group in the modern world, through a study of their denominational history, sociological analysis, and theological interaction with other groups.

Mennonites are trinitarian (believing in the doctrine of the Trinity—*i.e.*, Father, Son, and Holy Spirit), affirm the Scriptures (especially the New Testament and the teachings of Jesus) as their final authority for faith and life, and appeal to the pattern of the early church as their congregational model. They stress the importance of Baptism on confession of faith and a symbolic understanding of the Lord's Supper. Some practice foot washing, a practice based on an act of Jesus with his disciples. The doctrines of nonconformity to the world, nonswearing of oaths, nonresistance in lieu of military service, and church discipline are generally affirmed but not practiced universally.

Mennonite worship services are sermon-centred. A simple, almost austere, liturgy surrounds the Gospel proclamation. In the late 20th century, however, there were many signs of experiment in worship similar to those found in other denominations.

Most Mennonite congregations are joined together into numerous conferences, seven of which are in North America. The Amish, Hutterian Brethren, and some conservative Mennonites do not form conferences. Since 1925 there has been a Mennonite World Conference that meets every five years for fellowship, study, and inspiration but does not make decisions binding on its member bodies.

The desire to express positively the ethic of love and nonresistance has historically given Mennonites a deep social concern. An emergency relief committee for national and international aid, founded by the Dutch Mennonites in 1725, is still active. In 1920 North American Mennonites founded the Mennonite Central Committee (MCC) for the same purpose, initially to relieve famine in Russia. Mennonite migrations continued during the 20th century, primarily from Russia to North and South America—to Brazil, Paraguay, Uruguay, Bolivia, Mexico, and British Honduras. Mennonite migrants and missionaries from North America and Europe planted numerous churches in Latin America, Africa, Oceania, and India and other parts of Asia.

In the 20th century, the Mennonites of North America gave new emphasis to higher education, especially by supporting their own colleges and seminaries, while continuing to maintain secondary and Bible schools. New interest in the faith of early Anabaptists was fostered by the scholarly work of both Mennonite and non-Mennonite historians. This activity not only offered new insights for the renewing of church life but accented the disparity between the 16th-century Anabaptist ideals and present Mennonite beliefs and practices. A rediscovery of their history also gave new meaning to urban social relationships; witness, service, discipleship, and evangelism became household words and shaped Mennonite identity. Instead of withdrawal, they found in witness and service a new way of relating to the world. *See also* Amish; Hutterite.

BIBLIOGRAPHY. *The Mennonite Encyclopedia*, 4 vol. (1955–59), is the standard reference work in English.

Menodotus of Nicomedia (fl. *c.* AD 120), philosopher of the Skeptical school of empirical medicine, credited with elaborating the first scientific method of observation. Like many other physicians of the period, he considered medicine an art; this left him free to perfect his art while remaining a Skeptic. He also wrote against Asclepiades, who espoused Atomism and a theory of imbalance of corpuscles as the cause of illness. Some scholars think the voluminous writings of Menodotus, frequently mentioned by Galen, suggest two contemporary physicians of the same name.

Menominee, also spelled MENOMINI, Algonkian-speaking North American Indian tribe who lived along the Menominee River, now the eastern portion of the boundary between Wisconsin and the upper peninsula of Michigan, when first reported by the missionary-voyageur Jean Nicolet in 1639. The sedentary Menominee lived in villages of dome-shaped houses. Their economy was based on gathering wild rice and other plants; a limited amount of cultivation of corn (maize), squash, beans, and tobacco; fishing; and some hunting. They were divided into exogamous clans, which were grouped into two major divisions, or phratries. Their social organization changed, however, as a result of the fur trade, when the Menominee scattered in mobile bands over a wide territory, particularly for winter hunts.

In a series of treaties in the 19th century, the Menominee sold their rights in lands to the United States. In 1852 the U.S. government moved some 2,000 members of the tribe to a reservation on the upper Wolf and Oconto rivers in Wisconsin. Beginning in 1872 a tribally owned lumber mill operated under government supervision, providing jobs and income. In 1961 the reservation was terminated; the area became a county of the state of Wisconsin, and a corporation, Menominee Enterprises, Inc., was created to hold and administer tribal assets. Soon after termination the Indians became concerned about the loss of such services as a free hospital (leaving them with no hospital and no resident physician) and a development project involving the sale of lands, which some Menominee feared as a step toward increasing white control. Agitation began for restoration of reservation status, and this was done (by Congress) in December 1973. The tribe began to organize a government and to cope with internal divisions and with growing antipathy from nearby whites.

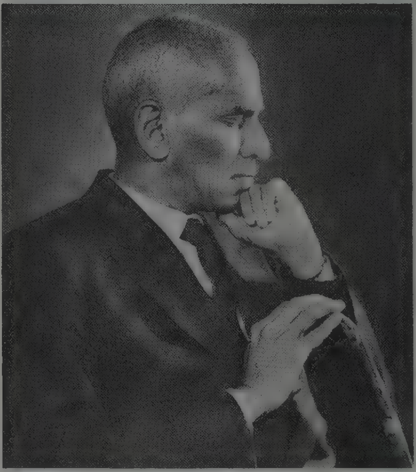
Menominee, city, seat (1864) of Menominee county and the southernmost city in the Upper Peninsula of Michigan, U.S.; it is located on Green Bay at the mouth of the Menominee River opposite Marinette, Wis., with which it is connected by a bridge. In 1796 a fur-trading post was established there. Lumbering began in 1832, reached its peak in the 1890s, and ended in 1930. Manufactures include paper products, furniture, electrical equipment, and helicopters. Dairying (notably cheese production) is important. Menominee (Indian for "wild rice," once gathered along the riverbanks) is also a hunting resort and fishing port. Inc. 1883. Pop. (1990) 9,398.

Menon, V(engalil) K(rishnan) Krishna (b. May 3, 1897, Calicut, India—d. Oct. 6, 1974, New Delhi), Indian nationalist and champion of India's anti-colonialism and neutralism.



Menon, 1962

Camera Press—Publix

After studying at the London School of Economics, Menon was called to the bar at the Middle Temple. He became an ardent Socialist and served as a Labour member of the St. Pancras Borough Council from 1934 to 1947. His primary political interest in England centred in the struggle for freedom in India, however, and he strove tirelessly in this cause as secretary of the India League from 1929. His long and close relationship with Jawaharlal Nehru, nationalist and first prime minister of independent India, began during that period.

With the coming of Indian independence in 1947, Krishna Menon was appointed high commissioner (ambassador) of India in London. He returned to India in 1952 after 27 years of residence in England, becoming a member of the Indian Parliament in 1953, minister without portfolio in 1956, and minister for defense in 1957. From 1952 to 1960 he represented India in the General Assembly of the United Nations, where his vigorous presentation of anti-colonial and neutralist policies of his government won him many admirers.

As minister of defense, he brought new vigour to his office and introduced many far-reaching changes, but his policies and methods received heavy criticism, and the military reverses suffered by India at the hands of the Chinese in the Himalayas in 1962 were attributed by some to his policies. Overwhelming opposition forced him to relinquish the Ministry of Defense in October 1962. Thereafter he devoted himself to left-wing political activity as an independent.

Menongue, formerly SERPA PINTO, town, southeastern Angola. It was named, previously, after Alexandre Alberto da Rocha de Serpa Pinto, a late 19th-century Portuguese explorer of the interior of southern Africa. Located on the Cuebe River (a tributary of the Okavango [Kubango] River) at an elevation of 4,462 feet (1,360 m), it is a garrison town and market centre for the surrounding sparsely populated, semiarid region. Cattle and subsistence crops of corn (maize) and other vegetables are raised by the Nganguela and Chokwe peoples, and trade in cattle and hides and skins is locally important. Chokwe artists are noted for their traditional masks and wooden sculptures of human beings. Menongue is the inland terminus of a 470-mile (756-kilometre) railway from the Atlantic port of Namibe (formerly Moçâmedes). The railway, however, has not functioned on a regular basis since the outbreak of civil war in Angola in 1975. A military headquarters of the South West Africa People's Organisation at Chitequeta, near Menongue, was destroyed in an incursion by South African forces in 1981. Pop. (latest est.) 3,000.

menopause, the period of time during a woman's life marked by cessation of menstruation and termination of the potential for reproduction. The average age of onset is about 48 years, but menopause may begin as early as age 40 or as late as the early 50s. Artificial menopause can be induced by surgically removing or by irradiating the ovaries.

A brief treatment of menopause follows. For full treatment, *see* MACROPAEDIA: Reproduction and Reproductive Systems.

The human ovaries function actively for about 35 years. Menopause is the result of a progressive decline in ovarian function due to aging. During a woman's reproductive years, the follicles of the ovaries, under the stimulation of hormones released by the pituitary gland, periodically rupture and discharge their ova (eggs). As menopause approaches, some follicles fail to rupture, and their ova are not discharged; later all the follicles fail to rupture. The cycle of menstruation is disturbed by this failure to ovulate. The continuing decline in ovarian activity may result in missed periods, longer intervals between periods, irregular bleeding, varying lengths of periods, or a decrease or increase in menstrual flow. In a minority of women, the menstrual periods cease abruptly.

During menopause the ovaries produce progressively smaller amounts of the hormone estrogen. This decrease affects the hormonal activity of other glands that regulate the reproductive function and disturbs the neurovascular mechanism of the hypothalamic region of the brain. These disturbances probably give rise to the brief flushes, or hot flashes, that are a characteristic symptom of menopause. A woman may begin experiencing hot flashes before the obvious onset of menopause and may continue to have them for a few months or for two or three years. The hot flash, often experienced as a sense of warmth, flushing of the face and body, a prickling sensation, and sweating, may occur several times a day.

Other symptoms of menopause such as nervousness, headaches, or dizziness may have a psychological origin stemming from a fear of aging or from changing patterns of life and family relationships. Weight gain may result from increased food intake and decreased physical activity. The medical management of menopause entails education to reduce fear or anxiety, periodic physical examination, and in some cases the administration of estrogenic hormones.

menorah, also spelled MENORA, multi-branched candelabrum used by Jews in rites during the eight-day festival of Ḥanukka. It has taken many forms throughout the ages, but its essential feature has always been eight receptacles for oil or candles (one lit the first day, two the second, etc.) and a further receptacle for the *shammash* ("servant") light, which is set apart and used for kindling the other lights.

Roman soldiers carrying the menorah from the Temple of Jerusalem, AD 70; detail of a relief on the Arch of Titus, Rome, AD 81

Alinari—Art Resource/EB Inc.

This menorah is an imitation of the seven-branched golden candelabrum of the Tabernacle, which signified, among other things, the seven days of creation. The cup atop the central shaft, which is somewhat elevated to signify the Sabbath, was flanked by three lights on each side. The seven-branched menorah is mentioned in the Talmud and has long been used in art as an iconographic symbol signifying Judaism.

Menorca (island, Spain): *see* Minorca.

Menotti, Gian Carlo (b. July 7, 1911, Cadegliano, Italy), Italian composer of operas of wider popularity than any others of their time. His realistic operas on his own librettos represent a successful combination of 20th-century dramatic situations with the traditional form of Italian opera. Menotti used largely traditional harmonies, resorting at times to dissonance and polytonality to heighten dramatic effect.

Menotti wrote his first opera, *The Death of Pierrot,* at the age of 11. He studied at the Milan Conservatory and in 1927 emigrated to the United States, where he continued his studies at the Curtis Institute of Music, Philadelphia (1927–33), at the suggestion of Arturo Toscanini. He retained his Italian citizenship.

Menotti

By courtesy of RCA Records

His opera *Amelia Goes to the Ball,* a witty satire on society manners and morals, was produced in Philadelphia in 1937 with great success and was transferred to the Metropolitan Opera in New York City in 1938. It was followed by a radio opera, *The Old Maid and the Thief* (1939), and *The Island God,* produced at the Metropolitan in 1942. These works were less successful, and Menotti turned to writing chamber operas—requiring fewer singers and smaller orchestras—on melodramatic subjects. His first opera of this type, *The Medium* (1946), was a tragedy about a medium who becomes a victim of her own fraudulent voices. It was followed by a one-act comic opera, *The Telephone* (1946). In 1947 the two operas were paired in an unprecedented Broadway run. In 1951 *The Medium* was made into a motion picture.

In 1950 his opera *The Consul,* which won a Pulitzer Prize, was produced on Broadway. Like all of his operas, it is a work of great theatrical effectiveness. Set in an unnamed country under totalitarian rule, it deals with the vain efforts of a woman to gain an exit visa to join her husband, an enemy of the state.

Amahl and the Night Visitors (1951), the first opera composed for television, is the story of a lame shepherd boy who gives his crutch to the Three Wise Men as a gift for the Christ child. With *The Saint of Bleecker Street* (1954) Menotti won a second Pulitzer Prize. In 1958 he wrote the libretto for Samuel Barber's opera *Vanessa.* His "madrigal fable" *The Unicorn, the Gorgon, and the Manticore,* for chorus, instruments, and dancers, was produced in 1956. His grand opera *Maria Golovin* (1958) was less successful than his earlier tragic operas. In 1963 he produced a cantata, *Death of the Bishop of Brindisi;* a television opera, *Labyrinth;* and a comic opera, *The Last Savage.* His instrumental works include the symphonic poem "Apocalypse" (1951) and concerti for piano and for violin. In 1958 Menotti established the Festival of Two Worlds, for opera, music, and drama, in Spoleto, Italy, and its New World branch in Charleston, S.C., in 1977. *Help! Help! The Globolinks!* (1968) is a satiric opera, and *Tamu-Tamu* (1973) is an antiwar opera that is sung in English and Indonesian. The opera *Goya* (1986) dealt with the life of the Spanish painter of that name.

BIBLIOGRAPHY. John Gruen, *Menotti: A Biography* (1978), is based on interviews with Menotti and others.

mens rea, in Anglo-American law, criminal intent or evil mind. In general, the definition of a criminal offense involves not only an act or omission and its consequences but also the accompanying mental state of the actor. All criminal systems require an element of criminal intent for most crimes. Only Anglo-American systems, however, employ the term *mens rea.* Countries such as France and Japan simply specify that there must be a criminal intent unless a specific statute directs otherwise.

Despite the evident importance of proper definition of the mental element, criminal statutes are frequently silent on what sort of *mens rea,* if any, must be shown. In other instances, a wide variety of terms are employed without any clear indication of how they are to be interpreted. The tentative draft of the American Law Institute's Model Penal Code reduces the *mens rea* terms to four: the criminal must act "purposely," meaning that he must have an actual, consciously formed intent to achieve the criminal consequence; "knowingly," meaning a conscious awareness that his conduct will produce the consequence; "recklessly," meaning conscious disregard of the fact that his conduct is creating an unreasonable peril; and "negligently," meaning inadvertence to peril that would have been apparent to a reasonable man.

In modern times a considerable body of penal offenses have been created in all countries in which no intent or other mental state need be shown. Absence of *mens rea* has always characterized a few offenses such as statutory rape, in which knowledge that the girl is below the age of consent is not necessary for liability, and bigamy, which often may be committed even though the parties believe in complete good faith that they are free to marry. *Mens rea* need not be shown in a number of statutes regulating economic or other activities, commonly termed public-welfare offenses, carrying minor penalties.

The justification for the elimination of proof of criminal intent in such cases is ordinarily made on the grounds of expediency. It is asserted that to require proof of intent or even recklessness would render some of these regulatory statutes largely ineffective or unenforceable. Laws regulating tobacco, alcohol, dangerous drugs, automobile traffic, and firearms would be useless if anyone who violated them could plead ignorance of the law. Australia, however, now allows a defendent to defeat a charge against him by a showing that he was not negligent in failing to observe the law. Supporters of this position argue that little is sacrificed in the way of effectiveness.

Another consideration in dispensing with a *mens rea* requirement is ignorance or mistake. It is commonly said that ignorance of fact excuses from liability, whereas ignorance of law does not. Although this simple formula holds true in wide areas of the criminal law, there are important exceptions, especially in the area of absolute liability offenses. In such cases mistake of law is increasingly being allowed as a defense, especially under statutes that impose harsh penalties.

Finally, all criminal systems make provision for certain types of diminished responsibility such as intoxication, infancy, or insanity. All countries specify a particular age at which a youth may be held responsible for the consequences of his acts. Intoxication is commonly held not to be a defense to a crime except insofar as it negates the existence of a particular mental state. Thus, in Anglo-American law one who commits murder while intoxicated is convicted of manslaughter rather than murder if it is found that he was incapable of entertaining the "malice aforethought" requisite to a finding of murder. *See also* diminished responsibility.

Menshevik (Russian: One of the Minority), plural MENSHEVIKS, or MENSHEVIKI, member of the non-Leninist wing of the Russian Social-Democratic Workers' Party, which evolved into a separate organization. It originated when a dispute over party membership requirements arose at the 1903 congress of the Social-Democratic Party. One group, led by L. Martov, opposed Lenin's plan for a party restricted to professional revolutionaries and called for a mass party modelled after western European social-democratic parties.

When Lenin's followers obtained a temporary majority on the central committee and on the editorial board of the newspaper *Iskra,* they appropriated for themselves the name Bolshevik (Those of the Majority); Martov and his followers became the Mensheviks. After the 1903 congress the differences between the two factions grew. In addition to disapproving of Lenin's emphasis on the dictatorial role of a highly centralized party, the Mensheviks maintained that the proletariat could not (nor should it) dominate a bourgeois revolution; therefore, unlike the Bolsheviks, they were willing to work with the bourgeois left to establish a liberal, capitalist regime, which they considered to be a necessary precursor to a Socialist society. They played active roles in the 1905 revolution, particularly in the St. Petersburg soviet, but afterward, like the Bolsheviks, they participated in the Dumas (parliaments), believing their success to be a step toward the creation of a democratic government. In 1912 the Social-Democratic Party was definitively split by Lenin; in 1914 the Mensheviks themselves became divided in their attitudes toward World War I.

Although they assumed leading roles in the soviets and provisional governments, created after the February Revolution (1917), and formally set up their own party in August, they were not sufficiently united to maintain a dominant position in the political developments of 1917. After the Bolshevik Revolution (October), they attempted to form a legal opposition but in 1922 were permanently suppressed; many Mensheviks went into exile.

Menshikov, Aleksandr Danilovich (b. Nov. 16 [Nov. 6, old style], 1673, Moscow—d. Nov. 23 [Nov. 12, O.S.], 1729, Berezov, Siberia, Russian Empire), prominent Russian political figure during and after the reign of Peter I the Great. A gifted general and administrator, he eventually became the most powerful official in the empire, but his insatiable greed and ambition ultimately resulted in his downfall.

Of humble origins, Menshikov became an orderly for Peter I in 1686 and soon became the tsar's favourite. As a commander during the Northern War against the Swedes after 1700, he scored a number of major victories, eventually receiving the title of field marshal. But he also gave increasing evidence of rapacity. As an administrator after 1714, he was under almost continuous investigation for corrupt practices; and, were it not for his indispensable abilities, he would likely have been stripped of power much earlier than he was.

Having fallen into disgrace toward the end of Peter's reign, Menshikov succeeded in having his ally Catherine, Peter's widow, named empress in 1725, at which point he became virtual ruler of Russia. When Catherine became mortally ill two years later he threw his support to Pyotr Alexeyevich, Peter the Great's grandson, and arranged to have his daughter marry the young tsar, now Peter II. However, his enemies managed to turn Peter II against him, whereupon he was arrested, stripped of his rank and property, and sent to Siberia, where he died.

Menshikov, Aleksandr Sergeyevich, Knyaz (Prince) (b. Aug. 26 [Aug. 15, old style], 1787—d. May 1 [April 19, O.S.], 1867, St. Petersburg, Russia), commander of the Russian forces in the first half of the Crimean War.

He began his army career in 1809 and achieved the rank of major general in 1816. In 1853, during the conflict over the protection of Christians' privileges at the holy places in Palestine, Menshikov was sent on a special mission to Istanbul; his insistence that the Russian government be recognized as the protector of the Ottoman Empire's Orthodox subjects led to the breakdown of negotiations between Russia and Turkey and to the beginning of the Crimean War (1854–56). Subsequently appointed supreme commander of the Russian land and sea forces in the Crimea, he was defeated by the British and French in the Battle of the Alma on Sept. 20, 1854. His attempt to relieve Sevastopol failed when he suffered severe losses at the Battle of Inkerman on November 5. Relieved of his command in March 1855, he was later appointed military governor general of Kronstadt.

menstruation, the periodic discharge from the vagina of blood, secretions, and disintegrating tissue that had lined the uterus. Menstruation takes place if the ovum (egg) released by the ovary has not been fertilized.

A brief treatment of menstruation follows. For full treatment, *see* MACROPAEDIA: Reproduction and Reproductive Systems.

The average human menstrual cycle is 28 days, but cycles ranging from 21 to 35 days are not uncommon. At the beginning of the cycle, the endometrium, or lining of the uterus, is thin, and the ovaries are quiescent. Under the influence of hormones from the pituitary gland, a follicle ripens in one of the ovaries. The follicle contains an ovum, surrounded by a group of cells that secrete an estrogenic hormone. This hormone causes the endometrium to become thicker and more vascular. At about mid-cycle ovulation occurs; the follicle ruptures and discharges the ovum, which enters the fallopian tube and travels to the uterus.

After ovulation the cells of the follicle that extruded the ovum form the so-called corpus luteum. This body continues to secrete estrogen and also begins to release progesterone, which induces the secretory phase in the endometrium. The glands and cells of the endometrium become swollen, and the entire uterine lining thickens in preparation for receiving the ovum. If the released ovum becomes fertilized, it embeds itself in the endometrium and begins to grow. If the ovum is not fertilized, it dies, and the ovary ceases to produce hormones, causing a spasm of the endometrial blood vessels and consequent breakdown of the uterine lining. Menstruation then occurs, and the disintegrating endometrium is sloughed off and discharged along with blood. The endometrial tissue regenerates during the proliferative phase of the next cycle.

Menstruation ordinarily begins between the ages of 11 and 13. The first menstrual periods may be somewhat erratic, or bleeding may be heavy. Usually regularity is established spontaneously. Each period lasts for about five days, but the duration and amount of flow vary considerably. Before the onset of a period, some women experience pelvic discomfort, soreness of the breasts, emotional tension, or tension due to fluid retention in the tissues. During the period, discomfort or some pain may be felt as the uterus contracts to expel the blood and disintegrating tissue. Menstruation continues on the average until the age of 45 or 50, when ovarian activity gradually declines and then ceases. The menstrual periods may stop abruptly, but often they become irregular and gradually diminish. The final cessation of the cycles, or menopause, marks the end of the reproductive period in a woman's life.

Disorders of the menstrual function include dysmenorrhea (painful menstruation); irregular or excessive bleeding due to a hormonal imbalance, disease of the pelvic organs, or emotional disturbance; and amenorrhea (absence of menstruation). Menstrual periods are normally absent throughout pregnancy and for a variable time after delivery. If a mother breast-feeds her baby, menstruation may not recur for as long as six months.

Ovulation occurs at about the midpoint of each menstrual cycle, and the ovum is capable of fertilization for about two days after that event. The rhythm method of contraception is based on the fact that for most women the time of ovulation is fairly constant. When cycles are of irregular length, however, the time of ovulation is uncertain and may vary unexpectedly in women with usually regular cycles. Infertility in some women is a consequence of cycles in which there is no ovulation although regular menstruation occurs. Cycles of this type take place in women who use oral contraceptives.

mensural notation, European system of musical notation used from *c.* 1260 to 1600. It evolved as a method to notate complex rhythms beyond the possibilities of previous notation (neumes) and reached its classical development after 1450. A major step forward was made by Philippe de Vitry in his highly influential treatise *Ars nova* ("New Art"), written about 1320.

Mensural notation was predicated on a single underlying musical pulse and the following divisions of time: *modus,* division of the longa (▜) into two or three breves (■); *tempus,* division of the breve into two or three semibreves (◆); and *prolatio,* division of the semibreve into two or three minima (𝆺𝅥). Time signatures (*q.v.*) showed *tempus* and *prolatio.* Coloration, at first red, then white, notes (such as ⊐, □, ◇, 𝆹𝅥) indicated specific changes in note value, *e.g.,* three coloured notes equaling two black notes. After about 1420, white void notes became the norm, black the coloration. Additional signs clarified more complex modifications of note value. In the late 16th century mensural notation gave way to the modern system.

mental age, intelligence test score, expressed as the chronological age for which a given level of performance is average or typical. An individual's mental age is then divided by his chronological age and multiplied by 100, yielding an intelligence quotient (IQ). Thus, a subject whose mental and chronological ages are identical has an IQ of 100, or average intelligence. However, if a 10-year-old has a mental age of 13, his IQ is 130, well above average. Since the average mental age of adults does not increase past age 18, an adult taking an IQ test is assigned the chronological age of 18.

Mental age was first defined by the French psychologist Alfred Binet, who introduced the intelligence test in 1905. Because the variation in scores for different age groups taking graded tests increases roughly in proportion to the increase in age, mental ages cannot be used accurately to compare the basic ability of children of different chronological ages.

mental disorder, any illness with significant psychological or behavioral manifestations that is associated with either a painful or distressing symptom or impairment in one or more important areas of functioning.

A brief treatment of mental disorders follows. For full treatment, *see* MACROPAEDIA: Mental Disorders and Their Treatment.

There exists no widely accepted definition of mental disorders that clearly distinguishes them from the more "normal" or "healthy" mental states or behaviours the term is intended to exclude. Moreover, specific definitions of mental disorder will vary slightly from culture to culture because of differing social and cultural norms. A disturbance or conflict between an individual and society does not in itself signify a mental disorder but may rather simply be a form of social deviance on the individual's part. Mental disorders can vary greatly in their symptoms, severity, course, outcome, and amenability to treatment. They can adversely affect any and every aspect of a person's life, including his enjoyment, mood, and attitudes, and his occupation or career, sexual functioning, family and marital life, other interpersonal relations, and the management of his financial affairs.

Most mental disorders can be broadly classified as either psychoses or neuroses. Psychoses are major mental illnesses that are characterized by such severe symptoms as delusions, hallucinations, disturbances of the thinking process, serious defects in judgment and insight, and the inability to objectively evaluate reality. The psychoses can in turn be classified as either organic or functional ones. Alzheimer's disease and other organic brain diseases comprise the organic psychoses. Schizophrenia and manic-depressive psychosis are functional psychoses, *i.e.,* psychoses for which there is no palpable evidence of organic brain disease, though there may be undetermined biochemical or other abnormalities.

Neuroses are less severe and more treatable illnesses than are psychoses. It is sometimes difficult to clearly distinguish between a neurosis and simple unhappiness, fear, or problems in coping with everyday life. Simple unhappiness, however, can usually be ameliorated by a change in external circumstances, while a neurosis is more resistant to real-life improvements unaccompanied by psychic change. A neurosis may cause a person distress and may impair his functioning in certain ways, but the neurotic person is able to objectively evaluate reality and he can basically function in everyday life. The major types of neuroses are depressive disorders, anxiety disorders, obsessive-compulsive disorders, paranoid disorders, posttraumatic stress disorders, conversion hysteria and other somatoform disorders, and dissociative disorders.

There are other mental disorders that cannot be classified as either psychoses or neuroses. Chief among these are personality disorders, which are long-term, maladaptive accentuations of one or a set of particular personality traits. There are also various mental disorders that typically first become evident in infancy or childhood, and there are a variety of psychosexual disorders affecting an individual's gender identity or his sexual preferences.

Despite the psychiatric profession's attempt to clearly delineate distinct clinical categories of mental illness, in actuality a patient may show a mix of symptoms, and the illnesses of many patients constitute intermediate cases between clearly defined disease categories. Mental disorders occur worldwide and affect a small but proportionally significant segment of the population. Schizophrenia, the most prevalent psychosis, affects about 0.5 to 1 percent of the population, and anxiety and depressive disorders each affect about 5 percent of the population at any one time.

Some mental disorders, such as Alzheimer's disease, are clearly caused by organic disease of the brain, but the causes of most other mental disorders are either obscure, unknown, or clinically unverifiable. Schizophrenia appears to be partly caused by genetic factors that are inherited. Some mood disorders, such as mania (undue and prolonged excitement) and depression, appear to be caused in some instances by imbalances of certain chemicals called neurotransmitters in the brain, and they are treatable by drugs that act to correct these imbalances. In many cases, neuroses appear to be caused by primarily psychological factors such as emotional deprivation, frustration, or abuse during childhood, with the delayed effects of these traumas manifesting themselves indirectly many years later in the production of neurotic symptoms. Certain neuroses, particularly the anxiety disorders known as phobias, may in some cases represent maladaptive responses that have been built up into the human equivalent of conditioned reflexes.

Contemporary therapeutic techniques for treating mental disorders include psychotherapy, psychopharmacology, and in extreme cases, psychosurgery (*qq.v.*). *See also* psychoneurosis; psychosis.

mental hygiene, the science of maintaining mental health and preventing the development of psychosis, neurosis, or other mental disorders.

Since the founding of the United Nations the concepts of mental health and hygiene have achieved international acceptance. As defined in the 1946 constitution of the World Health Organization, "health is a state of complete physical, mental, and social well-being, and not merely the absence of disease or infirmity." The term mental health represents a variety of human aspirations: rehabilitation of the mentally disturbed, prevention of mental disorder, reduction of tension in a stressful world, and attainment of a state of well-being in which the individual functions at a level consistent with his or her mental potential. As noted by the World Federation for Mental Health, the concept of optimum mental health refers not to an absolute or ideal state but to the best possible state insofar as circumstances are alterable. Mental health is regarded as a condition of the individual, relative to the capacities and social-environmental context of that person. Mental hygiene includes all measures taken to promote and to preserve mental health. Community mental health refers to the extent to which the organization and functioning of the community determines, or is conducive to, the mental health of its members.

Throughout the ages the mentally disturbed have been viewed with a mixture of fear and revulsion. Their fate generally has been one of rejection, neglect, and ill treatment. Though in ancient medical writings there are references to mental disturbance that display views very similar to modern humane attitudes, interspersed in the same literature are instances of socially sanctioned cruelty based upon the belief that mental disorders have supernatural origins such as demonic possession. Even reformers sometimes used harsh methods of treatment; for example, the 18th-century American physician Benjamin Rush endorsed the practice of restraining mental patients with his notorious "tranquilising chair."

Early institutions. The history of care for the mentally ill reflects human cultural diversity. The earliest known mental hospitals were established in the Arab world, in Baghdad (AD 918) and in Cairo, with that special consideration traditionally given disturbed people, the "afflicted of Allāh." Some contemporary African tribes benignly regard hallucinations as communications from the realm of the spirits; among others, Hindu culture shows remarkable tolerance for what is considered to be bizarre behaviour in Western societies. The Western interpretation of mental illness as being caused by demonic possession reached its height during a prolonged period of preoccupation with witchcraft (15th through 17th century) in Europe and in colonial North America.

So-called madhouses such as Bedlam (founded in London in 1247) and the Bicêtre (the Paris asylum for men) were typical of 18th-century mental institutions in which the sufferers were routinely shackled. Inmates of these places often were believed to be devoid of human feeling, and their management was indifferent if not brutal; the primary consideration was to isolate the mentally disturbed from ordinary society. In British colonial America, mentally deranged persons frequently were auctioned off to be cared for (or exploited) by farmers; some were driven from towns by court order, and others were placed in almshouses. Only after more than a century of colonization was the first British colonial asylum for the insane established in Williamsburg, Va., in 1773. In the 1790s, the French reformer Philippe Pinel scandalized his fellow physicians by removing the chains from 49 inmates of the Bicêtre. At about the same time, William Tuke, a Quaker tea and coffee merchant, founded the York (England) Retreat to provide humane treatment. Benjamin Rush, a physician and signer of the Declaration of Independence, also advocated protection of the rights of the insane. Despite this progress, more than half a century of independence passed in the United States before Dorothea Dix, a teacher from Maine, discovered that in Massachusetts the insane were being jailed along with common criminals. Her personal crusade in the 1840s led to a flurry of institutional expansion and reform in her own country, in Canada, and in Great Britain.

While these pioneering humanitarian efforts tended to improve conditions, one unplanned result was a gradual emphasis on centralized, state-supported facilities in which sufferers were sequestered, often far from family and friends. Largely kept from public scrutiny, the unfortunate inmates of what fashionably were being called mental hospitals increasingly became victims of the old forms of maltreatment and neglect.

Modern approaches. The modern mental-health movement received its first impetus from the energetic leadership of a former mental patient in Connecticut, Clifford Whittingham Beers. First published in 1908, his account of what he endured, *A Mind That Found Itself,* continues to be reprinted in many languages, inspiring successive generations of students, mental-health workers, and laymen to promote improved conditions of psychiatric care in local communities, in schools, and in hospitals. With the support of prominent persons, including distinguished professionals, Beers in 1908 organized the Connecticut Society for Mental Hygiene, the first association of its kind. In its charter, members were charged with responsibility for the same pursuits that continue to concern mental-health associations to this day: improvement of standards of care for the mentally disturbed, prevention of mental disorder and retardation, the conservation of mental health, and the dissemination of sound information. In New York City less than a year later, on February 19, 1909, Beers led in forming the National Committee for Mental Hygiene, which in turn was instrumental in organizing the National Association for Mental Health in 1950.

While philosophic and scientific bases for an international mental-health movement were richly available, Beers seems to have served as a catalytic spark. Charles Darwin and his contemporaries already had shattered traditional beliefs in an immutable human species with fixed potentialities. By the time Beers began his public agitation, it was beginning to be understood that developing children need not suffer some of the crippling constraints imposed on their parents. A newly emerging scientific psychology had revealed some of the mechanisms by which the environment had its effects on individual adjustment, fostering hopes that parents and community could provide surroundings that would enhance the growth and welfare of children beyond levels once thought possible. In this spirit, the mental-health movement early inspired the establishment of child-guidance clinics and programs of education for parents and for the public in general.

Psychiatric and psychological developments during and after World War I provided fresh impetus to the movement. Over the same period, the European development of psychoanalysis, initiated by Sigmund Freud in Vienna, placed heavy emphasis on childhood experiences as major determinants of psychiatric symptoms and led worldwide to increasing public awareness of psychological and social-environmental elements as primary factors in the development of mental disorders.

International organizations. Beers formed an International Committee for Mental Hygiene in 1919. By 1930, the time of the First International Congress of Mental Hygiene in Washington, D.C., there were mental-hygiene societies in 25 countries. In London at the third international congress in 1948, the World Federation for Mental Health was formed. It provides consultants and shares informal reciprocal functions with several United Nations agencies, including the World Health Organization (in which a mental-health unit was established in 1949). The federation has convened international study groups and expert committees, held regional and international meetings, and developed close contacts with mental-health workers worldwide. In almost every country there is increasing recognition of the interrelationship between mental health, population pressures, and social unrest. With growing urgency, people almost everywhere seek to promote mental health and to educate the public to pursue conditions conducive to individual growth and peaceful development.

National agencies. For more than a century before World War II, the mental hospitals of many countries had been the responsibility of local government. Under the British National Health Service Act of 1946, however, the task of providing hospital care fell almost completely on the national government through boards of hospital administration acting as regional agencies for the Ministry of Health. In the same year, existing privately supported mental-health organizations combined to form the (U.K.) National Association for Mental Health. This voluntary national group provides resident facilities for disturbed persons, offers follow-up services, and trains mental-health personnel, in addition to carrying on educational programs. The Mental Health Act of 1959 nullified earlier British laws governing policies toward psychiatric disturbance and retardation. The act provided that a person requiring treatment for a psychological disorder could obtain it in a hospital on the same basis as any medical complaint. Community mental-health services were placed under the jurisdiction of local health authorities working in close association with hospital and outpatient centres. British research into mental-health problems is mainly under the direction of the government-financed Medical Research Council.

Provisions for treating and caring for mentally disturbed persons and for encouraging mental hygiene are generally organized in this manner over most of the continent of Europe. In communist countries, the state, either through the central or regional governments, had the task of providing and maintaining facilities for disturbed or retarded persons. In countries of the European Economic Community, government shares its mental-health function with religious groups or with other nongovernmental agencies. Many innovative mental-health services have been initiated in Europe, including the concept of integrated community services, the use of tranquillizing drugs, the sheltered workshop, and the employment of nonprofessional workers in positions of responsibility.

Imported European ideas combined with the traditional reliance on self-improvement and adjustment already present in Canadian and U.S. culture to give the mental-health movement in those countries additional momentum in the 1930s and early 1940s.

World War II and the postwar problems of returning veterans stimulated further public interest in mental health. The mental-health movement and the mass media discovered each other, and a flood of exposés swept Canada and the United States, notably Albert Deutsch's *The Shame of the States* in 1948. Published in 1946, Mary Jane Ward's book *The Snake Pit* became a Hollywood film success and was followed by many more honestly realistic portrayals of mental problems on screen and television. A psychodynamic approach to the understanding and guidance of children infused North American popular culture. The introduction of pharmacotherapy (*e.g.,* tranquillizing and mood-elevating drugs) stimulated further progress.

In 1946 the passage of the National Mental Health Act in the United States made possible the creation of the National Institute of Mental Health (NIMH) in 1949 within what later became the Department of Health and Human Services. State hospital systems were reorganized with increased budgets, while significant federal funds were made available for research, training, and clinical facilities. NIMH is the major funding resource in the United States for basic and applied research in mental health and in the behavioral sciences, for demonstration projects, and for the training of mental-health professionals. It has developed special programs in a broad range of social problem areas, from drug addiction to suicide prevention. The National Clearinghouse for Mental Health Information, operated by NIMH, is a valuable resource, as is the periodical publication *Mental Health Digest.* Additional sources of support for mental health in the United States include the National Institute of Child Health and Human Development, the Veterans Administration, the Department of Education, the Social and Rehabilitation Service, the National Science Foundation, and the medical sections of the Department of Defense. Charitable foundations also have provided generous support over the years.

The situation in Australia and New Zealand is similar to that of North America and Europe. Developments in Latin America, Africa, and Asia commonly have been hampered by a shortage of trained institutional staff members and of local sources of support. In many so-called developing countries, mental health and hygiene depend heavily on missionaries, intergovernmental aid programs, and the efforts of agencies of the United Nations.

mental retardation, any of several conditions characterized by subnormal intellectual functioning and impaired adaptive behaviour that become manifest during the individual's developmental years.

Characterization. A standardized intelligence test is a common method of identification, a tested intelligence quotient of 70 being the usual upper borderline for those needing special care and training. Retardation is classified according to severity. The once standard labels—moron, imbecile, and idiot—have been abolished. Categories of retardation take into account an individual's physical and social development, and correspond roughly to IQ scores. Those with scores in the upper range of retardation, roughly 53 to 70, comprise the majority of retarded persons; they are able to learn academic and prevocational skills with some special training. Those in the moderate range, roughly 36 to 52, are able to talk and care for their own basic needs, to learn functional academic skills, and to undertake semi-skilled work under sheltered conditions. Those in the severe range, about 21 to 35, show slow motor development, limited communication skills, possible physical handicaps, and the ability to talk and care for their basic needs, as well as to contribute to their own maintenance with supervision in work and living situations. Finally, those in the profound range, comprising the smallest number of the retarded, demonstrate minimal responsiveness, secondary physical handicaps, poor motor development and communication skills, and the ability to perform only highly structured work activities. Institutionalization in this case is almost inevitable. Educators have coordinated IQ scores with school capabilities: educable, 50–75; trainable, 25–50; and custodial, 0–25.

Causes. Moderate to severe retardation can be caused by a number of mishaps that may occur before, during, or after birth, including: genetic disorders, such as Down's Syndrome (leading to cretinism or mongolism, for example); infectious diseases, such as meningitis; metabolic disorders; physical malformations; poisoning from radiation, lead, or other toxic agents; injuries to the head; and malnutrition. Milder cases of progressive retardation can be traced to economic and cultural deprivation early in childhood, mainly due to poverty.

Care and education. Care and treatment of the retarded in the past was mainly custodial. More recently, however, efforts have been directed toward improved medical treatment of organic conditions, parent education, special schooling, vocational training, and sheltered workshops. Many retarded persons have proved capable of becoming nearly independent and productive members of society, although in most cases specialized training and continuing guidance services are necessary to aid adjustment.

Residential care is often a necessity for the more severely retarded, who need constant attention, as well as for senior retarded persons. Psychologists believe the best kind of residential care is that most closely resembling family life. Residential-care facilities and group homes are normally located in apartments or individual houses.

For many school-agers, special education is one of the most important means to self-sufficiency. Federal legislation enacted in the United States in 1968 provides authority for the broadening of efforts in vocational education of the handicapped to include the mentally retarded. Mainstreaming, the integration of children from the special-education classes with those in the regular program, is an attempt to introduce retarded children to a normal school routine. Physical integration alone, however, does not guarantee acceptance by nonretarded youngsters. Psychological integration is also an important consideration.

Mentawai Islands, Dutch MENTAWEI EILANDEN, group of about 70 islands, Sumatera Barat *provinsi* ("province"), Indonesia. They lie off the western coast of Sumatra in the Indian Ocean. The major islands are Siberut, Sipura, Pagai Utara (North Pagai), and Pagai Selatan (South Pagai), the last two also known as the Nassau Islands. The principal town is Muarasiberut, in southeastern Siberut. The islands' western coasts are steep and rocky, and coral reefs and heavy surf make approach dangerous. Elevations are below 1,500 feet (450 m), and earthquakes are frequent. Most of the islands are covered with forest.

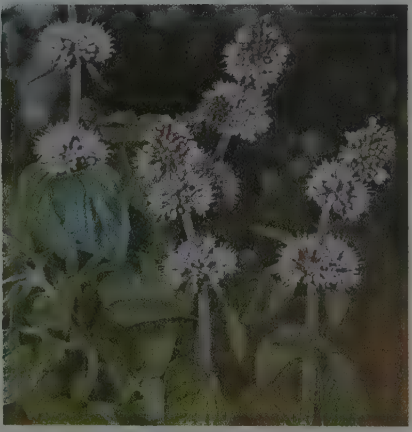
Racially the inhabitants seem to belong to the early (Proto-) Malays. Most are still animists and distrustful of Christian missionary activity. Their societies are usually subdivided into endogamous clan groups in which authority and inheritance are patrilineal. The villages are irregular groupings of small houses on stilts, usually along riverbanks, with occasional long houses. Tuber crops, chiefly taro and yams, are grown in temporary clearings. Flour from sago palms is also important. Pigs are kept but no large livestock. Hunting with bow and poisoned arrows, gathering of forest products, and fishing supplement agriculture. Coconuts are grown, and copra is the chief export. There are few roads. Pop. (latest est.) 14,732.

Menteşe DYNASTY, Turkmen dynasty (*c.* 1290–1425) that ruled in the Muğla-Milas region of southwestern Anatolia.

Founded by Menteşe, the dynasty's principality extended along the Aegean and the Mediterranean coasts, and its fleet engaged in trade and piracy. After repulsing a Byzantine attack in 1296, Menteşe's son Mesud occupied part of the island of Rhodes in 1300. Menteşe Ibrahim was compelled in 1355 to allow the Venetians to establish a trading colony at Balat (Miletus).

Divided in about 1360 into two major branches, with their respective centres at Balat and Beçin (Peçin), the principality came under Ottoman rule in 1390–91. Its independence was restored by the Central Asian ruler Timur (Tamerlane) in 1402, but it was permanently annexed by the Ottomans in 1425.

Mentha, the mint genus, containing 25 species of aromatic herbs native in temperate Eurasia, North America, southern Africa, and Australia. It belongs to the family Lamiaceae, order Lamiales, though the flowers are not typical of members of that family, having four rather than five united petals. The blue to lavender or white flowers bloom in whorls along the stem.



Wild mint (*Mentha arvensis*)

G.E. Hyde—EB Inc.

Spearmint (*M. spicata*), which grows to about 90 cm (3 feet) high, with open spikes of pink or lilac flowers and stalkless leaves, has the characteristic mint fragrance. Peppermint (*M. piperita*) has a heavier scent, stalked leaves, and reddish lilac flowers in denser spikes. Peppermint may be a hybrid between spearmint and water mint (*M. aquatica*), which has hairy stems, broadly oval, scented leaves, and a globed head of lavender flowers. Pennyroyal (*M. pulegium*) is a low plant with small, oval, scented leaves and bluish lilac flowers. All four species, native to Eurasia and naturalized in North America, are common in moist meadows. Wild mint (*M. arvensis*), native in North America and Eurasia, reaches about 1 m (over 3 feet) high. *See also* mint.

Consult the INDEX *first*

menthol, also called PEPPERMINT CAMPHOR, a crystalline organic compound with a strong, minty, cooling odour and taste obtained for centuries from the oil of the Japanese mint; it is used in cigarettes, cosmetics, and flavourings. It belongs to the isoprenoid family, the empirical formula being $C_{10}H_{20}O$.

The most common of the optical isomers (identical formula but different structures) of menthol is the levorotatory form (*i.e.,* a compound that rotates the plane of polarized light to the left) *l*-menthol, present in mint oil; smaller amounts are produced from citronellal. Racemic menthol—*i.e.,* a mixture of equal amounts of *l*-menthol and *d*-menthol, the latter being the isomer that rotates the plane of polarized light to the right—is not equivalent to the natural product, because the cooling effect is peculiar to the levo isomer.

Menton, Italian MENTONE, town, Alpes-Maritimes *département,* Provence-Alpes-Côte-d'Azur region, southeastern France. Situated near the Italian border 17 miles (28 km) northeast of Nice and 6 miles (10 km) northeast of Monte-Carlo by road, it is reputedly the warmest winter resort on the French Riviera's Côte d'Azur; it is also a popular summer resort. The town stands below a rocky amphitheatre, along a wide crescent-shaped bay that is divided by a spur and bounded to the southwest by Cape Martin. Along the shore lie the tourists' quarter with tropical gardens, luxurious hotels, wide promenades, and the municipal casino. An artificial sand beach lies between the old harbour and the newer yacht marina in Garavan Bay. The narrow, vaulted streets of the old 17th-century section of Menton are cramped together on a narrow promontory above Garavan Bay. The town, which belonged to the counts of Ventimiglia, a noble Genoese family, was purchased in the 14th century by the Grimaldis, lords of Monaco. In 1860, Menton was purchased by France. Pop. (1999) 28,812.

Mentor, city, Lake county, northeastern Ohio, U.S. It lies near Lake Erie, 22 miles (35 km) northeast of Cleveland. Mentor Township, organized in 1815, was named for Hiram Mentor, an early settler. Mentor Village was separately incorporated in 1855. After World War II the area experienced rapid population and industrial growth, and in 1962 the township and village were consolidated. James A. Garfield, later U.S. president, bought a farm there in 1876, and his home, Lawnfield, has been preserved as a memorial museum depicting the history of the Western Reserve. The city is the site of Lakeland Community College (1966). There are many garden nurseries in the vicinity. Inc. city, 1963. Pop. (2000) 50,278.

Mentuhotep II, also called NEBHAPETRE, king of Egypt's 11th dynasty (ruled 2008–1957 BC) who, starting as the ruler of southernmost Egypt in about 2008, reunified the country by defeating his rivals and ushered in the period known as the Middle Kingdom.

At his accession, Mentuhotep, then called Sankhibtawy ("He Who Causes the Heart of the Two Lands to Live"), controlled Upper Egypt from Aswān to This, an ancient city about 90 miles (145 km) north of Thebes, his capital. He inherited a realm that had already spent some 60 years in intermittent warfare with the Heracleopolitan kingdom, which ruled Middle and Lower Egypt, as each state sought to control the whole country.

In the 14th year of his reign, Mentuhotep launched a drive against Heracleopolis. Nothing is known of the course of the war, but the Thebans were aided by a change of rulers in the enemy capital, and, by 1968 at the latest, Mentuhotep had captured Heracleopolis and reunited Egypt. In subsequent years, fighting continued in the north and against the Bedouin, who habitually raided the delta, and northern Nubia was annexed later in the reign. To consolidate the unification, Mentuhotep received the submission of Middle Egypt's local governors, most of whom he left in office, thereby establishing the feudal character of the early Middle Kingdom. Thebes became the national capital, and Mentuhotep's loyal supporters received the key government posts; he also accepted partisans of the defeated Heracleopolitans who demonstrated loyalty to the new order.

Reunification was followed by great expansion in trade and building. Mentuhotep built temples with reliefs of his victories at numerous Upper Egyptian sites, but little survives from them. At Thebes he built a magnificent temple and tomb complex. The hills around the monument were honeycombed with the tombs of his officials and soldiers who perished in the wars. He died about 1957, leaving a reunited and prosperous kingdom to his successor, Sankhkare Mentuhotep III. Tradition accorded Mentuhotep II an honoured place with Egypt's other unifiers, the founders of the 1st and 18th dynasties.

menues verdure: *see* millefleur tapestry.

Menuhin, Sir Yehudi (b. April 22, 1916, New York, N.Y., U.S.—d. March 12, 1999, Berlin, Ger.), one of the leading violin virtuosos of the 20th century.

Menuhin grew up in San Francisco, where he studied violin from age four and where his performance of Felix Mendelssohn's *Violin Concerto* at age seven caused a sensation. He studied in Paris under the violinist and composer Georges Enesco, who deeply influenced his playing style and who remained a lifelong friend. As a teenager he toured widely, winning admiration both for his technical proficiency and for his musical interpretation. In 1936 he retired from performing for 18 months of study, then resumed concert activity. He moved to London in 1959 and in 1963 opened the Yehudi Menuhin School for musically gifted children at Stoke d'Abernon, Surrey. In 1965 he was granted knighthood, but he did not receive the title until 1985, when he became a British citizen.

Menuhin

By courtesy of Columbia Artists Management Inc.

Menuhin gained note for introducing into his concerts rarely performed and new music; works he commissioned include Béla Bartók's *Sonata for Solo Violin.* He presided over the annual music festivals at Gstaad, Switz. (from 1957); Bath, Eng. (1959–68); and Windsor, Eng. (1969–72). In 1966 at Bath and in 1967 at the United Nations, Menuhin performed duets with the noted Indian sitarist and composer Ravi Shankar, who composed the solo piece *Prabhati* for him.

His publications include a collection of essays, *Theme and Variations* (1972); works for musical instruction, *Violin: Six Lessons* (1972) and *Violin and Viola* (1976; with W. Primrose and D. Stevens); an autobiography, *Unfinished Journey* (1977); and *The Music of Man* (1979; with Curtis W. Davis).

Menuis (Egyptian religion): *see* Mnevis.

Menuisiers-Ébénistes, Corporation des, 18th-century French craft guild concerned with woodworking, the *menuisiers* doing principally the work of the carpenter and joiner and the *ébénistes* applying the veneered finish. Jean-Baptiste Colbert, the finance minister of Louis XIV, took the guild system from its medieval background and shaped it into an effective labour-control organization, inculcating a sense of professional pride among its members and encouraging a high degree of specialization. It was this attitude that produced the dynasties of superb craftsmen who made French furniture of the 18th century one of the glories of Western culture.

Although it was the *menuisier* who conceived and signed a piece of furniture, the end result was in fact brought about by a collective effort of various other craftsmen. As the art of veneering developed in the late 17th century, a new category appeared, the *menuisiers en ébène,* who were later known as *ébénistes;* and in 1743 the guild of *menuisiers* was reformed as the Corporation des Menuisiers-Ébénistes. Although the guilds were dissolved in 1791, their influence persisted into the 19th century.

Menzel, Adolf (Friedrich Erdmann) von (b. Dec. 8, 1815, Breslau, Prussia—d. Feb. 9, 1905, Berlin), German painter and printmaker, best known in his own day as a brilliant historical painter, whose patriotic works satisfied the public's taste for propagandistic art engendered by Prussia's continual expansion throughout the 19th century. In the 20th century he was chiefly esteemed for his sensitive treatment of light and the original compositions of his small genre pictures.

In 1832 Menzel took charge of his dead father's lithographic workshop and, self-taught, rapidly became famous in this medium by illustrating various histories of Prussia, especially those dealing with the reign of Frederick II the Great. These were followed by illustrations for similar publications, such as a lavish edition of Frederick's works with 200 plates (1844–49). In painting Menzel soon became famous for his glittering re-creations of such scenes as Frederick the Great's concerts at his palace, Sanssouci, and "The Ball Supper" (1878; Staatliche Museen zu Berlin), showing the court of King Wilhelm I vigorously refreshing itself.

In later times Menzel was most admired for small paintings and drawings dating from about 1840 onward. These interior, street, and landscape scenes show an unorthodoxy of vision and a refined feeling for the effects of light; such works as "Room with a Balcony" (1845; Staatliche Museen Preussischer Kulturbesitz, Berlin) and "The Artist's Sister in the Sitting Room" (1847; Neue Pinakothek, Munich) presage later developments of the Impressionist movement in France. Subjects are viewed from high or low angles, and there are departures from conventions of grouping and framing, as well as innovative excursions into industrial subjects, as in "Rolling Mill" (1875; Staatliche Museen Preussischer Kulturbesitz, Berlin).

Menzies, Sir Robert Gordon (b. Dec. 20, 1894, Jeparit, Victoria—d. May 16, 1978, Melbourne), statesman who, as prime minister of Australia (1939–41, 1949–66), strengthened military ties with the United States and fostered industrial growth and immigration from Europe.

Sir Robert Gordon Menzies

By courtesy of the Australian Information Service

Menzies gave up a highly successful law practice in Victoria to serve in the state legislature (1929–34). He entered the federal Parliament in 1934, serving as attorney general (1934–39) under Joseph Lyons; and in 1939, as leader of the United Australia Party, he became prime minister. Pressure from various quarters forced his resignation in 1941, after he had initiated Australia's mobilization for World War II. Organizing the Liberal Party in 1944, he regained control of the government in 1949, campaigning in opposition to the Socialist policies of the Labor Party.

Menzies presided over rapid industrial growth in Australia during the 1950s, sponsoring the development of natural resources and transportation and encouraging foreign investment. He had a traditional concept of the British Commonwealth and gave controversial support to Britain's intervention in the Suez crisis of 1956 and in the Malaysia–Indonesia confrontation of the early 1960s. His strong belief in the United States as the bulwark of Australian security led to the alliance (1951) of Australia, New Zealand, and the United States (ANZUS) and to Australia's joining the South East Asia Treaty Organization in 1954. His anti-Communism was expressed in an unsuccessful attempt to dissolve the Australian Communist Party in 1951 and in his joining the United States in supporting the South Vietnamese war effort. After the longest continuous ministry in Australian history, Menzies retired in 1966. He was knighted in 1963.

Menzies, William Cameron (b. July 29, 1896, New Haven, Conn., U.S.—d. March 5, 1957, Beverly Hills, Calif.), one of the most influential set designers in Anglo-American filmmaking, whose work on *The Tempest* and *The Dove* in 1927–28 won the first Oscar awarded by the Motion Picture Academy of Arts and Sciences for art direction.

Menzies' reputation derives from the opulent fairy-tale settings of such films as *The Thief of Bagdad* (1924) and *The Beloved Rogue* (1927), as well as extravagantly detailed historical spectacles such as *Gone with the Wind* (1939). His work on the latter, for which he won a second Oscar, was so broad in scope that he got credit as "production designer." He directed several films, including *Things to Come* (1936), for which he also designed remarkable sets.

Menzies often used forced perspective: making actual depths appear much greater than they were. Another of his techniques was to use broken diagonal barriers—fences, walls, or railings—to emphasize tension, grief, or separation.

Meo (Southeast Asian people): *see* Miao.

Meo (Indian tribe, or caste): *see* Mina.

mepacrine (drug): *see* quinacrine.

meperidine, synthetic narcotic analgesic (pain-relieving drug) used to alleviate both acute and chronic pain. It is an opioid, and thus its effects on the body resemble those of opium or morphine, one of opium's purified constituents. A common trade name for meperidine is Demerol.

The drug acts principally on the central nervous system and on the neural elements of the bowel. It can be administered orally, in liquid or tablet form, or by intramuscular or subcutaneous injection. Its effects are felt within 15 minutes and last from 3 to 5 hours. Meperidine commonly is used to relieve pain during childbirth, although it may slow the respiratory rate of both mother and infant. Other side effects include drowsiness, lightheadedness, dryness of the mouth, weakness, and nausea. The drug is also highly addictive. Nevertheless, its side effects tend to be less severe than those of morphine, making it a preferable choice in many instances.

Mephistopheles, also called MEPHISTO, familiar spirit of the Devil in late settings of the legend of Faust. It is probable that the name Mephistopheles was invented for the historical Faust by the anonymous author of the first *Faustbuch* (1587). A latecomer in the infernal hierarchy, Mephistopheles never became an integral part of the tradition of magic and demonology that predated him by thousands of years. He is mentioned only in the magic manuals attributed to Faust. He belongs essentially to literature. In *Doctor Faustus* (1604), by the English dramatist Christopher Marlowe, Mephistopheles achieves tragic grandeur as a fallen angel, torn between satanic pride and dark despair. In the drama *Faust* (Part I, 1808; Part II, 1832), by J.W. von Goethe, he is cold-hearted, cynical, and witty—perhaps a more subtle but certainly a slighter creation. At the end of Goethe's drama, Faust's soul escapes from Mephistopheles while he is making improper advances to the angels that have come to rescue it.

"Mephistopheles Offering His Help to Faust," illustration to Goethe's *Faust,* lithograph by Eugène Delacroix

The Bettman Archive

Meppel, *gemeente* (commune), Drenthe *provincie,* east-central Netherlands. It is situated near the confluence of the Drentche Hoofd and Hoogeveensche canals and the Reest River, which empty into the Meppelerdiep before it flows into the IJsselmeer (Lake IJssel). Meppel is a marketing centre for peat and agricultural products from the surrounding area, including cereals, dairy products, and pigs. The commune's factories manufacture transport equipment, chemicals, printed materials, textiles, and leather products. Reserves of natural gas are found nearby, and Meppel has an electric-transformer station.

A 15th-century church is an architectural feature of the town. The lakes of Beulakewijde and Belterwijde are located nearby. Forests lie to the southeast, and regional parkland is found to the north. Meppel is a highway and railway junction. Pop. (1994 est.) 24,427.

meprobamate, tranquilizing drug taken orally primarily to treat anxiety and tension. Meprobamate also has been effective for relief of insomnia, muscular spasms, and dermatological conditions and gastrointestinal disturbances arising from anxiety and tension. Because of its anticonvulsant action, it sometimes is helpful in treating petit mal and related minor epilepsies.

A central-nervous-system depressant, meprobamate acts selectively upon the spinal cord and the higher centres in the brain. The drug is absorbed readily from the gastrointestinal tract and distributed rapidly.

Physical dependence may be produced after utilization of high doses for prolonged periods. Possible side effects include drowsiness, lethargy, and unsteadiness of stance and gait.

Meprobamate was introduced in the mid-1950s and was first marketed as Miltown, a trade name derived from the name of the village, Milltown, N.J., in which the drug was developed.

mepyramine (drug): *see* pyrilamine.

Meramec River, tributary of the Mississippi River rising in the Ozark Mountains, near Salem in Dent county, southeast Missouri, U.S. The river winds 207 miles (333 km) generally north, northeast, and southeast through the limestone Meramec Caverns and Meramec State Park (near Sullivan) to enter the Mississippi River 20 miles (32 km) below St. Louis. Lead was mined along its banks in the 1700s, and the river was used by settlers and traders. A ferry, said to be the first in Missouri, was established near its mouth in 1776. Its main tributaries are the Bourbeuse and Big rivers. The Meramecian series of limestone rocks was named for the river. Meramec is possibly derived from an Algonquin Indian word meaning "catfish."

Merano, German MERAN, city, Bolzano-Bozen *provincia,* Trentino-Alto Adige *regione,* northern Italy. It lies at the foot of the central chain of the Alps, at the confluence of the Passirio and Adige rivers, northwest of the city of Bolzano.

Merano, first mentioned in 857, is that part of the Tirol transferred from Austria to Italy in 1918. The city is dominated by the Gothic parish church (1367–1495) and the small Principesco Castle (1445–80), built by the Habsburgs. In the surrounding area are about 30 castles, the most celebrated of which is Tirolo, from which the Tirol took its name.

In the 19th and 20th centuries Merano was transformed from a small mountain town into a tourist and health resort noted for its therapeutic baths. Fruit is grown locally, and wine and chemicals are produced. Pop. (1993 est.) mun., 33,638.

Merapi, Mount, Indonesian GUNUNG MERAPI, volcanic mountain peak located near the centre of the island of Java, Indonesia. The volcano is about 20 miles (32 km) north of Yogyakarta and somewhat farther south of Semarang. Merapi ("Mountain of Fire") rises to 9,551 feet (2,911 m) and has steep slopes with dense vegetation on its lower flanks. It is the most active of Indonesia's 130 active volcanoes. One of its largest eruptions occurred in 1006 and spread ash all over central Java. Other major eruptions were those of 1786, 1822, 1872, 1930, and 1976. Almost half of Merapi's eruptions have been accompanied by pyroclastic flows, or *nuées ardentes,* which are clouds of superheated gases and incandescent solid particles. In the eruption of Nov. 22, 1994, the release of a pyroclastic flow killed 64 people.

Merbecke, John (English composer): *see* Marbeck, John.

merbromin, first of a series of antiseptics in which mercury was incorporated into an organic molecule in an attempt to obtain the antibacterial action of mercury without the irritant effects of mercuric chloride. Commonly marketed as Mercurochrome, merbromin is applied to small cuts and abrasions to prevent infection; it stains surrounding tissue a brilliant red tinged with a yellow-green fluorescence. It is only a weak antiseptic and has been displaced in medical practice by the more effective agents of the series, nitromersol (Metaphen) and thimerosal (Merthiolate), and by antibiotics.

Merca (Somalia): *see* Marca.

Mercadante, Saverio, in full GIUSEPPE SAVERIO RAFFAELE MERCADANTE (b. before Sept. 17, 1795, Altamura, near Bari [Italy]—d. Dec. 17, 1870, Naples), Italian composer and teacher who was a transitional figure in opera composition between Gaetano Donizetti, Gioacchino Rossini, and Vincenzo Bellini on the one hand and Giuseppe Verdi on the other. He is considered to have been an important reformer of Italian opera.

Mercadante was born out of wedlock. He was taken to Naples at the age of 11, and in 1808 he was enrolled in the San Sebastiano College under an altered name, date, and place of birth. While a student there, he wrote a number of instrumental pieces, including music for three ballets. His first opera premiered on Jan. 4, 1819, and, less than three years (and precisely five operas) later, his *Elisa e Claudio* successfully opened at La Scala in Milan. Mercadante composed another popular opera, *Caritea, regina di Spagna* ("Caritea, Queen of Spain"; better known as *Donna Caritea*), in 1826. He was involved with Italian opera in Spain and Portugal from about 1827 to 1830. He married in 1832 and from 1833 to 1840 was maestro di cappella at Novara Cathedral. In 1835 Mercadante came in contact with the music of Giacomo Meyerbeer, and his next opera, *Il giuramento* ("The Oath"; performed in 1837 and considered to be his best opera), reflects the lessons he learned from that composer. Thereafter he continued to attempt a more harmonious blend of drama and music and led the way toward simplified vocal lines, originality, and thoughtful, serious composition. From 1840 until his death, he served as head of the Naples Conservatory. In addition to operas, he wrote sacred music (including a number of masses), cantatas and hymns, orchestral pieces, and a variety of chamber music.

mercantile agency, specialized organization engaged in supplying information on the creditworthiness and financial strength of business firms in highly developed economies. The first such agency, the Mercantile Agency, was founded in New York City in 1841 to reduce credit losses. As businesses expanded from their local area to a national scale, many of them found it impossible to judge the creditworthiness of prospective customers in distant locations. The Mercantile Agency, which changed its name to R.G. Dun & Company after 1859, merged in 1933 with the Bradstreet Company to form the most widely known agency, Dun & Bradstreet, Inc.

Mercantile agencies may be general (providing information on all types of business firms) or specialized (limited to firms in a particular line of trade or in a particular region). Most agencies provide two kinds of reports. General reports, containing a rating based on the firm's financial statement and a rating of the credit to which the mercantile agency judges the firm to be entitled, are issued periodically on all firms investigated by the agency. Special reports, containing a firm's history, fire record, insurance record, financial statements, public records, and the opinion of other creditors, are issued to clients of the agency on request.

mercantilism, economic theory and practice common in Europe from the 16th to the 18th century that promoted governmental regulation of a nation's economy for the purpose of augmenting state power at the expense of rival national powers. It was the economic counterpart of political absolutism. Its 17th-century publicists—most notably Thomas Mun in England, Jean-Baptiste Colbert in France, and Antonio Serra in Italy—never, however, used the term themselves; it was given currency by the Scottish economist Adam Smith in his *Wealth of Nations* (1776).

Mercantilism contained many interlocking principles. Precious metals, such as gold and silver, were deemed indispensable to a nation's wealth. If a nation did not possess mines or have access to them, precious metals should be obtained by trade. It was believed that trade balances must be "favourable," meaning an excess of exports over imports. Colonial possessions should serve as markets for exports and as suppliers of raw materials to the mother country. Manufacturing was forbidden in colonies, and all commerce between colony and mother country was held to be a monopoly of the mother country.

A strong nation, according to the theory, was to have a large population, for a large population would provide a supply of labour, a market, and soldiers. Human wants were to be minimized, especially for imported luxury goods, for they drained off precious foreign exchange. Sumptuary laws (affecting food and drugs) were to be passed to make sure that wants were held low. Thrift, saving, and even parsimony were regarded as virtues, for only by these means could capital be created. In effect, mercantilism provided the favourable climate for the early development of capitalism, with its promises of profit.

Later, mercantilism was severely criticized. Advocates of laissez-faire argued that there was really no difference between domestic and foreign trade and that all trade was beneficial both to the trader and to the public. They also maintained that the amount of money or treasure that a state needed would be automatically adjusted and that money, like any other commodity, could exist in excess. They denied the idea that a nation could grow rich only at the expense of another and argued that trade was in reality a two-way street. Laissez-faire, like mercantilism, was challenged by other economic ideas. *Compare* laissez-faire.

mercaptan: *see* thiol.

Mercāra, also called MADHU-KERI, town, southern Karnātaka (formerly Mysore) state, southern India, in the Western Ghāts, at an elevation of 3,800 feet (1,160 m), on the national highway from Mysore city to Mangalore. In 1681 Mudda Raja selected the central but inaccessible site for the capital of the independent Hindu dynasty of Coorg. A fort built in 1812 by Linge Raja and the hilltop Onkeshwara Temple overlook the quiet town. Raja's Seat, a picturesque little garden, commands a panoramic view. A government and a law college are affiliated with the University of Mysore. Pop. (1981) 24,724.

Mercator, Gerardus, original name GERARD DE CREMER, or KREMER? (b. March 5, 1512, Rupelmonde, Flanders [now in Belgium]—d. Dec. 2, 1594, Duisburg, Duchy of Cleve [Germany]), Flemish cartographer whose most important innovation was a map, embodying what was later known as the Mercator projection, on which parallels and meridians are rendered as straight lines spaced so as to produce at any point an accurate ratio of latitude to longitude. He also introduced the term atlas for a collection of maps.

Mercator, engraving by Frans Hogenberg, 1574

Copyright Bibliotheque royale Albert 1er, Bruxelles, Reserve precieuse (VH 14.348 C LP, fol. 2 v°)

Mercator's family had moved from Germany to Flanders shortly before he was born. He was educated in Hertogenbosch (Neth.), receiving training in Christian doctrine, dialectics, and Latin. In 1530 he entered the University of Louvain (Belg.) to study the humanities and philosophy and graduated with a master's degree in 1532.

Religious doubts assailed him about this time, for he could not reconcile the biblical account of the origin of the universe with that of Aristotle. After two years of study which led him to Antwerp and Mechelen he emerged from his personal crisis, fortified in his faith, with less enthusiasm for philosophical speculation. Moreover, he brought back to Louvain a freshly acquired taste for geography.

Under the guidance of Gemma Frisius, the leading theoretical mathematician in the Low Countries, who was also a physician and astronomer, Mercator mastered the essentials of mathematics, geography, and astronomy. Frisius and Mercator also frequented the workshop of Gaspar à Myrica, an engraver and goldsmith. The combined work of these three men soon made Louvain an important centre for the construction of globes, maps, and astronomical instruments. In 1534 Mercator married Barbara Schellekens, by whom he had six children.

By the time he was age 24, Mercator was a superb engraver, an outstanding calligrapher, and a highly skilled scientific-instrument maker. In 1535–36 he cooperated with Myrica and Frisius in constructing a terrestrial globe and in 1537 its celestial counterpart. These globes demonstrate the free and graceful italic lettering with which Mercator was to change the face of 16th-century maps. During that period he also began to build his reputation as the foremost geographer of the century with a series of printed cartographic works: in 1537 a map of Palestine, in 1538 a map of the world on a double heart-shaped projection, and about 1540 a map of Flanders. In 1540 he also published a concise manual on italic lettering, the *Literarum Latinarum quas Italicas cursoriasque vocant scribende ratio,* for which he engraved the wood blocks himself.

In 1544 he was arrested and imprisoned on a charge of heresy. His inclination to Protestantism, and frequent absences from Louvain to gather information for his maps, had aroused suspicions; he was one of 43 citizens so charged. But the university authorities stood behind him. He was released after seven months and resumed his former way of life. He obtained a privilege to print and publish books and was free to continue his scientific studies.

In 1552 Mercator moved permanently to Duisburg in the Duchy of Cleve. Once there, he became a well-known figure. He assisted the duke in establishing a grammar school by helping to design its curriculum. After establishing a cartographic workshop and engaging his own engravers, he returned to his main interest.

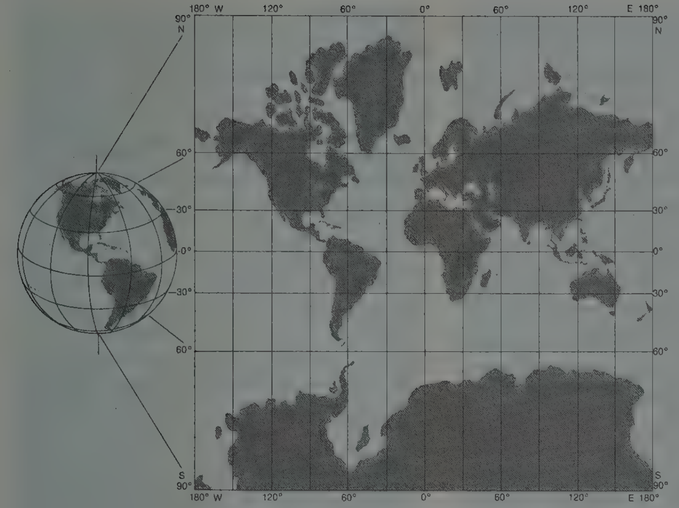
In 1554 he published a map of Europe that he had begun at Louvain, and between 1559 and 1562 he taught mathematics in the grammar school. During these busy years he also undertook genealogical research for Duke Wilhelm, drew up a Concordance of the Gospels, and composed a detailed commentary on the first part of the Letter of Paul to the Romans. In 1564 he completed a map of Lorraine (now lost) and another of the British Isles. Public recognition of his accomplishments came in 1564 with his appointment as court "cosmographer" to Duke Wilhelm of Cleve. During these years he perfected his projection, which enabled mariners to steer a course over long distances by plotting straight lines without continual adjustment of compass readings. This technique immortalized his name in the "Mercator projection," which he used on his map of the world in 1569.

Mercator then began to execute a series of publications intended to describe the creation of the world and its subsequent history. This *Atlas*—the term still used to indicate a collection of maps—was never fully realized.

In 1569, as the first section, he published a chronology of the world from the Creation to 1568. He then published 27 of the maps originally prepared by the Greek geographer Ptolemy, with corrections and commentary in 1578, under the title *Tabulae Geographicae C. Ptolemei ad mentem autoris restitutae et emendatae.* The next part of the *Atlas,* consisting of a set of new maps covering France, Germany, and the Netherlands, came out in 1585, with maps of Italy, "Sclavonia" (now the Balkan countries), and Greece following in 1589. A last section, on the British Isles, was included in an edition with the previous sections, which was seen through the press after his death by his son in 1595. Another printing followed in 1602, and further maps were added in a later edition of 1606, usually called the "Mercator–Hondius Atlas."

BIBLIOGRAPHY. A.S. Osley, *Mercator* (1969), contains a translation of Mercator's monograph on map lettering, and a translation of a biography written by his neighbour, as well as a general bibliography.

Mercator projection, type of map projection introduced in 1569 by Gerardus Mercator. It is often described as a cylindrical projection, but it must be derived mathematically. The meridians are equally spaced, parallel vertical lines, and the parallels of latitude are parallel, horizontal straight lines, spaced farther and farther apart as their distance from the Equator increases. This projection is widely used for navigation charts, because any straight line on a Mercator-projection map is a line of constant true bearing that enables a navigator to plot a straight-line course. It is less practical for world maps because the scale is distorted; areas farther away from the equator appear disproportionately large. On a Mercator pro-



(Left) Globe of the Earth with no land distortion and (right) the Mercator projection with increased land distortion, especially in the 60° to 90° latitudes

jection, for example, the landmass of Greenland appears to be greater than that of the continent of South America; in actual area, Greenland is smaller than Saudi Arabia.

Merced, city, Merced county, central California, U.S., on Bear Creek in the San Joaquin valley, 55 miles (89 km) northwest of Fresno. It was founded in 1872 by the Central Pacific Railroad, and it became county seat in the same year. It was named for the Nuestra Señora de la Merced River. It developed as a processing and shipping point for agricultural produce of the valley, irrigated by the Tri-Dam Project (18 miles [29 km] northeast). There is some light manufacturing, chiefly metal fabrication. Merced College was established in 1962. Lake Yosemite is 7 miles (11 km) northeast, Yosemite National Park 45 miles (72 km) northeast, and Merced National Wildlife Refuge 16 miles (26 km) southwest. Castle Air Force Base (1946) nearby is a significant economic asset. Inc. 1889. Pop. (2000) city, 63,893; Merced MSA, 210,554.

Mercedarian, also called NOLASCAN, member of ORDER OF OUR LADY OF MERCY, also called KNIGHTS OF SAINT EULALIA, religious order founded by St. Peter Nolasco in Spain in 1218, for the purpose of ransoming Christian captives from the Moors. It was originally a military order.

St. Raymond of Penafort, Nolasco's confessor and the author of the order's rule, based the rule on that of St. Augustine. In addition to the usual three religious vows of poverty, chastity, and obedience, the Mercedarians took a fourth vow, to offer themselves as hostages for Christian prisoners in danger of losing their faith.

The habit of a Mercedarian is white, originally to facilitate entrance into Muslim territory, and he wears a wide leather belt with a chain, suggesting the sword that all members once customarily carried.

Pope Gregory IX approved the order in 1235, and it spread rapidly through Europe. During the founder's lifetime, the order freed 2,700 prisoners and, overall, claimed to have freed about 70,000 prisoners. In 1265 a second order of Mercedarians for women was founded in Spain by St. Mary de Cervello.

In 1318 Pope John XXII decreed that the leader of the order should be a priest, an action that caused lay knights to leave the Mercedarians and join a military order of Our Lady of Montesa. The Mercedarians subsequently became a mendicant order. Mercedarians accompanied Columbus to America and founded monasteries in Latin America. They also established themselves in Africa, Italy, France, and Ireland.

In 1602 a reform movement led by Juan Bautista Gonzalez resulted in the Discalced Mercedarians, whose rule was approved in 1606 by Pope Paul V. The anticlerical mood of the 19th century came close to extinguishing the Mercedarians. In 1880, however, Pedro Armengol Valenzuela became master general, revised their constitution, and guided the order to educational, charitable, and social work, activities which the Mercedarians continued to pursue in the 20th century.

Mercedes, also called VILLA MERCEDES, city of west-central Argentina, located on the Quinto River of east-central San Luis *provincia,* in a semiarid transition area between the Pampa (east) and the San Luis Mountains (northwest). It was founded in 1856 as Fuerte Constitucional, and the surrounding lands were distributed to veteran army officers who guarded the frontier. In 1861 the settlement was renamed Villa Mercedes in honour of the Virgen de la Merced (Spanish: "Virgin of Mercy"), its patroness. From 1863 to 1865, the city was constantly attacked by Indians and mountain rebels; they were finally repelled and the rebel leader, Puebla, was killed. Water for irrigation from the Quinto River has enabled the area to become an important grain (corn [maize], sorghum, and rye) and cattle-producing region. Incorporated as a city in 1896, Mercedes has a large grain mill and refrigerator plants to process beef for export. Pop. (1999 est.) 100,876.

Mercedes, city, southwestern Uruguay, on the Negro River. The city, which was founded in 1781, is noted for its colonial architecture, beaches, a river promenade, and summertime regattas and tennis tournaments. Although much of the city's income derives from tourism, it functions as an administrative, commercial, ranching, and agricultural centre and has several industries. Mercedes has a government-owned television station. Shallow-draft vessels operating from its port connect with larger craft serving cities on the Uruguay River and Río de la Plata. Mercedes is linked to Montevideo by highway, air, and rail. Pop. (1996) 50,800.

Mercedes, El de las (Spanish: "He of the Largesse"): *see* Henry II *under* Henry (Spain: Castile).

mercenary, hired professional soldier who fights for any state or nation without regard to political interests or issues. From the earliest days of organized warfare until the development of political standing armies in the mid-17th century, governments frequently supplemented their military forces with mercenaries.

Employment of mercenaries could be politically dangerous as well as expensive, as in the case of the early 14th-century *almogaváres,* Spanish frontiersmen hired by the Byzantine Empire to fight the Turks. After helping defeat the enemy, the *almogaváres* turned on their patrons and attacked the Byzantine town of Magnesia (modern Alaşehir, Tur.). After the assassination of their leader they spent two years ravaging Thrace and then moved on to Macedonia.

Following the Hundred Years' War (1337–1453), Europe was overrun with thousands of men who had been trained for nothing but fighting. During the 15th century "free companies" of Swiss, Italian, and German soldiers sold their services to various princes and dukes. These hired soldiers, often greedy, brutal, and undisciplined, were capable of deserting on the eve of battle, betraying their patrons, and plundering civilians. Much of their mutinous behaviour was the result of their employer's unwillingness or inability to pay for their services. When rigid discipline, sustained by prompt payment, was enforced (as in the army of Maurice of Nassau), mercenaries could prove to be effective soldiers. Swiss soldiers were hired out on a large scale all over Europe by their own cantonal governments and enjoyed a high reputation. In 18th-century France the Swiss regiments were elite formations in the regular army.

Since the late 18th century, however, mercenaries have been, for the most part, individual soldiers of fortune. Since World War II they have won some prominence for their exploits in certain Third World countries, especially in Africa, where they were hired both by government and by antigovernment groups.

Mercer, David (b. June 27, 1928, Wakefield, Yorkshire, Eng.—d. Aug. 8, 1980, Haifa, Israel), playwright who established his reputation on the London stage in the mid-1960s with plays that examine the decay he saw in English society.

Mercer left school at the age of 14 and became a medical laboratory technician. He eventually joined the Royal Navy and, after his discharge in 1948, studied painting at King's College, Newcastle upon Tyne, and took his B.A. in fine arts at Durham University (1953). He began to write while living in Paris but only became a full-time writer in the early 1960s, after a period of teaching.

Mercer's first play, written for television, was *Where the Difference Begins* (1961); it was the first part of a trilogy, *The Generations* (1964). His *Suitable Case for Treatment,* televised in 1962, won a Writer's Guild award and was filmed in 1965 as *Morgan—A Suitable Case for Treatment.* From that play emerged Mercer's view of the world as anarchic, despairing, and insane, a view also apparent in *The Governor's Lady,* his first stage play (performed 1965), about a man who in utter frustration turned into a baboon and attacked his frigid wife. His other full-length plays include *Ride a Cock Horse* (1965), *Belcher's Luck* (1966), *Flint* (1970), *After Haggerty* (1970), *Duck Song* (1974), and *Cousin Vladimir* (1978). He wrote the screenplay for the motion picture *Providence* (1977), which was directed by Alain Resnais.

Mercer, Johnny, byname of JOHN HERNDON MERCER (b. Nov. 18, 1909, Savannah, Ga., U.S.—d. June 25, 1976, Bel Air, Calif.), American lyricist, vocalist, and composer who contributed to many Broadway musical productions and Hollywood films.

Educated in Virginia, Mercer arrived in New York City in the late 1920s and acted in bit parts until his collaboration with Everett Miller on "Out of Breath and Scared to Death of You" was accepted for the revue *Garrick Gaieties* (1930). Mercer used his wit and Southern background to produce clever lyrics that could be breezy, romantic, or full of local colour. He worked through music publishers until 1934, when he joined Paul Whiteman's orchestra as master of ceremonies and featured vocalist, continuing meanwhile to write for motion-picture musicals. In 1939 he joined Benny Goodman's "Camel Caravan" radio show.

In 1942 Mercer founded Capitol Records with two partners, serving as talent scout and company president. For the Broadway stage, he collaborated with Harold Arlen on *St. Louis Woman* (1946) and *Saratoga* (1959) and wrote lyrics to Gene DePaul's score for *Li'l Abner* (1956) and to Robert Emmett Dolan's music for *Texas, Li'l Darlin'* (1949), and *Foxy* (1964). He also continued to write lyrics for such films as *Charade* (1963), *Barefoot in the Park* (1967), and *Darling Lili* (1970). He was the first president of the Songwriter's Hall of Fame.

Credited with over 1,000 lyrics, Mercer collaborated with such composers as Hoagy Carmichael, Harry Warren, Henry Mancini, Richard Whiting, Harold Arlen, Jerome Kern, Jimmy McHugh, and Jimmy Van Heusen to produce many enduring popular songs. They include "Lazy Bones," "I'm an Old Cowhand," "Goody Goody," "Jeepers Creepers," "Hooray for Hollywood," "You Must Have Been a Beautiful Baby," "Blues in the Night," "That Old Black Magic," "Laura," "Ac-cent-tchu-ate the Positive," "Come Rain or Come Shine," "On the Atchison, Topeka and the Santa Fe," "Autumn Leaves," "Moon River," "Charade," and "Days of Wine and Roses."

mercerization, in textiles, a chemical treatment applied to cotton fibres or fabrics to permanently impart a greater affinity for dyes and various chemical finishes. Mercerizing also gives cotton cloth increased tensile strength, greater absorptive properties, and, usually, a high degree of lustre, depending on the method used.

The treatment consists of immersing the yarn or fibre in a solution of sodium hydroxide (caustic soda) for short periods of time, usually less than four minutes. The material is then treated with water or acid to neutralize the sodium hydroxide. If the material is held under tension during this stage, it is kept from shrinking appreciably; if no tension is applied, the material may shrink by as much as one-fourth. Higher-quality cotton goods are usually mercerized; cloths so treated take brighter, longer-lasting colours from less dye. The effect of caustic soda on cotton was discovered in 1844 by John Mercer, an English calico printer, who received a patent for it in 1850.

merchandising, element of marketing that is concerned specifically with promoting the sale of goods and services to consumers. *See* marketing.

Merchant Adventurers, company of English merchants who engaged in trade with the Netherlands (and later with northwest Germany) from the early 15th century to 1806. The company, chartered in 1407, principally engaged in the export of finished cloth from the burgeoning English woolen industry. Its heyday extended from the late 15th century to 1564, during which period it sent its fleets to its market at Antwerp in the Spanish Netherlands with cloth to be sold at the annual fairs. By the middle of the 16th century, as much as three-fourths of English foreign trade was controlled by the London officers of the company, many of whom served as financiers and advisers to the Tudor monarchs. After 1564 the Merchant Adventurers lost its market in the Spanish Netherlands and a long search for a new one followed. After 1611 its foreign trading activities were centred at Hamburg and one or another town in the republican United Provinces. The company was criticized in Parliament as a monopoly, and it lost many of its privileges in the 17th century. Its charter was abrogated in 1689, but the company survived as a trading association at Hamburg until the outbreak of the Napoleonic Wars.

merchant guild, European medieval association composed of traders interested in international commerce. The privileged fraternity formed by the merchants of Tiel in Gelderland (in present-day Netherlands) about 1020 is the first undoubted precursor of the merchant guilds, and the statutes of a similar body at St. Omer, France, actually use the term *gilda mercatoria* before the end of the 11th century. Although associations of merchants from different towns continued to flourish in the later Middle Ages (the so-called Hanse of London is the best-known 12th-century example), most merchant guilds naturally confined their membership to the inhabitants of one city. In most European towns the imposition of a high entrance fee gave the merchant guild an exclusive character, although it is clear that the merchant patriciate normally exercised authority through its control of the urban constitution rather than through the merchant guild as such. It followed that such guilds were unlikely to survive the urban social upheavals of the late 13th and 14th centuries, the so-called *Zunftrevolution* ("guild revolution"), which transferred all or part of the political and economic powers of the patriciate to the craft guilds, or mysteries. By the early years of the 15th century most European merchant guilds had disappeared into oblivion or survived as attenuated bodies, deprived of any genuine economic function.

merchant marine, the commercial ships of a nation, whether privately or publicly owned. The term merchant marine also denotes the personnel that operate such ships, as distinct from the personnel of naval vessels. Merchant ships are used to transport people, raw materials, and manufactured goods. Merchant fleets can be important economic assets for nations that have limited natural resources or a relatively small industrial base. By carrying the commerce of other nations on the seas, a merchant fleet contributes to its home nation's foreign-exchange earnings, promotes trade, and provides employment.

At the end of World War II the United States operated nearly half the world's oceangoing merchant marine, and Great Britain had another major share. Both nations' fleets declined in the postwar years, however, and Japan and Greece had become the largest oceangoing shippers by the end of the 20th century. Many ships owned in other countries operate under Liberian or Panamanian registry to avoid the heavy taxes and intrusive regulations imposed by their home nations.

Merchant shipping includes cargo ships, passenger ships, and tankers. Cargo ships can be either liners, which travel on established routes at regular intervals between specified ports; or tramps, which instead take cargo where and when it offers and to any port. Some of the newer types of cargo ships are bulk carriers, which transport ores or other dry cargoes in bulk; container ships, which handle standardized containers in a highly mechanized fashion; and roll-on, roll-off ships, which handle cargoes through their bow or stern ports. Passenger ships include oceanliners (which have now largely been supplanted by jet aircraft for transoceanic travel), cruise ships, and ferries. Tankers are used to transport crude oil, oil-based fuels, and natural gas. *See also* ship.

merchant ship, also called MERCHANTMAN, a ship used in commerce. *See* ship.

Merchant Taylors' School, in London, one of the major public (privately endowed) schools in England, founded (1560–61) by the Merchant Taylors' Company of London, an incorporated group of craftsmen tailors. Richard Mulcaster was the first headmaster. From the beginning, the school's curriculum has been noted for following modern trends. Other schools with the same name, founded by other trade or craft associations, have existed in other parts of England.

Merchants Staplers, formally COMPANY OF THE MERCHANTS OF THE STAPLE, company of English merchants who controlled the export of English wool from the late 13th century through the 16th century. English wool exports were concentrated in one town (called the staple) in order to minimize the problems of collecting the export duties. The location of the staple varied, but in the 14th century it was fixed at Calais, then held by England. The crown granted the Merchants of the Staple a monopoly over the export of wool and in return collected the duties. The Staplers exerted their greatest influence in the 15th century, becoming one of the crown's most important financiers. In addition to carrying on financial activities, they established trade regulations at Calais, administered merchant law in the city, and exercised political and diplomatic functions for the crown. With the growth of English manufacturing in the 16th century and after, more wool was used domestically, and the Staplers became less important as the export trade diminished.

Merci, Claudius Florimund, Count (Graf) **von:** *see* Mercy, Claudius Florimund, Graf von.

Merci, Franz, Baron (Freiherr) **von:** *see* Mercy, Franz, Freiherr von.

Mercia (from Old English Merce, "People of the Marches [or Boundaries]"), one of the kingdoms of Anglo-Saxon England; it held a position of dominance for much of the period from the mid-7th to the early 9th century. Mercia originally comprised the border areas (modern Staffordshire, Derbyshire, Nottinghamshire, and northern West Midlands and Warwickshire) that lay between the districts of Anglo-Saxon settlement and the Celtic tribes they had driven to the west. It later absorbed the Hwicce territory (the rest of West Midlands and Warwickshire, eastern Hereford and Worcester, and Gloucestershire) and spread also into what was later Cheshire, Salop, and western Hereford and Worcester. Mercia eventually came to denote an area bounded by the frontiers of Wales, the River Humber, East Anglia, and the River Thames.

The first Mercian king of whom anything is known was Penda (d. 654), who became dominant throughout southern England. His sons Wulfhere and Aethelred maintained the tradition of Mercian belligerence, but under Aethelbald (reigned 716–757) and his cousin Offa (reigned 757–796), the kingdom reached its zenith. Offa created what was virtually a single state covering the whole country from the Humber to the English Channel and treated lesser kings (of west Sussex, East Anglia, Essex, and—for a time—Kent) as his subjects. His reign marked the greatest advance to date toward political unification of England, and this was perhaps reflected in his relations with continental rulers, notably Charlemagne, who treated him almost as an equal. After Offa's death, Mercia gradually declined before the rising power of Wessex. It suffered from the Danish attacks of the later 9th century, and from 877 it was divided into an English and a Danish area. After the reconquest of the Danish lands in the early 10th century by King Edward the Elder, Mercia was ruled by ealdormen for the Wessex kings, who became kings of all England.

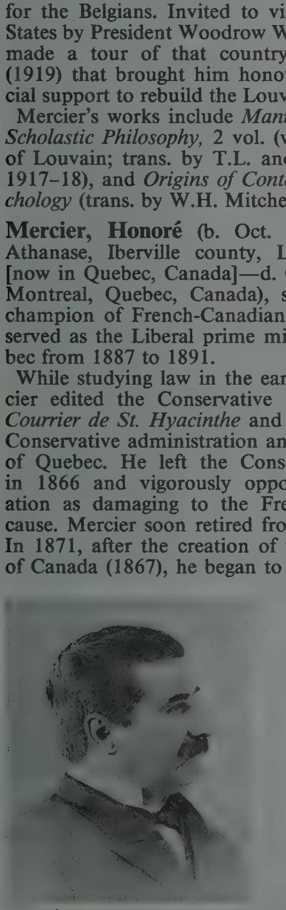
Mercier, Désiré-Joseph (b. Nov. 21, 1851, Braine-l'Alleud, Belg.—d. Jan. 23, 1926, Brussels), Belgian educator, cardinal, and a leader in the 19th-century revival of the philosophy of St. Thomas Aquinas.

Mercier was ordained in 1874 and taught philosophy at the seminary of Malines, Belg. (1877–82). In 1880 Pope Leo XIII requested that a program in Thomistic philosophy be offered at the University of Louvain, Belg., for which Mercier was appointed professor in 1882. His lectures there on Thomism in relation to modern philosophy and science attracted an international body of students. With the support of Leo, Mercier founded (1894) the Superior Institute of Philosophy at Louvain and served as its first president. The institute became a major centre of Thomism, publishing the *Revue Néoscolastique* (now *Revue Philosophique de Louvain*) and evaluating contemporary philosophies. Pope St. Pius X made Mercier archbishop (1906) of Malines and cardinal (1907). During World War I his stand against the Germans for their burning of the Louvain Library and for deporting workmen made him an international spokesman for the Belgians. Invited to visit the United States by President Woodrow Wilson, Mercier made a tour of that country and Canada (1919) that brought him honours and financial support to rebuild the Louvain Library.

Mercier's works include *Manual of Modern Scholastic Philosophy,* 2 vol. (with professors of Louvain; trans. by T.L. and S.A. Parker, 1917–18), and *Origins of Contemporary Psychology* (trans. by W.H. Mitchell, 1918).

Mercier, Honoré (b. Oct. 15, 1840, St. Athanase, Iberville county, Lower Canada [now in Quebec, Canada]—d. Oct. 30, 1894, Montreal, Quebec, Canada), statesman and champion of French-Canadian interests who served as the Liberal prime minister of Quebec from 1887 to 1891.

While studying law in the early 1860s Mercier edited the Conservative newspaper *Le Courrier de St. Hyacinthe* and supported the Conservative administration and the interests of Quebec. He left the Conservative Party in 1866 and vigorously opposed confederation as damaging to the French-Canadian cause. Mercier soon retired from journalism. In 1871, after the creation of the Dominion of Canada (1867), he began to help form the Parti National (National Party). In 1872 he was elected to the House of Commons for the county of Rouville, serving for two years.



Honoré Mercier

By courtesy of the Archives Nationales du Quebec

Mercier entered the legislative assembly of Quebec in 1879 and was made solicitor general, succeeding to the leadership of the Quebec Liberal Party in 1883. He succeeded in the 1886 provincial election largely because of his agitation on behalf of Louis Riel, French-speaking leader of the Northwest Rebellion, who was executed in 1885. As premier and attorney general of Quebec beginning in 1887, Mercier pursued a nationalist policy; he succeeded in passing the Jesuits' Estates Act to compensate the Society of Jesus for property formerly confiscated by the British crown.

While visiting Rome in 1891, Mercier was created a Roman count by Pope Leo XIII. Also in 1891, after several years of popularity, Mercier was accused of using railway subsidies for political purposes and was dismissed by the lieutenant governor. The Liberal Party was badly defeated in 1892, but the new government acquitted Mercier of the charges.

Mercier, Louis-Sébastien (b. June 6, 1740, Paris, France—d. April 25, 1814, Paris), one of the first French writers of *drames bourgeois* (middle-class tragedies). In *Du théâtre* (1773; "About the Theatre"), he emphasized the didactic function of the theatre, and in his plays he presented a thesis, subordinating dramatic considerations to the didactic end. He criticized traditional French tragedy as artificial and sterile, though he was not himself a technical innovator.

Mercier wrote about 60 plays, including a social comedy, *La Brouette du vinaigrier* (1775; "The Barrel-load of the Vinegar Merchant"); *Jenneval* (published 1767; performed 1781), adapted from George Lillo's *London Merchant* (1731); such dramas as *Le Faux Ami* (1772; "The False Friend") and the antimilitarist *Le Déserteur* (published 1770, performed 1782; "The Deserter"); and two historical dramas about the French religious wars, *Jean Hennuyer évêque de Lisieux* (1772; "Jean Hennuyer, Bishop of Lisieux") and *La Destruction de la ligue* (1782; "The Destruction of the League"), which were so anticlerical and antimonarchical that they were not performed until after the Revolution. Mercier also wrote a work of prophetic imagination, *L'An 2440* (1770; "The Year 2440"), and *Le Tableau de Paris* (2 vol., 1781; 12 vol., 1782–89; "The Tableau of Paris"), a work that classifies social types in a way that foreshadows the novels of Honoré de Balzac.

Mercier, nicknamed "Le Singe de Jean-Jacques" ("The Ape of Jean-Jacques"), was strongly influenced by Jean-Jacques Rousseau's views of society, rejecting the prevalent belief in progress. As a moderate member of the Convention, he opposed the death penalty for Louis XVI. He was imprisoned during the Terror but was released after Robespierre's death.

Mercoeur, Philippe-Emmanuel de Lorraine, Duke (duc) **de** (b. Sept. 9, 1558, Nomény, France—d. Feb. 19, 1602, Nürnberg [Germany]), prince who led the resistance in Brittany against King Henry IV of France when that monarch was trying to consolidate his kingdom.

Philippe was the son of Nicolas de Lorraine, who became Duke de Mercoeur in 1569, and was a half brother to Louise de Vaudémont, wife of Henry III of France. He succeeded to his father's duchy in 1577. Mercoeur served as governor of Brittany from 1582, but after Henry III had his cousins of the house of Guise assassinated in 1588, Philippe rebelled; when Henry III was himself assassinated (1589), Mercoeur rallied most of Roman Catholic Brittany against the Protestant Henry IV.

Mercoeur set up a *parlement* (high court) of his own at Nantes and put forward his son Philippe as "prince and duke of Brittany." Spain sent 7,000 men to help Mercoeur in October 1590, but England sent troops and ships against him. Mercoeur won a victory at Craon in Anjou in 1592 but lost ground in the years following Henry's conversion to Roman Catholicism (1593). Mercoeur at last submitted, received 4,000,000 livres, and agreed that his daughter and eventual heiress, Françoise, should marry Henry's illegitimate son César, Duke de Vendôme. Mercoeur then served with the army of the Holy Roman emperor Rudolf II against the Turks in Hungary and died of a fever on his way back to France. Two volumes of his *Correspondance* were published in 1899.

Mercouri, Melina (b. Oct. 18, 1925, Athens, Greece—d. March 6, 1994, New York, N.Y., U.S.), Greek actress and political activist who was the minister of culture in her country's first Socialist government (1981).

Mercouri came from a politically prominent family. She graduated from the Drama School of the National Theatre of Greece. Her first major role, at the age of 20, was Lavinia in Eugene O'Neill's *Mourning Becomes Electra,* but perhaps her most memorable parts were Blanche in *A Streetcar Named Desire* and the good-hearted prostitute in the film *Never on Sunday* (1960). This film gained her an international reputation that would serve her well in politics. Her involvement in politics was triggered by her indignation over the military coup that brought a handful of army colonels to power in Greece in 1967.

Married to the French-born American film director Jules Dassin (who directed most of her films), she was abroad when the coup occurred. She dedicated herself to stimulating opposition against the junta in Europe and the United States, to the extent that she was deprived of her Greek citizenship by the colonels' regime. After the collapse of the dictatorship in 1974, she returned to Greece and promptly joined Andreas Papandreou's Panhellenic Socialist Movement (Pasok). She ran unsuccessfully that year for deputy from the same Piraeus district that had made her famous in *Never on Sunday,* but she was elected the second time around in 1977. Reelected in 1981 when Pasok won a general election, she was appointed by Papandreou to be his minister for culture. She served in the post until 1989, when the Socialists lost power, and was reappointed after their electoral victory in 1993. In 1971 Mercouri published an autobiography, *I Was Born Greek.*

Mercurochrome, trade name of merbromin (*q.v.*).

Mercury, Latin MERCURIUS, in Roman religion, god of merchandise and merchants, commonly identified with the Greek Hermes (*q.v.*), fleet-footed messenger of the gods. His worship was introduced early, and his temple on the Aventine Hill in Rome was dedicated in 495 BC. There he was associated with the goddess Maia, who became identified as his mother through her association with the Greek Maia, mother of Hermes. Both Mercury and Maia were honoured in a festival on May 15, the dedication day of Mercury's temple on the Aventine (built about 500 BC).

Mercury, with winged hat and staff, classical statue; in the Uffizi, Florence
Alinari—Art Resource

Mercury is sometimes represented as holding a purse, symbolic of his business functions. Usually, however, artists borrow the attributes of Hermes irrespective of their appropriateness and portray him wearing winged sandals or a winged cap and carrying a caduceus (staff).

Mercury, in astronomy, innermost planet of the solar system. Its average distance from the Sun is about 58 million km (35,960,000 miles). Except for Pluto, it is the smallest of the nine major planets, having a diameter of about 4,870 km (3,050 miles).

A brief treatment of Mercury follows. For full treatment, *see* MACROPAEDIA: Solar System.

Mercury's orbit around the Sun is highly elliptical. Its period of revolution—only 88 Earth days—is the shortest among the planets and its average orbital speed of 48 km per second the highest. The planet is thus aptly named after the god Mercury, Roman counterpart of the Greek Hermes, fleet-footed messenger of the gods. Mercury also has an extremely low rotation velocity. Because it turns about its axis so slowly, one day on Mercury (one complete rotation) is equal to 59 Earth days. A solar day on the planet (the time from one sunrise to the next, for example) is 176 Earth days, however, owing to the revolution of Mercury around the Sun.

Mercury is difficult to observe from Earth because of its proximity to the Sun. Relatively little was known about its topographic details until 1974, when the U.S. Mariner 10 space probe transmitted numerous closeup photographs of the planet.

Much of the Mercurian surface is heavily cratered like that of the Moon, but it differs from the latter in various ways. Because Mercury's surface gravity is considerably greater than the Moon's, ejecta reach only 65 percent of the distance they would reach on the Moon. Vast areas of the planet known as intercrater plains are peppered with small craters. They are, however, devoid of large ones. Some of these plains appear to be as old as the heavily cratered terrain, while others seem to be much younger. Their origin is still unknown. The most impressive feature imaged by Mariner 10 is the 1,300-kilometre Caloris basin, centred in Mercury's northern hemisphere. This large circular structure, formed by a huge meteorite impact, is bounded by a ring of mountains, which stands about 1 to 2 km high. Smooth plains appeared after the Caloris impact. Different in character from the intercrater plains, they resemble the lunar maria. Their volcanic origin, however, has not yet been confirmed. The only surface features younger than the smooth plains are certain impact craters, some of which have extensive rays. Still another kind of topographic feature detected on Mercury is sinuous scarps that extend for hundreds of kilometres. These long, steep cliffs may have originated as a result of crustal compression. Various investigators have hypothesized that Mercury's core once consisted of molten iron, which shrank by several kilometres upon cooling. The resultant settling of the planetary crust produced large-scale wrinkles in the form of the scarps.

That Mercury, like the Earth, has a large iron core has been suggested by the discovery of a magnetic field in its vicinity. The presence of such a core would account for the high mean density of the planet. Although Mercury is considerably smaller than the Earth, its mean density is about 5.44 grams per cubic cm, as compared to 5.5 grams per cubic cm for the Earth.

Mercury's atmosphere is negligible, consisting chiefly of a tenuous layer of hydrogen, helium, sodium, potassium, oxygen, and possibly neon. Trace amounts of argon, carbon dioxide, krypton, and xenon are also present. The planet's gravity is so weak that it cannot retain significant amounts of atmospheric gases. Temperatures at the surface of Mercury fluctuate drastically, ranging from a high of approximately 675 K to a low of about 100 K.

mercury (genus *Mercurialis*), group of eight annual and perennial weedy flowering-plant species of the spurge family (Euphorbiaceae), native to Europe, Asia, and North Africa but naturalized in North America. Herb mercury (*M. annua*) grows as a weed in cultivated areas and shaded woods. Dog's mercury (*M. perennis*), which is malodorous and poisonous to livestock, grows wild in European woodlands. Its leaves are the source of an unstable blue dye. The clusters of small, green, nonpetaled male and female flowers are borne on separate plants; pollination is by wind. Three-seeded mercury, also in this family, is the annual weed *Acalypha virginica.*

Dog's mercury (*Mercurialis perennis*)
G.E. Hyde

mercury (Hg), also called QUICKSILVER, chemical element, liquid metal of Group IIb, or the zinc group, of the periodic table. Mercury was known to the ancient Chinese and Hindus and has been found in an Egyptian tomb of about 1500 BC.

For treatment of the mining, recovery, and refining of mercury, *see* MACROPAEDIA: Industries, Extraction and Processing.

Properties, uses, and occurrence. Mercury is the only elemental metal that is liquid at ordinary temperatures (cesium melts at about 28.5° C [83° F], gallium at about 30° C [86° F], and rubidium at about 39° C [102° F]). Mercury is silvery white, slowly tarnishes in moist air, freezes into a soft solid like tin or lead at about −39° C (−38° F), and alloys with most metals (iron is a notable exception) to form amalgams. Mercury does not wet glass or cling to it, and this property, coupled with its uniform volume expansion throughout its liquid range, makes it useful in thermometers. Barometers and manometers utilize its high density and low vapour pressure. The good electrical conductivity of mercury makes it exceptionally useful in sealed electrical switches and relays. An electrical discharge through mercury vapour produces a bluish glow rich in ultraviolet light, a phenomenon exploited in ultraviolet, fluorescent, and high-pressure mercury-vapour lamps. Mercury's high thermal neutron-capture cross section (360 barns) and good thermal conductivity make it applicable as a shield and coolant in nuclear reactors. Much mercury is utilized in the preparation of pharmaceuticals, agricultural and industrial fungicides, as dental fillings, and in the electrolytic production of chlorine and caustic soda.

Mercury occurs in the Earth's crust on the average of about 0.08 gram (0.003 ounce) per ton of rock. The principal ore is the red sulfide, cinnabar. Native mercury occurs in isolated drops and occasionally in larger fluid masses, usually with cinnabar, near volcanoes or hot springs. The free metal has been found in Spain (Almadén); in Yugoslavia, at Mount Avala; in Slovenia, at Idrija; in Germany (Moschellandsberg); and in the United States (Terlingua, Texas, and New Almaden, Calif.). For mineralogical properties, *see* native element (table).

Extremely rare natural alloys of mercury have also been found: moschellandsbergite (with silver), potarite (with palladium), and gold amalgam. Mercury is extracted from cinnabar by roasting it in air, followed by condensation of the mercury vapour. Mercury is toxic. Poisoning may result from inhalation of the vapour, ingestion of soluble compounds, or absorption of mercury through the skin.

Natural mercury is a mixture of seven stable isotopes: ^{196}Hg (0.15 percent), ^{198}Hg (10.02 percent), ^{199}Hg (16.84 percent), ^{200}Hg (23.13 percent), ^{201}Hg (13.22 percent), ^{202}Hg (29.80 percent), and ^{204}Hg (6.85 percent). As a wavelength standard and for other precise work, isotopically pure mercury consisting of only mercury-198 is prepared by neutron bombardment of natural gold, gold-197.

Principal compounds. The compounds of mercury are either of +1 or +2 oxidation state. Mercury(II) or mercuric compounds predominate. Mercury does not combine with oxygen to produce mercury(II) oxide, HgO, at a useful rate until heated to the range of 300° to 350° C (572° to 662° F). At temperatures of about 400° C (752° F) and above, the reaction reverses with the compound decomposing into its elements. Antoine-Laurent Lavoisier and Joseph Priestley used this reaction in their study of oxygen.

There are relatively few mercury(I) or mercurous compounds. The mercury(I) ion, Hg_2^{2+}, is diatomic and stable. Mercury(I) chloride, Hg_2Cl_2 (commonly known as calomel), is probably the most important univalent compound. It is used in antiseptic salves. Mercury(II) chloride, $HgCl_2$ (also called bichloride of mercury or corrosive sublimate), is perhaps the commonest bivalent compound. Although extremely toxic, this odourless, colourless substance has a wide variety of applications. In agriculture it is used as a fungicide; in medicine it is sometimes employed as a topical antiseptic in concentrations of one part per 2,000 parts of water; and in the chemical industry it serves as a catalyst in the manufacture of vinyl chloride and as a starting material in the production of other mercury compounds. Mercury(II) oxide, HgO, provides elemental mercury for the preparation of various organic mercury compounds and certain inorganic mercury salts. This red or yellow crystalline solid is also used as an electrode (mixed with graphite) in zinc-mercuric oxide electric cells and in mercury batteries. Mercury(II) sulfide, HgS, is a black or red crystalline solid used chiefly as a pigment in paints, rubber, and plastics. The red form of the compound, occurring as the mineral cinnabar, is the world's primary source of mercury.

atomic number	80

Mercury, any of the first series of manned space flights conducted by the United States (1961–63). The series began with a suborbital flight about three weeks after the Soviet cosmonaut Yury Gagarin became the first human in space (*see* Vostok). Alan B. Shepard, Jr., rode a Mercury space capsule dubbed Freedom 7 on a 302-mile (486-kilometre) flight of 15-minute duration, attaining a maximum altitude of 116 mi (186 km). The Freedom 7, like its successor on the second suborbital flight, was launched by a Redstone rocket. Subsequent manned flights in the Mercury program were launched by more powerful Atlas rockets. All capsules in the Mercury series weighed about 3,000 pounds (1,400 kilograms). The first U.S. manned flight in orbit was that of the Friendship 7, commanded by John H. Glenn. Launched on Feb. 20, 1962, it successfully completed three orbits and landed in the Atlantic Ocean near the Bahamas. The last Mercury flight, Faith 7, launched May 15, 1963, carrying L. Gordon Cooper, Jr., was also the longest, achieving 22 orbits before its landing and successful recovery 34 hours and 20 minutes later.

mercury(I) chloride, also called MERCUROUS CHLORIDE (Hg_2Cl_2): *see* calomel.

mercury lamp, electric discharge lamp (*q.v.*) in which light is emitted by electrically excited atoms of vapourized mercury.

mercury poisoning, harmful effects of various mercury compounds on body tissues and functions. Certain modern industrial and biological processes concentrate mercury compounds to dangerous levels. Mercury is used on a substantial scale in numerous industries, such as the manufacture of chemicals, paints and various household items, pesticides, and fungicides. In addition to the danger from many consumer goods that contain potentially harmful levels of mercury, the air may be contaminated by mercury vapours, fumes, and dusts and the waters by effluent wastes containing mercury in various forms. The latter may then be converted by bacteria in the muddy sediments into organic mercurials, which may in turn be concentrated by the fishes and other aquatic forms of life that are foods for man.

Depending on the type of mercury compound and the mode of contact, the symptoms of intoxication in man vary. Acute mercury poisoning usually results from the accidental or suicidal ingestion of soluble mercury salts, such as mercuric chloride. The effect is severe inflammation of the digestive tract. Abdominal cramps with nausea and vomiting and bloody diarrhea commonly occur within hours. The absorbed mercury is concentrated in the kidneys, where it poisons the blood-filtering structures; as a result, there is first a decrease and then complete cessation of urine output, causing the accumulation of toxic substances in the blood (uremia) and death.

Chronic mercury poisoning may result from the occupational inhalation of mercury vapours, dusts, or volatile organic mercurials or from the absorption through the skin of various mercury salts (such as mercuric nitrate, used in making felt for hats). Symptoms may include a metallic taste and excessive production of saliva; inflammation of the membranes of the mouth; loosening of the teeth; the formation of a blue line on the gums; pain, numbness, and tremor in the extremities; loss of weight and appetite; and mental and personality changes marked by depression and a tendency to withdraw.

Certain mercurial compounds are used as diuretics; that is, are used to promote the production of urine. Sensitivity reactions to these diuretics may cause asthma, hives, other skin lesions, and sudden death. The use of ointments containing mercury or the long-term ingestion of calomel (mercurous chloride, a cathartic) may produce fever, rash, and enlargement of the spleen and lymph nodes. In infants and young children, a disorder known as acrodynia, or "pink disease," is believed to be caused by an organic mercury compound, phenylmercuric propionate, which is incorporated into house paints to prevent the growth of mold. Symptoms of acrodynia include irritability, insomnia, loss of appetite, loosening of teeth, inflammation of the mouth, and redness of the skin.

Poisoning with organic mercurial compounds is characterized by lesions of the central nervous system. This form of mercury poisoning became known as Minamata disease because of a dramatic outbreak that occurred in Minamata, Japan, in the early 1950s. There was progressive weakening of the muscles, loss of vision, impairment of the cerebral functions, eventual paralysis, and, in some cases, coma and death. Minamata seabirds and household cats, which, like the fishermen and their families, subsisted mainly on fish, showed signs of the same disease. This led to the discovery of high concentrations of methyl mercurials in fish and shellfish taken from the bay. The source of mercury was traced to the effluent from a factory. Other outbreaks of this disease involving large numbers of persons have taken place where farmers who received grain seeds treated with an organic mercury compound ate the seeds instead of planting them.

Mercy, Claudius Florimund, Graf von (count of), Mercy also spelled MERCI (b. 1666, Lorraine—d. June 29, 1734, Parma, Italy), Austrian field marshal and military governor of the Banat of Temesvár, one of the ablest commanders during the War of the Spanish Succession (1701–14) and the Turkish wars of 1716–18.

Mercy entered the Austrian army in 1682, and distinguished himself in Hungary and Italy as a resolute and versatile cavalry commander. After the outbreak of the War of the Spanish Succession (1701), which involved most European powers on the death of the last Habsburg king of Spain, Mercy's conduct at the Battle of Cremona (February 1702), on the Rhine front (1702–03), in Bavaria (1704), and in raids into France (1706–09) added to his reputation. When Austria resumed its struggle against the Ottoman Empire in 1716, Mercy contributed substantially to Prince Eugene of Savoy's victories at Peterwardein (August 1716), Belgrade (1717), and the conquest of the Banat of Temesvár. Named governor of that eastern frontier region, he remained in Hungary, except for a short campaign in Sicily (1719–20), until 1734. Mercy strengthened the Banat's defenses and rebuilt the economy through the introduction of new settlers, the construction of roads, and the institution of sound government. Once again called to Italy in 1734, he was killed in battle at Parma.

Mercy, Franz, Freiherr von (baron of), Mercy also spelled MERCI (b. *c.* 1590, Longwy, Duchy of Bar—d. Aug. 3, 1645, Alerheim, Swabia), Austrian and Bavarian field marshal during the Thirty Years' War (1618–48), whose defense of Bavaria made him one of the most successful imperial commanders of his time.

Mercy entered the Austrian army around 1606. Wounded in the Battle of Breitenfeld (1631), he made his name in the five-month defense of Rheinfelden (1634) against the formidable Bernhard of Saxe-Weimar. After campaigning in Alsace (1635–37) and the Franche-Comté, he entered the service of the elector Maximilian I of Bavaria (1638). An able strategist, he frustrated French invasion plans of Bavaria in 1643 and defeated the French at Tuttlingen in November of that year. In 1644 he saw action against the Duc d'Enghien (later the Great Condé) and the marshal Henri de Turenne. On July 27, 1644, Mercy took Freiburg im Breisgau, relieved by the French in August, and at the Battle of Mergentheim (May 1645) Turenne suffered his "first and only" defeat at the hands of the imperial commander. As in 1643, Mercy consistently outmanoeuvred his enemies and gave battle only on the terms most favourable to himself. He was finally caught by the combined armies of d'Enghien and Turenne at Alerheim in the second Battle of Nördlingen and killed at the head of his men. In recognition of his skill and bravery, d'Enghien set the inscription of his death, *Sta viator, heroem calcas* ("Halt, traveller, you are treading on a hero"), on the spot where Mercy fell.

Mercy, Sisters of (R.S.M.), Roman Catholic religious congregation founded in Dublin in 1831 by Catherine Elizabeth McAuley. By 1822 she had developed a program for instructing and training poor girls, distributing food and clothing to the needy, and performing other works of mercy. In 1827, assisted mainly by wealthy women attracted to the religious life, she opened a centre for charitable works on Baggot Street in Dublin. Although she had not intended to be a religious or to found a religious congregation, she acceded to the insistence of the Archbishop of Dublin that she embrace the religious life, and on Dec. 12, 1831, after 15 months of preparation, she and two companions pronounced the simple vows of poverty, chastity, and obedience. The growth and diffusion of the congregation throughout the English-speaking world was rapid. The congregation is not governed centrally, although in the course of time unions have been effected among groups of convents.

The Sisters of Mercy engage in a wide range of apostolic works, including education, the care of the sick in their homes and in hospitals, the care of the aged and of orphans, and other forms of social service. In the United States alone they operate a score of colleges and many high schools, grammar schools, and hospitals.

Mercy d'Argenteau, Florimund, Graf (Count) (b. April 20, 1727, Liège, Austrian Netherlands—d. Aug. 25, 1794, London), Austrian diplomat who, at the outset of the French Revolution, attempted to maintain the Austro-French alliance and to save the life of the Austrian-born French queen Marie-Antoinette.

Entering the diplomatic service in 1751, Mercy served at the Sardinian court, as ambassador to Russia, and, from 1766, as ambassador in Paris. An adviser to Marie-Antoinette, the daughter of Emperor Francis I and Maria Theresa of Austria, he was active on behalf of the French monarchy during the Revolutionary crisis of 1789–90, but he was recalled in 1790. After his efforts to save Marie-Antoinette from the guillotine had failed, he became political chargé d'affaires with the Austro-Prussian army in the Netherlands, and in July 1794 he became Austrian ambassador to London but died there shortly after his arrival.

mercy killing: *see* euthanasia.

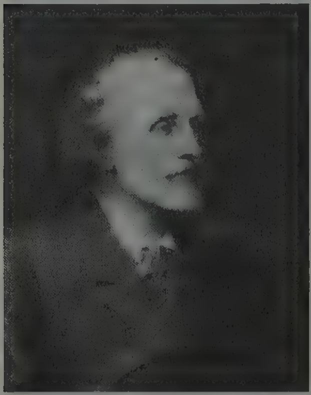
Meredith, (Oliver) Burgess (b. Nov. 16, 1907, Cleveland, Ohio, U.S.), American actor and director, best known for stage, television, and motion-picture character roles.

During the 1920s he held a variety of jobs and sporadically attended college. Determined to become an actor, he began as an unpaid apprentice in 1929 with Eva Le Gallienne's Civic Repertory Company in New York City. He made his Broadway debut in 1933 in *Little Ol' Boy* and achieved great success in 1935 as Mio in the Maxwell Anderson play *Winterset,* repeating the role for the motion-picture version the following year. He was a founder of the New Stage Society in 1937 and in the following year served as vice president of Actors' Equity. Among his notable stage performances were roles in *High Tor* (1937), *Liliom* (1940), *Playboy of the Western World* (1946), and *Major Barbara* (1956).

Meredith was a captain in the U.S. Army Air Corps during World War II. His numerous film appearances included memorable roles in *Of Mice and Men* (1939), *Advise and Consent* (1962), and *Rocky* (1976). He was a staple character actor in American television and also directed motion-pictures (*The Man on the Eiffel Tower;* 1950) as well as such notable plays as *Macbeth* and the Broadway production of James Baldwin's play *Blues for Mr. Charlie.*

Meredith, George (b. Feb. 12, 1828, Portsmouth, Hampshire, Eng.—d. May 18, 1909, Box Hill, Surrey), English Victorian poet and novelist, whose novels are noted for their wit, brilliant dialogue, and aphoristic quality of language. Meredith's novels are also distinguished by psychological studies of character and a highly subjective view of life that, far ahead of his time, regarded women as truly the equals of men. His best known works are *The Ordeal of Richard Feverel* (1859) and *The Egoist* (1879).



George Meredith, detail of an oil painting by G.F. Watts, 1893; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

Early life. George Meredith, the son and grandson of tailors, was born above the family tailor shop in Portsmouth. The name Meredith is Welsh in origin, and family tradition held that its bearers were descendants of Welsh kings and chieftains. In keeping with this tradition, the young Meredith was proud and patrician in his bearing. A small inheritance from his mother, who died when he was five, enabled Meredith to attend a superior local seminary and thus early to assume the role of a young "gentleman." Yet the sensitive boy must gradually have become conscious of the contrast between this role and his actual social status. And the reality was to become even harsher with the bankruptcy of the tailoring shop when he was about 11 and his father's subsequent marriage to the young woman who had been their housekeeper.

In 1840 a second legacy, this time from an aunt, enabled him to go first to a boarding school and then, in 1842, to the Moravian School at Neuwied on the Rhine River, which was to leave its stamp upon the remainder of his life. The picturesque Rhineland, with its cliffs, its ruined castles, and its legends, stimulated the fancy of the already romantic youth. Tolerant religious instruction was combined with humanism: the boys were taught to think for themselves, to respect truth, to admire courage, to love nature, and to live in peace and amity with their fellows. The monotony of study was broken by daily sports, storytelling, and playacting and on vacations by week-long expeditions or boating trips down the Rhine. All of these influences except the religious remained with Meredith throughout life. After "a spasm of religion which lasted about six weeks," he later said, he never "swallowed the Christian fable" and thereafter called himself a freethinker.

Meredith's return to England in 1844, at the age of 16, ended his formal education. Like all of the other great Victorian novelists, he was to be largely self-educated. After several false starts, he was apprenticed at 18 to a London solicitor named Richard Charnock and was ostensibly launched upon a career in law. There is no evidence, however, that he ever pursued it. Probably, like the writer and politician Benjamin Disraeli, the novelist William Makepeace Thackeray, and others before him, he found it intolerably dull and abandoned it at the start. But if not the law, what profession offered hope to a young man who was brilliant but untrained, ambitious but without means? If to be a poet seems an unlikely choice, it nevertheless accorded with his romantic nature.

He was steeped in *The Arabian Nights* and German legends and literature; he had already written verse, and he soon found that Charnock's interests were more literary than legal and that he had gathered around him a coterie of young friends whose interests were also literary. Perhaps all of these were influences. At any rate, among the Charnock circle was Edward "Ned" Peacock, son of Thomas Love Peacock, the eccentric author, and through Edward he met Edward's sister, Mary Ellen Nicolls, a widow with a small daughter. She was brilliant, witty, handsome, and about eight years older than he. In the course of editing and writing for a manuscript literary magazine conducted by the Charnock circle, he fell in love with her. Shortly after he reached his majority and came into the remainder of his little inheritance, they were married.

Beginnings as poet and novelist. On their return, the Merediths took lodgings at Weybridge, Surrey, near Peacock's house at Lower Halliford, Middlesex, and George busied himself writing poems and articles and making translations. Unfortunately, they brought in little money. Somehow, nevertheless, he managed to pay the publication costs of a little collection of verse, entitled *Poems,* in 1851. Though the writer and critic William Michael Rossetti praised it, Charles Kingsley, the novelist, found "very high promise" in it, and the poet Alfred Tennyson said kindly that he wished he might have written the beautiful "Love in the Valley," praise added nothing to the family coffers.

Beset by creditors, the Merediths had to take refuge in Peacock's house, where their only child, Arthur, was born in 1853. Understandably, Peacock soon preferred to rent a cottage for them across the village green from him. As poetry did not pay, Meredith now in desperation turned his hand to prose, writing a fantasy entitled *The Shaving of Shagpat: An Arabian Entertainment,* published in 1855. Original in conception but imitative of *The Arabian Nights* in manner, it baffled most readers, who did not know whether to regard it as allegory or fairy tale. But the most perceptive of the critics, the novelist George Eliot, praised it as "a work of genius, and of poetical genius."

Poverty, disappointment, and the growing antagonism between two highly strung, critical natures placed an unbearable strain upon the marriage of the Merediths. Little more is known of this period in their lives, except that Mrs. Meredith was in Wales, in the company of an artist friend of the couple, Henry Wallis, during the summer of 1857. In April 1858 she gave birth to a son, whose father was registered as "George Meredith, author," but whose paternity Meredith always denied. Subsequently, Mrs. Meredith and Wallis went off to Capri together. She died in 1861, leaving Meredith with his eight-year-old son, Arthur.

Work was Meredith's only solace, and he was feverishly working upon a novel, *The Ordeal of Richard Feverel* (published in 1859), with which he hoped to win fame and fortune. It was characteristic of his best work in many respects: in form it is a romantic comedy (but with a tragic ending, as is frequent in Meredith); it deals with the relationship between a baronet and his son; the son falls in love with a lower class girl and is subjected to an ordeal—a recurring motif in Meredith—by his father; the novel is rich in allusion, image, and metaphor; the dialogue is sparkling, witty, and elliptical as in life; there are frequent intrusions by the author; three of the chapters are written in highly lyric prose; and the psychology of motive and rationalization is explored in depth. Father and son suffer from excessive pride and self-delusion (regarded by Meredith as forms of egoism), which it is the purpose of comedy, as he later said in his "Essay on Comedy," to purge and replace with sanity. Though not without faults, the novel nevertheless remains Meredith's most moving and most widely read novel. But delicate readers found it prurient and had it banned by the influential lending libraries, scattering Meredith's hopes of affluence. He was forced to accept employment as a reader of manuscripts for a publisher and as a writer of editorials and news items for a provincial newspaper. His own writing had to be done in what spare time remained.

Feverel was followed by *Evan Harrington* (1860), an amusing comedy in which Meredith used the family tailoring establishment and his own relatives for subject matter. The hero is the son of a tailor who has been brought up abroad as a "gentleman" and has fallen in love with the daughter of a baronet. His ordeal comes when he returns home to find his father dead and himself heir to the tailor shop and a considerable debt. Taking up poetry again, Meredith next published a volume of poems, *Modern Love, and Poems of the English Roadside, with Poems and Ballads,* in 1862. If *Evan Harrington* had exorcised the tailor demon that haunted him, "Modern Love" doubtless served a similar purpose for his own disastrous marriage. Semi-autobiographical, it is concerned with the tragedy of marital infidelity and its nemesis, though his own wound was now sufficiently healed for him to write compassionately. The poem deserves a place among his permanent contributions to English poetry.

After a walking tour on the Continent, he once more turned to prose. The theme of his next novel, *Emilia in England* (later renamed *Sandra Belloni*), was the contrast between a simple but passionate girl and some sentimental English social climbers—an excellent theme for Meredithian comedy. Its publication in 1864 was made the occasion of the first general consideration of all his works up to this point in an article in the *Westminster Review* by the Irish journalist and writer Justin M'Carthy. A second event of importance in 1864 was his remarriage. Arthur had been placed in boarding school, and Meredith's own loneliness was intensified. Luckily, he met an attractive, well-bred young woman of Anglo-French descent, Marie Vulliamy, fell in love with her, and, after undergoing his own ordeal in persuading her father of his respectability, married her in September 1864. Thus ended a period in his life: he was no longer unknown and no longer lonely.

A son was born to the couple in 1865 and a daughter in 1871. With a family to support and popularity still elusive, Meredith had to keep hard at work for the next 15 years, with only occasional walking expeditions on the Continent. In 1866, however, he was sent out by *The Morning Post* to report the Italian campaign in the Austro-Prussian War, which lasted only seven weeks but enabled him to spend three months in his beloved Italy. After his return he was able to purchase a comfortable cottage near the bottom of Box Hill, Surrey, where he was to live quietly until his death. It stands today much as when he lived in it.

Mature works. During the next 20 years, from 1865 to 1885, Meredith continued the drudgery of reading manuscripts but substituted weekly readings to an elderly rich widow for the newspaper work. It was, however, a period marked by the birth of the children, the publication of seven novels and a volume of poems, and, in the 1880s, by growing public recognition. The next two novels, *Rhoda Fleming* (1865) and a sequel to *Emilia*, entitled *Vittoria*, added nothing to his reputation. With *The Adventures of Harry Richmond* (1871), however, Meredith returned to what was his forte—romantic comedy. Once more he wrote a close study of a father–son relationship, only this time the father is an impostor who out-Micawbers Dickens' Mr. Micawber in his belief that something will "turn up" to make his fortune. The son's ordeal is that he must perceive and reject the world of fantasy in which his father lives and achieve maturity through painful experience. After an interval of about four years came *Beauchamp's Career*. Its hero is a self-deluded idealist who is converted to radicalism and whose ordeal is both political and personal. It is one of Meredith's better novels and confirmed what was clear by now, that one of his greatest strengths was the creation of spirited, flesh-and-blood women who think for themselves.

The next two novels of consequence, *The Egoist* (1879) and *Diana of the Crossways* (1885), marked the beginning of Meredith's acceptance by a wider reading public and a more favourable reception by critics. Both are comedies, full of Meredithian wit and brilliant dialogue and notable for women characters who prove their right to be accepted as individuals, equal with men, rather than puppets. In *The Egoist* the enemy is egoism, and the egoist is tested by a succession of ordeals before joining the ranks of humanity. While that novel is concerned with the dangers of wrong choice before marriage, *Diana* is the first of a series of studies of mismating in marriage. Diana herself is a memorable character of spirit and brains, although Meredith is less successful in persuading readers that she could naively be guilty of a grave breach of confidence. In both novels, however, the men that Meredith approves of and hands the heroines over to are rather flat and uninteresting.

A new period now began in Meredith's life. Fame, if not popularity, and financial independence had come at last. Yet his enjoyment of them was to be tempered by the death of his wife in 1885 and of Arthur in 1890, by the beginning of deafness, and by the onset of ataxia that was first to limit his ability to walk and finally to render him immobile. Honours and testimonials came in plenty: an honorary LL.D. degree from the University of St. Andrews, Fife, Scot.; election to the prestigious office of President of the Society of Authors; and in 1905 the Order of Merit, strictly limited to 24 members, was conferred upon him by order of the King. Meredith had become a public institution, his home at Box Hill almost a literary shrine.

After 1885 his work was done except for three novels and five volumes of poems that were increasingly more philosophic than poetic. *One of Our Conquerors* (1891) is probably the most difficult of his novels because of the indirect and cryptic style, metaphor, and long passages of interior monologue. *Lord Ormont and His Aminta* (1894), unlike its predecessor, was praised for the brilliancy and clarity of its style. The final novel, *The Amazing Marriage* (1895), repeats the theme of *Lord Ormont*—that a wife is free to leave a husband who does not recognize her as an equal.

In person Meredith was slightly built but athletic, remarkably handsome, and aristocratic in manner. Because of his concern with upper class life in his novels, he has sometimes been accused of being ashamed of his lowly birth and of being at heart a snob. The charge hardly bears inspection: he chose the fashionable world as a subject because it was fittest for his brand of comic treatment. His own tastes and manner of living were almost spartanly simple, his greatest pleasures being long walks and communion with nature. His friends, for the most part, were not aristocrats; they were chiefly writers and artists, along with a few professional men. It is true that in the years of his fame he was taken up by various fashionable ladies—usually young ones whom he had fascinated—and that journalists began to beat a path to his door. If he was not the oracle with all the answers, he was willing to play the role. A brilliant talker, he delighted in expressing radical and startling ideas to journalists—that the Boers should have been given their freedom; that Britain should join the United States; that marriage should be for a 10-year trial period, renewable by mutual consent; that there was no future life; and that Britain should arm itself against impending German aggression. On his 80th birthday he was presented with another testimonial, with 250 signatures of the great ones of the world, and both King Edward VII and Pres. Theodore Roosevelt sent congratulations.

Influence. On his 80th birthday the newspapers of the world saluted Meredith as "the Dean of English Writers," the "last Great Victorian," the "Grand Old Man of Letters," and the "Sage of Box Hill." Shortly after his death, *The Times Literary Supplement* said that his mind was "so rich, so full, that one wonders where there is another mind so rich, outside Shakespeare, in English literature." As not infrequently happens, however, his great reputation went into eclipse, and other gods—Henry James, James Joyce, Joseph Conrad, and D.H. Lawrence—replaced him. Ardent Meredithians remained, but the pendulum of popular taste has not swung back. *The Ordeal of Richard Feverel* and *The Egoist* will continue to have a share in college and university curricula, *The Adventures of Harry Richmond* and *Beauchamp's Career* may have limited appeal, and for the rest, Meredith will be left to scholars and the intellectual elite.

The influence of Meredith on the novel has been indirect rather than direct. Although his highly personal style was incapable of imitation, his extensive use of interior monologue anticipated the stream-of-consciousness technique of James Joyce and others. Moreover, with George Eliot he was creating the psychological novel and thus was an important link between his 18th-century precursors and 19th- and 20th-century followers. Among later novelists influenced by him the Marxist critic Jack Lindsay cites George Robert Gissing, Thomas Hardy, Henry James, and Robert Louis Stevenson; and the writer and critic J.B. Priestley points to Virginia Woolf, D.H. Lawrence, and E.M. Forster. (C.L.Cl.)

MAJOR WORKS. *Poetry. Poems* (1851), including the first version of "Love in the Valley"; *Modern Love, and Poems of the English Roadside, with Poems and Ballads* (1862); *Poems and Lyrics of the Joy of Earth* (1883); *Ballads and Poems of Tragic Life* (1887); *A Reading of Earth* (1888); *Poems. The Empty Purse. With Odes to the Comic Spirit, to Youth in Memory, and Verses* (1892); *Odes in Contribution to the Song of French History* (1898); *A Reading of Life, with Other Poems* (1901); *Last Poems* (1909).

Novels. The Shaving of Shagpat: An Arabian Entertainment (1885, dated 1856); *Farina: A Legend of Cologne* (1857); *The Ordeal of Richard Feverel: A History of Father and Son* (1859); *Evan Harrington; or, He Would Be a Gentleman* (1860); *Emilia in England* (1864; renamed *Sandra Belloni*, 1889); *Rhoda Fleming* (1865); *Vittoria* (1867); *The Adventures of Harry Richmond* (1871); *Beauchamp's Career* (1875, dated 1876); *The Egoist: A Comedy in Narrative* (1879); *The Tragic Comedians* (1880); *Diana of the Crossways* (1885); *One of Our Conquerors* (1891); *Lord Ormont and His Aminta* (1894); *The Amazing Marriage* (1895); *Celt and Saxon* (1910; unfinished).

Other works. The House on the Beach (1877); *The Case of General Ople and Lady Camper* (1890); and *The Tale of Chloe* (1890), three short stories; *An Essay on Comedy* (1897).

BIBLIOGRAPHY. M. Buxton Forman, *A Bibliography of the Writings in Prose and Verse of George Meredith* (1922, suppl. 1924) and C.L. Cline, "George Meredith," in Lionel Stevenson (ed.), *Victorian Fiction: A Guide to Research* (1964), provide a fairly complete listing of works by and about Meredith. The Altschul Collection at Yale University and the Morgan Library in New York hold most of his manuscripts and papers. The University of Texas at Austin holds several hundred Meredith letters. The Memorial Edition of the *Works of George Meredith*, 27 vol. (1909–11), is the standard edition. The *Letters of George Meredith*, 2 vol., ed. by his son, W.M. Meredith, was published in 1912. C.L. Cline, *The Letters of George Meredith*, 3 vol. (1970), is now the standard edition. Lionel Stevenson, *The Ordeal of George Meredith* (1953), is the standard biography; see also J.B. Priestley, *George Meredith* (1926), a biographical and critical study.

Where the same name may denote a person, place, or thing, the articles will be found in that order

Meredith, Mary Gladys: *see* Webb, Mary (Gladys).

Meredith, Owen: *see* Lytton, (Edward) Robert Bulwer-Lytton, 1st earl of.

Meredith, Ted, byname of JAMES E. MEREDITH (b. Nov. 14, 1892, Chester Heights, Pa., U.S.—d. Nov. 2, 1957, Camden, N.J.), U.S. middle-distance runner, a world-record holder in the 800-metre (1912–26), 440-yard (1916–31), and 880-yard (1912–26) races and as a team member in the 4 × 400-metre relay race (1912–24) and the 4 × 440-yard relay race (1915–28).

Meredith began his running career at Mercersburg (Pennsylvania) Academy and continued it at the University of Pennsylvania (Philadelphia). In the 1912 Olympic Games at Stockholm, he won the gold medal in the 800-metre race, setting a world record of 1 min

51.9 sec, as well as a world record of 1 min 52.5 sec for the 880-yard race. He lowered the latter record to 1 min 52.2 sec in 1916.

Meredith served in the Aviation Section of the U.S. Signal Corps in World War I, wrote *Middle Distance and Relay Racing* (1924), and worked for the Internal Revenue Service.

Merelles (board game): *see* Nine Men's Morris.

merengue, French MÉRENGUE, couple dance originating in the Dominican Republic or Haiti and danced throughout Latin America. Originally, and still, a rural folk dance, and later a ballroom dance, the merengue is at its freest away from upper-class ballrooms. It is danced with a limping step, the weight always on the same foot. The music is in $\frac{4}{4}$ time with three sections: paseo, merengue, and jaleo. There are several varieties, some with other names, *e.g.*, jaleo and juangomero.

Merenptah (king of Egypt): *see* Merneptah.

Merenre, also spelled MERNERE, also called MERENRE ANTYEMSAF, fourth king of the 6th dynasty (*c.* 2325–*c.* 2150 BC) in Egypt who extended the authority of one official over all Upper (southern) Egypt and encouraged intensive exploration and trade in Nubia.

Merenre may have served briefly as coregent with Pepi I (his father) before succeeding to the kingship. In the first year of his independent reign, he visited the southern boundary of Egypt at Elephantine (modern Aswān) and received there the homage of the chiefs of Nubia. He shared his father's interest in the southern regions. He appointed a resident of Elephantine governor of the extreme south and led exploration and trade missions deep into Nubia.

Merenre elevated his father's trusted minister, Uni, to the post of governor of Upper Egypt, an unprecedented honour that placed all Upper Egypt under a single official. The king also expanded the authority of the son of his father's vizier over two nomes (administrative districts). These appointments undid a process of diffusion of government authority that had begun in the 5th dynasty (*c.* 2465–*c.* 2325 BC). In the process of conducting two major expeditions to Aswān to procure stone for his pyramid, Merenre cut five canals through the cataract rocks and recruited Nubian chieftains to cut timber and to build transport vessels for him. As suggested by a monument found in the Nile Delta, he possibly made his young half brother, Pepi II, his coregent, hoping to guarantee a smooth succession. Merenre ruled only four years alone and probably died at an early age.

mereology, branch of logic, founded by the 20th-century logician Stanisław Leśniewski, that tries to clarify class expressions and theorizes on the relation between parts and wholes. It attempts to explain Bertrand Russell's paradox of the class of all those classes that are not elements of themselves. Leśniewski claimed that a distinction should be made between the distributive and the collective interpretation of class expressions because failure to do so makes the presuppositions of Russell's paradox appear to be true. Once the distinction is made, however, some of those presuppositions are evidently false on either interpretation.

Meres, Francis (b. 1565, Kirton, Holland, Lincolnshire, Eng.—d. Jan. 29, 1647, Wing, Rutland), English author of *Palladis Tamia; Wits Treasury,* a commonplace book valuable for information on Elizabethan poets.

Meres was educated at the University of Cambridge and became rector of Wing, Rutland, in 1602. His *Palladis Tamia* (1598) is most important for its list of Shakespeare's dramatic output to 1598, but it also includes mention of the deaths of Christopher Marlowe, George Peele, and Robert Greene and briefly records the critical estimation of the poets of the day. Shakespeare is called "the most excellent in both kinds [comedy and tragedy] for the stage," and Chaucer, "the God of English poets."

Merezhkovsky, Dmitry Sergeyevich (b. Aug. 14 [Aug. 2, Old Style], 1865, St. Petersburg, Russia—d. Dec. 9, 1941, Paris), Russian poet, novelist, critic, and thinker who played an important role in the revival of religious-philosophical interests among the Russian intelligentsia.

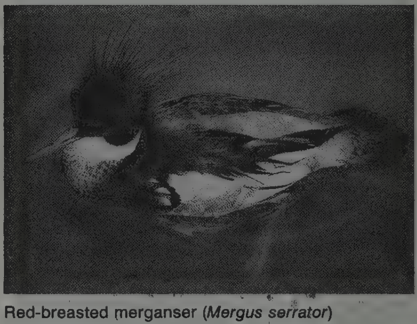
Merezhkovsky
By courtesy of the State Literature Museum, Moscow

After graduation from the University of St. Petersburg in history and philology, Merezhkovsky published his first volume of poetry in 1888. His essay *O prichinakh upadka i o novykh techeniyakh sovremennoy russkoy literatury* (1893; "On the Causes of the Decline and on the New Trends in Contemporary Russian Literature"), sometimes erroneously described as the manifesto of Russian Symbolism, was nevertheless a significant landmark of Russian modernism. At the beginning of the 20th century he and his wife, Zinaida Gippius, organized religious-philosophical colloquia and edited the magazine *Novy put* (1903–04; "The New Path").

With his trilogy *Khristos i Antikhrist* (1896–1905; "Christ and Antichrist"), Merezhkovsky revived the historical novel in Russia. Its three parts, set in widely separated epochs and geographical areas, reveal historical erudition and serve as vehicles for the author's historical and theological ideas. Another group of fictional works from Russian history—the play *Pavel I* (1908) and the novels *Aleksandr I* (1911–12) and *14 Dekabrya* (1918; *December the Fourteenth*)—also form a trilogy. Merezhkovsky's favourite method is that of antithesis. He applied it not only in his novels but also in his critical study *Tolstoy i Dostoyevsky* (1901–02), a work of seminal importance and enduring value. His *Gogol i chort* (1906; "Gogol and the Devil") is another noteworthy critical work.

Before the Revolution of 1917, Merezhkovsky was opposed to the existing regime (as can be seen from *Le Tsar et la révolution* [1907; written jointly with Gippius and Dmitry Filosofov]); he welcomed the February Revolution of 1917 but opposed the Bolshevik seizure of power. Emigrating in 1920, he eventually settled in Paris, where he published two more historical novels under the general title *Rozhdenie bogov* (1924–25; *Birth of the Gods*) and biographical studies of Napoleon, Jesus Christ, St. Augustine, St. Paul, St. Francis of Assisi, Joan of Arc, Dante, and many others; most of these have been translated into English. In later life he regarded Mussolini and Hitler as leaders capable of eradicating communism.

merganser, also called SAWBILL, FISH DUCK, or TRASH DUCK, any of several species of *Mergus,* long-bodied, more or less crested diving ducks; though essentially freshwater birds, they are classified with scoters and goldeneyes in the sea duck tribe, Mergini (family Anatidae, order Anseriformes). They are called trash ducks because their flesh is rank. Except for the rare Brazilian merganser (*Mergus octosetaceus*), all mergansers live in northern regions. The larger mergansers are seen most often on open reaches of lakes and rivers. The group is characterized by a distinctive narrow bill, with toothlike edges and hooked tip for catching fish.



Red-breasted merganser (*Mergus serrator*)
G. Ronald Austing from The National Audubon Society Collection/Photo Researchers

The common merganser, or goosander (*M. merganser*), is of mallard size; the male lacks a noticeable crest. It usually nests in hollow trees in north temperate to subarctic regions and migrates to more southerly rivers. The somewhat smaller and ground-nesting red-breasted merganser (*M. serrator*) has a similar range. In the United States, common and red-breasted mergansers are often called sheldrakes (properly a name for the shelducks).

Quite different is the hooded merganser (*M.*, or *Lophodytes, cucullatus*) of temperate North America, a small, tree-nesting species of woodland waterways.

The smew (*M. albellus*) is a small, compact merganser with a short bill; it breeds from Scandinavia to Siberia and south to Turkestan and winters on lakes and streams south to the Mediterranean and Central Asia.

Mergenthaler, Ottmar (b. May 11, 1854, Hachtel, Württemberg [Germany]—d. Oct. 28, 1899, Baltimore), German-born American inventor who developed the Linotype machine.

A precocious boy, Mergenthaler was anxious to study engineering, but his father, burdened with financing the higher education of older sons, found the expense beyond his means. He was apprenticed to a watchmaker at age 14 and attended technical school classes at night. In 1872 he emigrated to the United States, becoming a citizen in 1878. While employed in the Baltimore machine shop of a relative, he worked on plans for a device to make type molds of papier-mâché. This device proved impracticable, but Mergenthaler became dedicated to the problem involved—setting type by machine. In 1886 he produced his Linotype, which, by bringing copper matrices into brief contact with a molten but fast-cooling alloy, rapidly molded column widths of type. The machine reduced costs by speeding up the printing process; hence it fostered a dramatic expansion of all areas of publishing. Mergenthaler later patented other successful inventions, but developing the Linotype remained his life interest.

merger, corporate combination of two or more independent business corporations into a single enterprise, usually the absorption of one or more firms by a dominant one. A merger may be accomplished by one firm purchasing the other's assets with cash or its securities or by purchasing the other's shares or stock or by issuing its stock to the other firm's stockholders in exchange for their shares in the acquired firm (thus acquiring the other company's assets and liabilities).

Mergers are of several different types: horizontal, if both firms produce the same commodity or service for the same market; market-extensional, if the merged firms produce the same commodity or service for different markets; or vertical, if a firm acquires either a supplier or a customer. If the merged business is not related to that of the acquiring firm, the new corporation is called a conglomerate (*q.v.*).

The reasons for mergers are various. The acquiring firm may seek to eliminate a competitor; to increase its efficiency; to diversify its products, services, and markets; or to reduce its taxes. Merger activity varies with the business cycle, being higher when business is good.

Mergui, town, extreme southeastern Myanmar (Burma). It occupies an offshore island in the Andaman Sea at the mouth of the Great Tenasserim River. Mergui is a busy port engaged in coastal trade (rubber, tin ore, rattans, dried fish, edible birds' nests) north to Yangon (Rangoon) and south to Malaysia. Natural pearls are found offshore, and the Yatanabon tungsten (wolfram) mine is nearby. There is air service from Mergui to Yangon, Moulmein, and Singapore. Pop. (1983) 259,051.

Wharves along a tidal creek, Mergui town, Myanmar

Ivan Polunin—Bruce Coleman Inc./EB Inc.

Mergui Archipelago, group of more than 200 islands in the Andaman Sea off the Tenasserim coast of extreme southeastern Myanmar (Burma). The island cluster begins with Mali Kyun (Tavoy Island) in the north and ends beyond the southern limits of Myanmar. The group includes Kadan (King), Thayawthadangyi (Elphinstone), Daung (Ross), Sagantbit (Sellore), Bentinck, Letsok-aw (Domel), Kanmaw (Kisseraing), Lanbi (Sullivan's), and Zadetkyi (St. Matthew's) islands. Mountainous and jungle-covered, the islands of the archipelago are known for their scenic beauty. The islands' chief inhabitants are the Selungs, or Salons. Tin and tungsten (wolfram) are mined on some islands, and there is an old, established pearl-fishing industry. Other products include edible birds' nests and sea cucumbers.

Meri, Veijo (b. Dec. 31, 1928, Viborg, Fin.), Finnish novelist, poet, and dramatist of the generation of the 1960s.

Meri devoted many of his novels and dramas to the depiction of war. Unlike his many Finnish predecessors, however, he did not treat war in the heroic mode. His soldiers existed in an incoherent and farcical world. In *Manillaköysi* (1957; "The Manila Rope"), the main character deserts, taking with him a rope for which he is willing to risk his life, though he has no use for the rope. His journey home is interspersed with absurd stories from the war. *Vuoden 1918 taphatumat* (1960; "Incidents 1918") describes the Finnish civil war (1918) as a chain of confused and disconnected actions. Just as bizarre is *Everstin autonkuljettaja* (1966; "The Colonel's Driver"), in which a driver zigzags through the war zones across more than half of Finland to fetch an insignificant briefcase that a colonel has happened to forget. In *Peiliin piiretty nainen* (1963; "Woman in the Mirror") and *Suku* (1968; "The Family"), Meri dealt with contemporary psychological relationships. He also wrote a biography of the 19th-century Finnish writer Aleksis Kivi (1974).

Meri's most popular play, *Sotamies Jokisen vihkiloma* (1965; "Soldier Johkinen's Marriage Leave"), is set in the war years of the 1940s. An autobiography, *Kersantin poika,* was published in 1971.

Meriam, Junius L(athrop) (b. Oct. 28, 1872, Randolph, Ohio, U.S.—d. June 29, 1960, Los Altos, Calif.), American educator who, though highly critical of progressive education, was best known for his work in experimental schools and for his departure from traditional teaching methods.

Meriam was reared on a farm and attended Oberlin College, Oberlin, Ohio (A.B., 1895); New York State Normal College, Albany (B.Ph., 1898); Harvard University (M.A., 1902); and Columbia University (Ph.D., 1905). While pursuing his graduate education he held various administrative and teaching posts.

From 1904 to 1924 Meriam was professor of education at the University of Missouri, and he was superintendent of university schools there from 1905. In 1924 he moved to the University of California at Los Angeles, where he remained as professor of education until retirement in 1943.

Meriam was highly critical of traditional teaching methods that relied on a system of rewards and punishments, and he was equally opposed to many progressive practices. Instead, Meriam urged that elementary students be taught reading, writing, and arithmetic by tapping their natural interests through instructional activities appropriate to those interests. Children learn the formal disciplines, Meriam was convinced, while engaged in activities of interest to them.

Meriam articulated his views in scores of journal articles and five major books: *Normal School Education and Efficiency in Teaching* (1905), *Child Life and the Curriculum* (1920), *Catalog—Units of Work, Activities, Projects, etc., to 1932* (1932), *Activities, Projects, Units of Work Cataloged for 1932–1939* (1943), and *The Traditional and the Modern Curriculum, an Emerging Philosophy* (1960).

Merian, Matthäus (b. 1593, Basel, Switz.—d. 1650, Schwalbach, Fr. [now in Germany]), engraver, etcher, and book dealer, the leading German illustrator of the 17th century.

In 1609 Merian began studying with Dietrich Meyer, a painter and engraver of Zürich, and in 1613 he moved to Nancy. After studying in Paris, Stuttgart (1616), and the Low Countries, he went to Frankfurt, where in 1618 he married the eldest daughter of J.T. de Bry, publisher and engraver. He worked with his father-in-law at Oppenheim, then returned to Basel, but went back to Frankfurt after de Bry's death (1623) to take over his business.

Merian completed in 1624 the great record of discovery and travel *Collectiones Peregrinationum in Indiam* ("Collections of Travels in India"), begun by the de Brys in 1590. De Bry's business remained in Merian's family until 1726, when a fire destroyed it. From 1627 to 1629 the Bohemian etcher Wenzel Hollar was in Merian's studio in Frankfurt. Between 1625 and 1630 Merian published illustrations to the Bible. In 1635 he began the series *Theatrum Europaeum,* and between 1642 and 1688 he published Martin Zeiller's *Topographia Germaniae,* with more than 2,000 plates etched and engraved by himself and his sons Matthäus and Caspar. Among his last works was "Dance of Death" (1649).

His daughter, Anna Maria Sibylla(1647–1717), was noted for her accurate, detailed, and delicate drawings of subjects in the field of natural history.

Meriç (Europe): *see* Maritsa River.

Mérida, city, capital of Yucatán state, southeastern Mexico. It lies near the northwestern tip of the Yucatán Peninsula, 23 miles (37 km) south of Progreso, its port on the Gulf of Mexico. It stands at the northern end of a limestone plain well-suited for growing the cactuslike agave (*Agave fourcroyoides*), from which henequen, or sisal hemp, fibres are extracted. Founded in 1542 on the site of the ancient Mayan city of T'ho, Mérida is also a tourist base for trips to nearby ruined Mayan cities, including Chichén-Itzá, Dzibilchaltún, Uxmal, and Kabáh. Indian influence is still strong in the area and is most evident in language and dress. The most notable of the city's numerous colonial buildings is the House of Montejo, built in 1549. Mérida also has a 16th-century cathedral, an archaeological museum, Yucatán University (1624; refounded 1922), and the Regional Technical Institute of Mérida (1961). The city can be reached by highway, railroad, and air. Pop. (2000 prelim.) 660,848.

Mérida, town, Badajoz province, in the autonomous community (region) of Extremadura, western Spain, on the north bank of the Guadiana River. The town was founded by the Romans in 25 BC as Augusta Emerita. As the capital of Lusitania (a Roman province that encompassed modern Portugal), it became one of the most important towns in Iberia and was large enough to contain a garrison of 90,000 men. It prospered anew in the 7th century under the Visigoths.

Occupied in 713 by the Moors, who enlarged the alcazar, or citadel, originally the chief Roman fort, Mérida was recaptured in 1228 by Alfonso IX of Leon, who granted it to the Knights of Santiago. Chief among the town's Roman remains is a bridge constructed of granite near the end of the 1st century AD and restored by the Visigoths in 686 and by Philip III in 1610. It comprised 81 arches, 17 of which were destroyed during the siege of Badajoz (1812) by the French, and measured 2,575 feet (785 m) in length. There are a few remnants of Roman temples and of the colossal wall that encircled the town, as well as a Roman triumphal arch, commonly called the Arco de Trajano (Santiago), and a second Roman bridge. From the Pantano de Proserpina, also called Charca de la Albuera, a large Roman reservoir, 3 miles (5 km) north, water was conveyed to Mérida by a mighty aqueduct known as Los Milagros, of which there are extensive remains. The Roman theatre is well preserved; there are also vestiges of an amphitheatre and of a circus. The modern town's economy is based on agricultural trade and tourism. Pop. (1998 est.) 50,471.

Mérida, state, northwestern Venezuela. Except for a narrow neck extending northwestward to the shore of Lake Maracaibo, the territory of 4,400 square miles (11,300 square km) lies entirely within that portion of the Andes Mountains known as the Cordillera de Mérida. The cordillera, which rises to 16,427 feet (5,007 m) above sea level at Pico Bolívar (the highest point in Venezuela), is traversed from northeast to southwest by the Chama River. In the fertile Chama valley are most of the state's settlements, including Mérida (*q.v.*), the capital. Although it is known primarily for its agricultural produce (principally coffee, sugarcane, and corn [maize]) and livestock (cattle and goats), the state also contains minerals. Oil is found under and around Lake Maracaibo, and there are deposits of mica, gold, and emeralds. The dairy industry is well developed. The Pan-American Highway traverses the state from northeast to southwest, as does another highway along the Chama valley. The east–west road network is not well developed. Pop. (1997 est.) 706,870.

Mérida, city, capital of Mérida state, western Venezuela. The city lies on a large alluvial terrace near the Río Chama in the Cordillera de Mérida; at an elevation of 5,384 ft (1,641 m), it is the highest city in Venezuela and enjoys one of the most pleasant climates in the nation. In the vicinity are five snowcapped peaks exceeding 15,000 ft in height. To one of them, Pico Espejo (Mirror Peak; about 15,600 ft), runs a cable-car system 7⅔ mi (12 km) long, said to be the longest and highest in the world.

Bolívar Plaza, Mérida city, Venezuela
Jane Latta

Although Mérida was founded in 1558, frequent earthquakes and relative inaccessibility long hindered its development; it did become a religious and educational centre, with a cathedral, convents, and the Universidad de los Andes (founded in 1785). With the completion of all-weather highways to the major cities in the northeast, the northwest, and into the Llanos (plains) to the south, Mérida became a regional manufacturing and commercial centre. The city is renowned for its candied fruits, ruanas (Andean poncholike woolen cloaks), fishing, skiing, and mountaineering. Pop. (1981) 143,209.

Mérida, Carlos (b. Dec. 2, 1891, Guatemala—d. Dec. 22, 1984, Mexico), Guatemalan artist, known primarily as a muralist and printmaker.

From 1910 to 1914 Mérida traveled in Europe, where he studied art, becoming personally acquainted with such leaders of the avant-garde as Pablo Picasso and Amedeo Modigliani. He returned to Guatemala in 1919, had his first one-man show, and in 1920, attracted by the social and artistic revolution in Mexico, went to Mexico City, where he became one of the pioneers of that nation's mural-painting renaissance.

After a second trip to Europe in 1927 Mérida's art became less representational and eventually developed into his characteristic abstract style of geometrically conceived figures and forms. His later works show the influence not only of Cubism and such modern European artists as Paul Klee, Joan Miró, and Wassily Kandinsky but also of Mayan art. He executed important mosaic murals for the Benito Juárez housing development in Mexico City (1952) and a mosaic mural for the Municipal Building in Guatemala City (1956).

Meriden, city, coextensive with the town (township) of Meriden, New Haven county, south central Connecticut, U.S. Meriden is situated on the Quinnipiac River, with the Hanging Hills to the west. It was settled in 1661 by Jonathan Gilbert, who named it for his birthplace, Meriden Farm in Dorking, Eng. It became a separate parish in 1726 and was incorporated as a town and set off from Wallingford in 1806. The city was incorporated in 1867 and consolidated with the town in 1922. Industry is highly developed and is dominated by silverware and associated manufactures, which began in 1794 when Samuel Yale undertook pewter production there. In 1808 Ashbil Griswold began the manufacture of Britannia ware, made from an alloy of tin, antimony, and copper. The International Silver Company, one of the world's largest silverware manufacturers, was established in the city in 1898. The 1776 Bicentennial House is a replica of an 18th-century New England house and exhibits antique silver and pewter pieces. Pop. (1990) city, 59,479; New Haven–Meriden MSA, 530,180.

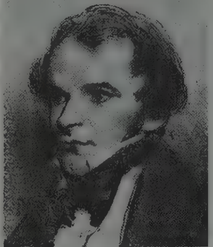
Meridian, city, seat of Lauderdale county, eastern Mississippi, U.S., lying 95 mi (153 km) east of Jackson. Settlement began in 1854 at the junction site of the Vicksburg–Montgomery and the Mobile and Ohio railway lines 20 mi (32 km) from the Alabama border. The name was chosen by a settler who thought "meridian" meant "junction." During the Civil War it was a Confederate military camp and served as the state capital for one month in 1863. General Sherman's Union troops destroyed the town the following February. Merrehope is a surviving stately 26-room antebellum mansion. The town recovered as a marketing centre for farm produce and timber and later acquired diversified manufactures, including textiles, wood and clay products, chemicals, and machinery. Meridian Junior College was opened in 1938. A naval air complex is 12 mi north. The Okatibbee Dam and Reservoir are 7 mi northwest.

Jimmie Rodgers (1897–1933), the "Singing Brakeman" of Meridian, is honoured by a memorial and an annual (May) country and western music festival. Inc. town, 1860; city, 1865. Pop. (1990) 41,036.

meridian, imaginary north–south line on the Earth's surface that connects both geographic poles; it is used to indicate longitude. The 40th meridian, for example, has a longitude of 40° E or 40° W. *See* latitude and longitude.

Mérimée, Prosper (b. Sept. 28, 1803, Paris—d. Sept. 23, 1870, Cannes, Fr.), French dramatist, historian, archaeologist, and master of the short story whose works—Romantic in theme but Classical and controlled in style—were a renewal of Classicism in a Romantic age.

Of a cultured, middle-class Norman background, Mérimée first studied law but was more devoted to learning the Greek, Spanish, English, and Russian languages and their literatures. At 19 he wrote his first play, *Cromwell* (1822); his close friend the novelist Stendhal encouraged him in this literary direction.



Mérimée, detail of an engraving after a drawing by A. Devéria, *c.* 1832
By courtesy of the trustees of the British Museum; photograph, J.R. Freeman & Co. Ltd.

A collection of his plays, *Le Théâtre de Clara Gazul,* appeared in 1825. Indulging his taste for mystification, he presented them as translations by a certain Joseph L'Estrange of the work of a Spanish actress. His next hoax was *La Guzla* (1827), by "Hyacinthe Maglanowich," ballads about murder, revenge, and vampires, supposedly translated from the Illyrian. Both works deceived even scholars of the day.

Mérimée's passions were mysticism, history, and the unusual. Inspired by the vogue for historical fiction established by Sir Walter Scott, he wrote *La Jacquerie* (1828), 36 dramatic scenes about a peasant insurrection in feudal times, and the novel *La Chronique du temps de Charles IX* (1829), concerning French court life during war and peace.

Mérimée's short stories best illustrate his imagination and sombre temperament; many are mysteries, of foreign inspiration and local colour. Spain and Russia were his principal literary sources; he was the first interpreter of Russian literature in France. Pushkin was his master, especially for his themes of violence and cruelty and the human psychology behind them. In one of his best known stories, "Mateo Falcone" (1833), a father kills a son for betraying the family honour. The collection *Mosaïque* (1833) was followed by his most famous novellas: *Colomba* (1840), the story of a young Corsican girl who forces her brother to commit murder for the sake of a vendetta, and *Carmen* (1845), in which an unfaithful gypsy girl is killed by a soldier who loves her. The latter story is internationally known through the opera by Bizet. *Lokis* (1869) and *La Chambre bleue* (1872) show Mérimée's fascination with the supernatural.

In 1831 he met a young girl, Jenny Dacquin, with whom he engaged in a lifelong correspondence, which was published after his death as *Lettres à une inconnue* (1874; "Letters to an Unknown Girl"). Mérimée, who served in the French Admiralty as general inspector of historical monuments, wrote his *Notes de voyages . . .* (1835–40), covering his travels through Greece, Spain, Turkey, and France. He was also an excellent historian and archaeologist and wrote several works in these fields, as well as literary criticism.

Mérimée was a longtime friend of the Countess of Montijo, whom he met in Spain in 1830. Later, in 1853, when her daughter became the empress Eugénie of France, Mérimée was admitted to the royal circle and made a senator. He was not fond of Napoleon III, however, and never became a wholehearted courtier. His letters to Sir Anthony Panizzi, principal librarian of the British Museum and his closest friend in Mérimée's old age, have been described as a "history of the Second Empire." They were published posthumously as *Lettres à M. Panizzi: 1850–70* (1881).

Mérimée has been acclaimed for the precision and restraint of his writing style. Though his best stories are imbued with mystery and local colour, exoticism never seems to take precedence over the psychological delineation of character. His use of realistic detail and precise delineation to establish the presence of the supernatural and fantastic is also notable. Mérimée's works frequently feature exceptional characters whose forceful and passionate natures have something inhuman about them and which lift them above the common run of humanity.

Merina, also called ANTIMERINA, IMERINA, or HOVA, a Malagasy people primarily inhabiting the central plateau of Madagascar. They are the most populous ethnolinguistic group on the island.

The early Merina, whose origins are uncertain, entered the central plateau of Madagascar in the 15th century and soon established a small kingdom there. Early Merina rulers organized vast irrigation projects to drain the local marshes and make possible the practice of wet-rice cultivation in irrigated paddies. Under the early 16th-century queen Rafohy and her successors, the rule of the Merina people spread gradually through the central plateau. King Andrianampoinimerina (or Nampoina; ruled 1787–1810) was the first Merina monarch to consolidate his power and make Merina a unified kingdom. His armies, commanded by his son Radama, secured control over much of the central highlands.

Radama, as king from 1810 to 1828, continued his father's policies and made tributaries of most of the kingdoms of Madagascar. He also instituted a policy of westernization and modernization, welcoming missionaries, European advisers, and Western education. This policy was reversed by his wife and successor, the xenophobic Queen Ranavalona I (reigned 1828–61), but it was revived under King Radama II (reigned 1861–63). The authority of the crown over the contentious Merina nobility was reinforced during the reigns of queens Rasoherina (reigned 1863–68) and Ranavalona II (reigned 1868–83) by the creation of a royal bureaucracy of European-style ministers. The Merina monarchs had nearly completed the unification of Madagascar into a single, centralized state when French troops occupied the capital in 1895 and turned the island into a colony.

The Merina cultivate rice, cassava, potatoes, onions, and other crops and raise cattle and pigs. They constitute a large proportion of the educated middle-class and intellectual elite of Madagascar, serving as businessmen, technicians, managers, and government officials.

Mering, Joseph, Freiherr von (baron of) (b. Feb. 28, 1849, Cologne—d. Jan. 5, 1908, Halle an der Saale, Ger.), German physician, physiologist, pharmacologist, and experimental pathologist. His discovery (with Oskar Minkowski) that removing the pancreas from dogs produces the symptoms of diabetes led to the discovery that insulin, synthesized in the pancreas, is a hormone important to the body's utilization of sugar.

At the University of Strassburg (1886–90) Mering and Minkowski attempted in 1889 to disrupt fat digestion in dogs by removal of the pancreas, the only organ known to secrete a fat-degrading enzyme; instead, the animals exhibited the symptoms of diabetes, a disease resulting from retention in the blood of sugar. As director of the medical clinic in Halle (1900–08), Mering worked with the German chemist Emil Fischer to develop (1902–05) the barbiturates known as barbital, veronal, and proponal.

meringue, mixture of stiffly beaten egg whites and sugar that is used in confections and desserts. The invention of meringue in 1720 is attributed to a Swiss pastry cook named Gasparini. Meringues are eaten as small "kisses" or as cases and toppings for fruits, ice cream, puddings, and the like. Shapes are piped onto a baking sheet through a pastry bag and dried out thoroughly in a slow oven. They are not ordinarily browned but remain an ivory colour. *Vacherins* and *schaumtorten* are plain meringue shells; *dacquoise* is a meringue with ground nuts and cornstarch added. Italian meringue, in which the sugar takes the form of a hot syrup, is used to cover puddings and ice creams. In the United States, a soft, moist meringue is used to top pies, especially lemon cream. Another famous American meringue dessert is the baked Alaska. A hard-frozen block of ice cream is placed on a layer of spongecake, and the whole is covered with uncooked meringue. The meringue is quickly browned in a hot oven and the dish served immediately, so that the meringue is warm but the ice cream is still frozen.

Merino, breed of fine-wool sheep originating in Spain; it was known as early as the 12th century and may have been a Moorish importation. It was particularly well-adapted to semiarid climates and to nomadic pasturing. The breed has become prominent in many countries worldwide.

Merinos vary considerably in size, conformation, and extent of skin folds, but the prevailing trend in breeding is to develop sheep of medium size, with fair mutton conformation and a minimum of skin folds. The colour of their faces and legs is white. Although they have a considerable growth of wool on their faces, it is seldom extensive enough to cause wool blindness. The fine wool fibres of Merino fleeces are beautifully crimped. Through selective mating and crossing with other breeds, the Merino has served extensively as foundation stock in the creation of many useful breeds and strains of sheep.

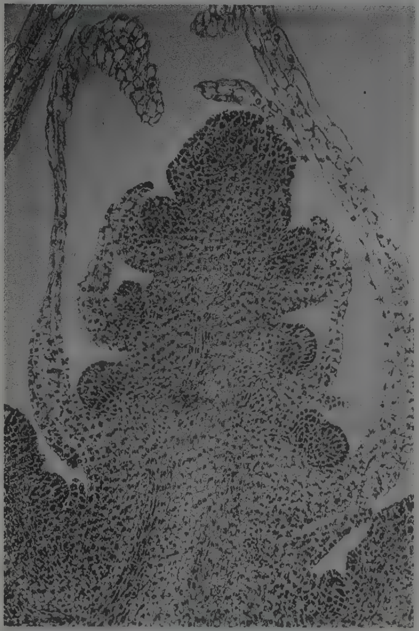
Merioneth (Wales): *see* Meirionnydd.

Merire, also spelled MERYRE (Egyptian kings): *see* Pepi.

Merisi, Michelangelo (painter): *see* Caravaggio.

meristem, region of cells capable of division and growth in plants. Meristem cells are typically small cells the diameters of which in different directions are about equal. They have a dense cytoplasm and relatively few small vacuoles (watery saclike enclosures).

Meristems are classified by their location in the plant as apical (located at root and shoot tips), lateral (in the vascular and cork cambia), and intercalary (at internodes, or stem regions between the places at which leaves attach, and leaf bases, especially of certain monocotyledons—*e.g.,* grasses). Apical meristems are also known as primary meristems because they give rise to the primary plant body. Lateral meristems are secondary meristems because they are responsible for secondary growth, or increase in stem girth and thickness. Meristems form anew from other cells in injured tissues and are responsible for wound healing.



Meristem

J.M. Langham

Merit, Legion of, the only U.S. military decoration that has distinct ranks, and the first U.S. medal to be awarded to citizens of other nations. It is awarded for outstanding service, fidelity, and loyalty in either combat or noncombat positions. Whereas U.S. military personnel qualify only for the lowest rank of legionnaire, any foreign citizen is eligible for the three higher ranks of officer, commander, and chief commander. These classifications are usually conferred upon foreign officials of high rank or on foreign military advisers.

The badge is a five-rayed white cross, edged with red, resting on a green wreath with a blue centre containing 13 white stars.

Merit, Medal for, U.S. civilian decoration established in 1942 by President Franklin D. Roosevelt to award civilians of the United States and its allies for exceptionally meritorious service or courageous acts in the furtherance of the war effort. No military personnel are eligible. Final authority to confer this award rests with the president. The badge consists of an eagle with outspread wings on a blue circle with 13 white stars.

Merit, Order for (Prussia): *see* Pour le Mérite.

Merit, Order of (O.M.), British honorary institution founded by Edward VII in 1902 to reward those who provided especially eminent service in the armed forces or particularly distinguished themselves in science, art, literature, or the promotion of culture. The order is limited to only 24 members, although the British monarch can appoint foreigners as "honorary members." The order carries no title of knighthood, but a member is entitled to add "O.M." after his name. It has a civilian and a military division. Both men and women are admitted into the order; Florence Nightingale was the first woman awarded the honour (1907), and not another woman received the order until the induction of Dorothy Hodgkin in 1965. The badge of the order portrays a crown with the motto "For Merit." An Indian Order of Merit (no longer in existence) was established in 1837.

Meriti (Brazil): *see* São João de Meriti.

Merjayun, also spelled MERJ ʿUYŪN (Lebanon): *see* Marj ʿUyūn.

Merka (Somalia): *see* Marka.

Merkava, also spelled MERKABAH (Hebrew: "Chariot"), the throne, or "chariot," of God as described by the prophet Ezekiel (Ezekiel 1); it became an object of visionary contemplation for early Jewish mystics. Merkava mysticism began to flourish in Palestine during the 1st century AD, but from the 7th to the 11th century its centre was in Babylonia.

Merkava mystics probably experienced ecstatic visions of the celestial hierarchies and the throne of God. In Merkava mystical literature the ascent of the visionary's soul is described as a perilous journey through seven spheres, or "heavenly dwellings," manned by hostile angels. The visionary's goal was to behold the divine throne situated on its chariot. Merkava mysticism was strongly influenced by Gnostic beliefs.

Merkava initiates (*tzenuʿim*), limited to a select few with specific moral qualities, were required to prepare themselves by fasting. A successful visionary journey depended, in part, on the use of certain magical formulas (called seals) that were used to placate the angelic gatekeeper of each heavenly dwelling. The use of an incorrect seal could result in severe injury or a fiery death. The Talmud warns that among four men who engaged in Merkava, one died, one went mad, one apostatized, and only Rabbi Akiba ben Joseph had a true visionary experience. Those who practiced Merkava were sometimes called Explorers of the Supernatural World (*Yorde Merkava*); Gershom Gerhard Scholem, a modern Jewish scholar of mysticism, suggests that the words may have implied a descent into the depths of self. The oldest literary sources of the movement are two *ḥekhalot* texts: the "Lesser" attributed to Rabbi Akiba, the "Greater" to Rabbi Ishmael ben Elisha. The Book of Enoch and the *Shiʿur qoma* ("Divine Dimensions") belong to this same tradition. The latter contains highly exaggerated anthropomorphic descriptions of God.

Merkle, Fred, byname of FREDERICK CHARLES MERKLE (b. Dec. 20, 1888, Watertown, Wis., U.S.—d. March 2, 1956, Daytona Beach, Fla.), American baseball player whose 16-year career (1,637 games) was overshadowed by his classic bonehead play in 1908.

In a pennant-deciding game, Merkle, first baseman for the National League New York Giants, had scored a single, but failed to touch second base and ran off the field as he saw the apparent winning run cross home plate. Chicago Cubs second baseman Johnnie Evers, a rule book fanatic, called for a ball from the home plate umpire and retired Merkle as a force out at second base. The game was declared a tie and the Giants lost the following game and the pennant. Merkle was subject to the derision of fans and sports writers thereafter.

After playing for the Giants (1907–16), the Brooklyn Dodgers (1916–17), and the Chicago Cubs (1917–20), Merkle was a coach and pinch hitter for the American League New York Yankees (1925–26). He batted and threw right-handed. After his retirement from baseball, Merkle was partner in an artificial bait manufacturing firm.

Merkys, Antanas (b. 1887, Bajorai, near Skapiskis, Lithuania, Russian Empire—d. 1955, U.S.S.R.), Lithuanian politician who was the last prime minister of Lithuania before its 1940 incorporation into the Soviet Union.

Educated in the law, Merkys served in the Russian Army during World War I (1914–18). In 1919 he entered the army of the newly independent Lithuania. A member of the right-wing Nationalist League, he served as Lithuanian defense minister on four occasions in the 1920s, and in 1927–32 he was governor of Klaipėda (Memel). Merkys became prime minister of an authoritarian Nationalist League government, formed in November 1939, but he was deported to the U.S.S.R. soon after the Soviets occupied Lithuania in June 1940.

Merle d'Aubigné, Jean-Henri (b. Aug. 16, 1794, Les Eaux-Vives, Switz.—d. Oct. 21, 1872, Geneva), Swiss Protestant minister, historian of the Reformation, and advocate of Evangelical (Free Church) Christianity.

The son of Protestant refugees from France, Merle d'Aubigné studied theology at Geneva and was ordained in 1817. While studying in Germany during the anniversary celebration of the German Reformation at Eisenach, he decided to write a history of Martin Luther and his era. After further work in Berlin, where he was influenced by the church historian J.A.W. Neander, he served as pastor at Hamburg and court preacher in Brussels. Returning to Geneva, he became a professor in the theological school of the Evangelical Society of Geneva.

Merle d'Aubigné's major work, in two parts, consisted of the popular *Histoire de la Réformation du seizième siècle,* 5 vol. (1835–53; *History of the Great Reformation of the Sixteenth Century,* 1838–41) and the more scholarly *Histoire de la Réformation en Europe au temps de Calvin,* 8 vol. (1863–78; "History of the Reformation in Europe at the Time of Calvin"). Although considered partisan toward the Presbyterian form of church structure, he revitalized church history and assembled more source documents than any other historian up to his time.

Merleau-Ponty, Maurice (b. March 14, 1908, Rochefort, Fr.—d. May 4, 1961, Paris), philosopher and man of letters, the leading exponent of Phenomenology in France.

Merleau-Ponty studied at the École Normale Supérieure in Paris and took his *agrégation* in philosophy in 1931. He taught in a number of lycées before World War II, during which he served as an army officer. In 1945 he was appointed professor of philosophy at the University of Lyon and in 1949 was called to the Sorbonne in Paris. In 1952 he received a chair of philosophy at the Collège de France. From 1945 to 1952 he served as unofficial co-editor (with Jean-Paul Sartre) of the journal *Les Temps Modernes.*

Merleau-Ponty's most important works of technical philosophy were *La Structure du comportement* (1942; *The Structure of Behavior,* 1965) and *Phénoménologie de la perception* (1945; *Phenomenology of Perception,* 1962). Though greatly influenced by the work of Edmund Husserl, Merleau-Ponty rejected his theory of the knowledge of other persons, grounding his own theory in bodily behaviour and in perception. He held that it is necessary to consider the organism as a whole to discover what will follow from a given set of stimuli. For him, perception was the source of knowledge and had to be studied before the conventional sciences.

Turning his attention to social and political questions, in 1947 Merleau-Ponty published a group of Marxist essays, *Humanisme et terreur* ("Humanism and Terror"), the most sophisticated defense of Soviet communism in the late 1940s. He argued for suspended judgment of Soviet terrorism and attacked what he regarded as Western hypocrisy. The Korean War disillusioned Merleau-Ponty and he broke with Sartre, who defended the North Koreans.

In 1955 Merleau-Ponty published more Marxist essays, *Les Aventures de la dialectique* ("The Adventures of the Dialectic"). This collection, however, indicated a change of position: Marxism no longer appears as the final word on history, but rather as a heuristic methodology. Later he returned to more strictly philosophical concerns.

Merlin, enchanter and wise man in Arthurian legend and romance of the Middle Ages, linked with personages in ancient Celtic mythology (especially with Myrddin in Welsh tradition). He appeared in Arthurian legend as an enigmatic figure, fluctuations and inconsistencies in his character being often dictated by the requirements of a particular narrative or by varying attitudes of suspicious regard toward magic and witchcraft. Thus, treatments of Merlin reflect different stages in the development of Arthurian romance itself.

Geoffrey of Monmouth, in *Historia regum Britanniae* (*c.* 1136), adapted a story, told by the Welsh antiquary Nennius (flourished *c.* 800), of a boy, Ambrosius, who had given advice to the legendary British king Vortigern. In Geoffrey's account Merlin-Ambrosius figured as adviser to Uther Pendragon (King Arthur's father) and afterward to Arthur himself. In a later work, *Vita Merlini,* Geoffrey further developed the story of Merlin by adapting a northern legend about a wild man of the woods, gifted with powers of divination. Early in the 13th century, Robert de Borron's verse romance *Merlin* added a Christian dimension to the character, making him the prophet of the Holy Grail (whose legend had by then been linked with Arthurian legend). The author of the first part of the Vulgate cycle (*see* Arthurian legend) made the demonic side of Merlin's character predominate, but in later branches of the Vulgate cycle, Merlin again became the prophet of the Holy Grail, while his role as Arthur's counsellor was filled out; it was Merlin, for example, who advised Uther to establish the knightly fellowship of the Round Table and who suggested that Uther's true heir would be revealed by a test that involved drawing a sword from a stone in which it was set. It also included a story of the wizard's infatuation with the Lady of the Lake, which eventually brought about his death.

Consult the INDEX *first*

merlin, also called PIGEON HAWK (*Falco columbarius*), small blue-gray falcon, family Falconidae, with a narrowly white-banded tail. It is found at high latitudes throughout the Northern Hemisphere, occurring in the western United States south to Colorado and in Europe in the western parts of the British Isles and in Scandinavia. Dark-coloured populations breed near Vancouver, B.C., and in Iceland. Most migrate to regions just south of the breeding range, although some species go as far as northern South America. The merlin inhabits wet, open country or conifer and birch woods. It usually lays its eggs on the ground amid bushes but sometimes occupies an old rook or magpie nest in a tree. An aggressive hunter, the merlin was once much used in falconry.

Merlin (*Falco columbarius*)

Eric Hosking

Merlin, Antoine-Christophe, byname MERLIN DE THIONVILLE (b. Sept. 13, 1762, Thionville, Fr.—d. Sept. 14, 1833, Paris), democratic extremist during the early years of the French Revolution who became one of the leading organizers of the conservative Thermidorian reaction that followed the collapse of the radical democratic Jacobin regime of 1793–94.

Merlin was the son of an attorney and studied theology before becoming a lawyer in 1788. The Revolution broke out in the following year, and in 1791 Merlin was elected to the Legislative Assembly. He vigorously urged the Assembly to confiscate the property of émigrés and hold their wives and children as hostages, and he was one of the three deputies who joined the Club of the Cordeliers—then the most radical political society in Paris.

Elected to the Convention, which succeeded the Legislative Assembly in September 1792, Merlin was sent in December on a mission to Mainz. While there he wrote the Convention demanding that King Louis XVI be put to death; the King was guillotined in January 1793. Merlin displayed great courage during the siege of Mainz by Austro-Prussian forces, and, after the garrison fell in July 1793, he fought against the counterrevolutionary Roman Catholic peasant insurgents of the Vendée. Nevertheless, the Jacobin Committee of Public Safety, suspecting him of colluding with the enemy at Mainz, recalled him to Paris in November. As a result, Merlin joined the group of conspirators who brought about the downfall of the Jacobin leader Robespierre on 9 Thermidor (July 27, 1794). During the ensuing Thermidorian reaction he helped organize the jeunesse dorée ("gilded youth"), a movement of fashionably dressed young men of bourgeois background who terrorized Jacobin workmen. Merlin then sat in the Directory government's Council of the Five Hundred from 1795 until 1798, when he was appointed administrator general of posts. He took no part in public life during Napoleon's regime (1799–1815), and he managed to escape banishment after the restoration of King Louis XVIII in 1815.

Merlin, Philippe-Antoine, Comte (Count), byname MERLIN DE DOUAI (b. Oct. 30, 1754, Arleux, Fr.—d. Dec. 26, 1838, Paris), one of the foremost jurists of the French Revolutionary and Napoleonic periods.

As a deputy for the town of Douai in the revolutionary Constituent Assembly of 1789, he was instrumental in the passage of important legislation abolishing feudal and seignorial rights. Merlin was elected to a new assembly, the Convention, in September 1792, and he voted for the death sentence at Louis XVI's trial in January 1793.

After July 1794 Merlin was almost continuously a member of the Committee of Public Safety, in which he supported the reaction against the extreme revolutionary Jacobins. He also drew up the code of crimes and penalties enacted by the Convention in October 1795. On the inauguration of the Directory (November 1795), Merlin was appointed minister of justice. Two days after the coup d'état of 18 Fructidor (Sept. 4, 1797), he became one of the five directors, resigning in June 1799 under threat of impeachment.

Under Napoleon, Merlin became procurator-general (1804) and did more than any other lawyer to fix the interpretation of the Napoleonic Code. He was appointed a councillor of state in 1806 and created a count in 1810. At the first Restoration (1814) Merlin immediately went over to Louis XVIII but was removed from office in July 1815. During Napoleon's return in the Hundred Days, he was elected to the Chamber of Representatives and appointed minister of state. Banished at the time of the second Restoration, he went into exile in the Low Countries. He returned to France during the July Revolution of 1830.

Merlo, *cabacera* (county seat) and *partido* (county) of Gran Buenos Aires, Argentina, west of the city of Buenos Aires, in Buenos Aires *provincia.* The region of the present-day *partido* was colonized shortly after the second and permanent founding of Buenos Aires (1580). In 1730 an interim parish was founded near the estancia (landholding) of Francisco de Merlo. In the same year, Merlo founded the Villa de San Antonio del Camino, which was renamed later in his honour. For many years, the development of Merlo lagged behind the growth of nearby Morón. In 1865 the region was officially declared a *partido.* It covers 66 square miles (170 square km) and is bordered by the *partidos* of Morón (northeast), La Matanza (southeast), Marcos Paz (southwest), and Moreno and the Río de la Reconquista (northwest). Besides the *cabacera* of Merlo, the significant localities are San Antonio de Padua, Libertad, and Mariano Acosta. The *cabacera* of Merlo was formerly important solely as a railroad junction and trade centre for the surrounding agricultural and pastoral lands. About half of the *partido* now lies within the Gran Buenos Aires urban area, and the population density is less than that of most of the *partidos.* Pop. (1999 est.) 430,213.

mermaid, masculine MERMAN, a fabled marine creature with the head and upper body of a human being and the tail of a fish. Similar divine or semidivine beings appear in ancient mythologies (*e.g.,* the Chaldean sea god Ea, or Oannes). In European folklore, mermaids (sometimes called sirens) and mermen were natural beings who, like fairies, had magical and prophetic powers. They loved music and often sang. Though very long-lived, they were mortal and had no souls.

Many folktales record marriages between mermaids (who might assume human form) and men. In most, the man steals the mermaid's cap or belt, her comb or mirror. While the objects are hidden she lives with him; if she finds them she returns at once to the sea. In some variants the marriage lasts while certain agreed-upon conditions are fulfilled, and it ends when the conditions are broken.

Though sometimes kindly, mermaids and mermen were usually dangerous to man. Their gifts brought misfortune, and, if offended, the beings caused floods or other disasters. To see one on a voyage was an omen of shipwreck. They sometimes lured mortals to death by drowning, as did the Lorelei of the Rhine, or enticed young people to live with them underwater, as did the mermaid whose image is carved on a bench in the church of Zennor, Cornwall, Eng.

Mermaids and merman, illustration by Hans Tegner from the 1900 edition of *Fairy Tales*, by Hans Christian Andersen

Aquatic mammals, such as the dugong and manatee, that suckle their young in human fashion above water are considered by some to underlie these legends.

Mermaid Tavern, famous London meeting place of the Friday Street Club, of which William Shakespeare, Sir Walter Raleigh, John Donne, and Ben Jonson were notable members. It stood to the east of St. Paul's Cathedral, with entrances in Bread Street and Friday Street.

It has intrigued scholars interested in Shakespeare's personality and in those of other great men of Elizabethan and Jacobean letters, mainly because of a passage in a poem, "Letter of Ben Jonson" (1640), by the playwright Francis Beaumont (also a member of the club):

> What things we have seen
> Done at the *Mermaid!* heard words that
> have been
> So nimble, and so full of subtle flame,
> As if that every one (from whence
> they came)
> Had meant to put his whole wit in a jest,
> And had resolved to live a fool the rest
> Of his dull life.

mermaid's tresses (algae): *see* Spirogyra.

merman: *see* mermaid.

Merman, Ethel, byname of ETHEL AGNES ZIMMERMAN (b. Jan. 16, 1909, Astoria, N.Y., U.S.—d. Feb. 15, 1984, New York City), American singer, actress, and lead performer in more than a dozen Broadway musicals.

After working as a secretary and part-time singer, she began to get professional engagements in 1929. She made her stage debut in the George and Ira Gershwin musical *Girl Crazy* in 1930 and achieved notable success with her rendition of the song "I Got Rhythm." She became a favoured performer for many of the major songwriters of the period—including Irving Berlin, Cole Porter, and George Gershwin. She made her first appearance in a full-length motion picture in 1934 and starred in her own weekly radio show in 1935.

Merman continued to perform on Broadway, scoring her most notable successes in *Anything Goes* (1934), *Red, Hot and Blue* (1936), *Du Barry Was a Lady* (1939), *Panama Hattie* (1940), *Something for the Boys* (1943), *Annie Get Your Gun* (1946), *Call Me Madam* (1950), and *Gypsy* (1959). She was most memorable for her strong, clear vocalizations, though she never had voice lessons, and received many awards for her performances over the years, including a 1972 special Tony award in recognition of her lifetime contribution to show business.

Her autobiography, *Who Could Ask For Anything More?,* was published in 1955.

Merneptah, also spelled MENEPTAH, or MERENPTAH (d. 1204?), king of Egypt (reigned 1213–04 BC) who successfully defended Egypt against a serious invasion from Libya.

The 13th son of his long-lived father, Ramses II, Merneptah was nearing 60 years of age at his accession in about 1213. Toward the end of his father's reign, Egypt's military preparedness had deteriorated. Early in Merneptah's reign, his troops had to suppress a revolt in Palestine by the cities of Ashqelon, Gezer, and Yenoam. (The action is shown by battle reliefs at al-Karnak previously ascribed to Ramses II.) Merneptah's greatest challenge, however, came from the west. Libyans had penetrated the buffer territory west of the delta oases and were encroaching on Egyptian lands. About 1209 Merneptah learned that some Sea Peoples, wanderers who had been displaced from Asia Minor and the Aegean lands and were roving the Middle East, had joined and armed the Libyans and with them were conspiring to attack Memphis and Heliopolis, the great administrative and religious centres near the delta's apex.

After receiving assurances in a dream from Ptah, god of endangered Memphis, the aged king marshaled his forces and prepared to meet the enemy. The site of the battle is disputed, but a place somewhere west of the apex of the delta is suggested by references in the four accounts of the war. At dawn of a spring day in 1209, the Libyans and their allies appeared, evidently expecting a pitched battle. Merneptah, however, unleashed his archers against them, while his infantry and chariotry held fast. For six hours the bowmen massacred the foe, after which the latter's chief fled, and the Egyptian chariotry and infantry routed the demoralized enemy. It was a great victory in which the Libyans and Sea Peoples lost nearly 9,400 men. Egypt was relieved, and Merneptah ordered the carving of four great commemorative texts. One of these, the famous "Israel Stela," refers to the suppression of the revolt in Palestine. It contains the earliest-known reference to Israel, which Merneptah counted among the peoples that he defeated. Hebrew scholars suggest that the circumstances agree approximately with the period noted in biblical books from late Exodus to Judges. A fragmentary stela from the Sudan also suggests that the king quelled a rebellion in Lower Nubia, probably after his Palestinian exploits.

He probably died in about 1204. He left few monuments, but in his conduct of Egypt's defense and diplomacy he was at least the equal of his father.

Mernere (king of Egypt): *see* Merenre.

Merodach-Baladan II, Babylonian MARDUK-APAL-IDDINA II ("Marduk Has Given Me an Heir") (d. *c.* 694 BC), king of Babylonia 721–710 and for nine months in 703, who maintained Babylonian independence in the face of Assyrian military supremacy for more than a decade.

Commencing in 728 the king of Assyria also officially held the title of king of Babylonia.

During that time Merodach-Baladan, a member of the Yakin tribe, was a district ruler in Chaldea. During the unrest surrounding the accession of Sargon II of Assyria in 722, Merodach-Baladan entered Babylon and claimed the Babylonian throne, which had belonged to his forebear Eriba-Marduk. An attack by the Elamites two years later so weakened the Assyrians—though both sides claimed victory—that, as king of Babylonia, Merodach-Baladan remained unmolested by Assyria for the next 10 years.

Sargon's inscriptions portray Merodach-Baladan as a usurper who oppressed Babylonia and relied on Elamite military power. On the other hand, Merodach-Baladan claimed to be the legitimate heir who had driven the Assyrians from Babylonia. Contemporary Babylonian documents indicate that temples were repaired, irrigation projects were carried out, and life was normal during his reign.

According to Assyrian accounts, Sargon marched south against Babylonia in 710. After defeating the Elamites and Merodach-Baladan's other allies, he turned toward Babylon. Merodach-Baladan fled, and the leading citizens of Babylon brought Sargon unopposed into the city, where he officially became king of Babylonia. The next year Sargon captured and destroyed Merodach-Baladan's capital, Dur-Yakin. Sometime after the death (705) of Sargon, Merodach-Baladan sent an embassy to Hezekiah of Judah in an attempt to foment unrest against the new Assyrian monarch, Sennacherib. In 703 he again seized the Babylonian throne. Before the end of the year, however, Sennacherib marched south and defeated the Babylonian forces. In 700 Sennacherib marched to Bit-Yakin in pursuit of Merodach-Baladan, who again fled, this time to southern Elam, where he died sometime before 694.

Meroe, city of ancient Cush (Kush) the ruins of which are located on the east bank of the Nile about 4 miles (6.4 km) north of Kabūshīyah in the present-day Sudan; Meroe is also the name of the area surrounding the city.

The 25th, or "Ethiopian," dynasty of ancient Egypt is believed to have retired to Cush after 656 BC and established itself at Meroe, where it fostered an Egypto-Cushite culture that through the subsequent 1,000 years became increasingly cut off from its source. Meroe was the southern administrative centre for the kingdom of Cush, beginning *c.* 750 BC, at a time when Napata was still its capital. After the sack of Napata in *c.* 590 by the Egyptian pharaoh Psamtik II, Meroe became the capital of the kingdom and developed into a wide and prosperous area. It survived a Roman invasion—though its status was lowered thereby—but it later declined in the face of raiding Negroid and Nilotic tribes, to fall at the more determined invasions of the Aksumite armies, probably under Ella-Amida, whose reign ended between *c.* AD 320 and 325.

Excavations of Meroe, begun in 1902, have revealed the streets and buildings of a great and populous city. The chief features are a riverbank quay, with palaces nearby, and a great temple of Amon.

Meroitic language, language spoken in the ancient city of Meroe and the surrounding area (in present-day Sudan). Dating from a period extending from about 200 BC until the 4th century AD, Meroitic inscriptions are written in two types of script: linear, or demotic, for general records; and hieroglyphic for royal or religious inscriptions on stone. They were usually written from right to left, as with Egyptian hieratic and demotic scripts. Inscriptions were sometimes written vertically. These scripts seem to have been inspired and influenced by their Egyptian counterparts, and in some cases the signs used are identical in Egyptian and Meroitic. Extant texts in Meroitic include funerary inscriptions (which compose the largest group of texts), captions accompanying temple reliefs, graffiti, and several lengthy royal memorial texts; a few papyrus fragments have also been preserved in the relatively dry region of Lower Nubia. A number of new texts were discovered during the excavations occasioned by the building of the Aswān High Dam.

Although a small number of Meroitic words and a small portion of the grammar are known, the language remains largely undeciphered. Nothing is known for certain about the relation of Meroitic to other languages, although some scholars believe the language to be related either to Nubian or to the Eastern Sudanic languages.

Meron, also spelled MEIRON, noncollective agricultural settlement (moshava) and nearby mountain, Upper Galilee, northern Israel, northwest of Ẕefat (Safad). Nearby is a perennial spring, the likeliest location of the "waters of Merom," site of Joshua's victory over the pagan kings of Palestine under Jabin, king of Hazor (Joshua 11). Mount Meron (3,963 feet [1,208 m]), Israel's highest point in its pre-1967 boundaries, is 2 miles (3 km) northwest.

Meron is mentioned in the *History of the Jewish War* of Flavius Josephus (AD 37/38–after 93). It is the site of the tomb of Rabbi Simeon ben Yoḥai, 2nd-century rabbinic teacher and legendary author of the Kabbalistic *Zohar*. On the day of Lag ba-Omer, Orthodox Jews by the thousands make a joyous pilgrimage to Rabbi Simeon's tomb; the festivities there last all night. There are remains of a 3rd-century synagogue and ancient tombs attributed to various Talmudic scholars.

The modern settlement of Meron, adjacent to the old site, was founded in 1949 by ex-servicemen from Hungary and Czechoslovakia. Mount Meron (Hebrew: Har Meron, formerly Har ʿAtzmon; Arabic: Jabal Jarmaq) is covered with fine forests and commands a scenic view of the surrounding hilly area, which has been set aside as a nature reserve. Hill farming is the primary activity. Pop. (1983) 508.

Meropidae (bird family): *see* bee-eater.

Merovech, also spelled MEROVICH, MEROVEUS, MERWICH, or MEROWIG, French MÉROVÉE, German MEROWECH (fl. *c.* AD 450), king of the Salian Franks, from whom Frankish tradition held the Merovingian dynasty to have taken its name. He was the father of Childeric I (d. 481/482) and grandfather of Clovis I (*c.* 466–511).

Nothing definite is known of Merovech's life. He is mentioned in Gregory of Tours's *History of the Franks* and, according to later sources, fought against Attila the Hun at the Battle of the Catalaunian Plains (451).

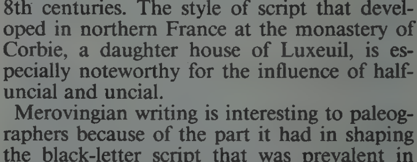
Merovingian DYNASTY, Frankish dynasty (AD 476–750) traditionally reckoned as the "first race" of the kings of France.

A brief treatment of the Merovingians follows. For full treatment, *see* MACROPAEDIA: France.

The name Merovingian derives from that of Merovech, of whom nothing is known except that he was the father of Childeric I, who ruled a tribe of Salian Franks from his capital at Tournai. Childeric was succeeded by his son Clovis I in 481 or 482. Clovis I extended his rule over all the Salian Franks, conquered or annexed the territories of the Ripuarian Franks and the Alemanni, and united nearly all of Gaul except for Burgundy and what is now Provence. Of equal importance, he was converted to Christianity in either 496 or 506. At Clovis I's death in 511, his realm was divided among his four sons, Theuderic I, Chlodomer, Childebert I, and Chlotar I. Despite the frequently bloody competition among the brothers, they managed among them to extend Frankish rule over Thuringia in approximately 531 and Burgundy in 534 and to gain sway over, if not possession of, Septimania on the Mediterranean coast, Bavaria, and the lands of the Saxons to the north. By 558 Chlotar I was the last suriviving son of Clovis I, and until his death in 561 the Frankish realm was once again united.

In 561 the realm was again divided among the brothers Charibert I, Guntram, Sigebert, and Chilperic I, and again family strife and intrigue ensued, particularly between Chilperic and his wife Fredegund in the northwest of Gaul and Sigebert and his wife Brunhilda in the northeast. Dynastic struggles and increasing pressures exerted on the realm by neighbouring peoples—Bretons and Gascons in the west, Lombards in the southeast, Avars in the east—prompted a reorganization of the Frankish kingdoms. Several eastern regions were merged into the kingdom of Austrasia, with its capital at Metz; in the west Neustria emerged, with its capital first at Soissons and later at Paris; to the south was the enlarged kingdom of Burgundy, with its capital at Chalon-sur-Saône. Overall Frankish unity was again achieved in 613, when Chlotar II, son of Chilperic I and king of Neustria, inherited the other two kingdoms as well. On the death of Chlotar's son Dagobert in 639 the realm was divided yet again, but by that time the kings of the two regions, Neustria and Burgundy on the one hand and Austrasia on the other, had been forced to yield much of their power to household officials known as mayors of the palace. The later Merovingian kings were little more than puppets and were enthroned and deposed at will by powerful mayors of the palace. The last Merovingian, Childeric III, was deposed in 750 by Pepin III the Short, one of a line of Austrasian mayors of the palace who finally usurped the throne itself to establish the Carolingian dynasty (*q.v.*).

Merovingian script, in calligraphy, the writing of the pre-Carolingian hands of France that were derived from Latin cursive script. Luxeuil, in Burgundy, was a particularly important centre in the development of a Merovingian cursive style during the 7th and 8th centuries. The style of script that developed in northern France at the monastery of Corbie, a daughter house of Luxeuil, is especially noteworthy for the influence of half-uncial and uncial.



Luxeuil cursive minuscule script from the *Moralia* by Gregory the Great, Merovingian, 8th century manuscript (British Library, Add. 11,878)

Reproduced by permission of the British Library

Merovingian writing is interesting to paleographers because of the part it had in shaping the black-letter script that was prevalent in the Middle Ages. Like Visigothic script, the Merovingian hands inherited the dominant vertical rhythm of the Latin cursive script of the ancient Romans. Angularity as a prevailing tendency and an effect of lateral crowding, especially in the first lines of a Merovingian manuscript, led to the use of the term picket-fence style by some 20th-century scholars of calligraphy.

Merowech, also spelled MEROWIG (Frankish king): *see* Merovech.

Merriam, Clinton Hart (b. Dec. 5, 1855, New York City—d. March 19, 1942, Berkeley, Calif., U.S.), American biologist and ethnologist, who helped found the National Geographic Society (1888) and what is now the U.S. Fish and Wildlife Service.

Merriam studied at the Sheffield Scientific School of Yale University and at the College of Physicians and Surgeons of Columbia University (M.D., 1879). Between 1872 and 1876 he traveled as naturalist with the Hayden Geological Surveys in Utah, Idaho, Montana, and Wyoming. From 1885 to 1910 he headed the U.S. Department of Agriculture's Division of Ornithology and Mammalogy, which became the U.S. Biological Survey (1896) and is now known as the Fish and Wildlife Service. While a research associate with the Smithsonian Institution (1910–39) and chairman of the U.S. Board on Geographic Names (1917–25), he conducted a study of the Pacific Coast Indians, collecting data on 157 Indian tribes. Merriam's books include the *Geographic Distribution of Life in North America* (1893) and *The Dawn of the World* (1910).

Merriam-Webster dictionary, any of various lexicographic works published by the G. & C. Merriam Company (renamed Merriam-Webster Inc. in 1982), which is located in Springfield, Mass., U.S., and which since 1964 has been a subsidiary of Encyclopædia Britannica, Inc. Among the dictionaries are *Webster's Third New International Dictionary of the English Language* (1961), which contains more than 470,000 entries and provides the most extensive record of American English now available, and *Merriam-Webster's Collegiate Dictionary, Tenth Edition*.

The G. & C. Merriam Company, founded in 1831, acquired the rights after the death of Noah Webster in 1843 to his *An American Dictionary of the English Language*. This work had first been published in 1828 and was the first American unabridged dictionary. A second edition had been published in 1840, and subsequent editions were published by the company in 1847 and 1864. The 1890 revision was given the title *Webster's International Dictionary* and was followed in 1909 by *Webster's New International Dictionary*, in 1934 by *Webster's New International Dictionary, Second Edition*, and in 1961 by *Webster's Third New International Dictionary*.

Merriam-Webster dictionaries began to be published in electronic formats, including CD-ROMs and handheld devices, in the 1980s. In 1996 Merriam-Webster introduced Merriam-Webster OnLine, a Web site offering language-related feaures, including access to the full text of *Merriam-Webster's Collegiate Dictionary* and *Merriam-Webster's Collegiate Thesaurus*.

Merrick, David, original name DAVID MARGULOIS (b. Nov. 27, 1912, St. Louis, Mo., U.S.—d. April 25, 2000, London, Eng.), prolific American theatrical producer who staged many of the most successful plays in American theatre during the 1960s.

Though he earned a law degree from St. Louis University, Mo., Merrick abandoned the practice of law after 1949 and became a full-time theatrical producer in New York City. His first independent production, *Clutterbuck* (1949), was followed over the next 40 years by more than 85 other Broadway shows, including *Look Back in Anger* (1957), *Gypsy* (1959), *A Taste of Honey* (1960), *Becket* (1960), *Hello, Dolly!* (1964), *Oh What a Lovely War!* (1964), *Cactus Flower* (1965), *Marat/Sade* (1965), *Play It Again, Sam* (1969), *42nd Street* (1980), and *Loot* (1986). He frequently had several productions running on Broadway at the same time. Besides his mastery of theatrical production, Merrick was known for his skillful use of publicity to draw theatregoers to his plays, many of which were significant critical and commercial successes. In 1983 Merrick suffered a stroke that rendered him wheelchair-bound and virtually unable to speak. He still continued to produce shows, such as *State Fair* (1996).

Merrick, Joseph Carey: *see* Elephant Man.

Merrifield, Bruce, in full ROBERT BRUCE MERRIFIELD (b. July 15, 1921, Fort Worth, Texas, U.S.), American biochemist who in 1984 received the Nobel Prize for Chemistry developing a simple and ingenious method for synthesizing chains of amino acids, or polypeptides, in any predetermined order.

Merrifield graduated from the University of California at Los Angeles (UCLA) in 1943 and earned a Ph.D. in biochemistry there in 1949. That same year he joined the staff of the Rockefeller Institute for Medical Research (now Rockefeller University), New York City, where he remained.

His innovative method, developed during the 1950s and '60s, grew from his idea that the key to the synthesis of polypeptides was the anchoring of the first amino acid to an insoluble solid. Other amino acids could then be joined, one by one, to the fixed terminus. At the end of the sequence of steps, the completed chain could be easily detached from the solid. The process, which can be carried out by machine, proved highly efficient and of great significance for research on such substances as hormones and enzymes, as well as in the commercial manufacture of such drugs as insulin and such substances as interferon.

Merrill, Charles E., in full CHARLES EDWARD MERRILL (b. Oct. 19, 1885, Green Cove Springs, Fla., U.S.—d. Oct. 6, 1956, Southampton, N.Y.), American investment banker who guided his company through a series of mergers that resulted in the creation of the brokerage firm of Merrill Lynch, Pierce, Fenner & Smith Inc.

After a series of jobs as a reporter, baseball player, and businessman, Merrill joined the commercial-paper house of George H. Burr & Company in New York City in 1911. He organized a bond department there, joined Eastman Dillon & Co. for one year, and in 1914 began his own investment-banking firm of Merrill, Lynch & Company, in partnership with Edmund C. Lynch. Merrill served as its director until his death.

With the successful underwriting of a $1,250,000 stock offering prior to World War I, Merrill Lynch earned a reputation and became the brokerage house for some of the largest chain-store securities, including S.S. Kresge Co., J.C. Penney Co., Safeway Stores, and First National Stores. Merrill played an important role in 1926 in the creation of Safeway Stores, Inc., under whose auspices he founded *Family Circle Magazine* six years later.

In 1930 the company left the brokerage field, concentrating instead on underwriting and investment banking; but it returned to brokerage in 1940, with amalgamations that resulted the following year in a change of company name to Merrill Lynch, Pierce, Fenner & Beane. (It became Merrill Lynch, Pierce, Fenner & Smith after Merrill's death.) One of the greatest contributions of Merrill Lynch was introducing stocks and bonds as an investment option to America's growing middle class.

Merrill, James, in full JAMES INGRAM MERRILL (b. March 3, 1926, New York, N.Y., U.S.—d. Feb. 6, 1995, Tucson, Ariz.), American poet especially known for the fine craftsmanship and wit of his lyric and epic poems.

Merrill was the son of Charles E. Merrill, a founder of Merrill Lynch, an investment-banking firm. He attended private schools and Amherst College (B.A., 1947), and inherited wealth enabled him to devote his life to his poetry. His first book, *First Poems* (1951), and subsequent collections revealed his formal mastery but were somewhat impersonal and artificial in tone. With *Water Street* (1962), critics noted a growing ease and the development of a personal vision in his writing. With *Nights and Days* (1966), *The Fire Screen* (1969), and *Braving the Elements* (1972), Merrill gained wider public appreciation. His verse in these books was more autobiographical and tended to focus on poignant moments in his romantic and domestic life. He skillfully combined lyric language with ordinary conversation and possessed a voice that could be witty, intimate, and colloquial while retaining a high degree of formal elegance.

The publication of the epic poetry in *Divine Comedies* (1976), *Mirabell: Books of Number* (1978), and *Scripts for the Pageant* (1980)—a trilogy later published in *The Changing Light at Sandover* (1982)—established Merrill as one of the leading American poets of his generation. This 17,000-line work presents a series of conversations held with various real and fictional persons in the spirit world by means of a Ouija board, a device that enabled Merrill to compose a serious yet witty summation of his lifelong concerns. A selection of his poetry, *From the First Nine: Poems 1946–1976,* was published in 1982. Merrill also wrote plays, novels, essays, and the memoir *A Different Person* (1993). His 15th and last book of poetry, *A Scattering of Salts,* appeared posthumously in 1995.

Merrill Lynch & Co., Inc., American financial-services holding company whose principal subsidiary, Merrill Lynch, Pierce, Fenner & Smith Inc., is the largest retail brokerage house in the United States. Headquarters are in New York City.

In 1914 Charles E. Merrill, a bond dealer, founded a small investment-banking firm and the next year took on a partner, Edmund C. Lynch. Merrill, Lynch & Company prospered by specializing in underwriting the securities of chain stores. Having helped organize Safeway Stores in 1926, Merrill sold his firm's retail brokerage operations to E.A. Pierce & Company in 1930 and concentrated on investment banking until 1940, when he merged his firm with that of Pierce to form Merrill Lynch, E.A. Pierce & Cassatt. In 1941 the company merged with the New Orleans-based brokers Fenner and Beane.

Under Merrill's leadership, the brokerage house (then called Merrill Lynch, Pierce, Fenner & Beane) set out after World War II to bring "Wall Street to Main Street," explaining to middle-income Americans how the stock market works and bringing average investors into the market in unprecedented numbers. Through innovative public-relations techniques, widely copied by other brokers, the company extensively advertised its services, cultivated small accounts, established a training school for stockbrokers, and paid brokers a salary instead of straight commission to reduce the incidence of needless portfolio churning to generate commissions. Merrill Lynch also was the first brokerage house to publicly disclose its own securities holdings. With the addition of Winthrop H. Smith to the partnership in 1958, the firm became Merrill Lynch, Pierce, Fenner & Smith.

In the 1970s, under Chairman Donald T. Regan (later treasury secretary under President Ronald Reagan), the firm moved aggressively into such other financial services as insurance and established the nation's largest money-market mutual fund. The holding company was created in 1973. Under Merrill Lynch International, it has several international operations, including Smith New Court PLC, a British securities firm acquired in 1995.

Merrimack and Monitor, Battle of: *see* Monitor and Merrimack, Battle of.

Merrimack River, stream in the northeastern United States, rising in the White Mountains of central New Hampshire at the confluence of the Pemigewasset and Winnipesaukee rivers and flowing southward into Massachusetts, then northeastward to its mouth on the Atlantic Ocean. Of its total length of 110 miles (177 km), the lower 22 miles (35 km) are tidal. The main cities along the river—Concord, Manchester, and Nashua in New Hampshire, and Lowell, Lawrence, and Haverhill in Massachusetts—used the Merrimack's waterpower to produce a large portion of the textiles and hosiery made in New England from about 1850 to the 1930s. While the river remains an important source of waterpower, its valley has become a central artery for tourist travel to the vacation centres in the White Mountains.

Merriman, John X., in full JOHN XAVIER MERRIMAN (b. March 15, 1841, Street, Somerset, Eng.—d. Aug. 1, 1926, near Stellenbosch, Union of South Africa), statesman who served South Africa as prime minister from 1908 to 1910.

In 1849 Merriman moved with his family to Cape Colony. He was educated at the diocesan college, Rondebosch, and at Radley College, England. He returned to the Cape in 1861, engaged in land surveying, and became a dealer in diamonds and a wine merchant.

Merriman's chief interest, however, was politics. He served as a member of the Cape House of Assembly from 1869 to 1910. An outspoken opponent of confederation, he served in two Cape ministries (1875–78 and 1881–84) and tried in vain to persuade the British government to proclaim a protectorate over South West Africa (Namibia). Advocating Anglo-Boer cooperation, Merriman held a post in the cabinet of his close friend Cecil Rhodes from 1890 to 1893; but after the abortive Jameson Raid (Dec. 29, 1895) into the Transvaal, he broke with Rhodes and became a vigorous opponent of the mining interests and British imperialism. Joining the William Schreiner ministry in 1898, he worked unsuccessfully to avert the South African War (1899–1902), resigning in 1900 over his government's harsh treatment of Cape rebels.

As a spokesman for the anti-imperialist English-speaking population with pro-Afrikaner sentiments, Merriman became the natural leader of the South African Party, which was founded in 1903. Becoming prime minister in February 1908, he undertook the twofold mission of restoring the colony's postwar finances and promoting a unitary constitution for South Africa. He was a member of the delegation that took the Union Bill to London in 1909. Passed over for the premiership in the new Union of South Africa, a disappointed Merriman rejected Louis Botha's offer to join his cabinet. As a private member of the Union Parliament, he supported the governments of Botha and Jan Smuts until he retired in 1924.

Merritt Parkway, innovative and widely copied American automobile highway built between Greenwich and Stratford, Conn., in the 1930s. The Merritt Parkway, a limited-access highway with two traffic lanes in each direction, was contemporary with the German autobahn system, the Pennsylvania Turnpike, and other limited-access highways but was outstanding in realizing the importance of aesthetics, achieved through a combination of an almost continuously curving roadway and attractive wooded and landscaped right-of-way. The parkway's extension inside New York state is the Hutchinson River Parkway and, in Connecticut, the Wilbur Cross Parkway.

Merryman, Ex Parte (1861), in U.S. legal history, American Civil War case contesting the president's power to suspend the writ of habeas corpus during a national emergency.

On May 25, 1861, a secessionist named John Merryman was imprisoned by military order at Fort McHenry, Baltimore, Md., for his alleged pro-Confederate activities. Supreme Court Chief Justice Roger B. Taney, sitting as a federal circuit court judge, issued a writ of habeas corpus on the grounds that Merryman was illegally detained. General George Cadwalader, in command of Fort McHenry, refused to obey the writ, however, on the basis that President Abraham Lincoln had suspended habeas corpus.

Taney cited Cadwalader for contempt of court and then wrote an opinion about Article I, Section 9, of the Constitution, which allows suspension of habeas corpus "when in cases of rebellion or invasion the public safety may require it." Taney argued that only Congress—not the president—had the power of suspension.

President Lincoln justified his action in a message to Congress in July 1861. More importantly, he ignored Taney's opinion and adhered to the suspension of habeas corpus throughout the Civil War. Merryman, however, was later released. The constitutional question of who has the right to suspend habeas corpus, Congress or the president, has never been officially resolved.

Mers el-Kebir, town and port, northwestern Algeria, at the western end of the Gulf of Oran. The town was an Almohad naval arsenal in the 12th century. It was under the rulers of Tlemcen in the 15th century and fell to corsairs in 1492. The town was later contested by the Spanish, Portuguese, and Turks until France gained control of it in 1830.

Mers el-Kebir (Arabic: "Great Harbour") was developed in 1939–56 as a major French naval base. In 1940 most of the French fleet at anchor there was destroyed by British warships to thwart a German takeover of them. Under the terms of the Evian Agreements for Algerian independence in 1962, France was to retain the port for 15 years. Control was relinquished to Algeria, however, in 1968.

Mers el-Kebir lies at the foot of Mount Santon, whose eastern projection forms Mers el-Kebir Point. The port's natural harbour is sheltered from east winds and protected by breakwaters. Pop. (1987 prelim.) 11,002.

Merseburg, city, Saxony-Anhalt *Land* (state), eastern Germany. It lies on the left bank of the Saale River, just south of Halle. Founded about 800 as a frontier fortress against the Slavs, it was a favourite residence of the German kings Henry I the Fowler (d. 936), Otto I, and Henry II. It was the seat of a bishop from 968 until the Reformation (1561) and was chartered in 1188. It passed to Saxony in 1561 and was captured (1631) by the Swedes in the Thirty Years' War. The residence of the dukes of Saxe-Merseburg from 1656 to 1738, it passed to Prussia in 1815. It was heavily bombed in World War II. Merseburg's most notable buildings are the imposing castle (1480–89) and the cathedral, begun in 1015 and dating mainly from the 13th and 16th centuries. The city's industries include brewing, brickmaking, paper milling, and aluminum foil. There is a large chemical works and a power station in adjoining Schkopau. Another large chemical complex is at Leuna, to the south, and there is a technical university (now part of Martin Luther University of Halle-Wittenberg) in Merseburg. Pop. (1994 est.) 41,528.

Mersenne, Marin (b. Sept. 8, 1588, near Oizé, Maine, France—d. Sept. 1, 1648, Paris), French mathematician, natural philosopher, and theologian whose discovery of the Mersenne numbers is considered to have been a pioneering effort to derive a formula that would represent all prime numbers. Although Mersenne numbers represent only some primes, their formula inspired great advances in the theory of numbers.

In 1611 Mersenne joined the Roman Catholic mendicant Order of Minims in Paris, and from 1614 to 1619, he taught philosophy at the Minim convent at Nevers. An ardent opponent of the mystical doctrines of alchemy, astrology, and related arcane arts, he vigorously supported science, defending the philosophy of René Descartes and the astronomical theories of Galileo. He held a post teaching philosophy at the convent L'Annonciade, Paris, and from 1620 he traveled extensively throughout western Europe.

The Mersenne numbers are generated from the formula $2^p - 1$, in which p is a prime. This formula, first proposed by Mersenne in 1644, does not yield a prime number for every prime value given to p, but it has long been of interest in studying primes and finding new ones.

One of Mersenne's most important contributions was his long service as a communication link between philosophers and scientists throughout Europe. Because there were then no scientific journals, men might work a lifetime on the same project, never knowing of one another's existence. Mersenne met regularly and corresponded at length with eminent figures, including Descartes, Girard Desargues, Pierre de Fermat, Blaise Pascal, and Galileo, and it was said that "to inform Mersenne of a discovery, meant to publish it throughout the whole of Europe."

In addition to his work on prime numbers, Mersenne investigated cycloids (certain geometric curves) and proposed to the Dutch physicist Christiaan Huygens the use of the pendulum as a timing device, thus inspiring the pendulum clock. His published works include *La Vérité dans les sciences* (1625; "Truth in the Sciences") and *Harmonie universelle* (1636–37; "Universal Harmony").

Mersey, River, river in northern Tasmania, Australia, rising in the lake district near Mount Pelion East on the Central Plateau. Fed by the Dasher and Fisher rivers, it flows 91 miles (146 km) north, east, and again north before entering its estuary at Latrobe, the head of navigation, and emptying into Bass Strait at Devonport. The stream cuts a gorge up to 2,000 feet (600 m) deep into the face of the plateau, where its steeply falling water is harnessed for hydroelectric power. The Mersey is linked with the Forth and Wilmot rivers and supplies water from its main storage reservoir, Lake Rowallan (1968), to hydroelectric-generating plants on the Forth. Named for the English river, the Mersey flows through a timber district before entering its lower valley, which supports dairying, sheep raising (wool), and fruit and potato farming.

Mersey, River, river formed at Stockport, Eng., by the junction of the Goyt and Tame, two headstreams that both rise at about 1,600 feet (490 m) on the west side of the Pennines, the upland spine of northern England. The Mersey lies entirely below 150 feet (45 m), draining large areas of the Lancashire and Cheshire plains. It flows in a westerly direction through the southern suburbs of Manchester and, at Flixton, receives its major right-bank tributary, the Irwell, in its canalized form as the

Manchester Ship Canal. The Mersey is itself artificially modified by the canal as far as Warrington, where it becomes tidal. At Runcorn, the river receives its major left-bank tributary, the Weaver, and opens out to form a wide estuary more than 30 square miles (75 square km) in area. The estuary is restricted at its seaward end, enabling the tidal movements to prevent the accumulation of silt and so reduce the dredging costs of the Port of Liverpool. This section of the estuary has been tunneled three times: two road tunnels (one opened in 1971) and one railway tunnel link Liverpool (north) with Birkenhead (south). The Mersey enters the Irish Sea after a total course of 70 miles (110 km).

Merseyside, metropolitan county in northwestern England, on both banks of the lower reaches of the River Mersey and centred on the city of Liverpool. It comprises five metropolitan boroughs: Knowsley, St. Helens, Sefton, Wirral, and the city of Liverpool. The areas to the north of the Mersey, including Liverpool, form part of the historic county of Lancashire, while the borough of Wirral to the south belongs to the historic county of Cheshire.

The Mersey estuary, a major inlet of the Irish Sea, is scoured by tides across its narrow neck so that the port of Liverpool, unlike many ports in the northwest, has not been silted up. Liverpool was seen by King John at the beginning of the 13th century as a convenient embarkation point for conquering Ireland. Until then the ill-drained marshlands with low cliffs of glacial till had not encouraged dense settlement, though place-names on the Wirral peninsula (west bank of the Mersey) are a reminder of the 10th-century invasion by Norsemen from Ireland and the Isle of Man.

By the late 17th century many ships sailing out of Liverpool were engaged in the slave trade with the West Indies; by the 19th century the ships were carrying emigrants en route to the New World, and cotton imports and other raw material from the United States were the principal cargoes. As a major centre for transatlantic shipping, Merseyside suffered heavy bomb damage during World War II.

The docks south of Liverpool Pierhead, although in decline after the Great Depression of the 1930s, remained open until 1973. In that year the Royal Seaforth Dock was opened at the estuary mouth, which helped Liverpool maintain its position as one of Britain's most important ports. Liverpool's port activities subsequently declined in the 1980s, however.

Shipbuilding and ship repair grew in the 19th century across the river from Liverpool at Birkenhead on the Wirral. Two ferries, two road tunnels, and an underground railway connect the two banks of the Mersey. The metropolitan area includes the coastal strip as far north as the resort of Southport.

Merseyside is famous for its contribution to national popular culture, not only for entertainers and singers (including the Beatles) but also for two internationally honoured association football (soccer) teams (Everton and Liverpool), the Grand National steeplechase run at Aintree racecourse, and championship golf at Hoylake and among the sand dunes at Royal Birkdale. The inheritance of cultural and religious ties with Ireland and a distinctive local dialect ("scouse") also provide the region with a strong identity. Area 247 square miles (642 square km). Pop. (1998 est.) 1,409,400.

Mersin, formerly MERSINA, also called İÇEL, city and seaport, south-central Turkey. It lies along the Mediterranean Sea at the extreme western end of the Cilician Plain, 40 miles (65 km) west-southwest of Adana.

A town of recent origin, Mersin stands near the site of an unidentified ancient settlement. The ruins of the Roman harbour town of Soli-Pompeiopolis lie immediately to the west. Excavations in a mound called Yümük Tepesi, 2 miles (3 km) north of the modern harbour, indicate settlements in the remote Neolithic (New Stone Age) Period: a village was fortified there as early as *c.* 3600 BC and again during the Old Hittite (*c.* 1750–1460 BC) and New Hittite (*c.* 1460–1200 BC) empires but was abandoned after the foundation of Pompeiopolis.

Mersin's artificial harbour is an outlet for the agricultural products and minerals of the Cilician Plain and southeastern Anatolia. The site was chosen because of its silt-free location and its rail and road connections with the interior. A branch line links Mersin with Adana and the Istanbul–Baghdad railway. The port is connected by ferry to Cyprus. Mersin is the site of one of Turkey's largest oil refineries. Pop. (1997 prelim.) 501,398.

Mersing, port, West Malaysia (Malaya). It lies along the South China Sea at the mouth of the Mersing River. Its predominantly Malay residents live in coastal and riverine fishing villages. There are some local tin-mining settlements and rubber estates. An embarcation point for Pulau Tioman and a regular port of call on the east coastal trade route, Mersing is linked by road inland to Batu Pahat and south to Johor Baharu and Singapore. Pop. (1980) 13,888.

Merta, town, central Rājasthān state, northwestern India. Founded *c.* 1480, it was at one time an important trade centre. The surrounding area was the scene of several battles, including the victory of the Marāṭhās over forces from the states of Jaipur and Jodhpur in 1790, and is the site of many memorial stone pillars. Captured by the Mughal emperor Akbar in 1562, Merta contains a mosque built by him. An agricultural distribution centre, the town has oilseed and cotton mills. Pop. (1991) 31,728.

Mertensia, genus of about 50 temperate North American and Eurasian species of plants in the family Boraginaceae, including the Virginia cowslip, or Virginia bluebell (*M. virginica*), a popular spring-blooming garden and wild flower with drooping, bell-shaped, pink flowers that turn blue. The Virginia cowslip is native in moist woods and wet meadows in eastern North America and has smooth, elliptical leaves and reaches approximately 60 cm (2 feet) high.

Northern shorewort, oyster plant, or sea-lungwort (*M. maritima*), a fleshy, grayish-leaved plant, is about the same height as Virginia bluebell but has smaller flowers that bloom in summer. It grows along pebbly coasts of northern North America and northern Europe. Languid ladies (*M. paniculata*), from western North America, is smaller, hairy, and summer blooming, and it has smaller, more nodding blooms.

Mertensia maritima, known variously as northern shorewort, oyster plant, and sea-lungwort

C. Foord—EB Inc.

Merthiolate (antiseptic): *see* thimerosal.

Merthyr Tydfil, also spelled MERTHYR TUDFUL, industrial town and county borough, southern Wales. It is named after a 5th-century Welsh Christian princess (Tydfil the Martyr) who was slain there. The county borough includes both sides of the deep valley of the River Taff and the surrounding steep hills. The town of Merthyr Tydfil is at the centre of the county borough, which extends in the north into Brecon Beacons National Park. Most of the county borough, including the town of Merthyr Tydfil, lies within the historic county of Glamorgan (Morgannwg), but it includes an area in the north that belongs to the historic county of Brecknockshire (Sir Frycheiniog).

Four large ironworks built after 1757 formed the basis for the town's modern growth. In 1804 Richard Trevithick built the world's first steam locomotive in Merthyr Tydfil. The ironworks were supplemented by coal mining. By 1850 the Dowlais ironworks were the largest in the world. After 1918 the area's coal mining gradually ceased, and the last surviving local steelworks, at Dowlais, closed.

The town's industrial revival dates from World War II, and Merthyr Tydfil now produces a wide range of manufactures, most notably Hoover washing machines. It is an important regional retail and services centre. Area county borough, 43 square miles (111 square km). Pop. (1991) town, 39,482; (1998 est.) county borough, 57,000.

Merton, outer borough of London. Located south of Wandsworth, it was established in 1965 by amalgamation of the boroughs of Mitcham and Wimbledon and the urban district of Merton and Morden. Merton is part of the historic county of Surrey.

The borough was occupied from Anglo-Saxon times or earlier, and remains of the Roman road, now called Stane Street, have been excavated in Morden. Until the dissolution of the monasteries in the 1530s, Morden was a parish under the control of Westminster Abbey, whereas Wimbledon was owned by the archbishop of Canterbury.

Between World Wars I and II substantial residential and industrial growth took place throughout the borough. Wimbledon is internationally known for its annual lawn tennis championships, which began in 1877. Pop. (1998 est.) 184,300.

Merton, Robert C. (b. July 31, 1944, New York, N.Y., U.S.), American economist known for his work on finance theory and risk management, especially in assessing the value of stock options and derivatives. Merton shared the Nobel Prize for Economics in 1997 with Myron S. Scholes (*q.v.*), whose option valuation model, the Black-Scholes formula (developed with economist Fischer Black), provided the foundation for Merton's work. (Upon his death in 1995, Black became ineligible for the Nobel Prize, which is not awarded posthumously.)

In 1966 Merton earned a B.S. in engineering mathematics from Columbia University, where his father, Robert K. Merton, had taught sociology from 1941. He also studied at the California Institute of Technology (M.S., 1967) and the Massachusetts Institute of Technology (Ph.D., 1970), where he taught at the Sloan School of Management (1970–88).

In 1988 he joined the faculty of the Harvard Graduate School of Business Administration and was named John and Natty McArthur University Professor in 1998.

The Black-Scholes formula, published in 1973, showed that a combination of shares and call options (options that give the holder the right to buy a share) could diminish the risk in an investment portfolio. Merton generalized the formula by relaxing certain restrictions set by Black and Scholes, thereby extending its application to other financial areas such as mortgages and student loans. Merton was a principal member of Long-Term Capital Management (LTCM), an investment firm in which Scholes was also a partner. LTCM went on to lose more than $4 billion in 1998 through highly leveraged investments.

Merton, Robert K(ing) (b. July 5, 1910, Philadelphia, Pa., U.S.), American sociologist whose diverse interests included the sociology of science and the professions, sociological theory, and mass communication.

After receiving his Ph.D. from Harvard University in 1936, Merton joined the Harvard faculty, where he developed a theory of deviant behaviour based on different types of social adaptation. He served on the faculty of Tulane University, New Orleans (1939–41), and then accepted an appointment at Columbia University (1941), becoming a full professor in 1947 and being named Giddings professor in 1963. He served as associate director of the university's Bureau of Applied Social Research (1942–71), working with Paul Lazarsfeld, who arrived a year earlier than Merton and headed the new bureau. Lazarsfeld's logic of concept clarification and his methodology of quantitative and qualitative research influenced Merton's orientation to historical studies, and Merton's gift for theory influenced Lazarsfeld's philosophic grasp of the discipline of sociology. They produced major research on methods of improving standards of training for the social sciences.

In *Social Theory and Social Structure* (1949; rev. ed. 1968), Merton defined the interrelationship between social theory and empirical research, advancing a structural-functional approach to the study of society and creating the concepts of manifest and latent function and dysfunction. In the sociology of science, he studied the relationship between Puritan thought and the rise of science, writing *Science, Technology and Society in Seventeenth Century England* (1938; reprinted 1970) and *The Sociology of Science* (1973).

Merton, Thomas, original name of FATHER M. LOUIS (b. Jan. 31, 1915, Prades, Fr.—d. Dec. 10, 1968, Bangkok, Thai.), Roman Catholic monk, poet, and prolific writer on spiritual and social themes, one of the most important American Roman Catholic writers of the 20th century.

Merton's early education was in England and France; after a year at the University of Cambridge, he entered Columbia University in New York, where he earned degrees in 1938 and 1939. After teaching English at Columbia (1938–39) and at St. Bonaventure University (1939–41), he entered the Trappist Abbey of Gethsemani near Louisville, Ky. He was ordained priest in 1949.

Merton's first published works were collections of poems, but international fame occurred after the publication of the autobiographical *Seven Storey Mountain* (1948). His early works were strictly spiritual, but in the early 1960s his writings tended toward social criticism, while many of his later works reveal an insight into Oriental philosophy and mysticism unusual in a Westerner. He was electrocuted by a faulty wire during an international monastic convention in Thailand.

His writings include *Figures for an Apocalypse* (1948), a book of poems; *The Waters of Siloe* (1949), a history of the Trappists; *Seeds of Contemplation* (1949); *The Living Bread* (1956), a meditation on the Eucharist; *Contemplation in a World of Action* (1971), an insightful book of essays; and *The Asian Journal of Thomas Merton* (1973).

Meru, town, central Kenya, located about 110 miles (180 km) northeast of Nairobi. Situated in the Eastern Highlands at an elevation of about 5,300 feet (1,600 m), in a region known for its dense oak forests, Meru lies midway between Mount Kenya on the west and Meru National Park on the east. It is connected by road to Embu and is the tribal centre of the Meru people. Economic activities include the production of wooden and iron agricultural tools, earthenware pottery, and woven goods. Pop. (1989) 94,947.

Meru, Mount, in Hindu mythology, a golden mountain that stands in the centre of the universe and is the axis of the world. It is the abode of gods, and its foothills are the Himalayas, to the south of which extends Bhāratavarṣa ("Land of the Sons of Bharata"), the ancient name for India. The roof tower crowning the shrine in a Hindu temple represents Meru. As the world axis, Mount Meru reaches down below the ground, into the nether regions, as far as it extends into the heavens. All of the principal deities have their own celestial kingdoms on or near it, where their devotees reside with them after death, while awaiting their next reincarnation.

Meru, Mount, volcanic cone (14,978 feet [4,565 m]), northern Tanzania. It is situated 42 miles (68 km) west-southwest of Mount Kilimanjaro, near the Kenyan border. Its extinct crater is easily accessible from Arusha town, which lies at the mountain's southern base. The mountain's densely populated southern and eastern slopes, exposed to the prevailing wind, are well watered, and the fertile volcanic soil supports coffee plantations. There are rain forests on the slopes up to about 9,500 feet (2,900 m).

Merv, ancient city of Central Asia lying near the modern town of Mary, Mary *oblast* (province), Turkmenistan. Mentioned in ancient Persian texts as Mouru and in cuneiform inscriptions as Margu, it was the seat of a satrapy of the Persian Achaemenid Empire. Under the Arabs in the 7th century the city was rebuilt as the capital of Khorāsān and served as a base for Muslim expansion into Central Asia and later China. A great centre of Islāmic learning under the ʿAbbāsid caliphs, Merv attained the zenith of its glory as capital of the Seljuq sultan Sanjar (reigned 1118–57) and his successors. Destroyed by the Mongols in 1221, the city and its irrigation system were rebuilt in the 15th century, but it never regained its former prosperity. Merv was under the Tekke Turkmens when it was occupied by the Russians in 1884.

Merychippus, extinct genus of early horses, found as fossils in deposits from the Middle and Upper Miocene epoch (23.7 to 5.3 million years ago). *Merychippus* descended from the earlier genus *Parahippus,* and a complete evolutionary series is known between the two forms.

The tooth pattern in *Merychippus* is basically the same as that in the modern horse; the teeth became higher and dental cement appeared, which allowed a grazing mode of life. Other developments in the skeleton are also evident: its size increased so that *Merychippus* was almost as large as a modern pony, and the skull became more elongated in a very horselike fashion. The limbs as well became more horselike in proportion and better adapted to running. In some forms the three toes remained comparatively large, but in progressive species of *Merychippus* the toes were short and small. The centre toe was much larger than the others and carried most of the animal's weight. A well-developed hoof was present on the large central toe. Authorities think it is probable that the coloration pattern of *Merychippus* was zebralike.

Méryon, Charles (b. Nov. 23, 1821, Paris, Fr.—d. Feb. 13, 1868, Saint-Maurice), French printmaker whose etchings romantically depicted the life and mood of mid-19th-century Paris.

Included among Méryon's earliest works were drawings of the New Zealand coast that he executed while he was with the French navy. He subsequently employed these studies for etchings. Following his time in the navy, he entered the studio of Alexandre Bléry, who taught him the technique of etching, which, because of Méryon's colour blindness, became the medium of his talent. He earned his living by doing hackwork, and for practice he made studies after Dutch etchers, such as Zeeman and Adriaan van de Velde. He then began the series "Eaux-fortes sur Paris," executed from 1850 to 1854; although Méryon always considered these plates as a set, they were never published as such. Besides these 22 etchings, Méryon produced about 70 others.

Although Méryon is considered a great master of etching, striking in his originality and modernity, he was appreciated by only a few contemporary artists and critics. His prints sold for almost nothing. His life was one of great disappointments and terrible hardships; he became subject to hallucinations, and, shortly after the completion of the Paris series, he was committed to the Charenton mental institution at Saint-Maurice. A partial cure was effected, but he was returned to the asylum in 1867 and committed suicide a year later.

Méryon's rendering of architecture is often visionary, and generally his figures are incidental, like those of a landscape painter; but sometimes, as in his "La Morgue," they tell the story of the picture or, as in "La Rue des Mauvais Garçons," with the two women secretly conversing, at least suggest it. "L'Apsis de Notre Dame" (1855), considered to be Méryon's masterpiece, characterizes his great sensitivity to the effects of light and atmosphere.

Merzifonlu Kara Mustafa Paşa (Ottoman grand vizier): *see* Kara Mustafa Paşa, Merzifonlu.

Mesa, city, Maricopa county, south-central Arizona, U.S. A southeastern suburb of Phoenix, its "tableland" site was settled in 1878 by Mormons who used ancient Hohokam Indian canals for irrigation. The community became the focus of an agricultural and fruit-growing region, developed from a Salt River reclamation project. It experienced rapid growth after World War II; and its basic farm economy diversified to include manufacturing, tourism, and retail trade. It is the site of a Mormon Temple (1927), Mesa Community College (1966), and the University of Arizona's Agricultural Experimental Station. Salt River Indian Reservation is across the river to the north. The Oakland Athletics have their spring training camp there. Inc. town, 1883; city, 1930. Pop. (1990) 288,091.

mesa (Spanish: "table"), flat-topped tableland with one or more steep sides, common in the Colorado Plateau regions of the United States; a butte is similar but smaller. Both are formed by erosion; during denudation, or downcutting and stripping, areas of harder rock in a plateau act as flat protective caps for portions of underlying land situated between such places as stream valleys, where erosion is especially active. This results in a table mountain (mesa) or fortress hill (butte; *q.v.*).

Mesa Central, also called MESA DE ANÁHUAC, or MESA CENTRAL DEL SUR, high plateau region in central Mexico. The Mesa Central comprises the southern section of the Mexican Plateau extending south from the Zacatecas Mountains to the Bajío, a fertile region at the northern base of the Neo-Volcánica Range. Lying at elevations of 6,000 to 7,500 feet (1,800 to 2,300 m), the Mesa Central is considerably higher and wetter than the Mesa del Norte ("Northern Plateau"). In areas of high volcanic activity, numerous blocked streams and rivers have formed extensive shallow lakes and swamps on the mesa; the Toltec name, Anáhuac, means "land on the edge of the water." Significant lakes in the area include Chapala, Pátzcuro, and Cuitzeo. The Mesa Central was explored by the Aztecs in the early 1300s. The area is densely populated and encompasses urban centres such as Guadalajara, León, Queretaro, and Pachuca. A temperate climate, relatively abundant rainfall, and rich alluvial and volcanic soils create favourable agricultural conditions, and much of the land supports extensive farming as well as cattle grazing in some of the drier pockets. Significant crops include corn (maize), beans, wheat, and sugarcane; sugar refineries and grain mills are located in Guadalajara. Other important industries are textiles, cement, and chemicals.

Mesa del Norte, also called NORTHERN PLATEAU, the northern section of the Mexican Plateau, sloping gently upward to the south for more than 700 miles (1,100 km) from the U.S.–Mexico border to the Zacatecas Mountains. Mesa del Norte largely spans the country from coast to coast and is bordered by the Sierra Madre Oriental on the east and the Sierra Madre Occidental on the west. Much of the region is arid land broken by mountains and salt-encrusted flats or depressions, locally called *bolsónes;* the sparse population is largely concentrated in the few irrigable areas such as the upper part of the Salado River valley, where wheat is grown, and the Laguna Basin, which produces much of Mexico's cotton. Other crops include corn (maize), beans, and alfalfa, and large areas of the more arid land are utilized as rangeland. The area yields significant amounts of lead and zinc as well as some iron and silver.

Mesa Verde National Park, national park, in southwestern Colorado, U.S., established in 1906 to preserve notable prehistoric cliff dwellings. Occupying a high tableland area of 52,085 acres (21,078 hectares), it contains hundreds of pueblo (Indian village) ruins up to 13 centuries old. The most striking are multistoried apartments built under overhanging cliffs. Cliff Palace, the largest, was excavated in 1909 and contains hundreds of rooms, including kivas, the circular ceremonial chambers of the Pueblo Indians. Besides the ruins, the park has some very striking and rugged scenery.

Mesa Verde's plant life is adapted to the semiarid climate: piñon-juniper forest, shrubs, and wildflowers. Deer are the most common large animals, and there are a few bears and mountain lions and many smaller mammals. Snakes and lizards also abound, as do birds.

Mesabi Range, largest of three iron ranges in Minnesota, U.S. (the others are Vermilion and Cuyuna), extending for 110 miles (180 km) from Babbitt (east) to Grand Rapids (southwest) at heights varying from 200 to 500 feet (60 to 150 m) with a high point of 2,000 feet (610 m). The great bulk of its iron-ore formation is hard, magnetic taconite, which exists in thick layers up to 3 miles (5 km) wide. By the 1950s reserves of high-grade hematite ore, worked since 1892, were depleted, and the lower grade taconite was economically processed as pellets containing more than 60 percent iron. The chief mining centres are Hibbing and Virginia. Mesabi is an Ojibwa Indian name meaning "giant."

Milt and Joan Mann from CameraMann

Mescalero, Eastern Apache of south-central New Mexico who formerly also had bands in the Davis Mountains of Texas and to the south in the Mexican state of Chihuahua (*see* Apache). The name Mescalero is taken from the mescal (peyote) cactus (species *Lophophora williamsii*), which provided fibre, food, and drink to these essentially hunting-and-gathering people. The Mescalero borrowed some elements of Plains Indian culture, such as the tepee.

Like the other Apachean groups, the Mescalero lacked any centralized tribal organization. The primary organizational unit was the band, which was in turn split into smaller local groups. The bands were small enough so that every individual was aware of his kinship with most if not all other members.

Though as a group they were not noted for their wars with pioneers, some Mescalero, such as Gomez and Chihuahua, resisted encroachment of the settlers. Geronimo's Chiricahua faction included Mescalero, but many Mescalero served as scouts for the frontiersmen.

mescaline, also called β-3,4,5-TRIMETHOXYPHENETHYLAMINE, naturally occurring alkaloid, the active principle contained in the flowering heads of the peyote (*q.v.*) cactus (species *Lophophora williamsii*) of Mexico and the southwestern United States, that has been used as a drug to induce hallucination. The mescaline molecule is related structurally to two hormones secreted by the adrenal glands, adrenaline and noradrenaline; both are catecholamine compounds that take part in the transmission of nerve impulses. Mescaline was isolated as the active principle of peyote in 1896, and its structural resemblance to adrenaline was recognized by 1919.

In experiments mescaline requires 2 to 3 hours for onset of action, and its effects sometimes last for more than 12 hours. The hallucinatory effects vary greatly among individuals and even for a particular individual from one drug session to the next. The variations seem to reflect such factors as the mood and personality of the subject and the setting in which the drug is administered. Hallucinations are usually visual, less often auditory. Side effects include nausea and vomiting. Mescaline is prepared from the peyote cactus by extraction and purification, but it can be synthesized.

Meschke, Michael (b. July 14, 1931, Danzig, Ger. [now Gdańsk, Pol.]), German-born founder and producer of the Marionetteatern ("Marionette Theatre") in Stockholm.

When Meschke was seven years old his family fled to Sweden from Danzig, which had elected a Nazi government. In his school years he became interested in puppetry and in 1951–52 studied in Braunschweig, W.Ger., with Harro Siegel, who at that time conducted the only puppet school in western Europe. Meschke then went to Paris (1953–54), studying with the mime Étienne Decroux, and became a close friend of the mime Marcel Marceau.

Returning to Sweden, he wrote and produced puppet plays and in 1958 acquired from the Stockholm municipal authorities an old theatre that he renamed the Marionetteatern. Over the years he produced dozens of plays, using his own handmade, highly stylized puppets, some operated by strings from above and others operated by rods from below. He also placed puppet operators onstage, dressed in black against black backgrounds or in white against white backgrounds and manipulating luminescent or colourful animated figures. His notable successes include productions of Alfred Jarry's *Ubu Roi* and Bertolt Brecht's *The Threepenny Opera.*

Meselson, Matthew Stanley (b. May 24, 1930, Denver, Colo., U.S.), American molecular biologist notable for his experimental confirmation of the Watson-Crick theory of the structure of deoxyribonucleic acid (DNA).

Meselson obtained his Ph.D. at the California Institute of Technology (Caltech), Pasadena, in 1957. His research, with Franklin W. Stahl, showed that during cell division, the replication of DNA in the cell is "semi-conservative"; that is, the DNA splits into its two component strands, each of which acquires a newly synthesized partner before passing into one of the daughter cells. Bacteria cultured in a nutrient containing a heavy isotope of nitrogen incorporated it in their DNA. When the bacteria were returned to nutrients containing ordinary nitrogen, their reproduction formed cells that had a new medium-weight DNA. (A new technique, density-gradient centrifugation, could be used to separate such molecules by weight.) On heating, this DNA separated into half heavy and half light strands. Meselson and Stahl concluded that the new DNA molecules were composed of one strand of each: the heavy inherited, the light newly synthesized. Meselson was on the staff at Caltech until 1960, when he was appointed associate professor of biology at Harvard University. He continued to study problems in the synthesis of DNA, RNA, and proteins.

Mesene, also called CHARACENE, Persian MESHAN, ancient Parthian vassal state located in the south of Babylonia (modern southern Iraq). After the fall of the Seleucid king Antiochus VII Sidetes in 129 BC, a local prince, Hyspaosines (also called Aspasine, or Spasines), founded the Mesene kingdom, which survived until the rise of the Sāsānian empire. Hyspaosines refortified a town originally founded by Alexander the Great near the junction of the Eulaeus (Kārūn) and Tigris rivers and called it Spasinou Charax ("Fort of Spasines"); in the following centuries it was the main mercantile centre on the Tigris estuary. The chief source of information about Mesene is the series of coins minted by the dynasty; they are dated according to the Seleucid era and make it possible to compile a fairly complete list of local kings, from Hyspaosines (reigned 127–*c.* 121 BC) to Thionesius IV (reigned *c.* AD 111–*c.* 112).

Meseta Central, great interior plateau (*meseta*) of the Iberian Peninsula. With Madrid at its centre, it extends over 81,000 square miles (210,000 square km) and has an average elevation of 2,300 feet (700 m). It constitutes the oldest and most complex geologic formation of the peninsula. Its western slope is gently inclined and forms the river basins of the Douro, Tagus, and Guadiana. The other borders rise abruptly into the Cantabrian Mountains (north) and a series of ranges on the east. A certain symmetry is provided by the tectonic troughs of the Ebro in the northeast and the Guadalquivir in the south, overlooked by various ranges on the east and by the Sierra Morena on the south. The Meseta Central is divided by the block mountains in the centre of the peninsula into the northern high basin of Old Castile and the lower plateaus of New Castile and Extremadura to the south.

There is also contrast in vegetation and economy between the western outcrops of crystalline rocks with poor soils and the eastern plains of limestones and marls that form the major agricultural zones. The southeastern section of the Meseta Central is occupied by the region of La Mancha.

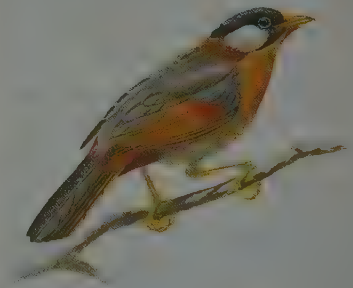
Meshed, also spelled MASHHAD, city, northeastern Iran, lying 3,231 feet (985 m) up in the valley of the Kashaf River. It is an important political and religious centre, visited annually by more than 100,000 pilgrims. The city is linked by rail with Tehrān and has an airport. Meshed serves a rich agricultural region in Iran and is the centre of the northern wool trade, manufacturing carpets for export.

Shrine of imam ʿAlī ar-Riḍā, Meshed, Iran
Fred J. Maroon—Photo Researchers/EB Inc.

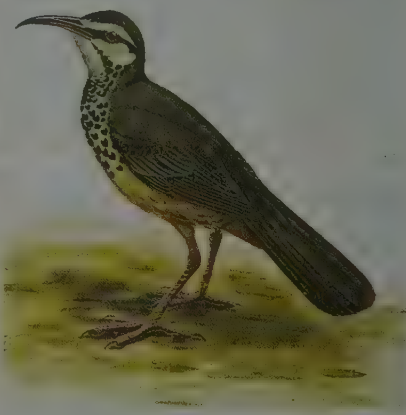
The city is an offshoot of the ancient city of Ṭūs and owes its historical importance to the burial place and shrine of the caliph Hārūn ar-Rashīd (d. AD 809) and that of ʿAlī ar-Riḍā (d. 818), the eighth imam of the Twelver Shīʿite sect of Islām. Although Meshed was severely damaged in a Mongol attack in 1220, the sacred buildings were partially spared, and traces of the earlier structures remain. Shāh Rokh, the son of the conqueror Timur (Tamerlane), did much to beautify Meshed, and his wife erected a mosque that is one of the finest architectural achievements of Iran. In the 16th and 17th centuries, Meshed was sacked by Turkmen and Uzbeks. It was restored by ʿAbbās I (reigned 1588–1629), who encouraged the pilgrimage and beautified the city. Nāder Shāh (reigned 1736–47) made it his capital and made several additions to its buildings. After Nāder's death, Meshed became the capital of a small state controlled by his grandson. Pop. (1986) 1,463,508.

mesia, also called SILVER-EARED MESIA, or SILVER-EAR (species *Leiothrix argentauris*), songbird of the babbler family Timaliidae (order Passeriformes). It is found from Pakistan through the Indochinese peninsula in scrub and secondary jungle. This 15-centimetre- (6-inch-) long bird is olive above and yellow below, with a black crown, silver ear patches, and some crimson on the tail. In groups of 6 to 30 it travels about the forest bushes and canopy seeking berries and peering under leaves for insects. Four eggs are laid in a cup-shaped nest. The mesia has a sweet, whistling song and is sometimes kept as a cage bird.



Silver-eared mesia (*Leiothrix argentauris*)
Drawing by John P. O'Neill

mesite, any of several species of small, brownish ground-dwelling birds constituting the family Mesitornithidae (sometimes Mesoenatidae), order Gruiformes. They are about 30 cm (12 inches) long, have short wings and a thick tail, and inhabit Madagascar. They differ from all other gruiform birds in possessing powder downs, areas of feathers that continuously disintegrate to a fine powder that is used for preening. Mesites go about in pairs or small flocks, picking up seeds and insects. They walk like pigeons, bobbing the head and tail. *Mesitornis* (sometimes *Mesoenas*) *unicolor* and *M. variegata* inhabit forests.

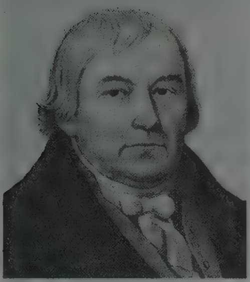


Monias (*Monias benschi*)
Painting by H. Douglas Pratt

Bensch's rail (not a true rail), also called Bensch's monias (*Monias*, or *Mesoenas, benschi*), inhabits brushland. All three species build platform nests low in bushes.

Mesmer, Franz Anton (b. May 23, 1734, Iznang, Swabia [Germany]—d. March 5, 1815, Meersburg, Swabia), German physician whose system of therapeutics, known as mesmerism, was the forerunner of the modern practice of hypnotism.

Mesmer's dissertation at the University of Vienna (M.D., 1766), which borrowed heavily from the work of the British physician Richard Mead, suggested that the gravitational attraction of the planets affected human health by affecting an invisible fluid found in the human body and throughout nature. In 1775 Mesmer revised his theory of "animal gravitation" to one of "animal magnetism," wherein the invisible fluid in the body acted according to the laws of magnetism. According to Mesmer, "animal magnetism" could be activated by any magnetized object and manipulated by any trained person. Disease was the result of "obstacles" in the fluid's flow through the



Mesmer, detail of a lithograph after a portrait, 1810

By courtesy of the Osterreichische Nationalbibliothek, Vienna

body, and these obstacles could be broken by "crises" (trance states often ending in delirium or convulsions) in order to restore the harmony of personal fluid flow. Mesmer devised various therapeutic treatments to achieve harmonious fluid flow, and in many of these treatments he was a forceful and rather dramatic personal participant.

Accused by Viennese physicians of fraud, Mesmer left Austria and settled in Paris in 1778. There he continued to enjoy a highly lucrative practice but again attracted the antagonism of the medical profession, and in 1784 King Louis XVI appointed a commission of scientists and physicians to investigate Mesmer's methods; among the commission's members were the American inventor and statesman Benjamin Franklin and the French chemist Antoine-Laurent Lavoisier. They reported that Mesmer was unable to support his scientific claims, and the mesmerist movement thereafter declined.

Whatever may be said about his therapeutic system, Mesmer did often achieve a close rapport with his patients and seems to have actually alleviated certain nervous disorders in them. More importantly, the further investigation of the trance state by his followers eventually led to the development of legitimate applications of hypnotism.

Mesoamerican civilization, the complex of aboriginal cultures that developed in parts of Mexico and Central America prior to Spanish exploration and conquest in the 16th century. In the organization of its kingdoms and empires, the sophistication of its monuments and cities, and the extent and refinement of its intellectual accomplishments, this civilization, along with the comparable Andean civilization (*q.v.*) farther south, constitutes a New World counterpart to those of ancient Egypt, Mesopotamia, and China.

A brief treatment of Mesoamerican civilization follows. For full treatment, *see* MACROPAEDIA: Pre-Columbian Civilizations.

Archaeologists have dated human presence in Mesoamerica to as early as 21,000 BC. By 11,000 BC, hunting-and-gathering peoples occupied most of the New World south of the glacial ice cap covering northern North America. The cooler climate of this period as compared with that of today supported a grassland vegetation, especially in the highland valleys, that was ideal for large herds of grazing animals. The shift toward sedentary agriculture apparently began after about 7000 BC, when a dramatic global warming caused the glaciers to retreat and tropical forests to overtake the Mesoamerican grasslands.

The gradual domestication of successful food plants—most notably a mutant corn (maize) with husks—over succeeding millennia gave rise to more or less permanent village farming life by about 1500 BC. In addition to corn, crops included beans, squashes, chili peppers, and cotton. As agricultural productivity improved, the rudiments of civilization emerged during the period designated by archaeologists as the Early Formative (1500–900 BC). Pottery, which had appeared in some areas of the region as early as 2300 BC, perhaps introduced from Andean cultures to the south, took on varied and sophisticated forms. The idea of the temple-pyramid seems to have taken root during this period.

Corn cultivation in one area—the humid and fertile lowlands of southern Veracruz and Tabasco, in Mexico—was sufficiently productive to permit a major diversion of human energy into other activities, such as the arts and commerce. Struggles for control of this rich but limited farmland resulted in a dominant landowning class that shaped the first great Mesoamerican civilization, the Olmec (*q.v.*).

San Lorenzo, the oldest known Olmec centre, dates to around 1150 BC, a time when the rest of Mesoamerica was at best on a Neolithic level. The site is most noted for its extraordinary stone monuments, especially the "colossal heads" measuring up to 9 feet (nearly 3 m) in height and possibly representing players in a sacred rubber-ball game.

The period known as the Middle Formative (900–300 BC), during which the La Venta urban complex rose and flourished, was one of increased cultural regionalism. The Zapotec people, for example, attained a high level of development at Monte Albán (*q.v.*), producing the first writing and written calendar in Meso-America. However, at this site, as well as in the Valley of Mexico, the Olmec presence can be widely detected.

In the subsequent Late Formative and Classic periods, lasting until about AD 700–900, the well-known Maya, Zapotec, Totonac, and Teotihuacán civilizations developed distinctive variations on their shared Olmec heritage. The Maya (*q.v.*), for example, brought astronomy, mathematics, calendar making, and hieroglyphic writing, as well as monumental architecture, to their highest expression in the New World. At the same time, Teotihuacán, in the Valley of Mexico, became the capital of a political and commercial empire encompassing much of Mesoamerica.

Teotihuacán power diminished after about 600, and for the next several centuries numerous states vied for supremacy. The Toltecs of Tula (*see* Toltec), in central Mexico, prevailed from about 900 to 1200 (the Early Postclassic Period). Following Toltec decline, a further period of unrest in the Late Postclassic Period lasted until 1428, when the Aztec (*q.v.*) defeated the rival city of Azcapotzalco and became the dominant force in central Mexico. This last native Mesoamerican empire fell to the Spaniards, led by Hernán Cortés (or Cortéz), in 1521.

mesoderm, the middle of the three germ layers, or masses of cells (lying between the ectoderm and endoderm), which appears early in the development of an animal embryo. In vertebrates it subsequently gives rise to muscle, connective tissue, cartilage, bone, notochord, blood, bone marrow, lymphoid tissue, and to the epithelia (surface, or lining, tissues) of blood vessels, lymphatic vessels, body cavities, kidneys, ureters, gonads (sex organs), genital ducts, adrenal cortex, and certain other tissues. *See also* ectoderm; endoderm.

mesofauna, also called MEIOFAUNA, in soil science, intermediate-sized animals (those greater than 40 microns in length, which is about three times the thickness of a human hair). Nematodes, mites, springtails, proturans, and pauropods are typical members of the mesofauna. These animals may feed upon microorganisms, other soil animals, decaying plant or animal material, living plants, or fungi. Most mesofauna feed on decaying plant material; by removing roots they open drainage and aeration channels in the soil. The channels contain mesofaunal fecal material that can be broken down by smaller organisms.

Mesohippus, genus of extinct early and middle Oligocene horses (the Oligocene Epoch occurred from 36.6 to 23.7 million years ago) commonly found as fossils in the rocks of the Badlands region of South Dakota, U.S. *Mesohippus* was the first of the three-toed horses and, although only the size of a modern collie dog, was very horselike in appearance. *Mesohippus* was still a browsing form; its teeth were unsuited to the grazing adopted by later, more advanced horses. *Mesohippus* gave rise to the next stage in horse evolution, the genus *Miohippus*, a larger form that was common in the Late Oligocene (30 to 23.7 million years ago).

mesolite, mineral of the zeolite family, similar to natrolite (*q.v.*).

Mesolithic Period, also called MIDDLE STONE AGE, ancient cultural stage, or level of human development, that existed between the Paleolithic Period (*q.v.*), with its chipped stone tools, and the Neolithic Period (*q.v.*), with its polished stone tools. Mesolithic tool kits are based on chipped stone and often include microliths, very small stone tools intended for mounting together on a shaft. Polished stone occurs in some Mesolithic assemblages, as do a variety of bone, antler, and wooden tools.

Mesolithic usually refers specifically to a development in northwestern Europe that began about 8000 BC, after the end of the Pleistocene Epoch, and lasted until about 2700 BC. Although culturally and technologically continuous with Paleolithic peoples, Mesolithic cultures developed diverse local adaptations to special environments. The Mesolithic hunter achieved a greater efficiency than did the Paleolithic and was able to exploit a wider range of animal and vegetable food sources.

Immigrant Neolithic farmers probably absorbed many indigenous Mesolithic hunters and fishers, and some Neolithic communities seem to have been composed entirely of Mesolithic peoples who adopted Neolithic equipment (these are sometimes called Secondary Neolithic).

There is no direct counterpart to the Mesolithic Period outside northwestern Europe, and the term is no longer used to reflect a hypothetical worldwide sequence of human cultural evolution. *See also* stone-tool industry.

Mesolóngion, also called MISSOLONGHI, town and capital of the *nomós* (department) of Aetolia and Acarnania, Greece. It lies along the Patraïkós Gulf on the shore of a large, shallow lagoon, which is partly given over to fish hatcheries. Seat of a metropolitan bishop of the Greek Orthodox church, the town is notable for two heroic actions in the War of Greek Independence (1821–29) and for its association with the English poet Lord Byron, who died there of fever in 1824. Byron is commemorated by a statue and a monument in the Heroon (war memorial). A long causeway extends southward across the lagoon to deep water at Tourlídha, a port of call. Pop. (1981) 10,164.

mesomorph, a human physical type (somatotype) that is marked by greater than average muscular development, as determined by the physique classification system developed by American psychologist W.H. Sheldon. Although the Sheldon system of classification does not make absolute distinctions between types, a person is classed as a mesomorph if mesomorphy predominates over endomorphy and ectomorphy in his body build. The extreme mesomorph has a square, massive head; broad, muscular chest and shoulders; a large heart; heavily muscled arms and legs; and minimal body fat. He tends to develop muscle easily. His muscular development can usually be distinguished from that of one who has developed his muscles through body-building exercises. *Compare* ectomorph; endomorph.

meson, any member of a family of subatomic particles composed of an even number of quarks and antiquarks. Mesons are sensitive to the strong force (the force that binds the components of the nucleus) because their constituent quarks are strongly interacting. Mesons consist of an even number of quarks with half-integral spin, and so they have integral spin. They vary widely in mass, ranging from 140 MeV to nearly 10 GeV. Various types of mesons have been discovered since their existence was first predicted in 1935 by the Japanese physicist Yukawa Hideki. Of those so far identified, the pi meson and the K meson are the most important. Pi mesons, also known as pions, are chiefly responsible for the strong interactions between the protons and neutrons in atomic nuclei. K mesons, or kaons, have several competing decay modes. Investigations of these processes have led to a better understanding of parity (the property of an elementary particle or physical system that indicates whether or not its mirror image occurs in nature) and its nonconservation.

Mesons serve as a useful tool for studying the properties and interactions of quarks, the fundamental units of matter that constitute all hadrons (any of the subatomic particles that react by the force of strong interaction). Although mesons are unstable, many last long enough (a few billionths of a second) to be observed with particle detectors, making it possible for researchers to reconstruct the motions of quarks. Any model attempting to explain quarks must correctly elucidate the behaviour of mesons. One of the early successes of the Eightfold Way, a forerunner of modern quark models devised by the physicists Murray Gell-Mann and Yuval Ne'eman, was the prediction and subsequent discovery of the eta meson (1962). Some years later the decay rate of the pi meson into two photons was used to support the hypothesis that quarks can take on one of three "colours" (*i.e.,* values of a quantum number). Surprises in meson behaviour are also important, as attested by the study of CP violation (the violation of the combined conservation laws associated with charge [C] and parity [P]) in the K-meson system.

Mesons also provide a means of identifying new quarks. The J/psi particle, discovered in 1974, proved to be a meson made up of a charmed quark and its antiquark. (Up to this time, three quark types had been postulated—namely up, down, and strange.) It was the first manifestation of charm, a new quantum number the existence of which implies that quarks are related in pairs. The subsequent discovery of another heavy meson, called upsilon, revealed the existence of the bottom quark and its accompanying antiquark and gave rise to speculation about the existence of a companion particle, the top quark. Efforts to find this sixth quark type have been unsuccessful. Conclusive proof of its existence would provide investigators with direct evidence in support of the underlying postulates of the prevailing quark model. *See also* quark.

mesonephros, permanent kidney of amphibians and most fish, developing posterior to and replacing the pronephros of the embryonic and larval stages. It is a paired organ consisting of a set of nephrons having capsules that filter blood from the glomerulus and tubules whose cells reabsorb water and nutrients and secrete nitrogenous wastes. Glomeruli are absent in some marine fish; urine then forms solely in the tubules, a process that conserves water. The tubules empty into a long tube, the Wolffian duct, a remnant of the pronephros. In more advanced vertebrates the mesonephros develops in the embryo but is replaced after the 10th week in humans by the metanephros.

Mesopotamia (Greek: "Land Between the Rivers"), region between the Tigris and Euphrates in western Asia. In a specific sense, Mesopotamia is the northern portion of that region from Baghdad, where the rivers come closest to one another, north to the foot of the Anti-Taurus Mountains; more generally, it is the northern portion and the southern portion down to the Persian Gulf including adjacent areas eastward to the Zagros Mountains and westward to the Arabian Plateau. Mesopotamia in general terms constitutes the greater part of what is now Iraq. It was one of the cradles of human civilization.

A brief treatment of Mesopotamia follows. For full treatment, *see* MACROPAEDIA: Mesopotamia, History of Ancient.

Archaeological excavations in Mesopotamia, conducted since about 1840, have revealed evidence of settlement back to about 10,000 BC. Favourable geographic circumstances allowed the peoples of Mesopotamia to pass from a hunter-gatherer culture to a culture based on husbandry, agriculture, and permanent settlements. Trade with other regions also flourished, as indicated by the presence in early burial sites of metals and precious stones not locally available. Irrigation techniques, pottery and other crafts, and building methods based on clay bricks were developed to a high level, and elaborate religious cults evolved. Two epochal developments occurred in relatively rapid succession during the 4th millennium BC: the birth of the city and, about 3000 BC, the invention of writing. Both took place in southern Mesopotamia in a region occupied by the Sumerians.

Excavations of Sumerian cities—Eridu, Kish, Uruk, Isin, Lagash, Ur, and others—have recovered thousands of clay tablets inscribed with the characteristic cuneiform writing of the region. The earliest tablets are inventories of goods and simple records of transactions. Later tablets are dictionaries, grammars, religious and scientific works, king lists, and literature. Many tablets record the triumphs of kings. One of those kings, Sargon of the city of Akkad, fought wars of conquest from the Mediterranean to the Zagros and ruled over history's first empire. The Akkadians were a Semitic people, and with their rise the Akkadian language became a major literary medium.

Akkadian rule lasted apparently little more than two centuries. Subsequently the chief power in Mesopotamia resided in the third dynasty of Ur (*c.* 2112–2004 BC), the more or less parallel dynasties of Isin and Larsa (to *c.* 1763 BC), and then in Babylon, which gave its name to the southern portion of Mesopotamia. The outstanding ruler of Babylon was Hammurabi (*c.* 1792–*c.* 1750 BC), who is best known for the code of laws he had inscribed on a great stela. In other areas as well the Old Babylonian Period was one of intellectual accomplishment.

From about 1600 to 1450 BC Babylonian culture declined as peoples known as the Hurrians and the Kassites migrated into Mesopotamia and established themselves as rulers. Some time after 1500 BC, the Mitanni kingdom extended its rule over much of northern Mesopotamia. The language of the kingdom was Hurrian, but its rulers may have been of Aryan origin. Toward the end of the 15th century BC, the city of Ashur in northern Mesopotamia, a region that came to be known as Assyria, began its rise. By 1350 BC the Assyrian empire was well-established, and successive kings, including Adad-nirari I (*c.* 1295–*c.* 1264), Shalmaneser I (*c.* 1263–*c.* 1234), and Tukulti-Ninurta I (*c.* 1238–*c.* 1197), conquered large areas from the Mitanni kingdom, the Kassites, and the Hittites. They achieved an uncertain dominance over much of Babylonia. Nonetheless, another Babylonian dynasty, known as the 2nd dynasty of Isin, revived the greatness of the Old Empire under Nebuchadrezzar I (*c.* 1119–*c.* 1098) and others. Assyria reached new heights of power under Tiglath-pileser I (*c.* 1115–*c.* 1077) and Ashurnasirpal II (883–859), the latter of whom also fostered great works of architecture in his capital, Kalakh.

An Assyrian usurper who took the name Tiglath-pileser III (746–727 BC) laid the foundation for the vast Neo-Assyrian empire by subduing the Aramaeans who had settled much of Babylonia and then conquering Urartu, Syria, Israel, and other areas. In 729 he took the crown of Babylon for himself. The empire reached its zenith under Esarhaddon, who conquered Egypt in 671, and Ashurbanipal (668–627), but its decline was remarkably rapid after that; under attack by Medes, Scythians, and Babylonians, the Assyrian empire was crushed in 609.

Babylon enjoyed one last period of glory under a dynasty of Chaldeans founded by Nabopolassar (626–605 BC). His son Nebuchadrezzar II (605–561) is best known for his destruction of Jerusalem in 588 or 587 and his forcing of thousands of Jews into the "Babylonian exile." The Neo-Babylonian empire ended in 539, when Nabonidus surrendered to Cyrus II of Persia.

Under the Persians and Alexander the Great, Babylon was a rich provincial capital whose cultural influence extended far beyond Mesopotamia. The Seleucid kings, who ruled Mesopotamia from about 312 BC until the middle of the 2nd century BC, patronized Mesopotamia's temples, and the cuneiform tradition continued. The interaction of Babylonian and Greek cultures in this period after Alexander was particularly fruitful in the field of astronomy, long a Babylonian specialty. In the 2nd century BC Mesopotamia became part of the Parthian empire. It became a buffer region between the Parthians and their successors the Sāsānians on one hand and the Roman Empire on the other. In the 7th century AD the region was conquered by Muslim Arabs. From that time forward the history of Mesopotamia is that of Iraq.

Mesopotamia, narrow, northeast-to-southwest-oriented geographic region of northeastern Argentina, comprising Misiones, Corrientes, and Entre Ríos *provincias,* bounded on the west by the Gran Chaco of Argentina, on the north by Paraguay, on the northeast by Brazil, and on the southeast by Uruguay. Its name, meaning "between the rivers" in Greek, is derived from its being between the Paraná River (on the southwest to north) and the Uruguay River (on the southeast to northeast). In the northeast (or Misiones *provincia*) Mesopotamia consists of a southeastward extension of the Paraná Plateau of Brazil covered with subtropical evergreen rain forest. Its several rivers plunge over the edges of the basalt plateau to create spectacular falls, such as Iguazú. Corrientes and Entre Ríos *provincias* differ from Misiones in several respects. Their land surface, like that of Uruguay to the east, consists of rolling, grass-covered hillocks rising from densely wooded and marshy lowlands. The region was originally colonized by Spanish settlers returning from Asunción, Paraguay, to refound Buenos Aires in the late 16th century; and in the 19th century many agriculturists of German, Italian, and Swiss descent settled in the region.

Southern Mesopotamia is one of Argentina's leading producers of wool and flax, and cattle are raised. The production of rice and oranges centres on the city of Corrientes. Rapids, sandbars, and shifting channels in the Paraná and the Uruguay rivers hinder their use as transportation arteries, necessitating transshipment of cargo to shallow-draft vessels. The highway network is fairly extensive, but roads are generally of poor quality. A rail line linking Buenos Aires and Asunción traverses eastern Mesopotamia. The hydroelectric potential of the rivers bordering Mesopotamia was finally being realized in the early 1980s with the completion of the Salto Grande complex on the lower Uruguay and the construction of the giant Apipê-Yaciretá complex on the upper Paraná. Pop. (1983 est.) 2,284,000.

Mesopotamian mythology, the myths, epics, hymns, lamentations, penitential psalms, incantations, wisdom literature, and handbooks dealing with rituals and omens of ancient Mesopotamia.

A brief treatment of Mesopotamian mythology follows. For full treatment, *see* MACROPAEDIA: Middle Eastern Religions, Ancient.

The literature that has survived from Mesopotamia was written primarily on stone or clay tablets. The production and preservation of written documents were the responsibility of scribes who were associated with the temples and the palace. A sharp distinction cannot be made between religious and secular writings. The function of the temple as a food redistribution centre meant that even seemingly secular shipping receipts had a religious aspect. In a similar manner, laws were perceived as given by the gods. Accounts of the victories of the kings often were associated with the favour of the gods and written in praise of the gods. The gods were also involved in the establishment and enforcement of treaties between political powers of the day.

A large group of texts related to the interpretation of omens has survived. Because it was felt that the will of the gods could be known through the signs that the gods revealed, care was taken to collect ominous signs and the events which they preached. If the signs were carefully observed, negative future events could be prevented by the performance of appropriate apotropaic rituals. Among the more prominent of the omen texts are the *shumma izbu* texts ("If a fetus . . . ") which observe the birth of malformed young of both animals and humans. Later a similar series of texts observed the physical characteristics of any person. Dream omens are represented but are relatively rare. There are also omen observations to guide the physician in the diagnosis and treatment of patients. The largest collection of omens, containing more than 100 tablets, is entitled "If a City is Situated on a Hill . . . "

Several types of prayers have also been preserved. Prayers begin with praise of the deity, then move to the request or complaint of the worshipper, and end with anticipatory praise of the deity for the deliverance which is expected. Other prayers were conjurations to rid the worshipper of various maladies through the intervention of the gods. Some prayers were laments while others praised a given deity.

A few explicitly ritual texts have survived. Significant in the Babylonian new year festival was the reading of the Creation Epic, entitled *Enuma Elish.* These tablets begin with a genealogy of the gods followed by an account of the creation of heaven and earth from the body of Tiamat who had been slain by Marduk. The rise of Marduk to rulership over the gods is the underlying theme of this epic. As part of his organization of the universe, mankind was created from the blood of Kingu, the cohort of Tiamat, and Babylon was established as Marduk's city.

Another famous text is the Gilgamesh Epic. The 12 tablets of this epic begin and end at the walls of Uruk, the city which Gilgamesh founded. The story itself tells of the exploits of Gilgamesh and his friend Enkidu. Prominent among these adventures is the defeat of the monster Humbaba, guardian of the Cedar Mountain. With the death of Enkidu, Gilgamesh turns his efforts toward a quest for immortality which eventually brings him into contact with such figures as Utnapishtim, who, because he had survived the Flood, was granted immortality. Three times Gilgamesh nearly attains his goal only to have it slip away.

Several other stories from Mesopotamia deal with the theme of immortality. In the Myth of Adapa, Adapa was summoned to the gods because he had broken the wings of the South Wind. Due to the warning of his divine father, Ea, he refused to eat or drink the food of the gods offered to him which would have granted him immortality. A different type of immortality was related in the story of Etana, the king of Kish, who was without children. In order to reach the Plant of Birth, he freed an eagle from captivity and rode its back to heaven.

Other Mesopotamian myths include the story of Atrahasis, a wise man who was saved from the Flood after being warned by one of the gods to build a ship to save himself. The myth of Ishtar's Descent and return from the underworld was evidently connected to the cycle of fertility. The story of Nergal and Ereshkigal told how Nergal became the ruler of the underworld. The Epic of Irra explained how Marduk, the god of Babylon, left the city in charge of other deities, which led to the destruction of the city. The epic ends with the return of Marduk and the renewed prosperity of the city. The work "Let Me Praise the Lord of Wisdom" has been compared to the Book of Job and describes the sufferings of a prince abandoned by his god. Praise to the god (Marduk) becomes the focus when the situation is later reversed.

Mesopotamian religion, the religious beliefs and practices of the Sumerians and Akkadians, and later their successors, the Babylonians and Assyrians, who inhabited ancient Mesopotamia.

A brief treatment of Mesopotamian religion follows. For full treatment, *see* MACROPAEDIA: Middle Eastern Religions, Ancient.

The deities of the earlier Sumerians tended to be localized, centring around the subsistence of the community. A primary concern in this and later periods was the fertility of the fields, waters, and flocks. During this period, the external manifestation of the deity took the form of the phenomenon which the deity represented. For example, the deity associated with the rain cloud was pictured as a dark, lion-headed bird hovering in the sky.

The Assyrian and Babylonian gods did not displace those of the Sumerians but were gradually assimilated into the older system. The gods were seen to be active in the history of the area and within the changing relationships of the various city-states in the Tigris–Euphrates Valley. With the development of the extensive empires of Babylon and Assur, the model of the king was used to express the transcendence of the deity. In this later period, the deities were conceived in anthropomorphic terms. The image of the deity, in which the presence of the deity resided, was fed and clothed and waited upon in a manner analogous to that of the king and his court. Just as for the king, the primary responsibilities of the deity were fertility and security.

National religion was organized around the care and feeding of the deity in his temple. In addition to its function as a religious centre, the temple also functioned as a food redistribution centre under royal control. While many of these temples may have been fairly modest, some, such as the temple of Marduk in Babylon named Esagila, achieved worldwide fame. The religion practiced in these temples was not generally public. Only on special days was the image of the deity brought out of the temple and paraded through the streets before the citizens. On a daily basis, worship was carried out by the priests within the temple which was conceived of as the house of the deity. Possibly the most notable of the religious buildings of Mesopotamia is the ziggurat. Unfortunately, its function in the religion of the area is not known.

Surrounding the deity in his temple were a number of officials connected with the cult. The first among these was the king himself, who functioned as the chief priest of the nation's deity. The king's role was particularly important at the new year festival held in the spring of the year in which the kingship was renewed and the triumph of the deity over the powers of chaos was celebrated. In these rituals it appears that the role of the deity was played by the king. Among the rituals was the "sacred marriage" which ensured fertility for the following year. Over 30 types of other cultic personnel are mentioned, including priests, priestesses, and personnel in charge of incantations and divination. An elaborate system of determining the will of the gods through the observation of omens was developed, a major element of which was haruspicy, the reading of the entrails of sacrificial animals.

Although the number of deities represented in the Mesopotamian pantheon numbered in the hundreds, a relatively small number of deities played a prominent role in the texts. Especially important among the older gods were Anu, the god of heaven, who was the oldest of the gods; Enki, later identified with the Akkadian god Ea, who was the god associated with water; and Enlil, the earth god who apparently presided over the divine assembly. As was common in the ancient Middle East, these deities were associated with particular cities: Anu with the city of Uruk, Enki with Eridu, and Enlil with Nippur.

In addition to these old, well-established deities, the pantheon also contained newer deities. As the political fortunes of a city increased, so did the stature of the associated deity. Marduk, the deity of Babylon, appears to have received many of the characteristics of an older god as the city of Babylon became predominant in the political affairs of Mesopotamia. A similar pattern can be observed for Ashur as Assyria gained political domination. It may be noted that while Mesopotamian religion remained polytheistic throughout, there were tendencies toward henotheism in which a deity such as Marduk was ascribed all the characteristics associated with the lesser gods.

A number of lesser deities were active in the Mesopotamian pantheon. Most prominent among the astral deities were Shamash, the sun deity worshipped in Larsa and Sippar, and Sin, the moon god associated with Ur and Harran. Because of their careful observation of the heavenly bodies, the Mesopotamians were famous in their day as astrologers. Other deities included Adad, the storm god worshipped under a variety of names, especially in Assyria and to the west; Nergal, who was regarded as the ruler of the underworld along with his consort Ereshkigal; and Tammuz (Dumuzi), who was a fertility god. Particular mountains, trees, rivers, and even certain man-made items such as the plow were also considered sacred.

Mesosaurus, extinct genus of early reptiles found as fossils in Late Pennsylvanian and Early Permian deposits (the Pennsylvanian Period ended 280,000,000 years ago and preceded the Permian Period). *Mesosaurus,* an elongated, slim, aquatic animal about one metre (3 feet) long, lived in freshwater lakes and ponds. It had a long and narrow skull and tail, which probably was employed for propelling the animal through the water. The many long, pointed teeth present may have strained small crustaceans from water drawn into its mouth;

they were too fragile to be effective for biting. The limbs and feet were primitive in form, but it is thought that webbing was present between the toes to aid in swimming. It is probable that the mesosaurs seldom, if ever, ventured onto land. Fossil mesosaurs occur only in South African and South American freshwater deposits. Because it is unlikely that the mesosaurs could have traversed broad stretches of open ocean, their geographic distribution corroborates other evidence that the continents of the Southern Hemisphere formerly were joined together. It is thought that the mesosaurs represent an early side branch of reptilian development.

Mesosaurus braziliensis

By courtesy of the American Museum of Natural History, New York

mesoscaphe, diving vessel built by the Swiss scientist Jacques Piccard that suspended itself automatically at predetermined depths. The first mesoscaphe was built for the 1964 Swiss National Exhibition in Lausanne and designed as a tourist submarine for 40 passengers. Although it could descend to more than 600 m (2,000 feet), most of the mesoscaphe's 1,100 descents into Lake Geneva during 1964 and 1965 reached only about 90 m (300 feet). A second and smaller mesoscaphe, equipped to remain submerged a month or more, was submerged in Florida and drifted underwater to Nova Scotia in a successful study of the Gulf Stream in the late 1960s.

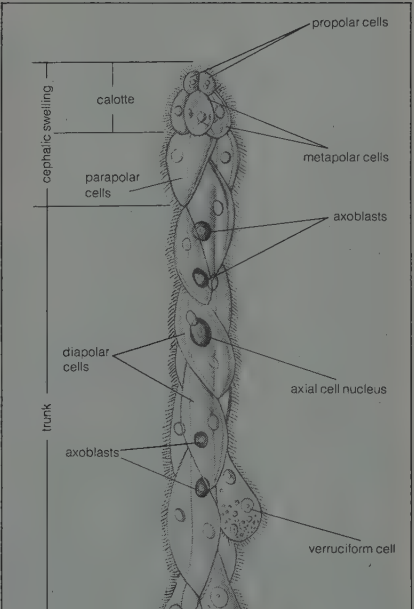
mesosphere, region of the upper atmosphere between about 50 and 80 km (30 and 50 miles) above the surface of the Earth. The base of the mesosphere is defined as the temperature maximum existing at the top of the stratosphere, with the boundary between the two regions usually called the stratopause but occasionally the mesopeak. The mesosphere extends upward to the next temperature minimum, which defines the base of the thermosphere; the boundary between the two regions is called the mesopause.

The amount of oxygen, nitrogen, and carbon dioxide in the mesosphere is essentially the same as that in the levels of the Earth's atmosphere immediately above the Earth's surface. The principal differences are that there is apparently very little water vapour in the mesosphere, and the mesosphere contains higher percentages of ozone than the lower levels.

mesozoan (phylum Mesozoa), any of approximately 50 species of small, ciliated, multicellular animals that are parasitic in marine invertebrates. These wormlike organisms lack digestive, respiratory, nervous, and excretory systems; their bodies consist of two layers of as few as 20 to 30 cells each. Both sexual and asexual reproduction occur. Their relationship to other phyla is obscure as it is not known whether their simple structure is primitive or, as a result of their parasitic existence, degenerate (*i.e.*, changed gradually into a lower form). Some authorities, however, have suggested a link with the phylum Platyhelminthes, a group of flatworms.

There are two distinct mesozoan classes, the Dicyemida and the Orthonectida, which are very different in morphology and life history. Dicyemids, such as the genus *Pseudicyema*, are parasitic in the kidneys of squids and octopuses. Orthonectids, such as *Rhopalura*, occur in a variety of marine invertebrates, *e.g.*, brittle stars, bivalve mollusks, and polychaete annelids. Recently some scientists have suggested that the two classes are not closely related and constitute two separate phyla.

In both the dicyemids and the orthonectids, the number and arrangement of cells is relatively constant for any given species. This definitive cell number is attained during embryonic development. Growth, therefore, consists of the enlargement and differentiation of existing cells. In both groups, chromatin (the material that comprises chromosomes) elimination occurs during early cleavage divisions from the cell line that will give rise to somatic cells.



Young dicyemid

From *The Encyclopedia of the Biological Sciences* by Peter Grey © 1961 by Litton Educational Publishing, Inc.; reprinted by permission of Van Nostrand Reinhold Co.

Both groups are very widely distributed wherever appropriate hosts occur in shallow-bottom environments of the sea. They are not found in hosts in open-sea environments, nor have they been found in hosts from tropical coral islands. In many regions, dicyemids infect entire populations of bottom-dwelling cephalopods, such as squids and octopuses. On the other hand, orthonectids infect only a small percentage of their hosts in a given region. In orthonectids, agametes (asexual reproductive cells), formed during the plasmodial stage, give rise to sexual adults that leave the host for a brief free-swimming period, during which the females are impregnated. The fertilized eggs develop into ciliated larvae that infect new hosts, giving rise to new plasmodia. While in the host, the plasmodia pass through a period of asexual reproduction, forming agametes before adults appear once more.

Dicyemids have a more complex life cycle. Two reproductive phases occur in the cephalopod host. During a phase called the nematogen phase, agametes give rise to wormlike larvae similar to their parents. These nematogens remain in the same host, thus increasing the parasite population. In the next phase, known as the rhombogen phase, a few axoblasts give rise to minute organisms known as infusorigens; these are reduced hermaphroditic individuals that remain in the axial cell of the rhombogen and form sperm and egg cells. The zygotes develop into ciliated infusoriforms, or swarm larvae, which escape from the parent rhombogen and from the cephalopod.

Mesozoic Era, the second of the Earth's three major geologic eras of Phanerozoic time and the interval during which the continental landmasses as known today were separated from the supercontinents Laurasia and Gondwana by continental drift.

A brief treatment of the Mesozoic Era follows. For full treatment, *see* MACROPAEDIA: Geochronology.

The Mesozoic Era saw the evolution of widely diversified and advanced flora and fauna, quite different from those that had developed earlier during the Paleozoic Era and would develop later during the Cenozoic Era. It lasted from about 245 to 66.4 million years ago and included the Triassic Period, the Jurassic Period, and the Cretaceous Period (*qq.v.*).

By mid-Mesozoic time, Laurasia, which included most of North America and Eurasia, was completely separated from Gondwana in the Southern Hemisphere by the Tethys Sea. Mesozoic rocks became widespread on every continent, and marine deposits were laid down by marine transgressions, which resulted in shallow epicontinental seas during periods of high sea level. Marine deposits were also laid down in geosynclines (large linear troughs) along the coasts of eastern North America and the Gulf of Mexico, on the margins of Eurasia and Gondwana, and around the rim of the present-day Pacific Ocean basin.

Reptiles were the dominant terrestrial form of life during the Mesozoic Era. In the Triassic Period there were the labyrinthodonts, large, clumsy amphibians living mostly in water, but they died out suddenly, leaving the toads and frogs, which eventually flourished. The cotylosaurs, or "stem reptiles," which had originated in the Late Carboniferous Epoch (320 to 286 million years ago), differentiated into the major reptile lines, leading to turtles, the major marine groups, the mammallike therapsid forms, and the thecodonts.

It was from the thecodonts that the best-known reptiles of the Mesozoic Era evolved—namely, the dinosaurs. During the Jurassic Period, the dinosaurs developed into huge and impressive forms. These included the herbivorous *Apatosaurus* and *Diplodocus,* the armoured *Stegosaurus,* and the carnivorous, bipedal *Allosaurus.* Cretaceous dinosaurs were even more abundant and diversified than those of the Jurassic. They included large herbivores like *Iguanodon,* the armoured *Ankylosaurus,* and the horned *Triceratops,* together with the duckbill hadrosaurs and small, lightly built, bipedal forms such as *Ornithomimus.* The best-known carnivore of the Cretaceous was the formidable *Tyrannosaurus.* The dinosaurs flourished throughout the Cretaceous Period until, in one of the great mysteries of paleontology, they suddenly became extinct at the end of the period.

The pterosaur, a creature with batlike wings, was the forerunner of the true fliers, the birds, and was one of the most unusually adapted reptile forms. Aerodynamically inefficient with their large, spreading, membranous wings, pterosaurs were little more than gliders that launched themselves from high places.

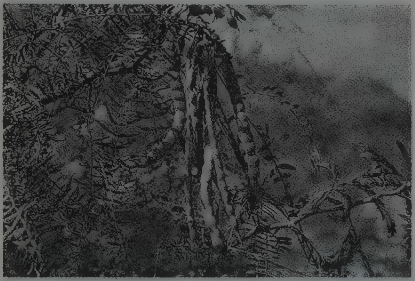
That birds did, in fact, evolve from reptile forms is evidenced by one of the most spectacular fossils ever found, that of the *Archaeopteryx,* the earliest known bird, which clearly possesses not only reptilian features but also, in extraordinary definition, the feathers that birds developed from reptilian scales.

The aquatic reptiles of the Mesozoic Era were widely diversified and thoroughly adapted to their marine environment. Among the most notable large-sized forms were the nothosaurs, placodonts, ichthyosaurs, plesiosaurs, and mosasaurs. Some forerunners of modern fish evolved during the Mesozoic. The most primitive form of the bony fishes was the Chondrosteiformes, which became extinct. They are represented in modern times by the sturgeon. The holost fishes replaced the chondrosts, but they, too, declined in numbers, and only a few modern forms, such as the Mississippi garpike, survive them. The teleosts, or bony fishes, were the most successful marine vertebrates; they became dominant in the Late Cretaceous Epoch and are well represented today. Probably the best-known survivors are the modern shark varieties that emerged during the Mesozoic. Some of the forms are little changed from their Jurassic and Cretaceous ancestors.

Among marine invertebrates the most important were the ammonoids, Mesozoic relatives of the pearly nautilus, which flourished in great diversity. Their straight or coiled, many-chambered forms are a valuable index to Mesozoic rocks, since they often serve to identify widely separated but contemporaneous stratigraphic forms. The ammonoids were almost as much a Mesozoic phenomenon as the dinosaurs, and they, too, died out suddenly at the end of the Cretaceous Period.

Mesquite, city, Dallas county, northeastern Texas, U.S., adjacent to the city of Dallas (west). It was established in 1873 when the Texas and Pacific Railway acquired land for the townsite (named for the mesquite shrubs that once covered the area), built a depot, and offered lots for sale. The city developed as a residential and industrial centre with many of its residents employed in Dallas, and it experienced rapid expansion after 1950. Tourist attractions include a (seasonal) weekend rodeo and an annual balloon festival. Mesquite is the seat of Eastfield College (1970). Pop. (1994 est.) 113,631.

mesquite, any of the spiny, deep-rooted shrubs or small trees constituting the genus *Prosopis* of the pea family (Fabaceae). They form extensive thickets in areas from South America into the southwestern United States. Two races occur, one low—called running mesquite—and the other often growing into trees 15 m (50 feet) tall. The plants' roots penetrate depths of as much as 20 m (70 feet) in search of water. Their trunks may be 45 cm (18 inches) in diameter but more commonly are smaller or shrublike. In warmer parts of the United States the mesquite is considered a pest and is eradicated.



Mesquite (*Prosopis*)
Leonard Lee Rue III

The compound leaves consist of many narrow olive-green to white hairy leaflets. The flowers occur in dense, cream-coloured catkins about 8 cm (3 inches) long and are followed by clusters of long, narrow, pale yellow beans 15–20 cm long. The beans, which contain a sweet pulp, are eaten by cattle. The wood of the mesquite, formerly used in railroad ties, is without economic value other than for unusual furniture and trinkets and for aromatic firewood.

Mesrop Mashtots, SAINT, Mesrop also spelled MESROB, (b. *c.* 360, Hatsik, Armenia [modern Muş, Tur.]—d. Feb. 17, 440; Western feast day, Thursday following 4th Sunday after Pentecost, and Monday following 3rd Sunday after the Assumption; Armenian feast day, February 19), monk, theologian, and linguist who, according to tradition, invented the Armenian script and helped establish Armenia's golden age of Christian literature.

After studying classical languages with the patriarch Nerses I, Mesrop Mashtots began a monastic existence about 395. He was ordained a priest, maintained a lifelong esteem for the ascetic life, and founded several monasteries. He spread the Gospel in remote areas of Armenia and suppressed Mazdaism, a religion descended from Zoroastrianism. Later, he served as chancellor to King Vramshapuh, who supported him in systematizing or inventing the definitive 36-character Armenian alphabet, following a Greek model. (Two letters were added later.) This alphabet was initially used to translate from the Greek the first popular Armenian Bible, the "Mesropian" Bible (*c.* 410). Mesrop Mashtots himself was responsible for translating the New Testament and the Old Testament book of Proverbs. He subsequently revised the entire text.

Mesrop Mashtots dispatched his circle of scholars to Constantinople (modern Istanbul), Alexandria, and Rome in search of biblical and literary manuscripts. A collection of biblical commentaries, translations of patristic works, and liturgical prayers and hymns constructed on an eight-tone scale is credited to him, corroborating his reputation for having laid the foundation of a national Armenian liturgy.

Messager, André, in full ANDRÉ-CHARLES-PROSPER MESSAGER (b. Dec. 30, 1853, Montluçon, France—d. Feb. 24, 1929, Paris), French conductor and composer whose operettas achieved popularity in France and England.

Messager established his reputation with his operetta *La Béarnaise* (performed Paris, 1885; London, 1886). Between 1890 and 1926 he produced 14 operettas, including *Madame Chrysanthème* (1893; on a plot similar to Puccini's *Madama Butterfly*), *Mirette* (1894), and *Monsieur Beaucaire* (1919). Of his three ballets *Les Deux Pigeons* (1886) was especially well known. He wrote in a light, elegant style that was characteristically Parisian. He became director of the Opéra-Comique in Paris in 1898, then artistic director of the Royal Opera, Covent Garden (1901–06), and later associate director of the Paris Opéra. He conducted the first performance (1902) of Claude Debussy's *Pelléas et Mélisande*. His wife was the Irish composer Hope Temple (Dotie Davies; 1859–1938).

Messager, Charles: *see* Vildrac, Charles.

Messali Hadj, Ahmed (b. 1898, Tlemcen, Alg.—d. June 3, 1974, Paris, France), revolutionary Algerian nationalist leader.

Messali emerged in 1927 as the head of an Algerian workers' association in Paris and spent most of the rest of his life forming pro-independence organizations, agitating both in France and Algeria, suffering imprisonment, and taking part in underground activities. Messali's first group, the Étoile Nord-Africaine (North African Star), was dissolved by the French in 1929 after he called for revolt against their colonial rule. In the mid-1930s he founded the Parti Populaire Algérien (PPA; Algerian Popular Party), which was suppressed only to reemerge in 1946 as the Mouvement pour le Triomphe des Libertés Démocratiques (MTLD; Movement for the Triumph of Democratic Liberties). His influence, however, declined dramatically in the postwar period. In 1954 he formed the Mouvement National Algérian (Algerian National Movement), but this organization was unable to compete with the Front de Liberation Nationale (National Liberation Front), a rival party, which came to lead the Algerian struggle for independence. He became politically isolated and spent his final years in Paris.

Messalina Valeria, Messalina also spelled MESSALLINA (b. *c.* AD 22—d. 48), third wife of the Roman emperor Claudius, notorious for licentious behaviour and instigating murderous court intrigues. Born into a patrician family, she was married to Claudius before he became emperor. They had two children, Octavia (later Nero's wife) and Britannicus. Early sources maintain that Messalina allied herself

Messalina, marble bust; in the Uffizi, Florence
Alinari—Art Resource

with Claudius' freedmen secretaries to dominate the Emperor and to gratify her avarice and lust. In 42, Messalina caused Claudius to condemn to death a senator, Appius Silanus, who had slighted her advances. This heightened tension between Emperor and Senate and prepared the way for a reign of terror in which many senators were executed after they had been denounced by Messalina. When she caused the death of Claudius' freedman secretary, Polybius, however, the other freedmen turned against her. The correspondence secretary, Narcissus, managed to have her put to death by convincing Claudius that she and her lover, Gaius Silius, had secretly married and were plotting to seize power.

Messalla Corvinus, Marcus Valerius (b. *c.* 64 BC—d. AD 13), Roman aristocrat and patron of literature.

Messalla was proscribed by the Second Triumvirate in 43, but he escaped to the camp of Brutus and Cassius, and after their defeat at Philippi (42) went over to Mark Antony. Later he joined Octavian and campaigned for him against Sextus Pompeius (36), the Illyrians (35–34), and the Alpine Salassi (34–33). Elected consul with Octavian, in place of Antony, for 31, he fought against Antony in the Battle of Actium (31). Messalla conquered Aquitania (in modern southwestern France) as proconsul and later held eastern commands. Becoming *curator aquarum* (superintendent of aqueducts) in 11, he restored the Via Latina between Tusculum and Alba and reconstructed several buildings.

As a literary patron Messalla included the poets Albius Tibullus and Sulpicia in his literary circle and was also a patron of Ovid. Messalla's own works are lost. His memoirs of the civil wars after the death of Caesar were used by Suetonius and Plutarch. He also wrote pastoral poems in Greek, translations of Greek speeches, occasional satirical and love poems, and essays on grammar. As an orator he followed Cicero instead of the Atticizing school, but his style was affected. Late in life he (or possibly his relative Messalla Rufus) wrote a work on the great Roman families.

Messana (Sicily): *see* Messina.

Messapic alphabet, also called MESSAPIAN ALPHABET, one of two Italian offshoots of the Tarentine–Ionic variety of the Greek alphabet. It was adopted *c.* 500 BC by the Messapii, who inhabited southeastern Italy in pre-Roman times.

Messapic language, also spelled MESSAPIAN, Indo-European language spoken by tribes (Messapii and Iapyges) living in the southeastern part of Italy in pre-Roman and early Roman times. Messapic inscriptions date from the 6th to the 1st century BC. The language is believed to be related to the extinct Illyrian languages that were spoken on the east side of the Adriatic.

Messapii, English MESSAPIANS, ancient pre-Roman people of the southeastern part of the Italian peninsula (Calabria and Apulia) who, with the closely related Iapyges, probably penetrated Italy from the other side of the Adriatic Sea *c.* 1000 BC. They spoke an Indo-European language, Messapic.

Messau (Nigeria): *see* Misau.

Messene, Modern Greek MESSÍNI, ancient city, southwestern Peloponnese, Greece, not to be confused with the modern township of the same name further south. It was probably founded in 369 BC after the defeat of Sparta by Athens and the Boeotian League in the Battle of Leuctra (371) for the decendants of exiled Messenians as a fortified city-state independent of Sparta. The site dominates the Messenian plain; with Megalopolis, Mantineia, and Argos, it formed a strategic barrier, conceived by the Theban Epaminondas, to contain Spartan ambition. The summit of Mt. Ithómi, 2,618 ft (798 m) in altitude, served as the acropolis, but apparently it had been fortified earlier as well.

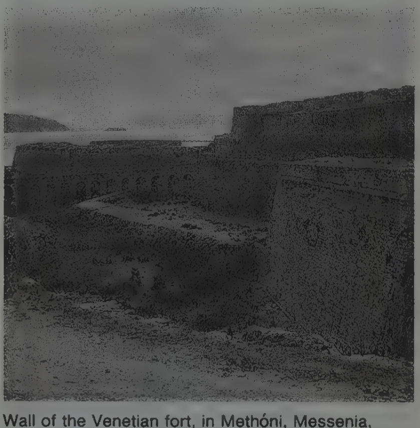
The earliest excavated part of the ancient agora, Messene, Greece
Starfoto—ZEFA

The classical city withstood several Macedonian and Spartan sieges. After the Battle of Chaeronea in 338 BC, it was absorbed into the domain of Philip II of Macedonia, and it remained important under the Romans. Pausanias, in the 2nd century BC, visited the city and claimed its fortifications excelled all others of the Greek world. Nothing is known of Messene in the Middle Ages.

Since 1957, the Hellenistic agora, theatre, stadium, and council chamber have been escavated. The foundations of the small Temple of Artemis Laphria sit on the shoulder of the acropolis, which is crowned by a small 16th-century monastery. The best preserved section of the ancient walls is on the northwest. The modern hamlet of Mavrommátion occupies a small part of the ancient site. Pop. (1981) 6,854.

Messenger (foaled 1780), racehorse who, though a Thoroughbred who sired many successful Thoroughbred (flat) racers, was most important as the foundation sire of the Standardbred (harness racehorse) breed. A son of Mambrino and grandson of Matchem, he was foaled in England but was taken to Philadelphia in 1788. His descendants became known for their trotting ability, and his great-grandson Hambletonian is the ancestor of most modern trotters.

Messenia, Modern Greek MESSINÍA, ancient district and modern *nomós* (department) of the southwestern Peloponnese, Greece, bounded on the east by the Taygetus Mountains (Taïyetos Óros), on the north by the Nédha Potamós (river) and the Arcadian mountains, and on the south and west by the Ionian Sea. Kalámai, at the head of the Messiniakós Kólpos (gulf), is the departmental capital. The heart of the province is the plain of Messenia, or Pámisos River Valley, historically one of the most fertile in Greece. It produces oranges, citrons, almonds, figs, grapes, and olives of the highest quality for export. It is bounded on the north by Tetrázion Óros and on the west and southwest by the foothills of the Kiparissías Óri. Off the southwest coast of the Akrítas peninsula lie the three Oinoúsai islands and the islet of Venétiko. The most notable of Messenia's Neolithic and Bronze Age settlements is the magnificent Mycenaean palace of Nestor north of Pylos (Pílos) on the Ionian Sea, discovered in 1939.



Wall of the Venetian fort, in Methóni, Messenia, Greece
Starfoto—ZEFA

According to Homeric legend, the southwestern Peloponnese was governed during Mycenaean times by the family of Neleides, originating in Iolcos, near modern Vólos, in Thessaly. The Dorians invaded Messenia after 1200 BC and intermingled with the inhabitants to form a single people. About 735 the aggressive Spartans invaded, annexing the central plain. Several more conflicts with Sparta occurred. In the 7th century BC the Messenians lost their remaining territory to Sparta, which enslaved those inhabitants who did not flee. Revolts in 490 and 465/464 were staged from the fortress citadel of Ithome, but *c.* 460 the defenders left the Peloponnese.

After the Battle of Leuctra in 371, the heavily fortified city of Messene was established. While the city flourished, the province remained depopulated; eventually it joined the Achaean League, which proved ineffective in protecting Messenia from Spartan onslaughts. In 146 the Messenians were brought under Roman rule as part of the province of Achaea.

In the Middle Ages Messenia shared the fortunes of the rest of the Peloponnese; it was overrun by Slavic hordes and was a battlefield for Byzantines, Franks, Venetians, and Turks, as the ruins of such medieval strongholds as Kalámai, Koróni, Methóni, and Pílos attest. Pop. (1981) 159,818.

Messenia, Gulf of, Modern Greek MESSINIAKÓS KÓLPOS, formerly GULF OF KORÓNI, or GULF OF KALAMÁTA, gulf of the Ionian Sea in the *nomós* (department) of Messenia, southwestern Peloponnese, Greece. It is enclosed by the Likódhimon Óros (mountain) and Ákra (cape) Akrítas on the west and the Mani peninsula on the east.

The non-navigable Pámisos Potamós (river), rising in the Mínthi Óros of Messenia, debouches at the head of the gulf just west of Kalámai, a manufacturing centre and the second port of the Peloponnese. On the east side of the Akrítas is the port of Koróni (ancient Asine), originally settled by Argives after the First Messenian War (*c.* 735–*c.* 715 BC). Reoccupied during the Middle Ages by refugees from the north who gave it the name of their former village, Koróni retains Byzantine, Venetian, and Turkish fortifications. In 1828 the French landed in this gulf during the War of Greek Independence to help clear the Peloponnese of Turks.

Messenian Wars (8th–7th century BC), contests between Sparta and Messenia in ancient Greece. Many modern historians believe that there were two early Messenian wars: the first (*c.* 735–*c.* 715) was the Spartan conquest of Messenia; the second (*c.* 660) was precipitated by a Messenian revolt over which the Spartans were ultimately successful. The complete conquest of Messenia by a land-hungry Sparta seems not to have ended until *c.* 600.

Messerschmitt, Willy (b. June 26, 1898, Frankfurt am Main—d. Sept. 17, 1978, Munich), German aircraft engineer and designer.

Messerschmitt was educated at the Munich Institute of Technology, where he received a degree in engineering in 1923. From 1926 he was employed as chief designer and engineer at the Bayerische Flugzeugwerke in Augsburg. His interest in gliders and sailplanes was carried into his early designs, which included the Bf 109 single-seat monoplane.

Messerschmitt, 1941
By courtesy of Bildarchive Preussischer Kulturbesitz BPK, Berlin

In 1938 the Augsburg company became the Messerschmitt-Aktien-Gesellschaft. The new company produced Messerschmitt's first military aircraft, the Me 109 (based on the Bf 109), which in 1939 set the world speed record at 481 miles (775 km) per hour. During World War II, about 35,000 Me 109s were produced for the German Luftwaffe. Other military designs produced during the war included the Me 110, a two-seater bomber and night fighter; the Me 163, the first operational rocket-propelled aircraft; and the Me 262, Germany's first operational jet-propelled aircraft.

After the war, Messerschmitt was detained by the U.S. occupation forces for two years; during the postwar ban on aircraft production, his firm produced prefabricated housing and sewing machines. In 1952 he served as an adviser to the Spanish government, and in 1958 he resumed aircraft production. In 1968–69 the Messerschmitt-Bölkow-Blohm company was formed with Messerschmitt as honorary chairman. The firm produced satellites, helicopters, missiles, and aircraft.

Messerschmitt 109 (German aircraft): *see* Me 109.

Messiaen, Olivier, in full OLIVIER-EUGÈNE-PROSPER-CHARLES MESSIAEN (b. Dec. 10, 1908, Avignon, France—d. April 27, 1992, Clichy, near Paris), influential French composer, organist, and teacher. As a composer he developed a highly personal style noted for its rhythmic complexity, rich tonal colour, and unique harmonic language.

Messiaen

Messiaen was the son of Pierre Messiaen, who was a scholar of English literature, and of the poet Cécile Sauvage. He grew up in Grenoble and Nantes, began composing at the age of seven, and taught himself to play the piano. At age 11 he entered the Paris Conservatoire, where his teachers included the organist Marcel Dupré and the composer Paul Dukas. During his later years at the Conservatoire he began an extensive private study of both Western and Eastern rhythm, birdsong, and microtonal music (which uses intervals smaller than a semitone). In 1931 he was appointed organist at the Church of the Trinité, Paris.

Messiaen became known as a composer with the performance of his *Offrandes oubliées* ("Forgotten Offertories") in 1931 and his *Nativité du Seigneur* (1938; *The Birth of the Lord*). In 1936, with the composers André Jolivet, Daniel Lesur, and Yves Baudrier, he founded the group La Jeune France ("Young France") to promote new French music. He taught at the Schola Cantorum and the École Normale de Musique from 1936 until the outbreak of World War II in 1939. As a French soldier he was taken prisoner and interned at Görlitz, where he wrote *Quatuor pour la fin du temps* (*Quartet for the End of Time*). Repatriated in 1942, he resumed his post at the Trinité and taught at the Paris Conservatoire. His students included Karlheinz Stockhausen and Pierre Boulez.

Much of Messiaen's music was inspired by Roman Catholic theology, interpreted in a quasi-mystical manner, notably in *Trois Petites Liturgies de la présence divine* (1944; *Three Short Liturgies of the Divine Presence*) for women's chorus and orchestra; *Vingt Regards sur l'Enfant Jésus* (1944; *Twenty Looks upon the Infant Jesus*) for piano; *Visions de l'amen* (1943; *Visions of Amen*) for two pianos; *Apparition de l'église éternelle* (1932; *Apparition of the Eternal Church*) and *Messe de la Pentecôte* (1950; *Mass for Pentecost*) for organ; and *La Transfiguration de Notre Seigneur Jésus-Christ* (1969; *The Transfiguration of Our Lord Jesus Christ*) for orchestra and choir. Among his most important orchestral works is the *Turangalîla-Symphonie* (1948) in 10 movements—containing a prominent solo piano part and using percussion instruments in the manner of the Indonesian gamelan orchestra, along with an Ondes Martenot (an electronic instrument). Also notable is *Chronochromie* (1960) for 18 solo strings, wind, and percussion. *Le Réveil des oiseaux* (1953; *The Awakening of the Birds*), *Oiseaux exotiques* (1956; *Exotic Birds*), and *Catalogue d'oiseaux* (1959; *Catalog of Birds*) incorporate meticulous notations of birdsong.

Messiaen's method of composition is set forth in his treatise *Technique de mon langage musical* (1944; "Technique of My Musical Language").

BIBLIOGRAPHY. Analyses of his style and his works include Carla Huston Bell, *Olivier Messiaen* (1984); Paul Griffiths, *Olivier Messiaen and the Music of Time* (1985); and Robert Sherlaw Johnson, *Messiaen*, new ed. (1989).

messiah (from Hebrew *mashiaḥ*, "anointed"), in Judaism, the expected king of the Davidic line who would deliver Israel from foreign bondage and restore the glories of its golden age. The Greek New Testament's translation of the term, *christos*, became the accepted Christian designation and title of Jesus of Nazareth, indicative of the principal character and function of his ministry. More loosely, the term messiah denotes any redeemer figure; and the adjective messianic is used in a broad sense to refer to beliefs or theories about an eschatological improvement of the state of humanity or the world.

The biblical Old Testament never speaks of an eschatological messiah, and even the "messianic" passages that contain prophecies of a future golden age under an ideal king never use the term messiah. Nevertheless, many modern scholars believe that Israelite messianism grew out of beliefs that were connected with their nation's kingship. When actual reality and the careers of particular historical Israelite kings proved more and more disappointing, the "messianic" kingship ideology was projected on the future.

After the Babylonian Exile, Jews' prophetic vision of a future national restoration and the universal establishment of God's kingdom became firmly associated with their return to Israel under a scion of David's house who would be "the Lord's anointed." In the period of Roman rule and oppression, the Jews' expectation of a personal messiah acquired increasing prominence and became the centre of other eschatological concepts held by various Jewish sects in different combinations and with varying emphases. In some sects, the "son of David" messianism, with its political implications, was overshadowed by apocalyptic notions of a more mystical character. Thus some believed that a heavenly being called the "Son of Man" (the term is derived from the Book of Daniel) would descend to save his people. The messianic ferment of this period, attested by contemporary Jewish-Hellenistic literature, is also vividly reflected in the New Testament. With the adoption of the Greek word Christ by the church of the Gentiles, the Jewish nationalist implications of the term messiah (implications that Jesus had explicitly rejected) vanished altogether, and the "Son of David" and "Son of Man" motifs could merge in a politically neutral and religiously highly original messianic conception that is central to Christianity.

The Roman destruction of Jerusalem's Second Temple and the Jews' subsequent exile, persecution, and suffering, however, only intensified their messianism, which continued to develop theologically and to express itself in messianic movements. Almost every generation had its messianic precursors and pretenders—the best-known case being that of the 17th-century pseudo-messiah Shabbetai Tzevi. Belief in and fervent expectation of the messiah became firmly established tenets of Judaism and are included among Maimonides' 13 Articles of Faith. Modernist movements in Judaism have attempted to maintain the traditional faith in an ultimately redeemed world and a messianic future without insisting on a personal messiah figure.

Islām, too, though it has no room for a saviour-messiah, developed the idea of an eschatological restorer of the faith, usually called the Mahdi (Arabic: "Rightly Guided One"). The doctrine of the Mahdi is an essential part of the Shīʿite creed.

Eschatological figures of a messianic character are known also in religions that are uninfluenced by biblical traditions. Even as unmessianic a religion as Buddhism has produced a belief, among Mahāyāna groups, in the future Buddha Maitreya, who would descend from his heavenly abode and bring the faithful to paradise. In Zoroastrianism, with its thoroughly eschatological orientation, a posthumous son of Zoroaster is expected to effect the final rehabilitation of the world and the resurrection of the dead.

Many modern movements of a millenarian character, particularly among primitive peoples (*e.g.,* the cargo cults of Melanesia), have been called messianic; but as the expectation of a personal saviour sent or "anointed" by a god is not always central to them, other designations (millenarian, prophetic, nativistic, etc.) may be more appropriate.

Messier, Charles (b. June 26, 1730, Badonviller, France—d. April 12, 1817, Paris), French astronomer who was the first to compile a systematic catalog of nebulae and star clusters. In Messier's time a nebula was a term used to denote any blurry celestial light source.

In 1751 Messier became a draftsman and recorder of astronomical observations for the noted French astronomer Joseph-Nicolas Delisle. Messier was the first in France to observe the anticipated return of Halley's Comet in 1758–59, and from that time he became an ardent searcher for new comets. Called the comet ferret by King Louis XV, Messier independently discovered 13 of them and observed many more.

In 1760 he began compiling a list of nebulae so that he could distinguish better between nebulae and comets, which look alike when viewed with a small telescope such as was available to Messier. Many of these nebulae, including some of the most prominent, are still known by his catalog numbers. Messier was elected a foreign member of the Royal Society of London in 1764 and obtained a seat in the Paris Academy of Sciences in 1770.

Messier catalog (M), in astronomy, list of approximately 109 star clusters, nebulae, and galaxies compiled by Charles Messier, who discovered many of them. The catalog is still a valuable guide to amateur astronomers, although it has been superceded by the New General Catalogue (NGC); both NGC numbers and Messier numbers remain in common use. The Messier catalog includes such diverse items as the Crab Nebula (M1), the Pleiades (M45), and the great spiral galaxy in Andromeda (M31). Messier's purpose was to make comet hunting easier by tabulating permanent deep-sky objects that could be mistaken for comets. He published a preliminary list of 45 such objects in 1771 and compiled the bulk of his catalog 10 years later. By 1784 he had listed 103 objects; in 1786 Pierre Mechain added 6 more. The existence of five Messier objects (M40, M47, M48, M91, and M102) is now considered doubtful.

Messina, Greek ZANKLE, Latin MESSANA, capital of Messina *provincia,* extreme northeastern Sicily, Italy. It lies on the lower slopes of the Peloritani Mountains, on the Strait of Messina opposite Reggio di Calabria. It was an ancient Siculan colony, first mentioned about 730 BC, founded by settlers from Chalcis, who called it Zankle ("Sickle"), from the shape of the harbour.

In the early 5th century BC it was occupied by Greek fugitives from Persian-occupied Miletus and Samos. The fugitives were assisted by Anaxilas, tyrant of Rhegium (Reggio di Calabria), who then ruled over Rhegium and Zankle, the name of which he changed to Messene in honour of his native region of Messenia in the Peloponnese. After regaining its independence, the city was destroyed by the Carthaginian Himilco in 396 BC. It was reconquered and rebuilt by the Syracusan tyrant Dionysius and was later involved in the war between the Carthaginians and the Syracusan tyrant Agathocles. It fell in 289 BC to the Mamertini, Campanian mercenaries in the service of Agathocles, who made it the centre for their domination of Sicily. Pressed by Syracuse and the Carthaginians, the Mamertini allied themselves with the Romans in 264 BC, and Roman intervention led to the First Punic War, at the end of which Messene was a free city and an ally of Rome.

When the western Roman Empire fell, Messana was taken successively by the Goths, the Byzantines (AD 535), and the Arabs (842). In the Byzantine attempts to reconquer the city, it suffered severe damage. Liberated in 1061 by the Norman leader Robert Guiscard (later Count Roger I of Sicily), the city prospered under the Normans as a commercial and cultural centre. The Swabian Holy Roman emperor Henry VI died there in 1197. When the Swabian dynasty ended with the death of Manfred in 1266, Messina passed to the Angevins (house of Anjou) of France and later, with the rest of Sicily, to the Aragonese and then to the Spanish Bourbons. It participated in the Risorgimento (movement for Italian political unity) risings in 1821, 1847, and 1848 and was liberated with the rest of the Kingdom of the Two Sicilies in 1860.

Severely damaged by an earthquake in 1783 and almost totally destroyed by an earthquake in 1908, Messina was rebuilt in modern style with wide streets and low, reinforced-concrete buildings. Notable surviving or restored landmarks include the cathedral and the Church of Annunciata dei Catalani, possibly of Byzantine origin, both rebuilt by the Normans in the 12th century. The National Museum houses works of art saved from the earthquake. Among numerous noteworthy modern buildings is the campanile adjacent to the cathedral. Messina has a university founded in 1548, a marine biological institute, and botanical gardens.

The city is an important port, and in 1943 it was the principal point for Axis reinforcement of troops and supplies to counter the Allied invasion of Sicily. It is connected with the Italian mainland by ferry service (including train ferry and hydrofoil boats) across the strait to Reggio di Calabria and Villa San Giovanni; Messina also has rail service to Palermo and Syracuse. The city's principal occupations are trade, citrus fruit industries, the manufacture of chemicals, pharmaceutical products, foodstuffs and preserves, and the operation of the port and dockyards. Its exports include fruit, wine, olive oil, chemical and pharmaceutical products, medicinal articles, and building materials. Pop. (1999 est.) mun., 259,156.

Messina, town, Northern province, South Africa. It lies near the Limpopo River, 10 miles (16 km) south of Zimbabwe. Messina is the northernmost town in South Africa.

Founded in 1904, Messina officially became a town in 1968. It is now the site of a large copper mine and contains smelting works. There is some cultivation along the river valley, and cattle breeding is important. The baobab trees characteristic of the area have been designated a national monument. The population is predominantly black. Pop. (1991) 11,006.

Messina, Strait of, Italian STRETTO DI MESSINA, ancient (Latin) FRETUM SICULUM, channel in the Mediterranean Sea separating Sicily (west) and Italy (east) and linking the Tyrrhenian and Ionian seas. The strait is 20 miles (32 km) long, 2 miles (3 km) wide in the north (between Faro Point and the Rock of Scylla), and 10 miles (16 km) wide in the south (between capes Alì and Pellaro); it is 300 feet (90 m) deep at the northern end.

The strait was greatly feared by sailors in antiquity, mainly because of the rocks and whirlpools known as Scylla and Charybdis (*q.v.*), which were personified as female monsters in Greek mythology. The strait's currents do, in fact, present considerable difficulties. The main current runs from south to north, but a subsidiary current flows in the reverse direction. These usually alternate every six hours, and the water falls 6 to 8 inches (150 to 200 mm) during the main current; especially strong currents tear seaweed from the bottom and sometimes throw up fish with atrophied or abnormal eyes and with organs for the production of phosphorescence. The frequent sighting of a mirage, called Fata Morgana (*see* Morgan le Fay), consisting of an apparent vertical elongation of an object on the shore, helped maintain the legends of the strait.

The major ports along the strait's scenic banks are Messina and Reggio di Calabria. The coastal regions are noted for archaeological remains and resorts, and the strait is rich in fish and plankton.

Messíni (Greece): *see* Messene.

Messinía (Greece): *see* Messenia.

Messner, Reinhold (b. Sept. 17, 1944, Bressanone, Italy), mountain climber who in 1980 made the first solo ascent of Mount Everest (29,035 feet [8,850 m]), the world's highest peak, without the use of contained oxygen for breathing. It was Messner's second ascent of Everest; his first climb in 1978 with Peter Habeler of Austria was the first ascent ever accomplished without additional oxygen.

Messner was introduced to mountaineering by his father, and from the age of 13 he made numerous difficult climbs in the Eastern Alps. In 1970 he scaled Nānga Parbati I (26,660 feet [8,126 m]) in the Himalayas by way of its Rupal (south) face; his younger brother Günther died during the descent. In 1975 Messner and Habeler made the first ascent of the northwestern face of Gasherbrum I (Hidden Peak; 26,470 feet [8,068 m]) in the Karakoram Range, without oxygen or support climbers. In 1978 he again climbed Nānga Parbat I, reaching the summit alone by a new route, and in 1979 he led a team of six to the top of the world's second highest mountain, K2 (28,251 feet [8,611 m]). In 1983 he led a party on a notable ascent of Cho Oyu (26,906 feet [8,201 m]) using a new route, the southwest face. Messner was the first man ever to climb all 14 of the world's mountains exceeding a height of 8,000 m (26,250 feet), and he was also the first to cross Antarctica without either dogs or machines. He also operated a successful Alpine-climbing school and wrote several books, including *Die Herausforderung* (1976; *The Challenge*) and *Everest* (1978).

Mesta River (Greece): *see* Néstos River.

Mestghanem (Algeria): *see* Mostaganem.

mestizo, plural MESTIZOS, feminine MESTIZA, any person of mixed blood. In Central and South America it denotes a person of combined Indian and European extraction. In some countries—*e.g.,* Ecuador—it has acquired social and cultural connotations; a pure-blooded Indian who has adopted European dress and customs is called a mestizo (or cholo). In Mexico the description has been found so variable in meaning that it has been abandoned in census reports. In the Philippines "mestizo" denotes a person of mixed foreign (*e.g.,* Chinese) and native ancestry.

Mestre, northwestern suburb of Venice, in Venezia *provincia,* Veneto *regione,* northern Italy. Mestre lies on the mainland shore of the Venice Lagoon. It existed in Roman times and was the site of an important fortress in the 12th century. It came under Venetian domination in 1337 and was incorporated into the commune of Venice in 1926. Included in Mestre are the industrial districts of Marghera and Porto Marghera. The latter was built in 1919–28 and is one of the most important industrial and commercial ports in Italy. There are chemical, metallurgical, iron, and glass industries, coal processing, oil refining, engineering, and naval dockyards. The port exports regional products and imports coal, oil, ores, and cereals. Pop. (1991) 181,900.

Meštrović, Ivan (b. Aug. 15, 1883, Vrpolje, Slavonia, Austria-Hungary [now in Croatia]—d. Jan. 16, 1962, South Bend, Ind., U.S.), sculptor whose works are characterized by bold cutting and great powers of design.

The son of Croatian peasants, Meštrović was apprenticed to a marble cutter at the age of 13, and three years later he entered the Vienna Academy, where he studied until 1904. He exhibited at the Vienna Sezession exhibitions, at the Austrian exhibition at Earl's Court in London in 1906, and at Munich, Venice, and Paris, where he attracted the notice of Auguste

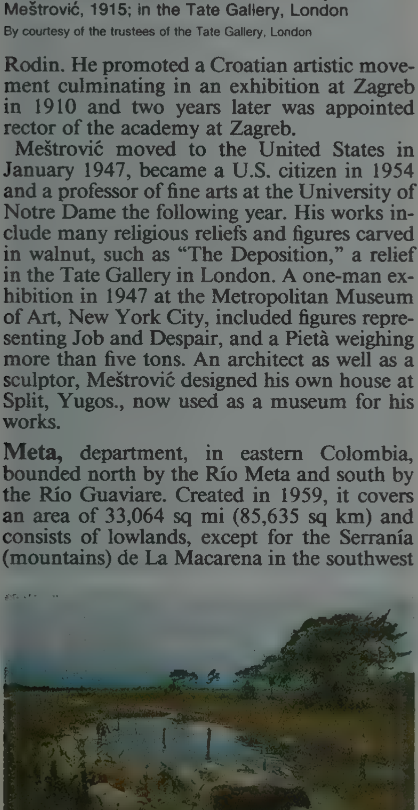
"Portrait of the Artist," plaster sculpture by Ivan Meštrović, 1915; in the Tate Gallery, London

By courtesy of the trustees of the Tate Gallery, London

Rodin. He promoted a Croatian artistic movement culminating in an exhibition at Zagreb in 1910 and two years later was appointed rector of the academy at Zagreb.

Meštrović moved to the United States in January 1947, became a U.S. citizen in 1954 and a professor of fine arts at the University of Notre Dame the following year. His works include many religious reliefs and figures carved in walnut, such as "The Deposition," a relief in the Tate Gallery in London. A one-man exhibition in 1947 at the Metropolitan Museum of Art, New York City, included figures representing Job and Despair, and a Pietà weighing more than five tons. An architect as well as a sculptor, Meštrović designed his own house at Split, Yugos., now used as a museum for his works.

Meta, department, in eastern Colombia, bounded north by the Río Meta and south by the Río Guaviare. Created in 1959, it covers an area of 33,064 sq mi (85,635 sq km) and consists of lowlands, except for the Serranía (mountains) de La Macarena in the southwest and the Andean Cordillera (mountains) Oriental in the east. Agriculture is concentrated on the lower mountain slopes, where grains, oilseeds, coffee, and other crops are cultivated. The cattle industry is well developed, and mineral deposits include coal and salt.



Cattle herding in Meta department, Colombia

Carl Frank

Industrial and commercial activity is centred on Villavicencio (*q.v.*), the departmental capital, whose chief industries are a brewery, a distillery, saddleries, soap factories, and coffee-roasting plants. A highway descends from Bogotá to Villavicencio; one branch then leads east-northeast along the Río Meta, and another runs southeast through the department. Air and river travel predominate in eastern Meta. Pop. (1981 est.) 388,917.

Meta River, major tributary of the Orinoco in eastern Colombia and western Venezuela. Formed in Meta department, Colombia, by the junction of the Upía and Guayuriba rivers, which descend from the eastern slopes of the Cordillera Oriental of the Andes, the Meta meanders east-northeastward across the Llanos (plains) of northern South America. At Nueva Antioquia, Colom., the river turns generally eastward, forming the border between Colombia and Venezuela. It empties into the Orinoco between Puerto Carreño, Colom., and Puerto Páez, Venezuela. Much of its 650-mi (1,046-km) length is navigable, but it is not a major transportation artery since the area it drains is sparsely populated.

metabolism, the sum of all the chemical reactions that take place within every single cell of a living organism, providing energy for vital processes and synthesizing new organic material.

A brief treatment of metabolism follows. For full treatment, *see* MACROPAEDIA: Metabolism.

Metabolic reactions are of two sorts. Some are anabolic reactions, which use energy to build complex molecules from simple molecules. The others are catabolic reactions, which make chemical energy available in the course of breaking down complex molecules into simpler molecules.

In order to carry on its life processes, every organism takes from its environment "free," or "useful," energy, *i.e.*, energy that is capable of performing work in the conditions of uniform temperature and pressure which characterize the interior of a cell. The organism eventually returns to its environment an equivalent amount of energy, much of it in the biologically unusable form of heat. All the energy used by living organisms derives ultimately from the Sun. Photosynthetic plants use solar energy directly to synthesize organic compounds from inorganic constituents, *e.g.*, carbon dioxide, water, and ammonia. By digesting photosynthetic organisms (or organisms that have digested photosynthetic organisms), nonphotosynthetic organisms obtain nutrients—mostly proteins, carbohydrates, and lipids—that serve them both as indirect sources of solar energy and as materials from which to synthesize their organic constituents.

In all organisms, the cellular reactions involved in metabolism make use of a particular energy-transferring compound—adenosine triphosphate (ATP). ATP releases energy when it is reduced; *i.e.*, when it drops its phosphate groups to become first adenosine diphosphate (ADP) and then adenosine monophosphate (AMP). As ATP is reconstructed from these intermediate compounds, energy is stored. During anabolic reactions, which require energy, ATP is reduced; during catabolic reactions, which yield energy, ATP is synthesized.

Every cellular chemical reaction is mediated by a specific enzyme (a protein that initiates and provides a site for a reaction between substances, without itself being chemically changed in the reaction). By their availability or unavailability as catalysts for chemical reactions, these enzymes regulate anabolism and catabolism.

The first phase of the liberation of chemical energy from food occurs mainly in the digestive tract in animals and is mostly a preliminary to catabolism; large food molecules are broken down into a number of relatively smaller molecules. Thus, proteins are broken down into the 20 or so amino acids of which they are composed, carbohydrates are broken down into simple sugars, and lipids into fatty acids and glycerols. The products of the first phase enter into the cells, where they are incompletely oxidized (by removal of hydrogen atoms or electrons). This incomplete oxidation constitutes the second phase of energy liberation, the key products of which are three carbon compounds—acetyl coenzyme A, oxaloacetate, and α-oxoglutarate. The details of the third and final phase of energy release from food were first elucidated by Sir Hans Krebs in 1937; in it, the products of the second phase combine and pass through a sequence of reactions (called the Krebs cycle, or tricarboxylic acid [TCA] cycle) that results ultimately in the re-formation of oxaloacetate and the production of two molecules of carbon dioxide (terminal respiration). Hydrogen atoms removed from intermediate products of this cycle are passed along a chain of carriers, eventually combining with oxygen to form water. Energy is released as the hydrogen atoms pass down the carrier chain; this energy is used to synthesize many molecules of ATP. This method of ATP synthesis, which requires oxygen, is called oxidative phosphorylation. Yeasts and certain other microorganisms do not produce ATP by oxidative phosphorylation; instead, they use intermediate products of the second phase of energy liberation as hydrogen acceptors. The end products of this process, which is called fermentation, are ethyl alcohol or lactic acid. Fermentation does not require oxygen, but it results in the synthesis of substantially less ATP than is achieved via oxidative phosphorylation. Fermentation also occurs in animal muscle cells when energy needs outstrip the cell's supply of oxygen.

The catabolic process begins with proteins, carbohydrates, and lipids and has as its rather indefinite end products the interconvertible intermediary compounds of the Krebs cycle. Anabolism begins with intermediate compounds and has as its end products the proteins, carbohydrates, lipids, and other large molecules that make up the tissues of the organism. Although certain chemical reactions and intermediary products (*e.g.*, acetyl coenzyme A) occur in both processes, the catabolism and anabolism of a specific compound are not achieved through reversals of the same chemical pathway.

Control over the rate of metabolic processes results from the greater or lesser production of the enzymes involved. Fine control results from the property of some of these enzymes (called pacemaker enzymes) whereby interaction with certain molecules other than their substrates (the substances they catalyze) causes them to modify their catalytic activity. The molecules that cause these modulations interact with the pacemaker enzymes at sites other than their active sites (those where they react with their substrates). These interfering molecules may be ATP or other products of the metabolic process to which the enzyme contributes, or they may be substances involved in another metabolic process. In any case, their availability to interact with the enzyme is an indication of the degree to which the reaction catalyzed by the enzyme may at a given moment be necessary to or superfluous in maintaining the metabolic balance of the organism.

Information about metabolic pathways is obtained in various ways. Organisms whose metabolisms are unbalanced (through either stress or disease) may accumulate abnormal quantities of particular metabolites (chemical substances involved in metabolism), a situation that will often be indicative of metabolic processes within the organism. Information as to metabolic pathways may also be obtained by feeding an organism nutrient compounds containing isotopes and then monitoring the isotopic atoms as they pass through and out of the organism. It is through the use of isotopes that rates of degeneration and reconstruction of the various tissues in the human body are known (*e.g.*, proteins in liver cells are replaced every five days, though the liver cells themselves last several months; proteins in muscle and brain tissue last much longer than do liver proteins). Important information linking enzyme–substrate pairs has been gained by the use of laboratory-bred mutants; these animals, genetically unable to synthesize particular metabolic enzymes, accumulate the substrate of that enzyme in their cells.

Metabolic diseases arise from nutritional deficiencies, especially of vitamins or proteins; in connection with diseases of the endocrine system, the liver, or the kidneys; or as a result of genetic defects.

---

metacarpal, any of several tubular bones between the wrist (carpal) bones and each of the forelimb digits in land vertebrates, corresponding to the metatarsal bones of the foot. Originally numbering five, metacarpals in many mammals have undergone much change and reduction during evolution. The lower leg of the horse, for example, includes only one strengthened metacarpal; the two splint bones behind and above the hoof are reduced metacarpals, and the remaining two original metacarpals have been lost. In humans the five metacarpals are flat at the back of the hand and bowed on the palmar side; they form a longitudinal arch that accommodates the muscles, tendons, and nerves of the palm. The metacarpals also form a transverse arch that allows the fingertips and thumb to be brought together for manipulation.

metacentre, also spelled METACENTER, in fluid mechanics, the theoretical point at which an imaginary vertical line through the centre of buoyancy intersects another imaginary vertical line through a new centre of buoyancy created when the body is displaced, or tipped, in the water, however little.

The centre of buoyancy of a floating body is the point about which all the body parts exactly buoy each other, in other words, the effective centre of the displaced water. The metacentre remains directly above the centre of buoyancy regardless of the tilt of a floating body, such as a ship. When at rest on even keel, the vessel's centre of buoyancy is directly below the centre of gravity as well as below the metacentre. (The centre of gravity is the point in a body about which all parts of the body balance each other.) When a vessel tilts, one side displaces more water than does the other, and the centre of buoyancy moves and is no longer directly under the centre of gravity; but regardless of the amount of the tilt, the centre of buoyancy remains directly below the metacentre. If the metacentre is above the centre of gravity, buoyancy restores stability when the ship tilts. The stability increases with the distance between metacentre and centre of gravity, called the metacentric height. If the metacentre is below the centre of gravity, the boat is unstable, and a tilt results in capsizing.

metachromatic leukodystrophy, rare inherited metabolic disease in which the lack of a key enzyme causes loss of the protective myelin sheath from the white matter of the brain, resulting in psychological disturbances, mental deterioration, and sensory and motor defects. The absence of the enzyme cerebroside sulfatase (arylsulfatase A) allows certain specialized lipids (sphingolipids) to accumulate in nerve tissues instead of being broken down. At least two types of the disorder, infantile and adult, have been identified; a third, intermediate juvenile variety is sometimes recognized as well. In the more common infantile disease, the child develops normally for up to two years; the progressive onset of behavioral problems, mental deterioration, and blindness ends, after several years, in death. The adult disease is characterized mainly by psychological disturbances, including dementia. The juvenile form resembles infantile disease but is distinguished by later onset and a more protracted course.

metacinnabar, a mercury sulfide mineral that has the same chemical composition as cinnabar (HgS). Typical specimens have been obtained from Italy, Romania, and California. A member of the sphalerite group of sulfide minerals having isometric crystal symmetry, metacinnabar is transformed to cinnabar, a more stable form, upon heating to 400°–550° C (750°–1,020° F). For detailed physical properties, *see* sulfide mineral (table).

Metacom, also called METACOMET, KING PHILIP, or PHILIP OF POKANOKET (b. *c.* 1638, Massachusetts—d. Aug. 12, 1676, Rhode Island), sachem (chief of a confederation of Algonkin tribes) of the Wampanoag Indians who led the most severe Indian war in New England history, known as King Philip's War (1675–76).

Metacom was the second son of Massasoit, Wampanoag chief who had managed to keep peace with the Massachusetts and Rhode Island settlers for many decades. Upon Massasoit's death (1661) and that of his eldest son Wamsutta (English name Alexander) the following year, Metacom became chief of the tribe. He found it increasingly difficult to keep his pledge of continuing peace, however, primarily because of the ever-widening sale of Indian land to the English in exchange for guns, ammunition, liquor, and blankets. He was further embittered by the humiliations to which he and his people were continually subjected by the whites. He was, for example, summoned to Taunton in 1671 and required to sign a new peace agreement that included the surrender of Indian guns.

Metacom's dignity and unbending spirit both impressed and frightened the settlers, and he came to symbolize the Indian menace that could not be controlled. For 13 years he kept the surrounding towns and villages on edge with the fear of an Indian uprising. Finally, in June 1675, violence erupted when three Wampanoag warriors were executed by Plymouth authorities for the murder of John Sassamon, a tribal informer. Aided by a coalition of the Narragansett, Abnaki, Nipmuck, and Mohawk tribes, the Wampanoag were at first victorious. After a year of savage fighting, however, during which considerable loss of life and property was sustained by both sides, the Indian alliance began to disintegrate, and food became scarce. Seeing that defeat was imminent, Metacom returned to his ancestral home at Mount Hope, where he was betrayed by an informer and killed in a final battle. He was beheaded and quartered and his head displayed on a pole for 25 years at Plymouth.

metaethics, the subdiscipline of ethics concerned with determining the nature of moral concepts and judgments largely through the analysis of the logical and semantic aspects of moral language.

A brief treatment of metaethics follows. For a full treatment, *see* the MACROPAEDIA: Ethics.

Analytic philosophers, also known as philosophers of language, distinguish between the first-order language, in which all humans communicate with one another, and the second-order language, in which philosophers attempt to understand, analyze, and clarify the nature and meaning of first-order discourse. Hence, metaethics, as a term in the second-order enterprise, identifies a fundamental task of the moral philosopher, the logical analysis (1) of the meanings of such moral terms as right and wrong, obligatory and forbidden, good and evil; (2) of the function of the statements in which such terms occur; and (3) of the nature of the justifications, or moral reasoning, used in the support of these statements. Metaethics (or analytic, or critical, ethics) is thus to be contrasted with practical, normative, or speculative ethics, which explores such first-order questions as: "What actions are right and what are wrong?"; "How should one live and what things should one value?"; and "Is life worth living?"

Analytic philosophers agree that the fundamental questions in ethical theory are metaethical; and some even assert that they are the only questions appropriate for a moral philosopher and that normative questions can be dealt with by all people in their capacity as moralists. The position of the moral philosopher is thus analogous to that of the philosopher of science, who considers only the logic of scientific statements and remains neutral on the question of which are true and which false. The possibility that metaethics might succeed in such neutral analyses of moral language has been questioned, however, even by Analytic philosophers themselves, who argue that there are presuppositions about moral language that are themselves normative, which may well underlie the analytic enterprise and condition its theoretical results.

Major metaethical theories include naturalism, nonnaturalism (or intuitionism), emotivism, and prescriptivism. Naturalists, such as Ralph Barton Perry, Stephen Coburn Pepper, W.T. Stace, Richard B. Brandt, and Geoffrey James Warnock, and nonnaturalists, such as G.E. Moore, H.A. Prichard, W.D. Ross, and A.C. Ewing, agree that moral language is cognitive—*i.e.,* that moral claims can be known to be true or false. They disagree, however, on how this knowing is to be done. Naturalists hold either that these claims can be adequately justified by reasoning from statements employing only nonmoral terms or that moral terms themselves can be defined in nonmoral (natural or factlike) terms. Intuitionists deny both of these positions and hold that moral terms are *sui generis,* that moral statements are autonomous in their logical status. Emotivists, notably Alfred Jules Ayer and Charles Stevenson deny that moral utterances are cognitive, holding that they consist in emotional expressions of approval or disapproval and that the nature of moral reasoning and justification must be reinterpreted to take this essential characteristic of moral utterances into account. R.M. Hare and other exponents of prescriptivism take a somewhat similar approach, arguing that moral judgments are prescriptions or prohibitions of action, rather than statements of fact about the world.

metagenesis: *see* alternation of generations.

metal, any of a class of substances characterized by high electrical and thermal conductivity as well as by malleability, ductility, and high reflectivity of light.

A brief treatment of metals follows. For full treatment, *see* MACROPAEDIA: Matter: Its Properties, States, Varieties, and Behaviour.

Approximately three-quarters of all known chemical elements are metals. The most abundant varieties in the Earth's crust are aluminum, iron, calcium, sodium, potassium, and magnesium. The vast majority of metals are found in ores (mineral-bearing substances), but a few such as copper, gold, platinum, and silver frequently occur in the free state because they do not readily react with other elements.

Metals are usually crystalline solids. In most cases, they have a relatively simple crystal structure distinguished by a close packing of atoms and a high degree of symmetry. Typically, the atoms of metals contain less than half the full complement of electrons in their outermost shell. Because of this characteristic, metals tend not to form compounds with each other. They do, however, combine more readily with nonmetals (*e.g.,* oxygen and sulfur), which generally have more than half the maximum number of valence electrons. Metals differ widely in their chemical reactivity. The most reactive include lithium, potassium, and radium, whereas those of low reactivity are gold, silver, palladium, and platinum.

The high electrical and thermal conductivities of the simple metals (*i.e.,* the non-transition metals of the periodic table) are best explained by reference to the free-electron theory. According to this concept, the individual atoms in such metals have lost their valence electrons to the entire solid, and these free electrons that give rise to conductivity move as a group throughout the solid. In the case of the more complex metals (*i.e.,* the transition elements), conductivities are better explained by the band theory (*q.v.*), which takes into account not only the presence of free electrons but also their interaction with so-called *d* electrons.

The mechanical properties of metals, such as hardness, ability to resist repeated stressing (fatigue strength), ductility, and malleability, are often attributed to defects or imperfections in their crystal structure. The absence of a layer of atoms in its densely packed structure, for example, enables a metal to deform plastically, and prevents it from being brittle.

metal carbonyl, any coordination or complex compound consisting of a heavy metal such as nickel, cobalt, or iron surrounded by carbonyl (CO) groups. Some common metal carbonyls include: tetracarbonylnickel $Ni(CO)_4$, pentacarbonyliron $Fe(CO)_5$, and octacarbonyldicobalt $Co_2(CO)_8$. In general, the metal carbonyls are produced by direct action of carbon monoxide on the finely divided metal. They are used in the preparation of metals of exceptionally high purity and as catalysts in organic syntheses.

The electronic structures of most metal carbonyls containing one metal atom per molecule (mononuclear carbonyls) bear striking resemblances to those of the noble-gas elements. For example, tetracarbonylnickel has 36 electrons (28 from the nickel atom and 8 electrons from the 4 carbonyl groups) surrounding the nickel nucleus. This number, called the effective atomic number (EAN), is also the total number of electrons in the noble-gas element krypton.

metal cut, an engraving on metal, usually lead or type metal, or a print made from such plates. The earliest example of metal cut is the 15th-century technique called dotted manner, or *manière criblée,* from its characteristic use of dots to form the design.

The English poet and artist William Blake (1757–1827) experimented with metal cuts, but the technique's greatest exponent was the Mexican engraver José Guadalupe Posada (1852–1913). As metal-cut prints are often indistinguishable from wood engravings, many wood engravers turned to work with type metal instead of wood.

"Calavera Huertista," relief etching on zinc by José Guadalupe Posada, 1913

By courtesy of the Art Institute of Chicago

metal fatigue, weakened condition induced in metal parts of machines, vehicles, or structures by repeated stresses or loadings, ultimately resulting in fracture under a stress much weaker than that necessary to cause fracture in a single application.

Though the term dates back to the 19th century and though considerable observation of the phenomenon was made then and in the first half of the 20th century, only with the spectacular failure of pressure cabins in British Comet jetliners in 1954 did it receive widespread engineering attention. In the 1970s much remained to be learned about metal fatigue, but empirical methods had proved effective in overcoming it. Fatigue-resistant metals had been developed and their performance enhanced by surface treatment, while fatigue stresses were significantly lessened in aircraft and other applications by designing to avoid stress concentrations. Large-scale prototype testing and new testing methods, including the metallurgical microscope, were also employed.

metal point, descendant of the stylus of classical times and ancestor of the modern pencil, a small, sharpened metal rod used for drawing precise compositions on paper or parchment. The metal could be lead, silver, copper, or gold, but silverpoint was the most common choice because it is the most suited to permanent drawing, its stroke adhering unerasably. The silverpoint was of great value in producing the hard, clearly defined line required, for instance, by miniaturists; modelling, emphases, and light phenomena, however, had to be rendered either by means of repetitions, dense hatching, or blanks or else supplemented by other mediums.

"Study of Hands," silverpoint heightened with white on pink grounded paper by Leonardo da Vinci; in Windsor Castle, Berkshire, Eng.

Reproduced by gracious permission of Her Majesty Queen Elizabeth II

Silverpoint achieved great popularity with such 15th-century Flemish artists as Jan and Hubert van Eyck, Rogier van der Weyden, and Hans Memling, to whose styles it was perfectly attuned. The German artist Albrecht Dürer, too, used it with great effect, notably in the "Self-Portrait" (1484; Albertina, Vienna). The silverpoint lost favour in the 17th century but was revived by 18th-century miniaturists and is still occasionally used by modern artists.

metalanguage, in semantics and philosophy, language used for the analysis of object language (language that is used to talk about objects in the world). Thus, a metalanguage may be thought of as a language about another language. Such philosophers as the German-born Logical Positivist Rudolf Carnap and Alfred Tarski, Polish-born mathematician, argued that philosophical problems and philosophical statements can be resolved only when seen in terms of a syntactical framework. The logic of semantics is what determines the truth of a statement, rather than the statement's nonformal, or actual, meaning. Carnap felt that by making use of symbolic notation in a metalanguage and by adhering to rules of logic it was possible to avoid metaphysical judgments, which, in his system, were by definition invalid.

metalation, any chemical process by which a metal atom is introduced into an organic molecule to form an organometallic compound, but more commonly the process involving a hydrogen–metal exchange. An example is the metalation of benzene (C_6H_6) by reaction with ethylsodium (C_2H_5Na), forming phenylsodium (C_6H_5Na) and ethane (C_2H_6). Metalation by means of hydrogen–metal exchange is a very powerful method of removing a hydrogen atom (in the form of its cation, H^+) from a chemical compound; the reaction, therefore, is useful in studying the relative acidities of such extremely weak acids as the hydrocarbons.

Metallgesellschaft AG, major German industrial company engaged in mining, metal refining, fabrication, and trade; the design and production of industrial plants and equipment; the manufacture of chemicals; financial services and insurance; and transportation. The firm's headquarters are in Frankfurt am Main.

Established in 1881 by Wilhelm Merton (1848–1916), the company originally confined its activities to metal trading. In 1928 it merged with Metallbank und Metallurgische Gesellschaft (established in 1910) and through this and other mergers, acquisitions, and expansions became one of the largest industrial enterprises in Germany and in Europe.

The company is a major processor of zinc and copper. It operates metal and chemical subsidiaries in the U.S. and a financial subsidiary in Curaçao, Netherlands Antilles, and has a minority interest in firms in Italy, Canada, Austria, France, and Switzerland. Large stakes of Metallgesellschaft are held by outside interests.

metallic bond, force that holds atoms together in a metallic substance. Such a solid consists of closely packed atoms. In most cases, the outermost electron shell of each of the metal atoms overlaps with a large number of neighbouring atoms. As a consequence, the valence electrons continually move from one atom to another and are not associated with any specific pair of atoms. In short, the valence electrons in metals, unlike those in covalently bonded substances, are nonlocalized, capable of wandering relatively freely throughout the entire crystal. The atoms that the electrons leave behind become positive ions, and the interaction between such ions and valence electrons gives rise to the cohesive or binding force that holds the metallic crystal together.

Many of the characteristic properties of metals are attributable to the non-localized or free-electron character of the valence electrons. This condition, for example, is responsible for the high electrical conductivity of metals. The valence electrons are able to move away when an electrical field is applied without any thermal activity—*i.e.,* without its having to be heated into a conduction band, as in covalent crystals. The presence of the mobile valence electrons, as well as the nondirectionality of the binding force between metal ions, account for the malleability and ductility of most metals. When a metal is shaped or drawn, it does not fracture, because the ions in the planes of its crystal structure are quite easily displaced with respect to one another. Moreover, the nonlocalized valence electrons act as a buffer between the ions of like charge and thereby prevent them from coming together and generating strong repulsive forces that can cause the crystal to fracture.

metallic fibre, in textiles, synthetic fibre, known generically as metallic, including manufactured fibres composed of metal, metal-coated plastic, or of a core covered by metal (usually aluminum). Trademarked names include Chromeflex, Lurex, and Melora. Foil types are made with a metal foil that is coated with a plain or coloured plastic film and then cut into strips. Metallized types employ such films as Mylar, a polyester treated with vaporized metal that is bonded between layers of clear film. Colour pigment may be added with the film.

Metallic fibres are light in weight and do not tarnish. Those using polyester films are the strongest, can be stretched to a considerable extent, and are elastic and resilient. Metallic fibres are usually washable, requiring low temperatures when ironed, and can be dry-cleaned with most of the common cleaning solvents. They are resistant to attack by insects and microorganisms.

Metallic fibres are usually combined with others for decorative effect. Such combinations are used for knitting yarns, trimmings, and ribbons; in such apparel as knitwear, evening gowns, swimsuits, and neckties; and in such home furnishings as curtains, upholstery, and tablecloths. Industrial applications include automotive upholstery, theatre curtains, and grilles for radio and television sets.

metallic wood-boring beetle, also called JEWEL BEETLE, any member of the family Buprestidae (order Coleoptera), among the most brilliantly coloured insects. Most of the approximately 15,000 species are widely distributed in tropical regions. These beetles are long, narrow, and flat, with a tapering abdomen. The wing covers (elytra) of some species are metallic blue, copper green, or black in colour and are sometimes used in jewelry. The brightly coloured body of other species is hidden by the dull dark wing covers and is exposed only during flight or from a ventral (bottom) view. A predator chasing a metallic-coloured flying beetle may not recognize it as prey when it stops flying and becomes a dull, dark-coloured lump on a branch.

Metallic wood-boring beetle (*Agrilus*)
William E. Ferguson

Many metallic wood-boring beetle larvae carve out ribbon-shaped tunnels in wood. *Chrysobothris* attacks trees and shrubs and often seriously damages fruit trees. Some (*e.g., Agrilus*) cause the formation of a gall in which the larvae live. The small, flat *Brachys* tunnels through leaves.

The white, legless larvae, which resemble tadpoles, are called flatheaded borers because of their shape. The head region is flattened and expanded sideways; the rest of the body is cylindrical and narrow.

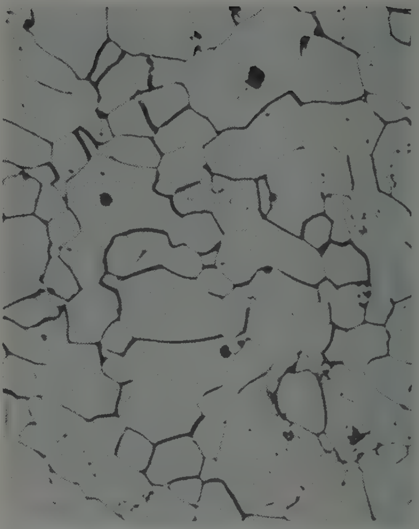
metallogenic province, geographic region in which predominantly one kind of ore deposit, or a grouping of ore deposits, occurs in relative abundance. Its cause is unknown, but it is postulated that the magmas (molten rocks) underlying such areas may have been richer in those ore minerals than the magmas elsewhere.

Among the examples of metallogenic provinces in North America are the gold province on the Canadian Shield that extends for 3,200 kilometres (2,000 miles) and includes all the major Canadian gold camps; the lead–zinc province of the Mississippi Valley, which is the world's largest producer of those metals; the copper province of the southwestern United States and adjacent parts of Mexico, which at one time produced about one-third of the world's copper; and a large silver–lead province in north central Mexico, which contains widespread, lead–zinc ores very rich in silver. In South America, the copper province extending northward from Chile into Peru provides a considerable portion of the world's copper. Europe has smaller and less well-defined provinces than North or South America; the German lead provinces, the English tin province, and the Scandinavian nickel province are good examples. Several outstanding provinces occur in Africa: the Witwatersrand and Orange Free State gold provinces; the Zambia and Shaba (formerly Katanga) copper provinces. Asia's metallogenic provinces include the Siberian Shield gold province, the platinum province in the Urals, the Georgian manganese province, the Malayan tin province, and the Chinese tungsten province. The mineral deposits of Australia do not occur in distinctive metallogenic provinces for the most part; exceptions include the very large gold provinces of Victoria and New South Wales and the silver–lead–zinc province of Broken Hill, New South Wales.

metallography, study of the structure of metals and alloys, particularly using microscopic (optical and electron) and X-ray diffraction techniques.

Metal surfaces and fractures examined with the unaided eye or with a magnifying glass or metallurgical or binocular microscope at magnifications less than 10 diameters can reveal valuable information as to the crystalline, chemical, and mechanical heterogeneity. Crystalline heterogeneity is known metallographically as grain. Chemical heterogeneity arises from impurities, segregation of chemical elements, and nonmetallic inclusions. Mechanical heterogeneity consists of local deformations of structure, elongation or distortion of nonmetallic inclusions, and regions of chemical segregation, resulting from cold fabrication processes.

Microscopic examination of polished or etched surfaces at magnifications ranging from about 100 to 1,500 diameters can reveal such information as size and shape of grains, distribution of structural phases and nonmetallic inclusions, microsegregation, and other structural conditions. Metallographic etching—that is, subjecting the polished surface to the action of a corrosive reagent—can reveal the structure by a selective and controlled solution or can unbuild the metal inwardly from the surface. This successive destruction occurs because of the different rates of dissolution of the structural components under the attack of the etching agent. Polarized light is useful to reveal grain structure, detect preferred orientation, examine oxide surface films, and identify phases of different composition.



Metallographic appearance of nominally pure iron (magnified 100 ×)

In electron microscopes a beam of electrons instead of a beam of light is directed onto the specimen; because only a highly energetic electron beam will pass through metal films thicker than about 0.05 micron (1 micron equals 0.001 millimetre), a microscope specimen replica of the surface is ordinarily made. To do this a plastic solution is poured over the etched surface; the hardened solution contains on one side a reverse impression of the surface contours of the specimen. The development of transmission electron microscopes, in which the electrons are accelerated to 100 kiloelectron volts or more, has made it possible to examine internal details of thin foils of metals.

X-ray diffraction techniques involve the impingement of a beam of X-rays on the metal specimen and the subsequent diffraction of the beam from regularly spaced planes of atoms; usually, the diffracted rays are recorded on photographic film. The technique is used to study phenomena related to the grouping of the atoms themselves. By measuring the lines or spots on the diffraction pattern and by analysis of the intensity of the deflected rays, information can be obtained about the positions of the atoms of the specimen and hence the crystallography of the phases, the presence of internal strains, and the presence of solute atoms in solid solutions.

metalloid, a chemical element with properties intermediate between those of typical metals and nonmetals. Usually considered under this classification are the chemical elements boron, silicon, germanium, arsenic, antimony, and tellurium. The rare elements polonium and astatine are also sometimes included. Most of these elements are important industrial materials, being used to make transistors and other semiconductor devices, ceramics, solar batteries, and certain polymers.

Metalloids are usually brittle, somewhat shiny solids that behave as electrical insulators at room temperature but become comparable to metals as electrical conductors when heated or when small quantities of certain elements are introduced into the lattices of their crystalline structures.

Metalloids have electronic structures intermediate between the nearly empty outer electron shells of the typical metals and the nearly filled electron shells of the nonmetals. Thus, they have enough empty electron orbitals (pathways within the shells) into which electrons can be moved to conduct electric current. Their chemical properties are intermediate between the behaviour of electropositive and electronegative atoms.

metallophone, any percussion instrument consisting of a series of struck metal bars (compare xylophone, with struck wooden bars). Examples include the *saron* and *gender* of the Indonesian gamelan orchestra and the Western glockenspiel, vibraphone, and (with a keyboard) celesta.

Javanese *saron*, metallophone, in the Musée Instrumental du Conservatoire Royal, Brussels

By courtesy of the Musée Instrumental, Brussels; photograph © A.C.L., Brussels

China had such instruments by the 7th century. Metallophones had reached northern Europe from Indonesia by about the second half of the 17th century. There they were originally used as practice instruments but were accepted as performance instruments in the 18th century.

metallurgy, the art and science of extracting metals from their ores and modifying the metals for use. Customarily, metallurgy refers to commercial as opposed to laboratory methods. It also concerns the chemical, physical, and atomic properties and structures of metals and the principles whereby metals are combined to form alloys.

A brief treatment of metallurgy follows. For full treatment, *see* MACROPAEDIA: Industries, Extraction and Processing.

Metallurgic practices date from approximately 4000 BC. Copper is believed to have been the first metal extracted from ore. Copper mines have been found in several places in the Middle East, and the mined metal was probably used for weapons and other utilitarian objects.

Bronze was probably developed between 4000 and 1400 BC, when it was discovered that an alloy made of copper and tin formed a metal that was less brittle than copper alone. The use of iron, noted as early as 3000 BC in the Middle East, became common there and in southwestern Europe about 1200 BC, and its use gradually spread to Asia. Brass, an alloy of copper and zinc, was developed from 1600 to 600 BC. It was used by the Romans for jewelry, armour, and as currency. Silver was successfully mined starting around 500 BC, and lead was ultimately recovered from the silver ore. Gold, one of the first metals mined, was used in an alloy with silver to form electrum. The first important steel production was started in India some time between 500 BC and 500 AD.

Although the Romans made few metallurgical innovations themselves, they contributed to existing techniques of mining and casting and devised a variety of new uses for the metals.

Metallurgical principles were first widely disseminated in the 16th century when Vannoccio Biringuccio and Georgius Agricola composed books cataloging most of the available metallurgical knowledge.

Extracting metals from crude ore is performed in two phases, mineral dressing and process metallurgy. In the first phase, the ore must be gradually broken down to isolate the desired metallic elements from the crude ore. The most common means of liberating minerals from the ore is by a process of crushing and grinding, after which the ore is sorted, either by hand (for which the ore must have at least one visually distinctive characteristic) or by more advanced methods which may involve gravity concentration, separation by flotation, electrostatic or magnetic separation, or other specialized processes.

Process metallurgy, the second phase, is the procedure or series of procedures whereby the minerals which have been separated from ore are reduced to metal, alloyed, and made available for specialization. The three processes commonly applied are pyrometallurgy, electrometallurgy, and hydrometallurgy. The product may be further refined by adapting additional metallurgical techniques, such as distillation. In pyrometallurgy the ore is heated to extreme temperatures, usually in a furnace. In most cases, the fire has a chemical as well as a physical function. The fire burns away certain components of the ore, or it deoxidizes, and thereby reduces, the ore. In electrometallurgy the ore is subjected to an electrolytic process in the extraction and refinement of metals. Hydrometallurgy refers to processes in which the metal is extracted from the ore by an aqueous acid or salt solution. From this solution the metal is precipitated by some suitable reagent.

Few methods of metal extraction yield a pure product. What is obtained, as a rule, is a more or less impure metal which must then be further refined to become fit for commercial, industrial, or research purposes.

There are six principal methods of metal processing: mechanical working (both cold and hot), foundry processes, surface treatments, powder metallurgy, nuclear metallurgy, and heat treatment. In cold working the metal is hardened and undergoes structural rather than chemical change. In hot working, the metal is softened by heat. This process alters the crystallinity of the metal so that it may then be refined. The metal may be forged or shaped by the rolling or drawing process. Foundries cast metals in molds so that each object is a uniform size and shape. Iron, steel, and nonferrous metals are cast in molds. Surface treatment methods involve the application of an exterior layer to metals by such means as hot dipping, electroplating, and cementation. The purpose of this process is to produce a layer to protect the base substance, or to otherwise alter the surface character of the metal. Powder metallurgy consists of processing metal powder into a die to produce a compressed shape which then, under the process of sintering (diffusion bonding by heating), becomes consolidated and strengthened. Metal powder may be manufactured mechanically or chemically. Nuclear metallurgy involves the production of highly specialized metals for nuclear engineering, specifically, it involves the isolation of fissionable materials. In heat treatment, metals are subjected to heat to produce or improve certain desired qualities—*e.g.*, hardness, ductility, etc.

Of great importance to metallurgy is metallography, the science and study of the compositions and structures of metals, particularly by microscopes and X-ray devices.

metalmark, any small butterfly of the principally South American family Riodinidae (order Lepidoptera), named for characteristic metallic wing markings. Metalmarks are difficult to recognize because many species mimic other lepidopterans and have evolved almost every combination of colour and wing shape.

Most males possess reduced front legs; females have functional ones. Most of the broad, flat, and usually hairy larvae feed on ragwort and thistles.

metalogic, the study and analysis of formal languages and formal systems with regard to their semantics (the relations between expressions and meanings) and syntax (the relations among expressions). The discipline thus includes the study of both mathematics and logic insofar as these are treated formally and in abstraction from their practical applications.

A brief treatment of metalogic follows. For full treatment, *see* MACROPAEDIA: Logic, The History and Kinds of: *Metalogic.*

The chief early impetus to the development of metalogic was the discovery, in the 19th century, of different geometries and the consequent desire to separate abstract mathematics from spatial intuition. David Hilbert, in his *Grundlagen der Geometrie* (1899; *The Foundations of Geometry*), organized Euclid's geometry into a more rigorous axiomatic system that uncovered many hidden axioms and opened the way for related attempts to axiomatize other areas of mathematics and logic. As a consequence of this desire for transparency and complete specification, greater attention came to be paid to the formal syntactic features of the languages and systems used rather than merely to their intuitive meanings. The use of predicate calculus in the determination of relationships further advanced the convergence of axiomatic mathematics, semiotics, and logic toward metalogic.

Certain aspects of metalogic made possible an attempt to develop a metalogical formalization of the physical and behavioral sciences. Building on Ludwig Wittgenstein's early work, Rudolf Carnap and other exponents of Logical Positivism sought to analyze these sciences into formal languages consisting of logically valid sentences with universal logical ranges (sentences that are true in all possible worlds) and factually true sentences of a more restricted range. One product of this attempt was to be a formal solution to the problem of meaning. The collapse of these expectations led to a narrowing of the scope of metalogic. A great deal of work of a mathematical nature has been done in the areas of axiomatic set theory, model theory, and recursion theory.

Currently the central questions of metalogic are those of the completeness and consistency of a formal system based on axioms. Two fundamental contributions to the understanding of these questions were made by Kurt Gödel. In 1931 he established that for any formal system that is sufficiently complex to generate an elementary arithmetic, it is impossible for that system to prove its own consistency, *i.e.*, there exists no consistency proof of such a system that can be formalized in the system itself. Then in 1934 he introduced the concept of recursive functions (functions mechanically computable by a finite series of purely combinatorial steps); this idea, further elaborated by the work of Alonzo Church, Alan M. Turing, and Emil L. Post, resulted in the development of recursion theory. By means of this theory it was possible to prove that certain classes of problems are either mechanically solvable or unsolvable, and it became possible for logicians to arrive finally at a sharply defined concept of a formal axiomatic system and at sharply defined concepts of decidability.

Church extended Gödel's findings in 1936 to show that interesting formal systems are undecidable both with regard to theorems and with regard to true sentences. The incompleteness theorem shows that truth in a system to which the theorem applies is undecidable, for if they were decidable then all true sentences would form a recursive set and could be taken as the axioms of a formal system that would be complete. Or alternatively, since truth in the language of a system is itself not representable (definable) in the system, it cannot, if all recursive or computable functions and relations are representable in the system, be recursive (*i.e.*, decidable) itself. From this it follows that a consistent system is undecidable with respect to theorems as well.

Despite the proof that interesting formal systems are incomplete and undecidable, it has been shown by M. Presburger and Thoralf Skolem (both in 1930) that arithmetic is decidable with regard to addition or multiplication alone. Alfred Tarski also developed (in 1951) a decision procedure for elementary geometry and elementary algebra. With regard to consistency proofs the work of Gerhard Gentzen (1936) opened up an area of extensive work in classical number theory. Gödel (in 1958) extended his interpretation from classical number theory to intuitionistic theory and obtained constructive interpretations for sentences of classical number theory in terms of primitive recursive functionals. Recent work in consistency proofs has extended the work of both these men and has tried to make constructive notations for the second number class of Georg Cantor. Consistency proofs have sparked much discussion about their implications for epistemology.

The metalogic concern with completeness and consistency has produced important results with regard to formal logic. It can be shown that propositional calculus is complete because every valid sentence in it is a theorem. Its consistency follows from the validity claim of its axioms, that they are true in all possible worlds, and because the rules of inference carry from valid sentences to valid sentences. Since all and only valid sentences are theorems, the calculus is decidable. With regard to first order predicate calculus, it can be proved that it is consistent and that all its theorems are valid. More importantly it has been proved that the calculus is complete but undecidable. The former was proved by Gödel in 1930 and the latter by Church and Turing in 1936 using very different methods.

Another important field of metalogic has been model theory, in which the interpretation of theories formalized in the framework of formal logic are studied. Model theory has yielded, for example, proof that no theory with an infinite model can be categorical or such that any two models of the theory are isomorphic, whether the model be constructed of infinite cardinal numbers or of any uncountable cardinality. Model theory also enabled Per Linström in 1969 to establish roughly that within a broad class of possible logics, elementary logic is the only one that satisfies the requirements of axiomatizability of the Löwenheim–Skolem theorem. Model theory has branched out to develop models of second order logic and infinitary logics, and with its concepts of ultrafilters, ultraproducts, and ultrapowers it has been used to develop an exact foundation for the classical differential calculus using infinitesimals.

metalwork, useful and decorative objects fashioned of various metals, including copper, iron, silver, bronze, lead, gold, and brass. The earliest man-made objects were of stone, wood, and bone, which were found naturally on the surface of the earth. It was only later in evolution that man learned to extract metals from the earth and to hammer those metals into utensils, jewelry, weapons, and ritualistic objects.

A brief treatment of metalwork follows. For full treatment, *see* MACROPAEDIA: Decorative Arts and Furnishings.

Metal is made into objects by various techniques, some used to form the object itself and others used for decoration only. Forming techniques are primarily hammering and casting. Hammering is the oldest technique. Plates of metal were hammered into shape and individual components either riveted together or pinned to a solid core before the invention of soldering or welding. After about 2500 BC both hammering and casting were used. To cast an object, molten metal is poured into a mold and allowed to cool. There are various techniques of casting that vary according to the type of mold used. In the technique known as the lost-wax, or *cire perdue,* process a wax model is encased in a refractory mold and is replaced by the hot metal, which melts the wax. After the metal hardens, the mold is broken to release the object. It can therefore be used only once. Other techniques using wooden or plaster molds allow several castings. Decorating techniques include hammering; embossing, or repoussé, in which ornament is raised in relief from the reverse side of the sheet metal; chasing; engraving; inlaying; enamelling; and gilding. Niello is a type of decoration in which molten silver sulfide is inlaid into another, hard metal, the surface of which has first been engraved with ornamental designs. Each decorative process has its own special technique and requires distinct skills on the part of the craftsman.

Silver and gold have been worked since ancient times, especially for items of personal ornamentation such as jewelry. Utilitarian objects of silver were common in antiquity and have remained important in modern times. Important centres included Greece, Persia, and Rome. Precious objects of gold and silver were made for the Christian church from Byzantine times onward. Many were lavishly decorated with inlaid jewels, gilding, and enamelling. Goldsmiths and silversmiths formed themselves into guilds in the 12th century; such was the patronage of royalty, nobility, and the wealthy merchant classes. By the end of the Middle Ages hallmarking was enforced in England to control the purity of silver objects. Fine goldsmith's work was made in the 16th century, especially in Flanders and in Germany. Much of the silver tableware made in England from the 17th century has survived and is still admired for its grace and simplicity of form. Goldwork and silverwork from pre-Columbian America was of the highest quality. Hollow ornaments were cast using the lost-wax process in what are now Colombia, Central America, and Mexico. Sheet gold and silver were hammered and decorated to make brilliant and delicate ritualistic objects. In the southwestern United States the silverwork of the American Indians, particularly the Zuni and the Navajo, introduced by Mexican craftsmen, is distinctive.

Copper was the first nonprecious metal to be wrought by man. Various copper alloys with tin and zinc were soon developed, making copper harder wearing and easier to work with. Copper is worked in a manner similar to silver or gold, being malleable and relatively soft, and it is often decorated with enamel. Many copper objects, such as mirrors and jugs, were made in ancient Egypt. The metal was widely used for domestic utensils in Europe in the 17th and 18th centuries and was used from the mid-18th century as the basis for Sheffield plate, a silver plate made by bonding silver to copper.

The alloy of copper and tin is called bronze, and the copper and zinc alloy is known as brass. Both bronze and brass were used for a wide range of objects, bronze exclusively being formed by casting. Fine bronze vases and statues were made in ancient Greece, and bronze became the most important medium for Greek large-scale sculpture. Smaller objects such as armour and vases were beautifully decorated with hammer ornament. Much important bronze ware—notably bells, candlesticks, and chandeliers—was cast from the Middle Ages onward for ecclesiastical purposes. Among the most important Renaissance works in bronze were Lorenzo Ghiberti's 15th-century doors for the Baptistery of the cathedral of Florence.

In England monumental brasses to mark tombs were made from the 13th to the 16th century, and many are still in place in churches and cathedrals. French 17th- and 18th-century furniture makers used gilded bronze mounts. Bronzes have been made in China for about 3,700 years, mostly originally as ritual vessels. Some of them are of such high quality as to be considered works of sculpture.

Pewter is an alloy of tin, which in its pure form is too brittle to cast and difficult to melt, and either copper or lead. Pewter objects are cast in molds and are usually simple and utilitarian in form and decoration, since the alloy is unsuitable for either stamping or chasing. A group of flagons, considered some of the finest of all pewter objects, was made in Silesia in about 1500. Pewter remained popular for plates and tankards throughout the 17th and 18th centuries, though it was gradually superseded by cheaper earthenware and porcelain from the mid-18th century.

Iron, either wrought or cast, has been used for a long time for decorative architectural components. Wrought iron particularly, which can be twisted and hammered, was used for gates and railings from the 16th century on. In medieval and Tudor times in England decorative ironwork hinges were common for church doors, and window openings were frequently protected by wrought iron bars.

Lead, because of its resistance to water, has traditionally been used for roof coverings. It was used from antiquity as a substitute for bronze and precious metals for the casting of metal sculpture. Lead garden figures, weather resistant and soft and silvery in colour, became popular in the late 17th century when some outstanding vases and statues were cast.

metameric segmentation, also called METAMERISM: *see* segmentation.

metamorphic rock, any of a class of rocks that result from the alteration of preexisting rocks in response to changing environmental conditions, such as variations in temperature, pressure, and mechanical stress, and the addition or subtraction of chemical components. The preexisting rocks may be igneous, sedimentary, or other metamorphic rocks.

A brief treatment of metamorphic rocks follows. For full treatment, *see* MACROPAEDIA: Minerals and Rocks.

The relative influence of the above-mentioned physical conditions defines the type of metamorphism involved. There are four basic kinds of metamorphic processes: (1) cataclastic, stress with low pressure; (2) contact, high temperature with low pressure; (3) regional, low to high temperature generally correlated with pressure; (4) metasomatic, wide range of temperatures and pressures in the presence of solutions.

The structure and mineralogy of any given metamorphic rock are reflective of the particular type of metamorphism that produced the rock. Its texture is determined by changes in the interrelationship between grains resulting from growth in the solid state, as opposed to liquid crystallization. The shape of the new crystals may be irregular or regular with crystal faces depending on the mineral type and the presence or absence of stress. Granoblastic texture describes a rock with grains having no preferred shape or relative orientation. Preferred orientation is exhibited by some rocks because of the growth of minerals with platy or elongate habit. This particular texture is manifested by micas in a rock called schist; the parallel alignment of most mica imparts a layered or foliated texture. Relic textures refer to those inherited from the preexisting rocks. Common relic textures include a preexisting mineral shielded from reaction by a new stable mineral overgrowth, or mineral layering that represents sedimentary layering. Folds or other deformation structures can be used to ascertain the direction of stress.

Metamorphic rocks formed by contact metamorphism are limited in extent and closely associated with an igneous intrusion. Pressure gradients are absent and fluid effects are dependent on the type of intrusion. A typical resultant rock has a hornfels texture with fine-grained, equidimensional grains. In common sedimentary rocks a sequence of minerals forms in response primarily to temperature changes. Such minerals include andalusite, cordierite, anorthite, diopside, grossularite, and wollastonite.

Because of the large areas affected, the most common metamorphic rocks are those produced by regional metamorphism. Typical rocks of this kind include schists and gneisses, coarse-grained rocks rich in feldspar with equidimensional grains. The coarse-grain size and regional extent both suggest long-term metamorphism characteristic of geosynclinal subsidence. Sedimentary sequences can frequently be traced for considerable distances and the change of mineralogy in response to metamorphism recognized for any restricted compositional range. For each composition, as represented by a particular type of sedimentary or igneous rock, the changes in mineralogy can be shown on a temperature/pressure graph as areas in which a certain mineral assemblage is stable. An examination of a sequence of metamorphic rocks reveals that there is also a general pattern in the structures or textures of the rocks in addition to mineralogic changes. In the case of common sedimentary shale low-grade metamorphism produces a slate, which is a micaceous, fine-grained rock. In turn, the slate becomes phyllite or a coarser-grained, laminated slate, and then schist. Further metamorphism results in a loss of volatile materials and metasomatic changes that produce a gneiss and subsequently a granulite (laminated rock without micas but with pyroxene-feldspar-garnet mineralogy), and finally migmatite, in which evidence of partial melting is present. Other rock compositions show parallel sequences: quartz sandstones become quartzites; limestones become marbles with a sequence of silicate minerals changing with pressure and temperature; and basic igneous rocks become greenschist, amphibolites, and ultimately eclogites. The appearance of characteristic minerals provides a mappable feature indicative of metamorphic intensity: the first occurrence of biotite, garnet, staurolite, kyanite, or sillimanite is represented by an isograd, which is an indicator of constant metamorphic conditions.

metamorphism, mineralogical and structural adjustments of solid rocks to physical and chemical conditions differing from those under which the rocks originally formed. Changes produced by surface conditions such as compaction and very high temperature processes such as partial melting are usually excluded. The most important agents of metamorphism include temperature, pressure, and stress. Equally as significant are changes in chemical environment that result in two metamorphic processes: (1) mechanical dislocation where a rock is deformed, especially as a consequence of differential stress; and (2) chemical recrystallization where a mineral assemblage becomes out of equilibrium due to temperature and pressure changes and a new mineral assemblage forms.

Three types of metamorphism may occur depending on the relative effect of mechanical and chemical changes. Dynamic metamorphism, or cataclasis, results mainly from mechanical deformation with little long-term temperature change. Textures produced by such adjustments range from breccias composed of angular, shattered rock fragments to very fine-grained, granulated or powdered rocks with obvious foliation and lineation. Large, pre-existing mineral grains may be deformed as a result of stress. Contact metamorphism occurs primarily as a conequence of increases in temperature when differential stress is minor. A common phenomenon is the effect produced adjacent to igneous intrusions where several metamorphic zones represented by changing mineral assemblages reflect the temperature gradient from the high-temperature intrusion to the low-temperature host rocks; these zones are concentric to the intrusion. Because the volume affected is small, the pressure is near constant. Resulting rocks have equidimensional grains because of a lack of stress and are usually fine-grained due to the short duration of metamorphism. Regional metamorphism results from the general increase, usually correlated, of temperature and pressure over a large area. Grades or intensities of metamorphism are represented by different mineral assemblages that either give relative values of temperature or absolute values when calibrated against laboratory experiments. Regional metamorphism can be subdivided into different pressure-temperature conditions based on observed sequences of mineral assemblages.

Other types of metamorphism can occur. They are retrograde metamorphism, the response of mineral assemblages to decreasing temperature and pressure; metasomatism, the metamorphism that includes the addition or subtraction of components from the original assemblage; poly-metamorphism, the effect of more than one metamorphic event; and hydrothermal metamorphism, the changes that occur in the presence of water at high temperature and pressure which affect the resulting mineralogy and rate of reaction.

metamorphosis, in biology, striking change of form or structure in an individual after hatching or birth. Hormones called molting and juvenile hormones, which are not species specific, apparently regulate the changes. These physical changes as well as those involving growth and differentiation are accompanied by alterations of the organism's physiology, biochemistry, and behaviour.

The immature forms, or larvae, are adapted to environments and modes of life that differ from those of the adult forms. These differences may be of significance in assuring that larvae and adults of the same species do not engage in direct competition for food or living space. Examples of metamorphosis include the tadpole, an aquatic larval stage that transforms into the land-dwelling frog (class Amphibia). Starfishes and other echinoderms undergo a metamorphosis that includes a change from the bilateral symmetry of the larva to the radial symmetry of the adult. Metamorphic patterns are well-known in crabs, lobsters, and other crustaceans and also in snails, clams, and other mollusks. The larval form of the urochordate (*e.g.,* the tunicate, or sea squirt) is tadpole-like and free swimming; the adult is sessile and somewhat degenerate.

Among the most dramatic and thoroughly studied examples of metamorphosis are the insects. Because development is not the same in all insects, it is convenient to group them into major categories according to the pattern of structural changes: ametabolous, hemimetabolous, and holometabolous. In ametabolous development there is simply a gradual increase in the size of young until adult dimensions are attained. This kind of development occurs in the silverfish, springtail, and other primitive insects. In more advanced insects (*e.g.,* grasshoppers, termites, true bugs) a phenomenon known as gradual, or hemimetabolous, metamorphosis occurs. The hemimetabolous life cycle consists of egg, nymph, and adult. The nymph, or immature insect, resembles the adult in form and eating habits, differing in size, body proportions, and colour pattern. Rudimentary wings are visible and develop externally. Development is gradual through a series of molts (periodic shedding of the outer skeleton), the adult emerging from the final molt.

Complete, or holometabolous, metamorphosis is characteristic of beetles, butterflies and moths, flies, and wasps. Their life cycle includes four stages: egg, larva (*q.v.*), pupa (*q.v.*), and adult. The larva differs greatly from the adult. It is wingless, and its form and habits are suited for growth and development rather than reproduction. The change to the adult occurs during the inactive, nonfeeding pupal stage. At this time the larva undergoes a transformation in which the wings appear externally, larval organs and tissues are broken down, and adult structures are developed. Hypermetamorphosis, a form of complete metamorphosis, occurs in some beetles, flies, and other insects and is characterized by a series of larval stages.

metanephros, permanent kidney in reptiles, birds, and mammals, developing by the 10th week in human embryos from the lower part of the Wolffian duct, and replacing the embryonic structure called the mesonephros. It consists of a compact, paired organ containing many nephrons; a ureter separate from the Wolffian duct leads from the metanephros to the bladder.

Metaphen (disinfectant): *see* nitromersol.

metaphor, figure of speech that implies comparison between two unlike entities, as distinguished from simile, an explicit comparison signalled by the words "like" or "as."

The distinction is not simple. The metaphor makes a qualitative leap from a reasonable, perhaps prosaic comparison, to an identification or fusion of two objects, to make one new entity partaking of the characteristics of both. Many critics regard the making of metaphors as a system of thought antedating or bypassing logic.

Metaphor is the fundamental language of poetry, although it is common on all levels and in all kinds of language. Many words were originally vivid images, although they exist now as dead metaphors whose original aptness has been lost—for example, "daisy" (day's eye). Other words, such as "nightfall," are dormant images. In addition to single words, everyday language abounds in phrases and expressions that once were metaphors. "Time flies" is an ancient metaphorical expression. When a poet says "The Bird of Time has but a little way / To flutter—and the Bird is on the Wing" (*The Rubáiyát of Omar Khayyam*), he is constructing a new metaphor on the foundations of an older, stock metaphor. When Tennessee Williams entitles his play *Sweet Bird of Youth,* he, too, is referring to that Bird of Time that flies. Thus, metaphorical language develops continuously in complexity just as ordinary language does.

In poetry a metaphor may perform varied functions from the mere noting of a likeness to the evocation of a swarm of associations; it may exist as a minor beauty or it may be the central concept and controlling image of the poem. The familiar metaphor "Iron Horse," for train, for example, becomes the elaborate central concept of one of Emily Dickinson's poems, which begins

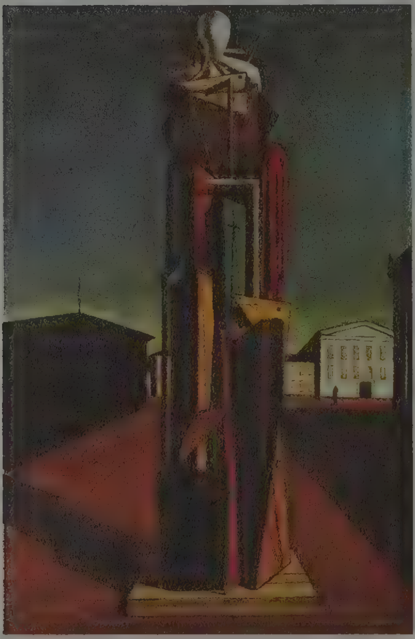
> I like to see it lap the Miles,
> And lick the Valleys up,
> And stop to feed itself at Tanks;
> And then prodigious step . . .

A mixed metaphor is the linking of two or more disparate elements, which often results in an unintentionally comic effect produced by the writer's insensitivity to the literal meaning of words or by the falseness of the comparison. A mixed metaphor may also be used with great effectiveness, however, as in Hamlet's

> Whether 'tis nobler in the mind to suffer
> The slings and arrows of outrageous fortune
> Or to take arms against a sea of troubles . . .

in which "sea" should be replaced by "host" for the strictly correct completion of the metaphor.

Metaphysical painting, style of painting that flourished mainly between 1911 and 1920 in the works of the Italian artists Giorgio De Chirico, Carlo Carrà, and Giorgio Morandi. These painters' representational but bizarre and incongruous imagery produces strange, disquieting effects on the viewer. Juxtaposing disparate objects set into deep perspectives, these works strongly influenced the Surrealists in the 1920s.



"The Great Metaphysician," Metaphysical painting by Giorgio De Chirico, oil on canvas, 1917; in the Museum of Modern Art, New York City

Collection, The Museum of Modern Art, New York City, the Philip L. Goodwin Collection

Metaphysical painting originated with De Chirico. In Munich, where he spent his youthful formative years, De Chirico was attracted to 19th-century German Romantic painting and to the works of the philosophers Arthur Schopenhauer and Friedrich Nietzsche. The latter's search for hidden meanings beyond surface appearances and his descriptions of empty squares surrounded by arcaded buildings in the Italian city of Turin made a particularly deep impression on De Chirico; his 1915 painting "Turin Melancholy" (Carlo Frua de Angeli Collection, Milan), for example, illustrates just such a square, with unnaturally sharp contrasts of light and shadow that lend an aura of poignant but vaguely threatening mystery to the scene. The arcades in this painting, as well as the deep perspectival space and dark-toned sky, are pictorial devices found in many of De Chirico's strange, evocative works. The enigmatic titles of his paintings contribute to their dreamlike effect: "The Nostalgia of the Infinite" (Museum of Modern Art, New York City), "The Philosopher's Conquest" (Art Institute of Chicago), and "The Soothsayer's Recompense" (Philadelphia Museum of Art).

Many of De Chirico's paintings depict mannequins, as do the works done around 1917–21 by the former Futurist Carlo Carrà, who came under his influence. The two artists met in 1917, in Ferrara where, together with De Chirico's younger brother—a poet, musician, and painter known as Alberto Savinio—they formulated the rather obscure principles of the *scuola metafisica* (Metaphysical school). De Chirico, however, had already arrived at his Metaphysical style several years before the movement came into existence and, by 1911, had shown paintings of this nature in Paris. Other adherents to Metaphysical painting were Filippo de Pisis and Mario Sironi. The Metaphysical school proved short-lived, however, and came to an end around 1920 because of dissension between De Chirico and Carrà over who had founded the group. De Chirico's work done after 1919 lost much of its mysterious power and eventually sank into a degraded and eccentric classicism.

Metaphysical poet, any of the poets in 17th-century England who inclined to the personal and intellectual complexity and concentration that is displayed in the poetry of John Donne, the chief of the Metaphysicals. Others include George Herbert, Henry Vaughan, Richard Crashaw, Andrew Marvell, John Cleveland, and Abraham Cowley.

Their work is a blend of emotion and intellectual ingenuity, characterized by conceit (*q.v.*) or "wit"—that is, by the sometimes violent yoking together of apparently unconnected ideas and things so that the reader is startled out of his complacency and forced to think through the argument of the poem. Metaphysical poetry is less concerned with expressing feeling than with analyzing it, with the poet exploring the recesses of his consciousness. The boldness of the literary devices used—especially obliquity, irony, and paradox—are always reinforced by a dramatic directness of language, whose rhythm is derived from that of living speech.

Esteem for Metaphysical poetry never stood higher than in the 1930s and '40s, largely because of T.S. Eliot's influential essay "The Metaphysical Poets" (1921). In this essay Eliot pointed out that the works of these men embody a fusion of thought and feeling that later poets were unable to achieve because of a "dissociation of sensibility," which resulted in works that were either intellectual or emotional but not both at once. In their own time, however, the epithet "metaphysical" was used pejoratively: in 1630 the Scottish poet William Drummond of Hawthornden objected to those of his contemporaries who attempted to "abstract poetry to metaphysical ideas and scholastic quiddities." At the end of the century, John Dryden censured Donne for affecting "the metaphysics" and for perplexing "the minds of the fair sex with nice speculations of philosophy when he should engage their hearts . . . with the softnesses of love." Samuel Johnson, in referring to the learning that their poetry displays, also dubbed them "the metaphysical poets," and the term has continued in use ever since. For an attempt to establish the justice of this term in relation to their work, Sir Herbert Grierson's *Metaphysical Poems and Lyrics of the 17th Century* (1921) and James Smith's essay "On Metaphysical Poetry" in *Determinations* (ed. F.R. Leavis, 1934) are of interest.

metaphysics, branch of philosophy concerned with critically examining basic philosophical assumptions and identifying what exists insofar as it exists. Metaphysics interacts with such other philosophical studies as logic, epistemology, aesthetics, and ethics.

A brief treatment of metaphysics follows. For full treatment, *see* MACROPAEDIA: Metaphysics.

Metaphysics has by tradition concerned itself with issues of broad philosophical interest. One of the most basic issues, first addressed by ancient Greek philosophers, is the existence and nature of forms, *i.e.,* abstract realities which are objects of the mind. Since the classical Greek philosophers distinguished between objects of the real world—sensible things—and objects of the mind—ideas—metaphysical philosophers have concerned themselves with the relationship between abstractions and substances, trying to determine whether both are real or whether one is somehow more real than the other. Metaphysicians have interpreted the natural world, the significance of time and space, and the existence and nature of God, all in an attempt to understand the relationship between form and idea.

Metaphysical argument is by and large an a priori process. A priori arguments start with basic, mutually consistent assumptions and develop them through to their logical conclusions. If absurdities arise during this deductive process, the original principles must be rejected or reevaluated. Since metaphysical conclusions are by nature extremely general, all-encompassing assertions that are paradigms of thought rather than statements of empirical fact, refuting them with counterexamples is ineffective criticism. Moreover, unlike in the empirical sciences, where new knowledge supersedes old beliefs, numerous conflicting metaphysical theories have all stood the test of time, affirming the notion that there is no single metaphysical truth.

The first metaphysicians, Parmenides and Plato, recognized a basic distinction between appearance and reality. Plato rejected the changeable, deceptive reality of the sensible world in favour of the unchanging and therefore truthful world of ideas. Aristotle began with Plato's distinction between form and matter and then integrated the two using a biological model. Aristotle assumed that matter was always moving toward its potential ideal form. In this way the material world is seen as a continuum of organic change.

With the development of Christianity, philosophers became concerned with finding an a priori proof of God's existence. Thomism, based on the metaphysics of St. Thomas of Aquinas, combined Aristotelian and Christian thought. According to St. Thomas, the contemplation of the everyday (which was the basis of Aristotle's examination of the relationship between form and matter) inevitably leads to the understanding that God exists and is the prime and sustaining cause of the material world. By examining the finite, ever-changing material world, one is inevitably led to the source of change, *i.e.,* God.

René Descartes caused another major shift in metaphysical thought. His dualistic philosophy defined the material and mental spheres as separate, independent realms. Rejecting the notion of God proposed by the Christian philosophers, Descartes postulated that the material world was set up by a prime agent, but thereafter, like a great mechanism, it ran free of divine interaction. Immanual Kant accepted dualism but rejected Descartes's explanation and revolutionized metaphysics by demonstrating the importance of perception. According to Kant, objective reality must be perceived through the human constructs of time and space. Thus the human view of the material world would always be influenced by the perceiving mechanism. What earlier metaphysicians had considered objective reality, Kant rejected as such, subordinating all observation to the mechanism of observation.

Materialism and Idealism tried to synthesize the concepts of mind and matter within a single theory. The Idealists merged the two spheres by subordinating matter to mind. Materialists assumed the antithetical position, subordinating mind to matter and asserting that all that existed was matter and that the mind was dependent on objective circumstances.

Several philosophers have questioned the validity of metaphysical methodology and conclusions. David Hume asserted that all knowledge comes through the senses. Since all basic concepts are derived from sense experience, Hume concluded that there is no pure thought. Logical Positivism, a 20th-century school of philosophy, asserted that any statement's meaning depends on how it can be verified. Since metaphysical statements cannot be verified, Logical Positivists concluded that metaphysical assertions have no meaning.

Ludwig Wittgenstein's criticism viewed metaphysical experience as something beyond the realm of language. Wittgenstein argued that there were things that could be said and things that could only be shown. Metaphysical theorizing is unsuccessful because it tries to talk about a realm that exists outside of the realm that language can illuminate.

A list of the abbreviations used
in the MICROPAEDIA *will be found*
at the end of this volume

metaplasia, in zoology, the conversion of one type of living cell or group of cells into another as a means of regeneration. For example, the damaged or removed lens of a salamander eye is replaced through the transformation of nearby pigmented iris cells into lens cells. The regeneration of brain tissue from epidermis in annelid worms is another well-documented example of metaplasia. The term metaplasia also refers to the abnormal replacement of cells of one type by those of another type.

Metapontum, Greek METAPONTION, ancient Greek city in Italy on the Gulf of Tarentum, near the mouth of the Bradanus (Bradano) River. It was founded by an Achaean colony from Sybaris and Croton about 700 BC. Pythagoras died at Metapontum *c.* 500. The city declined after 207 when its inhabitants, who had supported Hannibal in the years following his victory at the Battle of Cannae (216), followed the defeated Carthaginian general in his retreat.

Tavole Paladine, Metapontum, 570–480 BC
G. Tomisch—Photo Researchers

At Metapontum are the remains of two temples, both dating from 570 to 480 BC. Of the first, probably dedicated to Apollo Lyceius, only the foundations remain; 15 columns still stand of the second temple, Tavole Paladine, which lies outside the area of the ancient city.

Metasequoia (tree): *see* dawn redwood.

metasilicate (mineralogy): *see* inosilicate.

metasomatic replacement, the process of simultaneous solution and deposition whereby one mineral replaces another. It is an important process in the formation of epigenetic mineral deposits (those formed after the formation of the host rock), in the formation of high- and intermediate-temperature hydrothermal ore deposits, and in supergene sulfide enrichment (enriched by generally downward movement). Metasomatic replacement is the method whereby wood petrifies (silica replaces the wood fibres), one mineral forms a pseudomorph of another, or an ore body takes the place of an equal volume of rock.

Replacement occurs when a mineralizing solution encounters minerals unstable in its presence. The original mineral is dissolved and almost simultaneously exchanged for another. The exchange does not occur molecule for molecule, but volume for volume; hence, fewer molecules of a less dense mineral will replace those of a more dense mineral. Replacement takes place first along major channels in a host rock through which the hydrothermal solutions flow. Smaller openings, even those of capillary size, eventually are altered, the smallest by diffusion at the very front of the exchange where solutions cannot flow.

Early-formed replacement minerals are themselves replaced, and definite mineral successions have been established. The usual sequence among the commoner hypogene (deposited by generally ascending solutions) metallic sulfide minerals is pyrite, enargite, tetrahedrite, sphalerite, chalcopyrite, bornite, galena, and pyrargyrite.

Although replacement can occur at any temperature or pressure, it is most effective at elevated temperatures, at which chemical activity is enhanced. Replacement by cold circulating waters mostly is confined to soluble rocks, such as limestone. These may be replaced by iron oxides, manganese oxides, or calcium phosphates; vast surface deposits of copper and zinc carbonates have also formed where limestones were replaced, and valuable deposits have occurred where supergene sulfide enrichment (*q.v.*) occurs. With higher temperatures, replacement increases until, at high temperatures, hardly any rock may resist. Solutions at intermediate temperatures form simple sulfides and sulfosalts for the most part, and those at higher temperatures form sulfides and oxides. Replacement deposits are the largest and most valuable of all metallic ore deposits except those of iron.

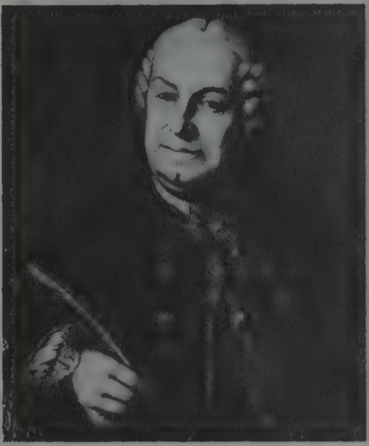
metastable state, in physics and chemistry, particular excited state of an atom, nucleus, or other system that has a longer lifetime than the ordinary excited states and that generally has a shorter lifetime than the lowest, often stable, energy state, called the ground state. A metastable state may thus be considered a kind of temporary energy trap or a somewhat stable intermediate stage of a system the energy of which may be lost in discrete amounts. In quantum mechanical terms, transitions from metastable states are "forbidden" and are much less probable than the "allowed" transitions from other excited states.

There are many examples of metastable states in atomic and nuclear systems. Analysis of atomic spectra often reveals metastable states as relatively final energy levels to which electrons have cascaded from higher energy levels in the act of generating light. Light energy trapped for a time in metastable mercury atoms accounts for the many photochemical reactions of this element. Metastable states of atomic nuclei give rise to nuclear isomers that differ—in energy content and mode of radioactive decay—from other nuclei of the same element.

Metastable atoms often lose their stored energy by collision with other atoms before they can radiate it, but in the rarefied upper atmosphere of Earth, in which atoms travel a longer time before collision, radiation from metastable oxygen atoms seems to account for the characteristic green colour of the aurora borealis and aurora australis. Metastable nuclei lose their energy by radioactive decay, usually by gamma radiation.

Metastasio, Pietro, original name PIETRO ARMANDO DOMINICO TRAPASSI (b. Jan. 3, 1698, Rome—d. April 12, 1782, Vienna), Italian poet and the most celebrated librettist in Europe writing during the 18th century for the opera seria (*q.v.*). In 1708 his astonishing skill in verse improvisation attracted the attention of Gian Vincenzo Gravina, a man of letters who made him his heir adoptive and Hellenized his name into "Metastasio."

In 1712, after receiving a good education from Gravina, Metastasio was taken to Scalea in Calabria, where he studied for some months with Gregorio Caloprese, the Cartesian philosopher. At the age of 14 he wrote *Giustino*, a tragedy in the Senecan style; and in 1717 he published a book of verses. In 1718 Metastasio entered the Accademia dell'Arcadia, and in 1719 he went to Naples where he was employed in a law office and gained acceptance in aristocratic circles through his voluptuous wedding poems.



Metastasio, detail of an oil painting by an unknown artist; in the Biblioteca Angelica, Rome
By courtesy of the Biblioteca Angelica, Rome; photograph, Aldo Marcucci

In honour of the birthday of the Empress of Austria, Metastasio composed *Gli orti esperidi* (1721), a serenata in which the principal role was taken by the prima donna Marianna Benti-Bulgarelli, called La Romanina, who became enamoured of the poet. In her salon Metastasio formed his lifelong friendship with the castrato male soprano Carlo Farinelli and came to know such composers as Nicola Porpora (from whom he took music lessons), Domenico Sarro, and Leonardo Vinci, who were later to set his works to music.

In this environment Metastasio's success was assured. At the request of La Romanina he gave up the law and composed his first *melodramma*, a lyric tragedy in three acts on the conflict of love and duty, called *Didone abbandonata* (1723, first performance 1724; *Dido Forsaken,* 1952). *Didone* was followed, between 1726 and 1730, by *Siroe, Catone in Utica, Ezio, Semiramide riconosciuta, Alessandro nell'Indie*, and *Artaserse*. On the recommendation of his friend and patroness Marianna Pignatelli, countess of Althann, Metastasio received an invitation (1729) from the emperor of Austria. In March 1730 he went to Vienna, where he lived the rest of his life as poet laureate to the imperial court.

During the reign of Charles VI Metastasio wrote cantatas, oratorios, and 11 *melodrammi*, some of the best of which—*Demetrio, Olimpiade, Demofoonte, La clemenza di Tito*, and *Attilio Regolo*—were performed as plays in their own right as well as being set to music by virtually every composer from Pergolesi to Mozart. After 1740, with the accession of Maria Theresa, Metastasio was not so well placed. He continued to be extremely productive until 1771, and his work was always honoured. But the Empress did not permit the same lavish expenditure on operatic spectacles as her predecessor, and Metastasio's talents gradually went into decline.

Metastasio's other writings include a rich *Epistolario* and five *canzonette*, of which *La libertà* (1733) and *La partenza* (1746) are outstanding examples of Italian verse in the Arcadian tradition. He also wrote works of criticism, the most interesting being the *Estratto della Poetica d'Aristotele* (1782), an exposition of his dramatic theories. Metastasio's works ran into innumerable editions. During the 18th century his verses were translated into many European languages.

metatarsal, any of several tubular bones between the ankle (tarsal) bones and each of the hindlimb digits, in land vertebrates corresponding to the metacarpal bones of the hand (forepaw). In humans the five metatarsal bones help form longitudinal arches along the inner and outer sides of the foot and a transverse arch at the ball of the foot. The first metatarsal (which adjoins the phalanges of the big toe) is enlarged and strengthened for its weight-bearing function in standing and walking on two feet.

metatarsalgia, disorder in which the weight of the body, when standing, rests on the centre of the anterior arch of the foot (on the heads of the central metatarsal bones) instead of on the inside and outside of the foot. Pain when walking may be severe, callosities develop on the area of stress, and there is a tendency to fracture of the metatarsals. The cause of metatarsalgia may be developmental or may occur secondary to another disease. Treatment consists in placing sponge-rubber pads in the shoes in such a position as to maintain normal formation of the anterior arch. A special form of metatarsalgia, Morton's toe, occurs in the middle-aged and is caused by enlargement of the digital nerve as it passes between the metatarsal heads to the toes. Constant severe pain is the main symptom, and treatment is by excision of the enlarged nerve.

metatexis, the process in which the magma-like portion of migmatites (mixed rocks that have granitic layers or veinlike bodies) is emplaced within a host rock of different composition. Migmatites may form by the injection of granitic magma (the metatect) into the host or by the partial fusion of the host itself; they form under the most extreme temperatures and pressures reached during regional metamorphism and are generally associated with rocks of the granulite facies. Such rocks, considered to represent the deeper parts of folded mountain belts, are often associated with large granitic bodies. The origin of these granites is closely tied to the migmatites because the metamorphic or igneous origin of the latter may be extrapolated to interpret the origin of the granitic body.

metatheory, a theory the subject matter of which is another theory. A finding proved in the former that deals with the latter is known as a metatheorem.

The most notable example of a metatheory was provided by David Hilbert, a German mathematician, who in 1905 set out to construct an elementary proof of the consistency of mathematics. For this purpose he needed a theory that studies mathematics and has mathematical proofs as the objects to be investigated. Although theorems proved in 1931 by Kurt Gödel, a Moravian-U.S. mathematical logician, made it unlikely that Hilbert's program could succeed, his metamathematics became the forerunner of much fruitful research. From the late 1920s Rudolf Carnap, a leading philosopher of science and of language, extended this inquiry, under the headings metalogic and logical syntax, to the study of formalized languages in general.

In discussing a formalized language it is usually necessary to employ a second, more powerful language. The former is then known as the object language, whereas the second is its metalanguage.

Metatron, greatest of angels in Jewish myths and legends, variously identified as the Prince (or Angel) of the Presence, as Michael the archangel, or as Enoch after his ascent into heaven. He is likewise described as a celestial scribe recording the sins and merits of men, as a guardian of heavenly secrets, as God's mediator with men, as the "lesser Yahweh," as the archetype of man, and as one "whose name is like that of his master." The latter appellation is based on Hebrew numerology; *i.e.,* when the consonants that comprise the names Metatron and Shaddai (Almighty) are analyzed according to preassigned numerical values, each name totals 314. Elisha ben Abuyah (flourished *c.* AD 100) is said to have apostasized after having had a vision of Metatron.

Metauro River, Italian FIUME METAURO, also called METRO, Latin METAURUS, river, Marche region, central Italy, rising in the Etruscan Apennines (Appennino Tosco-Emiliano) and flowing for 68 mi (109 km) east-northeast into the Adriatic Sea just south of Fano. The lower valley of the river (the ancient Metaurus) was the scene of a great Roman victory over the Carthaginians in 207 BC, when the consuls Marcus Livius Salinator and Claudius Nero defeated and slew Hasdrubal, the brother of the Carthaginian leader Hannibal. The battle was a decisive turning point in the Second Punic War.

Metaxas, Ioannis (b. April 12, 1871, Ithaca, Greece—d. Jan. 29, 1941, Athens), general and statesman, dictator of Greece from 1936 to 1941.

After active service in the Greco-Turkish war (1897), Metaxas completed his military training in Germany. He distinguished himself on the Greek general staff during the Balkan Wars (1912–13) and was appointed chief of staff in 1913 and promoted to general in 1916. During World War I he unsuccessfully fought to maintain Greek neutrality and opposed the plans of premier Eleuthérios Venizélos for the conquest of western Anatolia, accurately predicting the military catastrophe that ultimately overtook the Greek offensive in Anatolia in 1921–22. Strongly monarchist in his politics, he left the country after the deposition of King Constantine (1917), but returned after the King's restoration in 1920. With the fall of the monarchy in 1923, Metaxas again temporarily left Greece, but later held ministerial office under the republic (1928).

During the following years Metaxas provided doughty opposition to the government at the head of a small ultraroyalist party; shortly after the monarchy's restoration in 1935 King George II appointed him premier (April 13, 1936). Finally, on Aug. 4, 1936, he inaugurated a dictatorship under royal authorization. His Fourth of August Regime vigorously suppressed political opposition and succeeded in carrying out some beneficial economic and social reforms. When Italy invaded Greece in 1940, Metaxas brought a united country into the Western alliance. He remained in power until his death.

métayage (French), Italian MEZZADRIA, type of land tenure whereby the cultivator (metayer) uses land without owning it and pays rent in kind to the owner. Pure métayage is a form of share tenancy involving payment of approximately half the annual output; the métayer's family permanently occupies the land that it works. The term describes what was probably the dominant type of land tenure in 18th-century France, certainly in southern France, and in parts of Italy.

The typical French métayer's holding was small, consisting of either a single compact unit or scattered plots. The landowner usually furnished the chief capital items, possibly including livestock. Custom, rather than written contracts, prevailed. With the increasing use of money contracts that accompanied the growth of a market economy after 1800, métayage yielded largely to simple peasant tenure.

The economic and social conditions from which métayage emerged in late medieval France, including great population pressure on a limited land supply, have at various times also existed in India, Japan, eastern Europe, and the southern United States and have produced similar sharecropping systems.

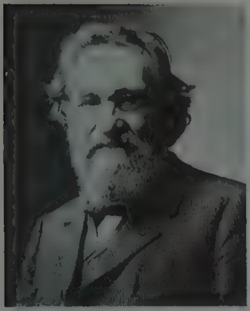
Metcalfe (of Fern Hill), Charles T(heophilus) Metcalfe, Baron, 2ND BARONET (b. Jan. 30, 1785, Calcutta—d. Sept. 5, 1846, Malshanger, Hampshire, Eng.), British overseas administrator who, as acting governor general of India, instituted in that country important reforms, particularly freedom of the press and the establishment of English as the official language. He later served as crown-appointed governor of Jamaica and governor general of Canada.

The second son of Maj. Thomas Metcalfe, who became a director of the East India Company and was made a baronet in 1802, Charles Metcalfe was educated at Eton College, Buckinghamshire. Returning to Calcutta (1801), he became a writer in the company's service. In 1803 he became personal secretary to the governor general, Lord Wellesley. He served as political assistant to Gen. Gerard Lake in the Third Marāthā War (fought between the British and the Marāthās of southwestern India). In 1808 he was sent as envoy to Lahore to secure Sikh support against the Napoleonic threat to India, afterward securing the Sikhs' agreement to British protection of all Sikh states east of the Sutlej River. He then served as resident in Gwalior (1810), in Delhi (1811–19), and in Hyderābād (1820–22), succeeding to the baronetcy in 1822.

Metcalfe became a member of the all-India governing supreme council in 1827 and, on Lord William Bentinck's departure in March 1835, acting governor general. The British government, refusing to retain an East India Company official as governor general, appointed Lord Auckland to the post. Metcalfe was made lieutenant governor of the northwest provinces the following year, but, denied governorship of Madras, he resigned in 1838 and returned to England. The following year he was appointed governor of Jamaica, where he eased the transition to the emancipation of blacks and updated judicial practices. Suffering from cancer, he resigned in 1842 and returned to England, but the following year he accepted the governor generalship of Canada, where he grappled with party politics. His health failing, he returned to England in 1845, soon after being raised to the peerage.

Metchnikoff, Élie, Russian ILYA ILICH MECHNIKOV (b. May 15, 1845, near Kharkov, Ukraine—d. July 16, 1916, Paris), Russian zoologist and microbiologist, who received (with Paul Ehrlich) the 1908 Nobel Prize for Physiology or Medicine for discovery in animals of amoeba-like cells that engulf foreign bodies such as bacteria—a phenomenon known as phagocytosis and a fundamental tenet of the science of immunology.

A graduate of the Kharkov A.M. Gorky State University (1864), he was professor of zoology and comparative anatomy at the University of Odessa (1870–82). In Messina, Italy (1882–86), while studying the origin of digestive organs in starfish larvae, he observed



Metchnikoff

H. Roger-Viollet

that certain cells unconnected with digestion surrounded and engulfed carmine dye particles and splinters that he had introduced into the bodies of the larvae. He called these cells phagocytes (from Greek words meaning "devouring cells").

Working at the Bacteriological Institute, Odessa (1886–87), and at the Pasteur Institute, Paris (1888–1916), which he directed (1895–1916), Metchnikoff established that the phagocyte is the first line of defense against acute infection in most animals, including man, whose phagocytes are known as leukocytes, or white blood cells. With the French bacteriologist Émile Roux, Metchnikoff succeeded in transmitting syphilis to apes (1903). He devoted the last decade of his life to the study of lactic acid-producing bacteria as a means of increasing human longevity. He wrote *The Comparative Pathology of Inflammation* (1892), *L'Immunité dans les maladies infectieuses* (1901; *Immunity in Infectious Diseases*), and *Études sur la nature humaine* (1903; *The Nature of Man*).

Metel, François Le: *see* Boisrobert, François Le Metel, seigneur de.

Metellus, Lucius Caecilius (d. 221 BC), Roman general during the First Punic War (264–241 BC).

As consul in 251, Metellus decisively defeated the Carthaginian general Hasdrubal at Panormus (now Palermo, Sicily) by panicking the enemy's elephants. Thereafter the image of an elephant frequently appeared on coins issued by the Metelli family. Metellus held a second consulship in 247. He is said to have been blinded in 241 while rescuing the statue of Minerva from a fire in the temple of Vesta.

Metellus Celer, Quintus Caecilius (d. 59 BC), Roman politician, a leading supporter of the Optimates (conservative senatorial aristocracy) and opponent of Pompey the Great.

Metellus was legate under Pompey in Asia in 66. As praetor in 63, he was sent to northern Italy to cut off the retreat of the rebel Catiline. During his consulship (60) Metellus turned against Pompey, who had divorced his sister. He persuaded the Senate to reject the proposed agrarian law that was to provide land grants for veterans discharged from Pompey's legions.

Metellus Creticus, Quintus Caecilius (fl. 1st half of the 1st century BC), Roman general.

Consul in 69 BC, Metellus was appointed to the command of the war against Crete, the headquarters of the pirates of the Mediterranean. Two years later the Senate passed the Lex Gabinia, giving Pompey absolute control of all operations against the pirates. The Cretans offered to surrender to Pompey, who instructed Metellus to cease operations. Metellus refused and completed the conquest of the island, which was annexed to Cyrene and became a Roman province. Pompey's partisans prevented Metellus from celebrating a triumph at Rome until 62, and in retaliation Metellus led the senatorial opposition that temporarily blocked ratification of Pompey's Asiatic settlement.

Metellus Macedonicus, Quintus Caecilius (d. 115 BC), Roman general and statesman.

While praetor in 148 Metellus deposed Andriscus, usurper of the throne of Macedonia, with the result that Macedonia became a Roman province. During his consulship of 143, he vanquished the Celtiberians in northern Spain. As censor in 131, he delivered a famous address proposing that all citizens be compelled to marry in order to increase the birth rate. Metellus opposed the agrarian reforms of the Gracchi (the brothers Tiberius Sempronius and Gaius Sempronius Gracchus) and participated in the attack in which Gaius Gracchus was killed (121). He erected a splendid colonnade in the Campus Martius and two temples dedicated to Jupiter Stator and Juno.

Metellus Numidicus, Quintus Caecilius (d. *c.* 91 BC), Roman general during the Jugurthine War (111–105) and a leader of the Optimates (conservative senatorial aristocracy).

As consul in 109 Metellus defeated the Numidian leader Jugurtha by the River Muthul in North Africa. Despite further military successes against Jugurtha, he lost his command to his subordinate Gaius Marius, who was elected consul for 108 despite Metellus' opposition. As censor in 102, Metellus unsuccessfully attempted to remove the reformers Lucius Appuleius Saturninus and Gaius Servilius Glaucia from the Senate, and in 100 he went into exile to escape having to swear support for Saturninus' agrarian law. Metellus returned to Rome in 99, the year after Saturninus was killed, but thenceforth took no part in politics.

Metellus Pius, Quintus Caecilius (d. *c.* 63 BC), one of the commanders of the Social War (90–89), who later defeated Quintus Pompaedius Silo, the Marsian leader (88). He earned his surname Pius (signifying filial devotion) by his attempts to obtain the recall from exile of his father, Quintus Caecilius Metellus Numidicus.

Metellus was praetor in 89 and was given proconsular command over southern Italy when Sulla left Rome to campaign in the East (86). He was unable to defend the city from the Marians (supporters of Sulla's rival, Gaius Marius). He retired to Africa but rejoined Sulla in Italy in 83. In the brief ensuing civil war against the Marians, Metellus overwhelmingly defeated Gaius Norbanus at Faventia (now Faenza) in 82. Consul with Sulla in 80, he was sent to Spain to fight the rebel Quintus Sertorius, who pressed him hard until the arrival of Pompey in 76. In the decisive battle of the war Sertorius' lieutenant, Lucius Hirtuleius, was routed at Segovia (75). In 71 Metellus returned to Rome and celebrated a triumph. He was *pontifex maximus* ("high priest") from *c.* 81.

Metellus Pius Scipio, Quintus Caecilius (d. 46 BC), Roman politician, a leading supporter of his son-in-law Pompey the Great in the power struggle between Pompey and Julius Caesar.

The son of Publius Cornelius Scipio Nasica, Metellus was adopted by Quintus Caecilius Metellus Pius. In 60 the renowned orator Cicero defended him in court against a charge of bribery. Metellus became consul in 52 through the influence of Pompey, who had married his daughter Cornelia. In January 49 Metellus proposed before the Senate that Caesar be declared an enemy of the state if he refused to disband his army. During the ensuing Civil War (Caesar against Pompey and the Optimates, 49–45) Metellus was assigned to govern Syria. He commanded the centre at the battle of Pharsalus in Thessaly (48), where Pompey's army was crushed. Metellus then took charge of the senatorial forces in Africa, but in 46 Caesar decisively defeated him in the bloody battle of Thapsus. Captured while attempting to flee to Spain, he committed suicide.

metempsychosis: *see* reincarnation.

meteor, also called SHOOTING STAR, or FALLING STAR, streak of light in the sky that results when a particle or small chunk of stony or metallic matter enters the Earth's atmosphere and vaporizes. The term is sometimes applied to the falling object itself, but the latter is properly called a meteoroid (*q.v.*). The vast majority of meteoroids burn up in the upper atmosphere, but occasionally one of relatively large mass survives its fiery plunge and reaches the surface as a solid body. Such an object is known as a meteorite (*q.v.*).

A brief treatment of meteors follows. For full treatment, *see* MACROPAEDIA: Solar System.

The speed at which a meteoroid enters the upper atmosphere is dependent primarily on two motions—that of the meteoroid in its elongated orbit and that of the Earth in its path around the Sun. Also, the Earth's gravitational pull on the meteoroid increases its velocity by 3 km (1.9 miles) per second or more. Observations have shown that meteoroids penetrate the atmosphere at velocities ranging from 11 to 72 km (7 to 45 miles) per second.

When a meteoroid plunges toward the Earth at high speed, its surface collides with the atoms and molecules of the atmosphere. These collisions dislodge material from the meteoroid's surface and break up atoms and molecules of both the meteoroid and atmosphere into charged particles. The ionized atoms are excited to produce visible light. Much of this light is generated near the moving solid body, but in the case of very fast, bright meteors a residual luminosity called the train may be left behind the meteor head. As the meteoroid plunges closer to the ground, an extremely dense, hot gas cap develops in front of it. A shock wave also may be produced in the air ahead of the meteoroid. Such atmospheric shock waves may propagate to the Earth's surface because meteoroids travel through the air at five times the speed of sound or higher. A meteoroid weighing about 1 kg (2.2 pounds) penetrating to an altitude of roughly 40 km (25 miles) can produce sounds on the ground resembling thunder or sonic booms.

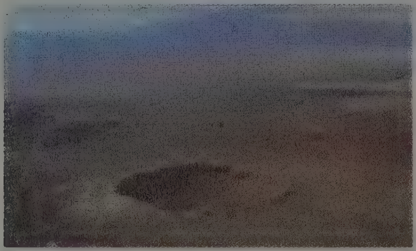
Most meteoroids crumble and disintegrate completely before they reach an altitude of 80 km (50 miles). It has been speculated that meteoroids that readily fragment originated with comets, whereas the denser objects that penetrate to the surface are remnants of asteroids that broke apart hundreds of millions of years ago.

When the Earth encounters swarms of meteoroids moving together, meteor showers become visible. Photographic data indicate that many such phenomena are associated with the orbits of observed comets. For example, the meteor shower known as Eta Aquarid, which can be seen each year in early May, has been identified with Halley's Comet. The meteoroids in the swarm producing this shower are thought to be debris ejected from the comet along its orbit.

Much accurate observational data on meteors has been obtained in recent years by means of special high-speed, wide-angle cameras and electronic image intensifiers. Radar also has been widely used in studying meteors, since radio waves can be bounced off the ionized gases yielded by the vaporizing constituent matter. It is very useful in determining the speed, direction, and height of meteors, particularly in daylight and under weather conditions unfavourable for visual observations.

Meteor Crater, also called BARRINGER CRATER, COON BUTTE, ARIZONA METEOR CRATER, or CANYON DIABLO, rimmed, bowl-shaped pit produced by a large meteorite in the rolling plain of the Canyon Diablo region, 19 miles (30 km) west of Winslow, Ariz., U.S. It is 4,000 feet (1,200 m) in diameter and about 600 feet (180 m) deep inside its rim, which rises nearly 200 feet (60 m) above the plain. Drillings reveal undisturbed rock beneath 700–800 feet of fill. The strata forming the rim of the crater are upturned and covered with the debris of the same bedrock, which shows an inverted stratigraphy.

Discovered in 1891, its age has been variously estimated at between 5,000 and 50,000 years. Large numbers of nickel–iron fragments from gravel size to 1,400 pounds (640 kg) have been found in a 100-square-mile (260-square-kilometre) area. The distribution and composition of several thousand tons of sand-grain size nickel–iron droplets indicate that they condensed from a cloud of metallic vapours. Surveys show only fragments within the pit, but the 1960 discovery there of coesite and stishovite, which are high-pressure modifications of silica, helped to confirm the crater's meteoritic origin.

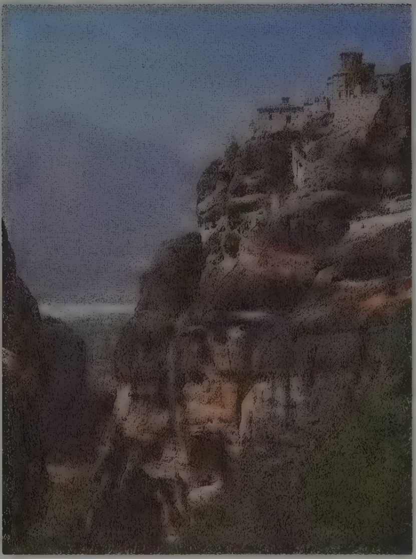


Meteor Crater in Arizona
D.J. Roddy, U.S. Geological Survey

meteor shower, entry into the Earth's atmosphere of a number of meteoroids at approximately the same place and time, traveling in parallel paths and apparently having a common origin. Many meteor showers are associated with comets. Some showers return annually, others at greater intervals, irregularly or not at all, depending on the relative positions of the shower orbits and Earth's orbit.

A meteor shower's name is derived usually from that of the constellation (or of a star therein) in which is situated the shower's radiant—*i.e.,* the point in the sky at which perspective makes the parallel meteor orbits seem to originate. Some showers (*e.g.,* the Bielids, now called Andromedids) are named for an associated comet. The Cyrillid shower of 1913 had no radiant (it seemed to enter the atmosphere from a circular orbit around the Earth) and was named for St. Cyril of Alexandria, on whose feast day (February 9) it was observed. The great Leonid meteor shower of Nov. 12, 1833, in which hundreds of thousands of meteors were observed in one night, was seen all over North America and initiated the first serious study of meteor showers. It was later established that the Leonid shower recurred at 33-year intervals, and occasional records of its appearances were traced as far back as AD 902. Since about 1945, radar observations have revealed meteor showers regularly occurring in the daylight sky, where they are optically invisible.

Metéora, group of monasteries on the summits of rock pinnacles in the *nomós* (department) of Trikala, Thessaly, Greece, just north of the small town of Kalabáka (medieval Stagoi). From the Cambunian Mountains two rock masses, eroded into isolated crags, pinnacles, and mounds of various heights, girths, and shapes, project southward into the valley of the Piniós River. The pinnacles average 1,000 feet (300 m) in height, but several reach 1,800 feet (550 m).



Monastery of St. Varlaám at Metéora, Thessaly, Greece
Robert Harding Picture Library, London

The earliest monastic settlement, a community of anchorites, was the Panayía Dhoúpiani, atop a rock called the pillar of Dhoúpiani. At the base of the pillar is the chapel of the Holy Virgin, dating possibly from the 12th century. About 1350 Athanasios Koinovitis, a monk from the monastic communities on Mount Athos, ascended the *plathy lithos* ("broad rock") and built the first structures of the Great Meteoron, whose regulations forbade access to women. In 1367 the hermit Neilos erected four churches on various rocks, one of which survives. In 1388 Athanasios' pupil, the hermit Ioasaf (son of the King of Serbia), enlarged the Metereon, making it the wealthiest and most prominent. Several more monasteries were erected in the 15th and 16th centuries after the Turkish occupation of Thessaly. Despite their cramped sites, each monastery contained monks' cells, cisterns, a church or two, and refectory; some also had a library. In the 16th century there were 16 monasteries, accessible only by rope and net. Today most are uninhabited, but monastic communities remain at the four largest: Great Meteoron (1356–72); Varlaám, or All Saints (Áyioi Pándes; *c.* 1530); St. Stephen (Áyios Stéfanos; 1312); and Holy Trinity (Áyia Triás; 1458). All can be reached by bridge or rock-cut steps. The monasteries suffered much during World War II and the subsequent civil war. Restoration in 1960 ensured preservation of the manuscripts and 16th-century frescoes; however, the construction of a highway in the early 1960s, which made the monasteries accessible to mass tourism, discouraged new monks from joining, while many of the older ones moved to Mount Athos in search of solitude and privacy.

meteorite, any interplanetary particle or chunk of stony or metallic matter known as a meteoroid (*q.v.*) that survives its passage through the Earth's atmosphere and strikes the ground. The term is often applied to similar objects that reach the surfaces of other planets or satellites.

A brief treatment of meteorites follows. For full treatment, *see* MACROPAEDIA: Solar System.

Meteoroids enter the Earth's atmosphere at a velocity of at least 11 km (7 miles) per second. Interaction with the atmosphere heats them to high temperatures, causing them to become incandescent, vaporize, and heat the surrounding air. This process produces a streak of light, which is referred to as a meteor (*q.v.*).

As meteoroids penetrate into the dense lower atmosphere, they usually fragment and disintegrate. Although several thousand enter the atmosphere each year, only a few hundred actually reach the ground. Occasionally, the remnant of a very large meteoroid weighing several tons or more may collide with the surface, exploding upon impact to create a so-called meteorite crater (*q.v.*).

Meteorites may be classified into two broad groups: undifferentiated and differentiated. Undifferentiated meteorites are those that do not appear to have experienced chemical differentiation associated with igneous melting. They consist of the chondrites, which constitute the most abundant type of meteorite. The chondrites are so called because they contain chondrules, spherules of millimetre size composed primarily of the silicate minerals olivine and pyroxene. The chondrites are commonly divided into three major subclasses—ordinary, enstatite, and carbonaceous—on the basis of chemical differences. The enstatite chondrites are, for example, more chemically reduced than the ordinary variety, so that nearly all their constituent iron is in metallic form. The carbonaceous chondrites, for their part, contain more carbon than either the ordinary or enstatite chondrites.

Differentiated meteorites evince the kind of chemical fractionation that is thought to occur on a planetary body that underwent core formation and magmatic differentiation comparable to that observed in volcanic rocks of the Earth and the Moon. Meteorites of this group are generally classified into three categories: iron, stony, and stony iron. The iron meteorites consist chiefly of nickel–iron metal and iron sulfides. The stony type are rich in silicates (*e.g.,* olivine, orthopyroxene, and plagioclase) but are poor in metal and sulfides. The principal subclass of the stony meteorites are the achondrites, which characteristically have no chondrules. The stony-iron meteorites contain mixtures of large masses of nickel–iron metal and differentiated silicate rock.

Meteorites are of considerable scientific interest because their chemical characteristics and their texture and internal structure carry clues to the early history of the solar system. It is widely held that nearly all meteorites originate from meteoroids produced by collisions between asteroids, which aggregated from fragmentary material about the same time as the Earth, some 4.5 billion years ago. There also are indications that a few meteorites, the CI carbonaceous chondrites, are derived from the nuclei of comets, which are considered by many researchers as the most pristine remnants of the dust and gas that formed the solar system.

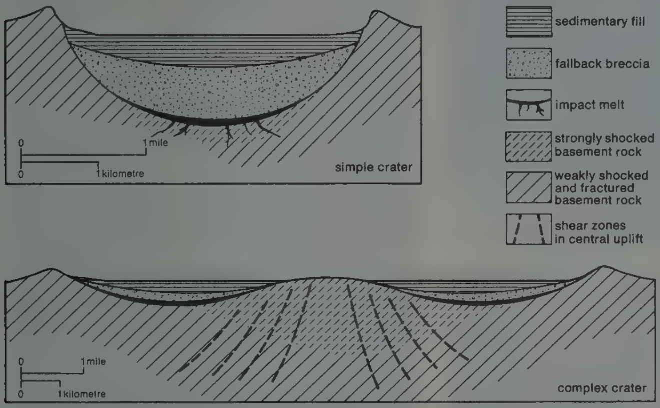
---

meteorite crater, depression that results from the impact of a meteorite with any planetary body. Data collected by Ranger, Orbiter, Surveyor, and Apollo spacecraft indicate that roughly 3,000,000,000,000 craters with diameters greater than one metre (about three feet) exist on the Moon's surface. The space probe observations also allow lunar craters to be classified by size and morphological characteristics and, at least inferentially, by modes of origin. Thus, most lunar scientists now recognize primary and secondary impact craters, volcanic calderas, maars, summit craters, and drainage or collapse craters as probable genetic types on the lunar surface.

Impact craters have been discovered on the surface of Mars as well as on various other planets and satellites. It is reasonable to assume that impacts occur frequently on all unprotected planetary surfaces in the solar system and, by extrapolation, on any similar bodies elsewhere in the universe. In general, the number of craters per unit of surface area correlates closely with the nature and density of the planetary atmosphere and its capability for erosion, as well as with the flux of bombarding particles (meteorites) over time in a planet's neighbourhood.

Impact craters are much less common on the Earth than on the Moon. This is partly because friction from the Earth's atmosphere effectively burns up most of the smaller bodies entering it from outer space. Thus, any craters formed on the Earth's surface will tend to be larger than the average size of all entering meteorites. Over the last eon (1×10^9 years) meteorites large enough to survive the plunge through the air and then excavate big craters appear to have been too few to produce the expected population of impact structures on the continents. The combined effects of the hydrosphere and the atmosphere in eroding the land surface evidently have erased most meteorite craters between 10 m (33 feet) and about 1 to 2 km ($^2/_3$ to $1^1/_4$ miles) in diameter. If such craters were more abundant in the first $2–3 \times 10^9$ years of terrestrial history, owing to a greater meteorite flux in the early solar system, their traces have long since been removed by erosion, deposition, and metamorphism.



Major types of impact craters; those larger than about six kilometres tend to be complex

Adapted from M.R. Dence in B.M. French and N.M. Short (eds.), *Shock Metamorphism of Natural Materials*

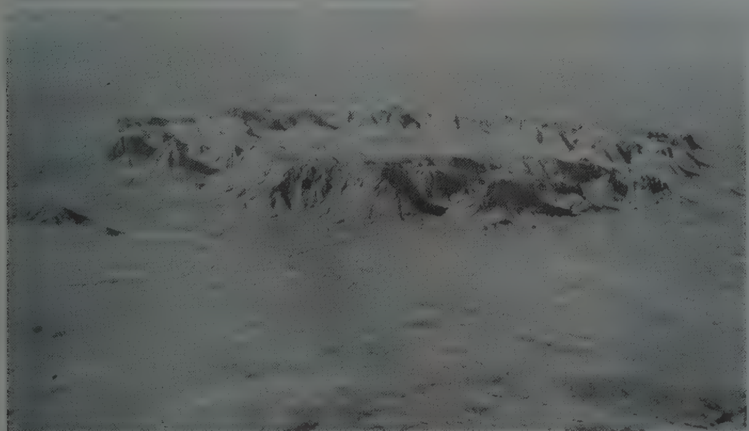
Since 1955, the list of definite and probable impact structures on the Earth's surface has grown significantly from the 20 to 27 proposed by investigators up until then. (*See* the Table.) The chief reasons for the sharp increase in the numbers of identified craters have been formulation of the astrobleme concept, more intensive searching, and development of new criteria for recognizing impact structures.

The astrobleme concept provided a better understanding of what to look for in relation to meteorite craters. An astrobleme is simply the scar of an impact crater—*i.e.,* any part of the structure that has survived erosion. Older impact structures may completely lack discernible crater rims, but they still retain some degree of circularity, have distinctive internal deformation features, or contain remnants of the original rock fragments (breccia) shocked in the impact. Thus, in the broader sense, a meteorite crater can be defined as any structure now at or near the surface containing evidence of a shock-producing impact in which the disturbance by deformation and fragmentation of rock or soil is generally circular in outline (plan) and dies out rapidly upon reaching diameter-to-depth ratios of 3 to 1 or greater.

The impact-cratering process. A noteworthy advance in meteoritics results from theoretical and experimental investigations of the cratering process. This includes field studies of nuclear and chemical explosions and of rocket-missile impacts, laboratory simulations of impacts using gun-impelled high-velocity projectiles, and the development of physical models of the sequence of crater formation using sophisticated computer programs.

A widely accepted model for impact-cratering mechanics postulates the following sequence of events:

Immediately after a meteorite strikes the ground, shock waves are imparted both to the rocks of the planetary surface and the meteorite itself. The ground-traversing shock front outruns the penetrating meteorite and forms an expanding cavity. The rocks behind the front are strongly compressed and generally are set in radial motion outward from the region of penetration. Varying fractions of the rock material will be vaporized, melted, crushed, fragmented, or fractured; ultimately, different sections of the volume of rock that are excavated will be dispersed and mixed together. The shock generated in the meteorite at the interface with the ground moves back into it as a compression that, upon reaching boundary surfaces along the sides and rear, transforms to a rarefaction that reflects into the meteorite. Thus, some of the meteorite is vaporized, whereas other parts are melted or intensely heated and mechanically damaged as the entire body breaks up. A fraction of this meteorite is smeared along with the outward-moving rock mass; much of the meteorite, however, ejects as fragments that escape the eventual crater.



Meteorite crater at Gosse Bluff, Northern Territory

The initially intense shock wave attenuates as it diverges outward. The net effect is that the degree of shock damage attributable to compression diminishes with increasing radial distance from the line of penetration. Only a small proportion of the total volume excavated undergoes strong to intense shock pressures; in contrast, the bulk of the rock experiences little or no permanent damage.

The actual excavation process occurs as the advancing shock waves encounter free rock units at the ground–air interface or meet discontinuities such as stratigraphic bedding surfaces, joints (rock fractures), or units with varying physical properties because of varying rock types. The rarefactions effectively place the rock medium under tension, resulting in a general disruption of the units. Because these now-fragmented pieces were already in motion, they retain momentum sufficient to carry many of them forward and out of the developing crater as ejecta that follow trajectories established by their initial movements. Most such fragments move from the crater at low angles, and these are termed throwout deposits; at high angles the fragments fall back as crater-filling breccia deposits. Some, however, fall downward without leaving the crater, to form fragmental debris that concentrates along the crater base. This base is defined by its boundary with the rupture zone, which consists of broken and displaced but not fragmented and ejected rock, that underlies the breccia fill. This boundary also represents the surface below which the compression and rarefaction waves become too weak to efficiently excavate material.

Within the rupture zone below the true crater floor and walls, the rocks can be folded, faulted, and intricately displaced. Especially in the rim, which marks the outer limit of surface excavation, layered units may be folded over completely to form structures that rival in complexity some of the great nappes (rock masses translated by thrust faulting) of the Alps. The overturning results when adjacent units below the uplifting free surface are peeled back as they go into motion in close succession. Massive rocks do not fold back but tend to uplift along joints, so that any preexisting foliation is distorted. However, all crater-related deformation decreases abruptly away from the breccia-rupture zone contact, so that drilling beyond this contact would rapidly pass out of shocked or disturbed rock into ordinary, unmodified country rock.

For small craters the entire formational process requires no more than a few seconds to completion. Craters that are tens of kilometres wide probably form in one to five minutes at most. The excavation caused by shock action occurs more rapidly than the later infilling process from fallback and slumping.

Experimental studies have added several details to the conceptual model. In the initial compression stage, materials behind the shock front experience pressures so high (many hundreds of kilobars) that their dynamic compressive strengths are greatly exceeded. Rocks behave under these conditions much like fluids. The first rarefactions develop along the target–projectile interface and later the projectile itself. Decompression leads to the ejection of fluidized rock as a hot jet that, according to some workers, accounts for the glassy objects called tektites. As the spherical shock front advances outward, the compressed shell of material behind it mixes with the projectile (meteorite) and ejects steadily increasing amounts to begin the excavation stage. Ejection and crater growth is a continuous, orderly process involving a steady flow of materials along shear lines. Cratering ceases when stresses become too weak to break up materials or when momentum is insufficient to carry fragments beyond the excavation limits.

Criteria of impact origin. Impact craters can differ from one another in both size and shape. They can vary from small, simple cup-shaped depressions that originally had raised rims, through cavities with a central hill (or peak), to those with more complicated central peaks and basins, and finally to multiringed basins that measure up to several hundred kilometres in diameter. Shape is thus one of the criteria used for identifying impact structures. A simple crater is characterized by a well-defined lip, a bowl-shaped cross section, and extensive fallback deposits that thicken toward the centre. The crater's initial diameter-to-depth ratio is about 5 to 1. When the crater diameter begins to exceed 4 to 5 km (2.5 to 3 miles), the rupture zone beneath the central base tends to uplift along shear lines. Large, complex craters have broad, domelike uplifts, which sometimes have topographic expression as central peaks. Rocks within this uplifted portion may be strongly shocked and intricately contorted. It has been proposed that large craters with diameter-to-depth ratios of about 10 to 1 and with central uplifts result from the impact of a comet rather than that of a meteorite. When a low-density cometary projectile strikes the ground, the dominant energy release remains near the surface; this causes lateral excavation to be more effective than is true of penetrating iron meteorites.

Some structures of nonimpact origin share many features with meteorite craters. The only truly definitive criteria so far advanced reside in the rocks themselves. Thus, rocks of any type are subject to remarkable changes during impact that, collectively, are described as shock metamorphism. The passage of transient pressure waves through rocks and their constituent minerals induces distinctive effects of very high pressures and temperatures and rapid strain rates that alter their composition and properties. These changes are produced in microseconds to milliseconds by pressures of up to 500–750 kilobars (comparable to pressures at depths of 1,400–1,800 km [about 870 to 1,120 miles] within the Earth), temperatures that rise above 2,000° C (3,600° F), and strain rates millions of times faster than those operating during mountain building.

meteoritics, scientific discipline concerned with meteors and meteorites. The awe-inspiring noise and lights accompanying some meteoric falls convinced early humans that meteorites came from the gods; accordingly these objects were widely regarded with awe and veneration. This association of meteorites with the miraculous and religious made 18th-century scientists suspicious of their reality. Members of the French Academy, which was then considered the highest scientific authority, were convinced that the fall of stones from heaven was impossible. Keepers of European museums discarded genuine meteorites as shameful relics of a superstitious past. Against this background, the German physicist Ernst Florens Friedrich Chladni began the science of meteoritics in 1794, when he defended the trustworthiness of accounts of falls (*see also* Hraschina meteorite). A shower of stones that fell in 1803 at L'Aigle, Fr., finally convinced the scientific world of the reality of meteorites. Interest was intensified by the great meteor shower of Nov. 12, 1833, which was visible in North America. Most natural-history museums now have meteorite collections.

For many years the only method of observing meteors was with the naked eye. The observer would plot the path of a meteor among the stars on a chart and note its apparent magnitude, the time, and other information. A similar plot of the same meteor made about 60 km (40 miles) away permitted rough estimates to be made of its altitude and the true angle of its path. This data can now be obtained more accurately with photographic or radar techniques, but visual observation continues to provide information on the magnitudes of meteors and serves as a check of instrumental methods. Binoculars and telescopes extend the range of visual observations from the 5th or 6th magnitude, the limit of the unaided eye, to the 12th or 13th. Direct photographs of a meteor's trail (the column of ionized gases formed by the passage of a meteoric body through the upper atmosphere) taken at two points on the Earth's surface several kilometres apart yield the most accurate data for tracing the path of a meteor. Specially designed wide-angle, high-speed cameras are employed. A rapidly rotating shutter in front of the open lens makes it possible to photograph the meteor trail in short segments, from which the velocity and deceleration of a meteor can be computed.

Radar is also widely used for meteor detection and observation. Radar pulses (short bursts of radio-frequency energy) emitted from a ground-based transmitter are reflected by a meteor's trail. The distance to the meteor can be determined by measuring the time lapse between the transmitted and reflected radar signals. Its motion toward (or away from) the radar facility can be derived from the rate at which the distance changes, which in turn yields the velocity of the object in the line of sight.

meteoroid, any interplanetary body of relatively small size that enters the Earth's atmosphere. In colliding with atmospheric atoms and molecules at high velocity, the object begins to burn up and heats the air around it. The resultant luminous phenomenon is called a meteor (*q.v.*). If the object survives its plunge through the atmosphere and lands on the ground, it is termed a meteorite (*q.v.*).

A brief treatment of meteoroids follows. For full treatment, *see* MACROPAEDIA: Solar System.

Meteoroids range in size from dust particles measuring less than 1 micrometre across to bodies several kilometres in diameter. Most meteoroids consist either of rocky material (largely silicate minerals) or of nickel-iron alloy, though some are made up of silicates intermixed with nickel–iron alloy.

Observational and theoretical studies of the orbits of meteoroidal bodies, as well as laboratory investigations of recovered meteorites, strongly suggest that the majority of meteoroids are fragments of asteroids produced by collisions between such objects in the asteroid belt lying between the orbits of Mars and Jupiter. There also is evidence that some meteoroids, particularly the smaller ones, are of cometary origin. The nucleus of a comet (*q.v.*) is composed of a mixture of ice and less-volatile material, chiefly in the form of grains of rock dust. When a comet approaches the Sun, the ice begins to evaporate and the dust particles embedded within it are swept away from the nucleus. Particles of millimetre-to-centimetre size may enter the Earth's atmosphere to become meteoroids.

meteorology, scientific discipline concerned with atmospheric phenomena, particularly of the troposphere and lower stratosphere.

A brief treatment of meteorology follows. For full treatment, *see* MACROPAEDIA: Earth Sciences.

Meteorology entails a systematic study of short-term—that is, day-to-day—variations in temperature, humidity, air pressure, wind, cloud cover, and precipitation, along with their causes. It provides the basis for weather forecasting. Meteorology is closely related to, but distinct from, climatology (*q.v.*), which deals with weather conditions in a given area over an extended period of time (from a month to many millions of years).

Meteorology is divided into two major branches, dynamic and synoptic. Dynamic meteorology deals primarily with the motions of the atmosphere and the physical processes involved in air flow. Research in the field involves the extensive use of computer models of general global circulation and of small-scale motion systems such as tornadoes and hurricanes. These mathematical models contribute much to the understanding of the physics and structure of the lower atmosphere.

Synoptic meteorology concentrates on atmospheric phenomena that are directly associated with weather. It derives its name from the synoptic method, in which simultaneous observations of atmospheric conditions for a specific time are plotted on a map for a broad area whereby a general view of the weather in that area is attained. The observations are routinely collected from a worldwide network of facilities, including ground-based radars and remote-sensing systems—*e.g.,* balloon-borne radiosondes and Earth-orbiting meteorological satellites. Synoptic meteorologists use data from these facilities to make short-range forecasts of local weather. Such forecasts project atmospheric conditions for time periods of a few hours to 12 hours in advance.

meter: *see* metre.

metes and bounds, limits or boundaries of a tract of land as identified by natural landmarks, such as rivers, or by man-made structures, such as roads, or by stakes or other markers. A principal legal type of land description in the United States, metes-and-bounds descriptions are commonly used wherever survey areas are irregular in size and shape. The land boundaries are run out by courses and distances, and monuments, natural or artificial, are fixed at the corners, or angles. A course is the direction of a line, usually with respect to a meridian but sometimes with respect to the magnetic north. Distance is the length of a course measured in some well-known unit, such as feet or chains.

Metge, Bernat, also called BERNARDO METGE (b. 1350, Barcelona, Catalonia [now in Spain]—d. 1413, Barcelona), poet and prose writer whose masterpiece, *Lo Somni* (1398; "The Dream"), initiated a classical trend in Catalan literature.

Educated in medicine, Metge entered (1376) the royal household of Peter IV of Aragon and Catalonia to serve as secretary-mentor to Prince John (later King John I). He was arrested for obscure reasons in 1381, and while in prison he translated *Valter y Griselda,* Boccaccio's story of Griselda, from Petrarch's Latin version and wrote *Libre de Fortuna y Prudencia* (1381; "The Book of Fortune and Prudence"), which is more a philosophical treatise than a poetic work.

When John I became king (1387), Metge returned to royal service, as secretary-procurator for John and his wife, Violante (by whom Metge had an illegitimate son). The victim of court intrigues, the poet was again imprisoned in 1388 and 1396. On the latter occasion he composed *Lo Somni,* a series of four prose dialogues in which he reflects on human frailties and ill-fated love. Part of *Lo Somni* takes place in a dreamlike setting inhabited by John I, the legendary poet and musician Orpheus, and the blind Theban seer Tiresias. Combining scholastic enquiry with poetic imagination, Metge in *Lo Somni* ponders the immortality of the soul versus natural death and discusses the ethical conduct of women. In this work Metge achieved a stylistic masterpiece of Catalan prose that was emulated by Catalan writers for centuries.

Although restored to royal favour in 1403 as secretary to King Martin of Aragon, Metge faded from the public view after 1410.

methadone, potent synthetic narcotic drug that is the most effective form of treatment for addiction to heroin and other narcotics. Methadone first became available at the end of World War II. Similar to morphine in its analgesic effect, it was originally used in medicine to alleviate severe pain. Methadone is used in the form of its hydrochloride salt, which is a white, crystalline powder with a bitter taste. It is soluble in water, in alcohol, and in chloroform.

Methadone's usefulness in treating heroin addiction was discovered in the 1960s. It is now routinely used on a daily, long-term (maintenance) basis as a substitute drug given to persons who were formerly or who would otherwise be addicted to heroin. It is given orally once a day. Methadone's usefulness as a heroin substitute stems from several important effects the drug has. First and foremost, when taken daily it prevents a former heroin addict from feeling withdrawal symptoms and it suppresses his drug hunger for heroin. Second, methadone itself causes no euphoric effects whatsoever, unlike heroin, so the person feels no disruptive psychological craving for it. Third, the human body does not develop a tolerance for methadone, unlike heroin, so methadone doses of the same (rather than increasing) size can be taken for long periods of time. Fourth, when used on a maintenance basis, methadone actually blocks the euphoric effects, or "high," produced by heroin, thus robbing this drug of its psychological attractiveness to the former addict. Finally, methadone's lack of euphoric effects and its 24-hour period of action enable persons maintained on it to lead relatively normal lives involving work, schooling, and normal family and social relations.

Methadone is an addictive drug, but one can more easily cease using it than heroin. Because of this, methadone is sometimes used to detoxify heroin addicts; the addict switches from heroin to a high daily dose of methadone, which is then gradually reduced over several weeks until the patient is drug-free. In this way the severe withdrawal symptoms encountered in abruptly quitting heroin are avoided.

Methadone-maintenance therapy is markedly successful in keeping addicts off the use of heroin or whatever other narcotic they were using, but there is considerably less success in enabling such people to stop using methadone as well and be drug-free.

methamphetamine, also called *d*-DESOXYEPHEDRINE, byname SPEED, potent and addictive synthetic stimulant drug that affects the central nervous system. It was used widely for legal medical purposes throughout much of the 20th century. In the United States it was marketed under the brand names Methedrine and Desoxyn, and it was widely administered to industrial workers in Japan in the 1940s and '50s to increase their productivity.

Methamphetamine, which increases physical activity and suppresses the appetite, is of limited usefulness in the treatment of attention deficit disorder, narcolepsy, and obesity. However, heavy or prolonged use may produce powerful side effects, including aggression and paranoia, kidney and lung disorders, brain and liver damage, chronic depression, immune deficiency disorders, convulsions, and schizophrenia. It is normally taken in pill form or, as a crystalline powder ("crystal meth"), sniffed through a hollow tube; it may also be taken intravenously.

Methamphetamine was regarded with deep suspicion and hostility in the United States by the 1960s, not just by law enforcement officials, politicians, the media, and medical professionals but also by large sections of the drug subculture. After the Controlled Substances Act (1970) severely restricted its availability, a large illicit manufacturing industry, relying on hundreds of clandestine "meth labs," arose in the southwest and west and spread to parts of the Midwest in the 1990s. Despite periodic police crackdowns, large quantities of the drug continue to be produced in these labs.

Methamphetamine use has been particularly widespread in Pacific Rim nations, where it has become a serious social problem. Partly because of its association with energy and aggression, its growing use was often correlated with rapid modernization and industrialization. In the United States, a 1996 survey estimated that nearly 5 million people had tried methamphetamine, representing an increase of approximately 240 percent from 1990. (J.P.J.)

methanal: *see* formaldehyde.

methane, also called MARSH GAS, colourless, odourless gas that occurs abundantly in nature as the chief constituent of natural gas, as a component of firedamp in coal mines, and as a product of the anaerobic bacterial decomposition of vegetable matter under water (hence its alternate name, marsh gas). Methane also is produced industrially by the destructive distillation of bituminous coal in the manufacture of coal gas and coke-oven gas. The activated-sludge process of sewage disposal also produces a gas rich in methane.

Methane is the simplest member of the paraffin series of hydrocarbons. Its chemical formula is CH_4. It is lighter than air, having a specific gravity of 0.554. It is only slightly soluble in water. It burns readily in air, forming carbon dioxide and water vapour; the flame is pale, slightly luminous, and very hot. The boiling point of methane is −164.0° C (−263.2° F) and the melting point is −182.5° C (−296.5° F). Methane in general is very stable, but mixtures of methane and air, with the methane content between 5 and 14 percent by volume, are explosive. Explosions of such mixtures have been frequent in coal mines and collieries and have been the cause of many mine disasters.

The chief source of methane is natural gas, which contains from 50 to 90 percent methane, depending on the source. Methane produced by the destructive distillation of bituminous coal and by coal carbonization is important in locations where natural gas is not plentiful.

Since commercial natural gas is composed largely of methane, their uses may for all practical purposes be considered identical. Because of its abundance, low cost, ease of handling, and cleanliness, such gas is widely used as a fuel in homes, commercial establishments, and factories.

Methane is an important source of hydrogen and some organic chemicals. Methane reacts with steam at high temperatures to yield carbon monoxide and hydrogen; the latter is used in the manufacture of ammonia for fertilizers and explosives. Other valuable chemicals derived from methane include methanol, chloroform, carbon tetrachloride, and nitromethane. The incomplete combustion of methane yields carbon black, which is widely used as a reinforcing agent in rubber used for automobile tires.

methanol, also called METHYL ALCOHOL, WOOD ALCOHOL, or WOOD SPIRIT, the simplest of a long series of organic compounds called alcohols; its molecular formula is CH_3OH. Methanol was formerly produced by the destructive distillation of wood. The modern method of preparing methanol is based on the direct combination of carbon monoxide gas and hydrogen in the presence of a catalyst. Most methanol is produced from the methane (*q.v.*) found in natural gas.

Pure methanol is an important material in chemical synthesis. Its derivatives are used in great quantities for building up a vast number of compounds, among them many important synthetic dyestuffs, resins, drugs, and perfumes. Large quantities are converted to dimethylaniline for dyestuffs and to formaldehyde for synthetic resins. It is also used in automotive antifreezes, in rocket fuels, and as a general solvent. Methanol is also a high-octane, clean-burning fuel that is [illegible] potentially important substitute for gasoline in automotive vehicles. The methanol derived from wood is used chiefly for rendering ethyl alcohol unfit to drink.

Methanol is a colourless liquid that boils at 64.96° C (148.93° F) and solidifies at −93.9° C (−137° F). It forms explosive mixtures with air and burns with a nonluminous flame. It is a violent poison; many cases of blindness or death have been caused by drinking mixtures containing it.

methemoglobinemia, inherited or acquired decrease in the oxygen-carrying capacity of the red blood cells. The hemoglobin of the red blood cells must be in the reduced (deoxidized) state to bind with oxygen; methemoglobin, the oxidized form of hemoglobin, is useless for oxygen transport. Normally, various organic catalysts or enzymes are active in keeping hemoglobin in the reduced form. Hereditary methemoglobinemia occurs when there is an inborn defect in this enzyme system or when the hemoglobin molecule is abnormally structured (hemoglobin M) and is thereby more susceptible to oxidation. Acquired methemoglobinemia may arise as a result of contact with certain drugs and chemicals that produce oxidant compounds in the circulation, causing the oxidation of hemoglobin faster than the enzyme system can keep it in the reduced state. The severity of the symptoms is related to the quantity of methemoglobin present in the circulation, and range from a bluish discoloration of the skin and mucous membrane to weakness, difficulty in breathing, and dizziness in the more severe cases. Treatment of hereditary methemoglobinemia usually includes the administration of reduction compounds such as vitamin C or methylene blue. Acquired methemoglobinemia usually disappears spontaneously when the cause is removed.

methionine, sulfur-containing amino acid obtained by the hydrolysis of most common proteins. First isolated from casein (1922), methionine accounts for about 5 percent of the weight of egg albumin; other proteins contain much smaller amounts of methionine. It is one of several so-called essential amino acids for mammals and fowl; *i.e.,* they cannot synthesize it. In microorganisms it is synthesized from the amino acids cysteine and aspartic acid.

Methionine is important in methylation (the process by which methyl, or $-CH_3$, groups are added to compounds) and is also a precursor of two other amino acids, cystine and cysteine.

method, the (acting): *see* Stanislavsky method.

method of exhaustion (mathematics): *see* exhaustion, method of.

methodic doubt, in Cartesian philosophy, a way of searching for certainty by systematically though tentatively doubting everything. First, all statements are classified according to type and source of knowledge—*e.g.,* knowledge from tradition, empirical knowledge, and mathematical knowledge. Then, examples from each class are examined. If a way can be found to doubt the truth of any statement, then all other statements of that type are also set aside as dubitable. The doubt is methodic because it assures systematic completeness, but also because no claim is made that all—or even that any—statements in a dubitable class are really false or that one must or can distrust them in an ordinary sense. The method is to set aside as conceivably false all statements and types of knowledge that are not indubitably true. The hope is that, by eliminating all statements and types of knowledge the truth of which can be doubted in any way, one will find some indubitable certainties.

In the first half of the 17th century, the French Rationalist René Descartes used methodic doubt to reach certain knowledge of self-existence in the act of thinking, expressed in the indubitable proposition *cogito, ergo sum* ("I think, therefore I am"). He found knowledge from tradition to be dubitable because authorities disagree; empirical knowledge dubitable because of illusions, hallucinations, and dreams; and mathematical knowledge dubitable because people make errors in calculating. He proposed an all-powerful, deceiving demon as a way of invoking universal doubt. Although the demon could deceive men regarding which sensations and ideas are truly of the world, or could give them sensations and ideas none of which are of the true world, or could even make them think that there is an external world when there is none, the demon could not make men think that they exist when they do not.

Methodism, movement founded by John Wesley in the 18th century, purportedly to revitalize the Church of England. The movement survives in the form of the modern Methodist churches worldwide.

A brief treatment of Methodism follows. For full treatment, *see* MACROPAEDIA: Protestantism: *Methodist churches.*

In 1738 Wesley, an Anglican clergyman, attended a religious meeting where, as he relates in his *Journal,* he felt his "heart strangely warmed" and experienced an assurance of personal salvation he had not known before. Soon he was cooperating with George Whitefield in open-air preaching among the outcasts of society—those who felt themselves neglected by the Church of England. Although Wesley later separated from Whitefield on doctrinal grounds, he was joined by many lay recruits and a few ordained clergy, most notably his brother Charles, whose hymns expressed the message of the Methodist Revival.

The Methodists formed a "society" within the Church of England. Wesley never wished them to leave the church, but after years of strained relations, the formal break with the Church of England came in 1795, four years after Wesley's death. The Methodists' tightly knit system of church government, which combined a strong central authority with effective local organization and the employment of lay preachers, enabled the movement to expand rapidly throughout the 19th century. Methodism was especially successful in the expanding industrial areas, where it helped the working people to overcome economic depression by spiritual means and often, by encouraging thrift and simple living, to raise their economic status as well.

In America the Methodist Episcopal Church was constituted as an autonomous body in 1784 under the guidance of Francis Asbury and Thomas Coke, who organized the American church according to Wesley's principles but adapted them to the needs of both the settled communities and the frontier. Although the first Methodist itinerants did not arrive in America until shortly before the Revolution, by the middle of the 19th century the Methodists had more members than any other American denomination. This remarkable advance occurred especially on the American frontier, where Methodist circuit riders preached to the frontier folk in simple terms.

It was the unique Methodist institutions, however, that made Methodism so dynamic an element in American Protestantism. Methodists were organized locally into "classes" which enforced discipline, while a hierarchical structure with a strong central authority efficiently organized and supervised the itinerant preachers. The Methodist advance was temporarily halted in 1844 by the church's division into Northern and Southern branches over the issue of slavery. After the Civil War, both branches continued their rapid increase in numbers and in material resources. As Methodism gradually became assimilated to the general pattern of middle-class American Protestantism, a "holiness" movement emerged out of Methodism and then separated from it in the late 19th century. The Northern and Southern branches reunited in 1939, and further mergers took place later in the 20th century, but the independent holiness and pentecostal denominations that grew out of the holiness movement still exist. The black Methodist churches, which had been merged into a new central jurisdiction in 1939 (forming a separate but equal jurisdiction within the United Methodist Church), gradually became integrated after 1968. By 1974 all districts based on race had been abolished.

Because of the enthusiasm for missionary activity among both British and American Methodists, the movement has become worldwide. The churches derived from American Methodism are more widespread and more numerous, but the movement toward autonomy has proceeded more smoothly among those in the British sphere of influence. Despite a series of schisms in both British and American Methodism in the 19th century, Methodists have gradually but consistently moved toward reunification in the 20th century, and Methodists from all countries have played a full part in worldwide ecumenical activities.

Despite wide variations in belief, practice, and status, Methodists share a warm acceptance of the doctrines of historic Christianity, without a stringent insistence on the need for doctrinal conformity or a great interest in theological speculation. They share an emphasis on those doctrines that indicate the power of the Holy Spirit to confirm the faith of the believer and to transform one's personal life (especially the teaching about assurance and

Christian perfection that is associated with John Wesley); an insistence that the heart of religion lies in one's personal relationship with God; a simplicity of worship and a partnership of ordained ministers and laity in the worship and administration of the church; a concern for the underprivileged and the betterment of social conditions; the formation of small groups for mutual encouragement and edification; a connectional system of government (by which all ministers are "in connection" with the central authority of the church, and the agencies of the church are centrally administered); and an allegiance to John Wesley.

Methodius, SAINT: *see* Cyril and Methodius, Saints.

Methodius I, SAINT (b. 788/800, Syracuse, Sicily—d. June 14, 847, Constantinople [now Istanbul]; feast day June 14), patriarch of Constantinople from 843 to 847.

As a monk, Methodius embraced the position of the Iconodules, who supported the veneration of images, as opposed to the Iconoclasts, who denounced the veneration of images. The Iconoclastic movement arose in the 8th century as a reaction against pagan tendencies in Christianity. During the reign of the iconoclast emperor Theophilus (829–842), Methodius was respected as a learned man and was allowed to live in the palace in Constantinople despite his Iconodule beliefs. He found an ally in the wife of Theophilus, Theodora, who venerated icons and kept them in her room. After the death of Theophilus, Theodora became regent for their son Michael III. In 843 she named Methodius patriarch and with his help restored the legitimacy of venerating icons to the Byzantine Empire.

methotrexate, cytotoxic drug used to slow the growth of certain cancers, especially a highly malignant but rather rare form in women called choriocarcinoma. It has also been used in the treatment of psoriasis, a skin disease in which abnormally rapid proliferation of epidermal cells occurs, and as an inhibitor of some types of immune reactions. Methotrexate is an antimetabolite of the vitamin folic acid. It prevents the synthesis of nucleic acids and thus inhibits cell reproduction.

methoxychlor, also called 1,1,1-TRICHLORO-2,2-BIS(*p*-METHOXYPHENYL)ETHANE, a colourless, crystalline organic halogen compound used as an insecticide. Methoxychlor is very similar to DDT but acts more rapidly, is less persistent, and does not accumulate in the fatty tissues of animals as does DDT.

Methoxychlor is prepared by the reaction of chloral with anisole (methyl phenyl ether) in the presence of sulfuric acid; the commercial product usually is about 88 percent pure.

Methuen (of Corsham), Paul Sanford Methuen, 3rd Baron (b. Sept. 1, 1845, Corsham Court, Wiltshire, Eng.—d. Oct. 30, 1932, Corsham Court), British military commander who was defeated by the Boers (Dec. 11, 1899) in the Battle of Magersfontein during the South African War.

After serving in the Gold Coast (now Ghana; 1873–74) and in Bechuanaland (now Botswana; 1884–85), Methuen was made a lieutenant general in 1898. In 1899, as commander of the British 1st Division in South Africa, he directed part of a three-pronged operation aimed at relieving the Boer siege of Kimberley and was defeated in the Magersfontein Hills by the Boer generals J.H. De la Rey and P.A. Cronje. In March 1902 he was captured by De la Rey at Tweebosch. Methuen was later commander in chief in South Africa (1907–12) and governor of Malta (1915–19). He was made a field marshal in 1911.

Methuselah, also spelled METHUSHAEL, Old Testament patriarch whose life span as recorded in Genesis (5:27) was 969 years; he has survived in legend and tradition as the longest-lived human. Genesis tells nothing about Methuselah beyond sparse genealogical details: he was the great-great-great-great-grandson of Seth, the child of Adam and Eve begotten more than a century after Cain. He was the father of Lamech and the grandfather of Noah. By the Biblical account he came of hardy stock: all his forebears lived for between 895 and 962 years except for his father, Enoch, who lived to be 365.

The enumeration of Methuselah in Genesis is his only appearance in the Old Testament save for a mention in I Chronicles 1:3, where he is cited in the lineage of Saul. In the New Testament he is mentioned once in the Gospel of Luke. There, at 3:23–28, the lineage of Joseph, whom people supposed to be the father of Jesus, is traced back 75 generations, through David and Saul, and Abraham, Isaac, and Jacob, to Methuselah and thence to Seth and Adam.

methyl alcohol: *see* methanol.

methyl bromide, also called BROMOMETHANE, a colourless, nonflammable, highly toxic gas (readily liquefied) belonging to the family of organic halogen compounds. It is used as a fumigant against insects and rodents in food, tobacco, and nursery stock; smaller amounts are used in the preparation of other organic compounds.

Methyl bromide is manufactured by the reaction of methanol with hydrobromic acid; it is slightly soluble in water but miscible with many organic solvents. For use as a fumigant, methyl bromide often is mixed with chloropicrin, which serves as a warning agent because of its intense odour.

methyl chloride, also called CHLOROMETHANE, a colourless, flammable, toxic gas belonging to the family of organic halogen compounds. It is used in the manufacture of silicone polymers, tetramethyllead (an antiknock agent for gasoline), and methylcellulose (a textile-sizing agent) and as a solvent in the production of butyl rubber. It has also been used as a refrigerant, but less toxic and less flammable compounds have largely replaced it.

Methyl chloride was first prepared about 1835 from methanol, sulfuric acid, and common salt. The oldest commercial process was the thermal decomposition of betaine, a waste product of the beet-sugar industry; later methods depend on the reaction of methanol with hydrogen chloride or of methane with chlorine. The compound is ordinarily stored and shipped as the liquid, which boils at −24° C (−11° F) at atmospheric pressure.

methyl group, one of the commonest structural units of organic compounds, consisting of three hydrogen atoms bonded to a carbon atom, which is linked to the remainder of the molecule. The methyl radical (CH_3), the methyl cation (CH_3^+), and the methyl anion $(CH_3^-)_4^3$ are transient intermediates in many chemical reactions.

methylene (chemistry): *see* carbene.

methylene blue, a bright greenish blue organic dye belonging to the phenothiazine family. It is mainly used on bast (soft vegetable fibres such as jute, flax, and hemp) and to a lesser extent on paper, leather, and mordanted cotton. It dyes silk and wool but has very poor lightfastness on these fibres. It is also employed as a biological stain, in testing milk for tubercular infection, and as a chemical oxidation–reduction indicator.

Methylene blue was discovered in 1876 and is manufactured by a process, introduced about 1886, using dimethylaniline as the principal starting material.

methylene chloride, also called DICHLOROMETHANE, a colourless, volatile, practically nonflammable liquid belonging to the family of organic halogen compounds. It is extensively used as a solvent, especially in paint-stripping formulations.

Methylene chloride is commercially produced along with methyl chloride, chloroform, and carbon tetrachloride by the chlorination of methane. It boils at 40° C (104° F) at atmospheric pressure; it is denser than water and very slightly soluble in it. It is an effective solvent for fats, oils, greases, and many polymeric substances; its use is favoured by low toxicity, low flammability, high stability, and ease of recovery for reuse.

methylmorphine: *see* codeine.

metic, Greek METOIKOS, in ancient Greece, any of the resident aliens, including freed slaves. Metics were found in most states except Sparta. In Athens, where they were most numerous, they occupied an intermediate position between visiting foreigners and citizens, having both privileges and duties. They were a recognized part of the community and specially protected by law, although subject to restrictions on marriage and property ownership. A significant source of manpower and skilled labour, they constituted a large part of the population of Athens by the 5th century BC. Cephalus, father of Lysias and a metic, was a character in Plato's *Republic;* Pasion, a metic and former slave, became a great Athenian banker of the 4th century BC.

métis, plural MÉTIS, in Canadian history, a person of mixed Indian and French or Scottish ancestry. The first métis were the offspring of local Indian women and European fur traders in the Red River area of what is now the province of Manitoba. They resisted the Canadian takeover of the Northwest in 1869. In the course of half a century they had developed a distinctive way of life and thought of themselves as a nation with rights in the northwest. Fearing the oncoming wave of settlers from Ontario, they established a provisional government under the leadership of Louis Riel, an educated métis. In 1870 their government negotiated a union with Canada that resulted in the establishment of the province of Manitoba.

Metochites, Theodore (b. *c.* 1260, Nicaea, Empire of Nicaea [now İznik, Turkey]—d. March 13, 1332, Constantinople [now Istanbul]), Byzantine prime minister and negotiator for Emperor Andronicus II Palaeologus, one of the principal literary and philosophical scholars of the 14th century.

The son of George Metochites, a prominent Eastern Orthodox cleric under Emperor Michael VIII Palaeologus and a leading advocate of union with the Latin Church, Theodore became a favourite of Emperor Andronicus II and undertook various diplomatic missions to enlist help against the encroaching Ottoman Turks. In a vain attempt to reverse Byzantium's military and political decline through an alliance with Serbia, Metochites, in 1298, led an embassy to the Serbian court at Skoplje and arranged the marriage of Emperor Andronicus' five-year-old daughter, Simonis, to Tsar Milutin. As a result Serbia, although militarily stronger than Byzantium, and acknowledged as ruler of formerly Byzantine Macedonia, admitted the universal sovereignty of the Eastern emperor. In his *Presbeutikos* ("Embassy Papers"), Metochites left a valuable historical account of these negotiations as well as a concrete description of Byzantine influence on Slavic royalty.

Promoted to *megas logothetēs* ("grand logothete," or "chancellor"), Metochites married Irene Palaeologus and, as a relative of the ruling dynasty, directed Byzantine political affairs from 1321 to 1328, when Andronicus fell from power. Because of his fidelity to Andronicus II, he was deprived of his wealth and exiled by Andronicus III. In 1331 he retired to Chora Monastery (now Kariye Camii), in Constantinople, to continue his scholarly pursuits. He directed the material and artistic restoration of the monastery, the mosaic work of which, particularly the extant piece showing him offering the church of Chora to an enthroned Christ, represents the acme of 14th-century Byzantine mosaic art.

Metochites' voluminous writings range from scientific to theological matters. His best-known work, *Hypomnēmatismoi kai sēmeiōseis gnōmikai* ("Personal Comments and Annotations"), commonly designated the "Philosophical and Historical Miscellany," is an encyclopaedic collection of tracts and essays on classical thought, history, and literature, comprising more than 70 Greek authors. Other treatises on physics, astronomy, physiology, and Aristotelian psychology survive only in Latin translations. His commentaries on the *Dialogues* of Plato were an important influence on the 15th-century Platonic renaissance.

Metonic cycle, in chronology, a period of 19 years in which there are 235 lunations, or synodic months, after which the Moon's phases recur on the same days of the solar year, or year of the seasons. The cycle was discovered by Meton (fl. 432 BC), an Athenian astronomer. Computation from modern data shows that 235 lunations are 6,939 days, 16.5 hours; and 19 solar years, 6,939 days, 14.5 hours. *See also* golden number.

metonymy (Greek: "change of name," or "misnomer"), figure of speech in which the name of an object or concept is replaced with a word closely related to or suggested by the original, as "crown" for "king" ("The power of the crown was mortally weakened") or an author for his works ("I'm studying Shakespeare"). A familiar Shakespearean example is Mark Antony's speech in *Julius Caesar* in which he asks of his audience: "Lend me your ears." Metonymy is closely related to synecdoche, the naming of a part for the whole or a whole for the part, and is a common poetic device. Metonymy has the effect of creating concrete and vivid images in place of generalities, as in the substitution of a specific "grave" for the abstraction "death." Metonymy is standard journalistic and headline practice as in the use of "city hall" for "municipal government," the "White House" for the "President of the United States," or "Kremlin" for the government of the Soviet Union.

Métraux, Alfred (b. Nov. 5, 1902, Lausanne, Switz.—d. April 12, 1963, Paris, Fr.), Swiss anthropologist noted for his pioneering contributions to South American ethnohistory and the examination of African culture in Haiti.

Métraux studied with several prominent European anthropologists. He was director of the ethnological institute at the University of Tucumán, Arg. (1928–34), and wrote two classic works (1928) on the ethnohistory of the extinct Tupinambá Indians of Brazil. Following an expedition to Easter Island (1934–35), Métraux joined the Bishop Museum, Honolulu, and engaged in a major field effort in Argentina and Bolivia. In two works, *Ethnology of Easter Island* (1940) and *L'Île de Pâques* (1935; *Easter Island*), he argued that Easter Island's indigenous population is Polynesian, both culturally and physically, and that the island's well-known monolithic sculptures are native creations rather than Asian or American Indian ones.

As a member of the Bureau of American Ethnology of the Smithsonian Institution, Washington, D.C. (1941–45), Métraux contributed extensive, exemplary historical reconstructions to the bureau's *Handbook of South American Indians* (7 vol., 1946–59). From 1946 to 1962 Métraux held posts with the United Nations and the United Nations Educational, Scientific, and Cultural Organization (UNESCO). For the latter he engaged in studies in the Amazon (1947–48) and Haiti (1949–50). *Le Vaudon haïtien* (1958; *Voodoo in Haiti*), one of his two books on that island's culture, presented voodoo as a structured, complex religious system, examined its African origins, and showed its relation to Roman Catholicism in Haiti.

metre, also spelled METER, in measurement, fundamental unit of length in the metric and International systems of measurement. It is equal to approximately 39.37 inches in U.S. Customary measure. The metre was historically defined by the French Academy of Sciences in 1791 as 1/10,000,000 of the quadrant of the Earth's circumference running from the North Pole through Paris to the equator. The International Bureau of Weights and Measures in 1889 established the international prototype metre as the distance between two lines on a standard bar of 90 percent platinum and 10 percent iridium. By 1960 advances in the techniques of measuring light waves had made it possible to establish a more accurate and easily reproducible standard not dependent on any artifact. In 1960 the metre was thus defined in the International System (*q.v.*) as equal to 1,650,763.73 wavelengths in vacuum of the orange-red line in the spectrum of the krypton-86 atom.

By the 1980s, advances in laser measurement techniques had yielded values for the speed of light of an unprecedented accuracy, and it was decided in 1983 by the General Conference on Weights and Measures that the accepted value for this constant would be exactly 299,792,458 metres per second. The metre is now thus defined as the distance traveled by light in a vacuum in 1/299,792,458 second.

metre, also spelled METER, in poetry, the rhythmic pattern of a poetic line. Various principles, based on the natural rhythms of language, have been devised to organize poetic lines into rhythmic units. These have produced distinct kinds of versification, among which the most common are quantitative, syllabic, accentual, and accentual-syllabic.

1. Quantitative verse, the metre of classical Greek and Latin poetry, measures quantity, or the length of time required to pronounce syllables regardless of their stress. Various combinations of long and short syllables (the long syllables being roughly equivalent to twice the duration of the short syllables) constitute the basic rhythmic units. Quantitative verse has been adapted to modern languages but with limited success.

2. Syllabic verse, most common in languages that are not strongly accented, such as the Romance languages and Japanese. It is based on a fixed number of syllables within a line, although the number of accents or stresses may be varied. Thus, the classic metre of French poetry is the alexandrine, a line of 12 syllables with a medial caesura (a pause occurring after the 6th syllable). The Japanese haiku is a poem of 17 syllables, composed in lines of 5/7/5 syllables each.

3. Accentual verse, occurring in strongly stressed languages such as the Germanic. It counts only the number of stresses or accented syllables within a line and allows a variable number of unaccented syllables. Old Norse and Old English poetry is based on lines having a fixed number of strongly stressed syllables reinforced by alliteration. Accentual metres are evident in much popular English verse and in nursery rhymes; *i.e.*, "$\overset{\prime}{\text{One}}$, $\overset{\prime}{\text{two}}$, $\overset{\prime}{\text{Buck}}|\overset{\smile}{\text{le}}$ $\overset{\smile}{\text{my}}$ $\overset{\prime}{\text{shoe}}$." In the late 19th century, the English poet Gerard Manley Hopkins used it as the basis for his poetic innovation "sprung rhythm" (*q.v.*).

4. Accentual-syllabic verse, the usual form of English poetry. It combines Romance syllable counting and Germanic stress counting to produce lines of fixed numbers of alternating stressed and unstressed syllables. Thus, the most common English metre, iambic pentameter, is a line of ten syllables or five iambic feet. Each iambic foot is composed of an unstressed syllable followed by a stressed syllable.

Variations within any of these regular metres are not only permissible but inevitable and desirable. The words $\overset{\smile}{\text{a}}|\overset{\prime}{\text{gain}}$ and $\overset{\smile}{\text{for}}|\overset{\prime}{\text{lorn}}$, for instance, may each constitute an iambic foot, but they are vastly different in quality. Even in the most formal metrical designs, the quality, pitch, and force of certain sounds, along with the interplay of other poetic devices such as assonance, consonance, alliteration, or rhyme may act to reinforce or obscure the basic metrical pattern.

The function of regular metre in poetry is complex. In its most primitive aspects, as in nursery rhymes or folk ballads, it creates the physical pleasure that any simple rhythmic acts such as rocking, swaying, trotting, or foot tapping provide. Used mimetically, it may be lulling, galloping, staccato, heavy and slow, or quick and light to match the content and emotional tone of the poem. In more sophisticated poetry, regular metre is a subtle and flexible device, organically integrated into the total poem through its sensitive interaction with the natural rhythms of speech and the meaning of words. Although the late 19th century and early 20th century witnessed a widespread rebellion against the restrictions of metrically regular poetry, the challenge of condensing an imaginative impulse into a formal framework still appeals to poets. *See also* foot; scansion.

metre, also spelled METER, in music, rhythmic pattern constituted by the grouping of basic temporal units, called beats, into regular measures, or bars; in Western notation, each measure is set off from those adjoining it by bar lines. A time (or metre) signature, found at the beginning of a piece of music, indicates the number of beats in a measure and the value of the basic beat. For example, $\frac{3}{4}$ metre has three quarter-note beats per measure. The time signature implies that an accent regularly occurs on the first beat of each measure. Simple metres are duple (*e.g.*, $\frac{2}{2}$, $\frac{2}{4}$), triple ($\frac{3}{4}$, $\frac{3}{8}$), or quadruple ($\frac{4}{4}$, $\frac{4}{8}$). Compound metres are also duple ($\frac{6}{8}$, $\frac{6}{16}$), triple ($\frac{9}{8}$), or quadruple ($\frac{12}{8}$) but have time signatures that indicate the number of beats to be a multiple of three. Thus, in $\frac{6}{8}$, for example, both beats of the basic duple division are divisible into three subunits, yielding a total of six. Some metres that occur less frequently are neither duple nor triple ($\frac{5}{4}$, $\frac{7}{4}$) but may be considered a combination of duple and triple—such as $\frac{2}{4}+\frac{3}{4}$ or $\frac{3}{4}+\frac{2}{4}+\frac{2}{4}$.

The concept of regular rhythmic groups is traceable to the ancient beginnings of dance and poetry, which music primarily served to undergird. Specifications of metre first appeared in written music as early as about 1200, when short rhythmic formulas called rhythmic modes (*see* rhythmic mode) came into use, implying repetition of simple triple patterns. From 1300 to 1600 both duple and triple metres were recognized in music theory, but, in practice, rhythm was often complex and involved combinations of metres. From the 17th to the 20th century, regular metres as used today became the standard. In the course of the 18th century, metre changes from movement to movement gained aesthetic significance equal to that of key and tempo distinctions in multimovement works. Such 20th-century composers as Igor Stravinsky and Béla Bartók accorded their extensive metrical manipulations a structural prominence previously reserved for melody and harmony.

metric space, in mathematics, a set together with a rule, called a distance function, for relating a number to every pair of objects from the set such that the correspondence has properties similar to those of distance in Euclidean space. That is, the distance function (dist) is always positive and satisfies the triangle inequality (that is, the length of any side of a triangle is less than the sum of the other two sides) for any three points.

Any metric space can be made into a topological space by choosing the open subsets of the topology to be the analogues of circles in the Euclidean plane; that is, for each point p and each positive real number r the corresponding open set consists of all points x such that dist(p, x) is less than r. One important characteristic of metric spaces is that they have the Hausdorff property, meaning that sequences can have only one limit point.

Metrization is a process for making a suitable Hausdorff topological space into a metric space in such a way that the open sets resulting from the use of the distance function, as in the preceding paragraph, are the same as the open sets of the original topology. The determination of exactly which types of topological spaces are metrizable is one of the important problems in general topology.

metric system, international decimal system of weights and measures, based on the metre for length and the kilogram for mass, that was adopted in France in 1795 and, by the late 20th century, was used in almost all nations.

The French Revolution of 1789 provided the opportunity to pursue the frequently discussed idea of replacing the confusing welter of traditional but illogical units of measure with a rational system based on multiples of 10. In 1791 the French National Assembly directed the French Academy of Sciences to address the chaotic state of French weights and measures. It was decided that the new system would be based on a natural physical unit to ensure immutability. The academy settled on the length of 1/10,000,000 of a quadrant of a great circle of the Earth, measured around the poles of the meridian passing through Paris. An arduous six-year survey to determine the arc of the meridian from Barcelona, Spain, to Dunkirk, Fr., eventually yielded a value of 39.37008 inches for the new unit to be called the metre, from Greek *metron,* meaning "measure."

All other metric units were derived from the metre, including the gram for weight (one cubic centimetre of water at its maximum density) and the litre for capacity (one-thousandth of a cubic metre). Greek prefixes were established for multiples of 10, ranging from pico- (one-trillionth) to tera- (one trillion) and including the more familiar micro- (one-millionth), milli- (one-thousandth), centi- (one-hundredth), and kilo- (one thousand). Thus, a kilogram equals 1,000 grams, a millimetre 1/1,000 of a metre. In 1799 the Metre and Kilogram of the Archives, platinum embodiments of the new units, were declared the legal standards for all measurements in France, but the motto of the metric system expressed the hope that the new units would be "for all people, for all time."

Not until 1875 did an international conference meet in Paris to establish an International Bureau of Weights and Measures. The Treaty of the Metre signed there provided for a permanent laboratory in Sèvres, near Paris, where international standards are kept, national standard copies inspected, and metrological research conducted. The General Conference of Weights and Measures, with diplomatic representatives of some 40 countries, meets every six years to consider reform. The conference selects 18 scientists who form the International Committee of Weights and Measures that governs the Bureau.

For a time, the international prototype metre and kilogram were based, for convenience, upon the archive standards rather than directly upon actual measurement of the Earth. Definition by natural constants was readopted in 1960, when the metre was redefined as 1,650,763.73 wavelengths of the orange-red line in the krypton-86 spectrum, and again in 1983, when it was redefined as the distance traveled by light in a vacuum in 1/299,792,458 second. The kilogram is still defined as the mass of the international prototype at Sèvres.

In the 20th century the metric system generated derived systems needed in science and technology to express physical properties more complicated than simple length, weight, and volume. The centimetre-gram-second (CGS) and the metre-kilogram-second (MKS) systems were the chief systems so used until the establishment of the International System of Units (*q.v.*).

Metric system

base unit*

quantity	*name of unit*	*symbol*
length	metre	m
area	square metre	square m, *or* m^2
	are (100 square metres)	a
volume	cubic metre	cubic m, *or* m^3
	stere (1 cubic metre)	s
weight	kilogram	kg
	metric ton (1,000,000 grams)	t
capacity	litre	l
temperature	Celsius	°C

prefixes designating multiples and submultiples

prefix	*symbol*	*factor by which unit is multiplied*	*examples*
exa-	E	10^{18} = 1,000,000,000,000,000,000	
peta-	P	10^{15} = 1,000,000,000,000,000	
tera-	T	10^{12} = 1,000,000,000,000	
giga-	G	10^{9} = 1,000,000,000	
mega-	M	10^{6} = 1,000,000	megaton (Mt)
kilo-	k	10^{3} = 1,000	kilometre (km)
hecto-, hect-	h	10^{2} = 100	hectare (ha)
deca-, dec-	da	10 = 10	decastere (das)
		1	
deci-	d	10^{-1} = 0.1	decigram (dg)
centi-, cent-	c	10^{-2} = 0.01	centimetre (cm)
milli-	m	10^{-3} = 0.001	millilitre (ml)
micro-, micr-	μ	10^{-6} = 0.000001	microgram (μg)
nano-	h	10^{-9} = 0.000000001	
pico-	p	10^{-12} = 0.000000000001	
femto-	f	10^{-15} = 0.000000000000001	
atto-	a	10^{-18} = 0.000000000000000001	

*The metric system of bases and prefixes has been applied to many other units, such as decibel (0.1 bel), kilowatt (1,000 watts), megahertz (1,000,000 hertz), and microhm (one-millionth of an ohm).

Metro-Goldwyn-Mayer, Inc. (MGM), American corporation that, during its peak in the 1930s and '40s, was the world's largest and most profitable motion-picture studio.

The corporation was formed when Marcus Loew, a film exhibitor and distributor, bought into Metro Pictures in 1920. Four years later the company merged with the Goldwyn production company (whose studios in Culver City, near Hollywood, eventually became the MGM studio headquarters). In 1925 Louis B. Mayer Pictures joined the group, and Mayer himself was head of the studio for 25 years. Also prominent during MGM's early years was producer Irving Thalberg, the "boy genius" of Hollywood who was granted authority to reedit any film. Among the studio's major releases during the late silent era were *The Big Parade* (1925), *Ben-Hur* (1926), and *Flesh and the Devil* (1927), and its top stars included Greta Garbo, John Gilbert, and Lon Chaney.

Mayer successfully honed an elegant image for the studio during the 1930s and '40s, its most prosperous years. *Grand Hotel* (1932), *David Copperfield* (1935), *The Wizard of Oz* (1939), *Gone with the Wind* (1939), *The Philadelphia Story* (1940), *Mrs. Miniver* (1942), and *Gaslight* (1944) were among the major productions that helped make MGM the "Tiffany of studios," as it was regarded at the time. Boasting that it had "more stars than there are in the heavens," the studio had a roster of talent that included Clark Gable, Spencer Tracy, Joan Crawford, Jean Harlow, William Powell, Myrna Loy, Katharine Hepburn, Judy Garland, Mickey Rooney, Elizabeth Taylor, and Gene Kelly.

Beginning with *Meet Me in St. Louis* (1944), MGM launched a series of lavish Technicolor musicals, a style of film with which the studio would be permanently associated thereafter. The best of these included *On the Town* (1949), *An American in Paris* (1951), *Singin' in the Rain* (1952), and *The Band Wagon* (1953). Such films were expensive to produce, however, and they reaped only modest profits. MGM's gradual decline in the 1950s led to a series of management changes the following decade, when the studio's output was limited to a few high-profile, large-budget films such as *Doctor Zhivago* (1965) and *2001: A Space Odyssey* (1968). In the 1970s the studio sold many of its assets and concentrated on several nonfilm ventures such as hotels and casinos. By the end of the decade, MGM Grand Hotels in Las Vegas and Reno, Nev., earned the company more money than any of its films.

MGM purchased United Artists films in 1981 and became known as the MGM/UA Communications Company when it incorporated in 1986. Also in that year, the company bought back many of the assets it had sold the previous decade and again became a major producer of motion pictures. *Moonstruck* (1987), *Get Shorty* (1995), *The Birdcage* (1996), *Legally Blonde* (2001), and, especially, the ongoing series of James Bond films have been among the studio's most successful subsequent productions.

MGM/UA has since been divided, sold, and resold several times. Although its main product continues to be motion pictures, it has diversified into such ventures as international television networks, video and computer games, and touring ice shows.

Metro Toronto Zoo, zoological park in West Hill, Ontario, Can., which ranks as one of the largest zoos in the world. This 287-hectare

(710-acre) park was opened in 1974 by the municipality of Toronto and the Metropolitan Toronto Zoological Society. It replaced the overcrowded and outdated municipal Toronto Zoo at Riverdale.

The Metro Toronto Zoo has a fine collection comprising a few thousand specimens representing nearly 280 species. Its exhibits are arranged zoogeographically so that all the animals native to a particular continent are grouped together. Each area has a pavilion for displaying the smaller specimens and for housing those that cannot tolerate the cold Canadian climate. Plants indigenous to the areas represented are used in the pavilions to create the appropriate natural setting. Half of the African pavilion, for example, is designed to simulate a jungle habitat and houses gorillas and bongo antelope, while the other half holds swamplands for such animals as pygmy hippopotamuses and sitatunga antelope. Outdoors, the 20-hectare (50-acre) reproduction of the savannah is home for a mixed group of zebras, white rhinoceroses, and various other species of large mammals and birds. The "Canadian Animal Domain" is another of the larger exhibits, covering 166 hectares (410 acres). Visitors may ride a train through this section of the zoo to observe the large mammals displayed there.

metrology, the science of measurement. From three fundamental quantities, length, mass, and time, all other mechanical quantities—*e.g.,* area, volume, acceleration, and power—can be derived. A comprehensive system of practical measurement should include at least three other bases, taking in the measurement of electromagnetic quantities, of temperature, and of intensity of radiation—*e.g.,* light.

Accordingly, the 11th General Conference of Weights and Measures in 1960 adopted six quantities and units as the bases on which was established the International System of Units (*q.v.*). Since 1887 many national standards laboratories have been founded to set up and maintain standards of measurement, both for the six basic quantities and for their systematic derivatives. They also do attendant test and verification work for science and industry. Examples are the National Bureau of Standards (NBS) in the United States, the National Physical Laboratory (NPL) in the United Kingdom, and similar bodies in many other countries. The international metric organization created by the Metric Convention of 1875 (amended in 1921) also has a central laboratory, the International Bureau of Weights and Measures, at Sèvres (near Paris). It has duties analogous to those of the national laboratories but is concerned especially with the international coordination of all scientific work relating to the maintenance and improvement of the metric system of units and standards. This organization acts under the authority of the General Conference of Weights and Measures with the aid of an elected executive body, the International Committee of Weights and Measures, which meets every year.

Measuring a quantity means ascertaining its ratio to some other fixed quantity of the same kind, known as the unit of that kind of quantity. A unit is an abstract conception, defined either by reference to some arbitrary material standard or to natural phenomena. For example, the standard of length in the metric system was defined (1889–1960) by the separation of two lines on a particular metal bar, but it is now defined as equal to a certain number of wavelengths of light produced by a particular kind of atom under given conditions.

metronome, instrument for marking musical tempo, erroneously ascribed to the German Johann Nepomuk Maelzel (1772–1838) but actually invented by a Dutch competitor, Dietrich Nikolaus Winkel (*c.* 1776–1826). It consists of a pendulum swung on a pivot and actuated by a hand-wound clockwork whose escapement (a motion-controlling device) makes a ticking sound as the wheel passes a pallet. Below the pivot there is a fixed weight; above it, a sliding weight. A scale of numbers indicates how many oscillations per minute occur when the sliding weight is moved to a given point on the pendulum. Thus, the notation "M.M. (Maelzel's metronome) 𝅗𝅥 = 60" indicates that at 60 oscillations per minute the half note will receive one beat. The conventional metronome is housed in a pyramidal case. Pocket and electric metronomes are also made. Metronomes have occasionally been used as musical instruments, *e.g.,* by the Hungarian György Ligeti (*Poème symphonique,* 1962, for 100 metronomes).

Metrophanes Kritopoulos (b. 1589, Beroea, Macedonia, Ottoman Empire—d. May 30, 1639, Walachia, Ottoman Empire), Greek Orthodox patriarch of Alexandria, Egypt, and theologian whose discussions with European Protestants concluded with his writing an exposition of Eastern Orthodox doctrine in an attempt at Christian unity.

After becoming a monk at Mt. Athos, Greece, Kritopoulos in 1617 was sent on a tour of leading Anglican and Protestant university centres by the patriarch of Constantinople (now Istanbul), Cyril Lucaris, who sought to integrate Orthodox and Calvinist teaching. After study and exchanges with Anglicans at Oxford (1617–23) and with continental reformers in Germany, Switzerland, and Italy until *c.* 1630, he returned to the East and was made an Egyptian bishop in 1631; by 1636 he had been consecrated patriarch of Alexandria. He subscribed to the decisions of the 1638 Council of Constantinople that condemned Cyril for his Protestant leanings.

While at Helmstedt, Ger. (1624–25), Kritopoulos wrote in Greek "Confession of the Catholic and Apostolic Eastern Church," a treatise on the traditional Orthodox creed. The confession reverts to the doctrinal expressions of the early Greek Church Fathers as a basis for mutual understanding among the contending Christian communions. Thus, he emphasizes the biblical and devotional simplicity of primitive Christianity, with its emphasis on the divine Trinity and the reconciliation of fallen man with God through a mystical, sacramental relationship to Christ's divinity and sacrifice. Critical of aspects both in Protestant and Roman Catholic teaching, Kritopoulos maintained an ambiguous position in mediating the contrary theologies.

metropolitan, in the Roman Catholic, Eastern Orthodox, and Anglican churches, the head of an ecclesiastical province. Originally, a metropolitan was a bishop of the Christian Church who resided in the chief city, or metropolis, of a civil province of the Roman Empire and, for ecclesiastical purposes, administered a territorial area coextensive with a civil province. The first known use of the title in church conciliar documents was at the Council of Nicaea in 325, which definitely established the metropolitan in the organization of the church.

Following the general pattern of civil government, the expanding church created ecclesiastical provinces, each headed by a metropolitan, who was assisted by his suffragan bishops, each of whom headed a diocese within the province. This system has continued substantially unchanged. The metropolitan convokes and presides at provincial synods, and he takes the chief part, assisted by his suffragans, in the consecration of bishops.

In Slavic-speaking Orthodox churches the title metropolitan is used to designate heads of autocephalous churches and a few important episcopal sees; in Greek-speaking Orthodox churches it is given to all diocesan bishops, as distinct from their auxiliaries. In Western medieval Roman Catholicism, especially since the 9th century, the rights of the metropolitans gradually disappeared in the framework of papal centralization. The title archbishop, conferred by popes on metropolitans of particular note, took on connotations of spiritual authority, and the title metropolitan came to be regarded as being particularly associated with temporal authority. The distinction still remains in the Roman Catholic Church, but in the Church of England the titles are synonymous. *See also* archbishop.

metropolitan area, also called METROPOLIS, a major city together with its suburbs and nearby cities, towns, and environs over which the major city exercises a commanding economic and social influence. Literally construed, *metropolis* from the Greek means "mother city," and by implication there are progeny or dependents scattered about the core area. Sometimes there may be two or more major cities, as in the Tokyo–Yokohama Metropolitan Area (Japan) or an agglomeration of metropolitan boroughs as in Greater London (England). The U.S. Census employs a unit called a metropolitan statistical area (MSA) which includes either (1) a city with a population of at least 50,000 or (2) an urbanized area of at least 50,000 population with a total metropolitan population of at least 100,000 (75,000 in New England). An urbanized area is defined as having a population of at least 50,000, and a population density of at least 1,000 per square mile.

Metropolitan Museum of Art, largest and most comprehensive art museum in New York City and one of the foremost in the world. The museum was incorporated in 1870 and opened two years later. The complex of buildings at its present location in Central Park opened in 1880. The main building facing Fifth Avenue, designed by William Morris Hunt, was completed in 1902. McKim, Mead and White designed certain later additions. The American section, added in 1924, included the 1823 marble facade saved from the demolished U.S. Branch Bank on Wall Street. The American Wing, a four-acre addition, was wrapped around the old section in 1980 by architects Kevin Roche, John Dinkeloo, and associates, who had also designed the Lehman Wing in 1975, the Michael C. Rockefeller and Sackler wings in 1978, and a projected European wing.

The Saint-Guilhem arcade and garden court at The Cloisters, a branch of the Metropolitan Museum of Art, New York City

By courtesy of the Metropolitan Museum of Art, The Cloisters Collection

The Metropolitan Museum has important collections of Egyptian, Babylonian, Assyrian, Far and Near Eastern, Greek and Roman, European, Pre-Columbian, New Guinean, and American art including architecture, sculpture, painting, drawings, prints, glass, ceramics, textiles, metalwork, furniture, period rooms, arms and armour, and musical instruments. It has a Costume Institute and a Junior Museum. The Thomas J. Watson Library, built in 1964, has one of the most complete art and archaeology reference collections in the world.

European art of the Middle Ages is found on display in both the Central Park complex and The Cloisters, the Metropolitan's museum of medieval art in Fort Tryon Park. The building, which opened in 1938, is made up of parts of medieval monasteries and churches.

Metropolitan Opera Association, New York City, leading U.S. opera company, distinguished for the outstanding singers it has attracted since its opening performance (Gounod's *Faust*) on Oct. 22, 1883. After its first season under Henry E. Abbey had ended in a $600,000 deficit, its management passed to the conductor Leopold Damrosch and later to his son, conductor and composer Walter Damrosch. In 1892, under Abbey, Walter Schoeffel, and Maurice Grau, the programming was a balance of German, French, and Italian. Grau, as manager during the Metropolitan's "Golden Age" (1898–1903), drew many excellent artists from all over the world.

Heinrich Conried, manager from 1903 to 1908, arranged performances of Richard Wagner's *Parsifal* (first performance outside Bayreuth, Ger.) and Richard Strauss's *Salome,* which so shocked its audience that it was withdrawn. During Giulio Gatti-Casazza's 25 years as general manager, weekly radio broadcasts were inaugurated.

Under Edward Johnson (general manager 1934–50), U.S. composers and artists were encouraged. His successor, Rudolf Bing, made innovations in staging and brought the first black singers to the Metropolitan. He also arranged the Metropolitan's first televised performance and organized its touring company. In 1966 the Metropolitan moved to the Lincoln Center for the Performing Arts, New York City. In 1972, Bing resigned and was succeeded by Göeran Gentele, former head of the Stockholm opera; Gentele was killed in an automobile accident later that year and was succeeded by Schuyler G. Chapin in 1973 and Anthony Bliss in 1975.

Metsähine (Finnish god): *see* Tapio.

Metsu, Gabriel, Metsu also spelled METZU (b. January 1629, Leiden, Neth.—buried Oct. 24, 1667, Amsterdam), Dutch painter of scenes of everyday life.

The son of a painter of Leiden, he studied and worked there until about 1650, when he settled in Amsterdam. He began with religious subjects, but sacred art was unsuited to his temperament: he turned to the life of the marketplace and of the drawing room, which he painted with equal facility. Among his better-known works are "The Music Lesson" and "The Artist and His Wife" (Metropolitan Museum of Art, New York City), and "The Duet" (National Gallery, London).

Metsys, Quentin (Flemish artist): *see* Massys, Quentin.

mettā (Pāli), in Buddhism, the perfect virtue of sympathy. *See* brahmavihāra.

Metternich, Klemens, Fürst von (prince of), in full KLEMENS WENZEL NEPOMUK LOTHAR, FÜRST VON METTERNICH-WINNEBURG-BEILSTEIN (b. May 15, 1773, Coblenz, Archbishopric of Trier—d. June 11, 1859, Vienna), Austrian statesman, minister of foreign affairs (1809–48), and a champion of conservatism, who helped form the victorious alliance against Napoleon I and who restored Austria as a leading European power, hosting the Congress of Vienna in 1814–15.

Metternich, black and white chalk drawing by Anton Graff, c. 1803–05; in the Kupferstichkabinett, Dresden, Ger.

By courtesy of the Staatliche Kunstsammlungen, Dresden, Ger.

Early life. Metternich, the descendant of an old Rhenish noble family, was the son of Franz Georg Karl, Graf von Metternich-Winneburg and Countess Beatrix Kagenegg. His father was then the Austrian envoy to the Rhenish principalities of the empire, and Metternich spent his youth in the Rhine–Moselle region, for which he retained a lifelong affection.

In 1788 he entered the University of Strasbourg, where he studied diplomacy; but the spread of the French Revolution prompted him to leave Strasbourg in 1790 and enter the University of Mainz. Before the French revolutionary troops entered Mainz, he went to Brussels in the Austrian Netherlands, where his father was then chief minister. In 1794 he undertook a diplomatic mission to England, where he published a pamphlet calling for a general arming of the German people; but in October he rejoined his father, who had in the meantime fled to Vienna as the French invaded the Netherlands. In Vienna he occupied himself with natural, scientific, and medical studies, in which he always kept a lively interest and which he later did much to encourage.

In September 1795 Metternich married the countess Eleonore Kaunitz, heiress and granddaughter of the former Austrian state chancellor Wenzel Anton, Graf von Kaunitz. This marriage gave him the link with the high nobility of Austria and the access to high office he had long desired. After having represented the Roman Catholic Westphalian counts of the empire at the end of the Congress of Rastatt (1797–99), which ratified compensation for the German princes ousted by the French from their possessions on the left bank of the Rhine, he was in 1801 appointed Austrian minister to the Saxon court at Dresden, and there he formed his friendship with Friedrich von Gentz, the German publicist and diplomat. Serving as Austrian minister in Berlin after 1803, Metternich failed to persuade Frederick William III of Prussia to join Austria in the war of 1805 against France but gained a profound insight into the internal brittleness of the Prussian state, whose speedy ruin he predicted.

Ministry during the Napoleonic Wars. In 1806 Metternich served as Austrian minister to France. In contact with Napoleon's sister Caroline Murat and other ladies of Parisian society, he won a reputation for licentiousness; nevertheless, from those ladies and from his relations with the foreign minister Talleyrand and with the Russian envoy, he obtained excellent reports on the state of affairs in France. Although Metternich's successes in the negotiations leading up to the Franco-Austrian Treaty of Fontainebleau were insignificant, he used his time to acquire a deep insight into the emperor Napoleon I's character. Yet he overestimated the impact of the Spanish rising of 1808 on the Napoleonic system, and his optimistic reports did much to induce Austria to undertake the disastrous war of 1809 against France. After the Battle of Wagram, he tried to obtain favourable terms in the peace negotiations but was rebuffed by Napoleon.

On Oct. 8, 1809, the emperor Francis (at that time Francis I of Austria but no longer Holy Roman emperor) appointed Metternich minister of foreign affairs. Six days later the oppressive Treaty of Schönbrunn was signed with France. Austria was now in urgent need of a respite, which Metternich obtained by forming the project of a marriage between the archduchess Marie-Louise, a daughter of Francis I, and Napoleon, whose vanity Metternich cleverly exploited. It is not clear how far he expected that this marriage would restrain Napoleon from further campaigns of conquest, but at least he achieved a relationship between France and Austria loose enough to preserve Austria's freedom of action: Austria neither joined the Confederation of the Rhine, a league of German princes under Napoleon's protection, nor became one of the client states of the Napoleonic system. Utterly exhausted and debt-ridden, Austria could hardly have resisted any further demands of Napoleon, but it was then no longer the main object of Napoleon's hostility.

As early as 1811, in order to promote Austria's internal development, Metternich wanted the state to be reorganized on federal lines instead of continuing under the centralized system that the emperor Joseph II had imposed. Yet Metternich could never overcome the objections of his strictly absolutist emperor. At the same time the enthusiasm for arming the nation and for a German national rising against Napoleon, which he had felt as late as 1809, began to be superseded by a firm dislike for all popular movements. Agreeing with the Emperor on this, he now came to regard these manifestations as a menace to the multinational Habsburg state. He became the strictest exponent of the doctrine of the balance of power in Europe—a doctrine instilled into him originally by Koch, latterly by his diplomat friend Gentz.

When Napoleon launched his invasion of Russia in 1812, Metternich obtained the status of an independent contingent for the Austrian forces under Prince Karl Schwarzenberg that accompanied the French Army. The disaster that befell Napoleon's army came as a surprise to Metternich. On Jan. 30, 1813, Schwarzenberg concluded an indefinite armistice with the Russians. But in view of the inadequacy of Austria's armaments, Metternich could not make up his mind to change over to war on Russia's side against Napoleon. Resisting all ill-considered projects, in particular those of the archduke John (who was put under house arrest for planning a premature anti-French rising in the Alps), Metternich firmly adhered to neutrality while Austria secretly rearmed. He even drew Saxony into the neutral camp for a time. When, later in 1813, Saxony's return to the French side and Napoleon's victory over the Russians and Prussians at Bautzen shook Metternich's will to make war and stiffened Napoleon's attitude, Metternich mediated an armistice between France, Russia, and Prussia. Even so, in the subsequent Treaty of Reichenbach, June 24, 1813, between Austria, Prussia, and Russia, Metternich undertook to bring Austria into the war against France if Napoleon rejected the peace terms that he was offering.

By dominating the negotiations with the French during the summer of 1813, Metternich gained more time for rearming. At this point he was not interested in the annihilation of Napoleon's power, which the emperor Francis likewise, out of consideration for his daughter Marie-Louise, was unwilling to destroy altogether. Metternich also distrusted the Russian emperor Alexander I and feared that after the collapse of France, Europe would be at Russia's mercy. Napoleon's obstinacy frustrated the attempt at a settlement; but when in August Austria finally declared war on France, Metternich, by his superior conduct of negotiations, had won for his country the leadership both in the political and in the military field. In October 1813 the hereditary title of prince was bestowed on him by the Austrian emperor.

In opposition to the plans of the Prussian minister Karl, Freiherr vom Stein, and of the Russian emperor, Metternich promised the South German states of the Confederation of the Rhine that if they went over to the allies they would not forfeit the position they had achieved on Napoleon's side. This promise alone showed that, while he was striving for a solution compatible with the interests of all parties, he also wanted to gain the South German states as allies against the Prussian–Russian designs of aggrandizement. After Napoleon's defeat at Waterloo and abdication, Metternich rejected as unrealistic the proposals of Baron Stein and others for the resuscitation of the Holy Roman Empire. The first Treaty of Paris (May 30, 1814) stipulated nothing more for Germany than a loose confederation of states.

Leadership of the Congress of Vienna. The Congress of Vienna (September 1814–June 1815) was the climax of Metternich's work of reconstruction. The very fact that it was held in Vienna was in itself a great success for him. He had precise ideas about the basis for a new order in Europe but knew from the start that he would have to modify them substantially if he was to salvage even a small part of his plans against the opposition of self-interested princes. He wanted to secure Austria's predominance by forming two confederations, one German and the other Italian, with Austria as the leading power in both. Within Germany, he proposed the creation of a hereditary German imperial title, and he thought that Austria and Prussia should share the task of protecting Germany's western frontier. Friendship with Prussia on the one hand and with Bavaria on the other thus seemed to him to be the prerequisite of success. Supported by the British foreign secretary, Lord Castlereagh, Metternich sought to prevent the elimination of France, which he saw as a necessary counterweight against Russia. Likewise, he resisted the territorial aggrandizement of Russia and Prussia and objected in particular to Prussia's designs for annexing all of Saxony.

The congress became a splendid social event. By an unbroken chain of festivities Metternich kept the visiting monarchs in a mood that made them disinclined to interfere very persistently in the real work of the statesmen. Facile and not averse to amorous adventures, Metternich brilliantly mastered his dual role of social representation and political leadership.

Yet Metternich only partly succeeded in his plans: the German imperial project came to nothing because Francis steadfastly refused to support it; the Italian confederation did not materialize; and the German confederation, when it at last did come into being in June 1815, was based only on a brief and noncommittal federal act derived from a Bavarian compromise proposal. In European affairs, however, Metternich was more successful: he achieved equality of status for France; he obtained a reduction of the Prussian demands on Saxony; and, in particular, he blocked the farther reaching demands of Russia. Both Russia and Prussia, in fact, were held in check by the common front of Austria, England, and France that Metternich had created.

Metternich's moderation produced a long-lasting European order. This, however, must be ascribed to his diplomatic capability rather than to his political foresight. Austria's status in the German confederation had been strengthened; but the Emperor's refusal of the German crown meant that Prussia, with equal status in the confederation, would be able to counterbalance Austria.

Role in the German confederation. Not even within the Austrian Empire was Metternich able to prevail with the idea (already at the root of his plans of 1811) of overcoming the spirit of national revolution by revitalizing the old historical regions and the privileges they enjoyed in preabsolutist times. His attempt to organize the newly acquired Italian provinces according to historical principles was frustrated by the emperor Francis, who, though accepting Metternich's ideas, united two incompatible regions in a completely unhistorical "Lombardo-Venetian kingdom" and so destroyed Metternich's hopes of counteracting pan-Italian nationalism. Moreover, as Metternich had feared, the initially strong pro-Austrian mood turned into its opposite.

The reconstruction of Austria took shape entirely in the spirit of the emperor Joseph II, on centralist and absolutist lines, without regard to national differences and without the establishment of departmental ministries, which Metternich had demanded. After many futile remonstrances Metternich eventually yielded to the obstructionism of the Emperor, who detested innovation and stood jealously on his dignity. The reestablishment of the ancient diets of the estates of Tirol and Galicia complied to some extent with Metternich's idea of resurrecting the provincial diets in order to create a counterweight against the growing forces of liberal and nationalist opinion that was demanding a central parliament. He condemned, however, the repressive measures by which the police minister tried to achieve these aims.

The domestic affairs of Austria created difficulties for Metternich at the Frankfurt am Main Bundestag (federal assembly), which opened in 1816. He had originally intended to use this assembly to oppose revolutionary thought all over Germany. Pointing to the examples of Tirol and Galicia, he attempted in 1817–18 to encourage the German states to introduce constitutions resurrecting the historical provinces and to set up their own diets instead of a central parliament. In summer 1818, however, Bavaria and Baden promulgated constitutions that reflected not Metternich's ideas but those of limited monarchy similar to that outlined by the French charter of June 1814; and in 1819, when revolutionary activity culminated in the murder of the dramatist August von Kotzebue and when the opening sessions of the Bavarian and Baden assemblies proved stormy, Metternich decided to stifle these unmanageable liberal currents.

He managed to convince the Prussian chancellor Prince Karl August von Hardenberg that his prescription for provincial diets was right. Then, assured that Prussia would not follow the South German example, he could quietly watch how parliaments created against his advice fulfilled his predictions and discouraged the liberal inclinations of German princes. Consequently, at the ministerial conferences of Carlsbad and Vienna in 1819–20, Metternich, to the surprise of the South German states, did not attempt to undo the new constitutions but simply curtailed the activity of the federal assembly, which had become an inconvenience to him. Reorienting his German policy, he began to rely not on the assembly but on the common interest of the princes whom he led to share his point of view by personal contact. Henceforth it was no longer the privileges of Austria as granted by the federal act, but Metternich's personality that guaranteed Austria's predominance in the German confederation.

Years of decline. Metternich had hoped that a system of congresses, at which the great powers would concert their actions, would maintain order and peace in Europe. At the congresses of Aix-la-Chapelle (1818), of Troppau (1820), of Laibach (1821), and of Verona (1822) his international reputation was at its zenith, but the disruption of the forum of great powers became evident when Great Britain abandoned the policy of intervention against revolutions in other countries: Viscount Castlereagh prepared the way for this change at Troppau, and George Canning, his successor as British foreign secretary, brought Metternich's influence on western Europe to an end by insisting on the right of national self-determination for the South American colonists in revolt against Spain and for the Greek insurgents against Turkey. With Alexander I's death (1825) it seemed likely that Metternich's influence on Russia would likewise come to an end; and Prussia's jealousy of Austria's dominance was causing further difficulties, when in 1830 the July Revolution in France, followed by insurrections in Belgium, Poland, and Germany, appeared to justify again Metternich's dismal prognoses and served to convince the eastern powers, Austria, Prussia, and Russia, that they should stand together by his principles.

Metternich had been appointed Austrian state chancellor on May 25, 1821, but his influence in Austria was decisively restricted by the appointment of Franz Anton, Graf von Kolowrat, as minister of state and head of the Cabinet conferences (1826). Kolowrat opposed an orderly governmental organization and won great ascendancy over the emperor Francis. Metternich, as his influence dwindled, yielded to an increasingly irritating vanity and to a passion for theorizing that caused his utterances to become increasingly prolix and, at times, to verge on the ridiculous. For the sake of legitimacy and despite general apprehensions, he gave Francis the disastrous advice to recognize his feebleminded eldest son, the archduke Ferdinand, as heir to the throne. In 1835, therefore, when Ferdinand succeeded his father, Metternich, at first together with the archduke Louis (Ludwig), took the chair at the "conference," or council of state that assumed the functions of a regency. In 1836 it seemed as if he would at last be able to carry out his idea of well-ordered government, but at the decisive moment Kolowrat managed to convert the archdukes John and Louis to his own theories. Thenceforth Metternich's authority was confined to external affairs. His vanity tempted him to disguise the waning of his influence by accepting responsibility for decrees that neither came from him nor accorded with his views. He thus became a hated symbol of repression and reaction and, eventually, on March 13, 1848, had to resign, as the first victim of the revolution. He made his way with difficulty into exile in England but returned to Vienna in 1851, where he died eight years later.

After his first wife's death in 1825, Metternich married Baroness Antoinette Leykam in 1827. After her death in 1829, he married Countess Melanie Zichy-Ferraris in 1831, who died in 1854. His son by his second marriage, Richard, Fürst von Metternich, was Austrian ambassador in Paris from 1859 to 1870 and one of the foremost diplomats of his time.

An opposing and unfavourable view of Metternich is given in V. Bibl, *Metternich, der Daemon Oesterreichs* (1936). The works by E.L. Woodward, *Three Studies in European Conservatism: Metternich, Guizot, the Catholic Church in the Nineteenth Century* (1929); A. May, *The Age of Metternich, 1814–1848* (1933); and A. Cecil, *Metternich, 1773–1859* (1933), have pursued

lines of inquiry opened up by Srbik. Several modern studies have offered various other views of Metternich. Among them are E.E. Kraehe, *Metternich's German Policy,* vol. 1, *The Contest with Napoleon, 1799–1814* (1963); Kraehe (ed.), *The Metternich Controversy* (1977); and G. de Bertier de Sauvigny, *Metternich et la France après le Congrès de Vienne,* vol. 1, *De Napoléon à Decazes 1815–1820* (1968), vol. 2, *Les Grands Congrès—1820–1824* (1970). The dominant position of Metternich in Europe is treated in P.W. Schroeder, *Metternich's Diplomacy at Its Zenith, 1820–1823* (1962); H.F. Schwarz (ed.), *Metternich, the Coachman of Europe* (1962); D.E. Emerson, *Metternich and the Political Police: Security and Subversion in the Habsburg Monarchy (1815–1830)* (1968); and A.G. Haas, *Metternich, Reorganization and Nationality, 1813–1818* (1963), which describes a fundamental aspect of Metternich's plans for internal reform in Austria.

Metz, city, capital of the Moselle *département,* Lorraine *région,* northeastern France, at the confluence of the Moselle and Seille rivers, northwest of Strasbourg and south of the Luxembourg frontier. It was partly rebuilt and its suburbs considerably extended after World War II.

Metz derives its name from the Mediomatrici, a Gallic tribe who made it their capital. It was fortified by the Romans. In the 3rd century it was evangelized, and it became a bishopric in the 4th century. After being plundered by the Huns in the 5th century, the city passed under Frankish domination. In 843, at the partition of the Carolingian Empire, Metz became the capital of Lorraine. During the Middle Ages, the city was a free town within the Holy Roman Empire and grew prosperous. After the Reformation in the 16th century, when Metz became Protestant and was in danger of being subjected to persecution, Henry II of France (reigned 1547–59), though a Roman Catholic, offered to defend it, successfully withstanding a siege by Charles V, the Holy Roman emperor, in 1552. The French continued to occupy the town; and in 1648, at the Peace of Westphalia, it was ceded to France with Toul and Verdun.

Porte des Allemands (Gate of the Germans), Metz, France

P. Salou—Shostal

During the 1870–71 Franco-Prussian War the French troops retreated into Metz after an indecisive battle. The Germans besieged the town, and 54 days later the French were forced to capitulate. Metz was returned to France after World War I. During World War II it was occupied by the Germans and in 1944 was liberated only after a long battle.

Metz has pleasant promenades along the banks of the Moselle River, which divides into several arms as it flows through the city. The Gothic cathedral of Saint-Étienne was originally formed when two 12th-century churches were joined into a single edifice. The transept and the nave, one of the highest of French Gothic churches, have huge pointed windows. The two towers were begun in the 13th century. The cathedral has remarkable 13th- and 14th-century stained-glass windows, as well as contemporary ones by the painters Marc Chagall and Jacques Villon. The old city gate, the Porte des Allemands (Gate of the Germans), built in the 13th and 15th centuries, which was partly destroyed during World War II, has imposing crenellated towers. The museum has a collection of Gallo-Roman antiquities, which are exhibited in the vestiges of Roman baths discovered in 1935.

Metz, a railway junction on the Nancy-Luxembourg line, is also the centre of a complex road and motorway network and is located in a commanding position on the canalized Moselle. It is also near the Lorraine iron-mining basin and near the Moselle coal mines. The manufacture of automobile, electrical, and mechanical equipment and of food products (brewing, canned foods) and the processing of tobacco are among the main industries. The University of Metz was founded in 1971. Pop. (1990) 123,920.

Meudon, city, Hauts-de-Seine *département,* Paris *région,* France, southwestern suburb of Paris, standing on a hill on the south bank of the Seine River. Meudon is bordered to the south by woods and by the terrace of Meudon and has a fine panoramic view of Paris. The Observatoire de Meudon on the terrace is housed in the transformed early 18th-century royal Château-Neuf, severely damaged by fire in 1870.

During the 19th or early 20th century, the sculptor Auguste Rodin, the painters Édouard Manet and Pierre-Auguste Renoir, and the composer Richard Wagner all lived in Meudon. Rodin's estate is a museum housing his tomb and many of his works. There is an aeronautical museum outside the city. Industry, centred in the Bas Meudon quarter, is predominantly machinery fabrication. Pop. (1990) 46,173.

Meulen, Adam Frans van der (baptized Jan. 11, 1632, Brussels, Spanish Netherlands [now in Belgium]—d. Oct. 15, 1690, Paris, France), Flemish Baroque painter who specialized in battle scenes.

Meulen was a pupil of the painter of battle scenes Pieter Snayers, of the Flemish school, and was called to Paris about 1666 by the finance minister Jean Colbert, at the request of Charles Le Brun, to fill the post of battle painter to Louis XIV. His paintings of the campaigns in Flanders (1667) so delighted Louis that from that date van der Meulen was ordered to accompany him on all his campaigns. He also made many tapestry cartoons for the Gobelins factory depicting Louis's military career. In 1673 he was received into the French Academy.

Meunier, Constantin (Emile) (b. April 12, 1831, Etterbeek, Belg.—d. April 4, 1905, Ixelles), Belgian sculptor and painter, one of the principal social-realist artists of the late 19th century in Europe.

Meunier began his career as a sculptor, but during the years 1857–84 he pursued only painting. After visiting some mines and factories, Meunier demonstrated in his paintings a humanitarian interest in labourers, focusing particularly on the miners of the Borinage, dockworkers of Antwerp, metalworkers, and women labourers.

In 1882, under the sponsorship of the Belgian government, Meunier went to Spain, where he produced paintings primarily on religious subjects. After returning to Belgium, he began to explore in bronze sculpture the social themes that had dominated his earlier paintings. The empathy and respect with which he viewed his subjects (*e.g.,* "The Fire-Damp Explosion," 1887) renders Meunier's work universal rather than political. Notable works include "The Docker" (bronze; 1905) and a large sculptural group, "Monument to Labour," which was installed in the Place de Trooz, Brussels, in 1930.

Meurthe-et-Moselle, *département,* Lorraine *région,* northeastern France, created in 1871 from those parts of the *départements* of Meurthe and Moselle that remained in French possession after the Franco-Prussian War (1870–71). These *départements* originally had been constituted from a section of historical Lorraine (*q.v.*), and when the territories annexed by Germany in 1871 were restored to France following World War I, they were formed into the neighbouring *département* of Moselle.

Meurthe-et-Moselle extends from Vosges *département* in the south to the Belgian and Luxembourg frontiers in the north and has at its centre the Moselle River valley and Nancy (*q.v.*), the departmental capital. The country is forested and hilly, rising to about 1,200 feet (370 m) in the southwest, where the hills are cut by the Meuse River valley, and to more than 2,000 feet in the southeast in the Vosges mountains. The Meurthe and Moselle rivers approach each other south of Nancy. The Moselle loops around the ancient cathedral city of Toul and receives the Meurthe north of Nancy. It flows past metallurgical works and through Pont-à-Mousson before leaving the *département.* The wooded, hilly northern strip contains the greater part of the Briey iron-ore basin and embraces the heavily industrialized valleys of the Longwy iron-ore field, with its concentrations of blast furnaces and foundries. The area accounts for a sizable proportion of France's total iron and steel output. The prospect of the abandonment of iron mining weighs heavily on the local economy. Planners hope to substitute automobile-related industries. The Canal de la Marne au Rhin crosses the *département* west-east through Nancy and the middle of the Dombasle-sur-Meurthe rock-salt deposits, which are exploited for heavy chemical industries.

The climate in the *département* is predominantly continental, with severe winters (averaging 20 to 30 days of snow) and hot summers. Forestry is important, and cereals, beets, and potatoes are grown, but there is a trend toward cattle raising to provide local markets with meat and dairy produce. Traditional local industries include brewing at Nancy, glassworks at Baccarat, and iron pipes at Pont-à-Mousson. The *département* is divided into the *arrondissements* of Nancy, Briey, Toul, and Lunéville, which has a fine 18th-century palace inspired by Versailles. Nancy is the administrative centre for education. Area 2,024 square miles (5,241 square km). Pop. (1992 est.) 709,700.

INDEX
first

Meuse, *département,* Lorraine *région,* northeastern France, created from parts of historical Lorraine (*q.v.*) province and a fragment of Champagne.

Bounded in the northeast for 8 miles (13 km) by the Belgian frontier, Meuse occupies an oblong area of 2,400 square miles (6,216 square km), which the Meuse River traverses from south-southeast to north-northwest for over 100 miles (160 km). The Meuse flows in a deeply entrenched valley past Commercy and through the ancient fortress city of Verdun (*q.v.*), the largest centre, in the middle of the *département.* The Ornain River, a tributary of the Marne, crosses the southwest, passing through Bar-le-Duc (*q.v.*), the administrative capital. The Canal de la Marne au Rhin passes through the Ornain valley. The Aisne River gathers its headwaters north of Bar-le-Duc in the rugged, forested highlands of Argonne (750–900 feet [225–275 m]) that extend along the western border. The Aire, a tributary of the Aisne, flows below the eastern escarpment of the Argonne range and is separated from the Meuse by a stretch of hilly, forested country. The Meuse Heights, which rise to more than 1,300 feet [about 400 m] and were the scene of heavy fighting during World War I, follow the east bank of the Meuse.

Because of its higher elevation, Meuse has a more severe climate than most other parts of northern France. Forests cover the heights. The economy has traditionally been largely agricultural, featuring cattle raising, cereals, and forage. Many of the vines that once grew on sheltered slopes have been replaced by plum and apricot trees. Industry, now the largest employment sector, was formerly confined to metalworking and food processing at Bar-le-Duc, Commercy, and Verdun, the administrative centres of the three *arrondissements* and the only sizable towns. Industry is now more widespread but is small-scale and has not altered the rural character of the *département*. Meuse is in the educational division of Nancy. Pop. (1988 est.) 196,400.

Meuse-Argonne, battles of the (Sept. 26–Nov. 11, 1918), a series of final confrontations on the Western Front in World War I.

Following the German retreat from the Marne River in July, General Ferdinand Foch and the Allied high command designed a series of convergent and practically simultaneous offensives against the shaken German armies. One was a joint operation in the Meuse valley toward the Mézière and Sedan rail centre. The Americans proceeded west of the Meuse River, the French west of the Argonne Forest. The Americans faced the most difficult natural obstacle, the dense Argonne Forest. General John Pershing's opening surprise attack advanced 5 miles (8 km) along the Meuse River but only 2 miles (3 km) in the difficult Argonne Forest sector. Attack after attack edged deeper into the Germans' defensive position, and on the 11th day of the American offensive, the Germans recognized that they were outflanked and retreated to avoid capture. Meanwhile the French advanced steadily across the Aisne lowlands. By October 31 the American forces had advanced 10 miles (16 km), the French had advanced 20 miles (32 km), and the Argonne had been cleared of German troops.

Hard fighting continued in the Meuse-Argonne sector during October. More than 1,000,000 Americans participated in the battles. On November 10 the Allies reached Sedan and cut the rail line there. The Armistice was declared (November 11) before a final offensive against Germany itself could begin.

Meuse River, Latin MOSA, Flemish MAES, Dutch MAAS, river, rising at Pouilly on the Langres Plateau in France and flowing generally northward for 590 miles (950 km) through Belgium and The Netherlands to the North Sea. In the French part, the river has cut a steep-sided, sometimes deep valley between Saint-Mihiel and Verdun, and beyond Charleville-Mézières it meanders through the Ardennes region in a narrow valley. Entering Belgium at Givet, it continues northward to Namur, where it is joined on the left (west) bank by the Sambre River and then turns eastward to Liège. The Meuse there forms a natural routeway for river transport and is the centre of industrial development. At Liège it is deep and narrow and lies about 450 feet (137 m) below the plateau tops. The river turns north and from Maastricht (The Netherlands) to Maaseik (Belgium) forms the frontier between The Netherlands and Belgium. From Venlo (The Netherlands) it curves gradually west, reaches sea level and divides, one branch flowing into the Hollandsch Canal (an outlet of the North Sea), while another joins the Waal River (a channel of the Rhine) near Gorinchem to become the Merwede. Near Dordrecht the Merwede divides into the Noord to the north, which joins with the Lek River to become the Nieuwe Maas, and the Oude Maas to the south. The Nieuwe Maas and Oude Maas come together at the Nieuwe Waterweg (New Waterway), which leads to the North Sea.

The Meuse River is navigable for most of its length and is one of the more important waterways of western Europe. In the vicinity of Maastricht, the Albert Canal extends northwestward from the Meuse to reach Antwerp, while the Juliana Canal parallels the Meuse's course northward into the southern part of The Netherlands. The Meuse and its canals are heavily traveled by small cargo ships and barges.

The valley of the Meuse River is a natural barrier that has historically formed part of the defenses on the approach to the heart of the Paris basin from the east. Its line has given great strategic importance to the fortress of Verdun and was the scene of heavy fighting in World War I. During World War II, the crossing of the Meuse River capped the successful German breakthrough into France in May 1940.

Mevleviyah (Islām): *see* Mawlawīyah.

Mewār painting, one of the most important schools of Indian miniature painting of the 17th and 18th centuries. It is a school in the Rājasthanī style and was developed in the Hindu principality of Mewār (in Rājasthān state). The works of the school are characterized by simple bright colour and direct emotional appeal. The comparatively large number of paintings to which dates and places of origin can be ascribed make possible a more comprehensive picture of the development of painting in Mewār than in any other Rājasthanī school. The earliest-dated examples come from a *rāgamālā* (musical modes) series painted in 1605 at Chawand, an early capital of the state. This expressive and vigorous style continued with some variations through 1680, after which time Mughal influence became more apparent. One of the outstanding painters of the early phase was the artist Sāhibdīn.

Krishna lifting Mount Govardhana, Mewār miniature painting, early 18th century; in a private collection

P. Chandra

The Mewār school continued through the 18th century and into the 19th, the production being fairly prolific. An increasing number of paintings were concerned with portraiture and the life of the ruler, though religious themes continued to be popular.

Mewati (people): *see* Mina.

Mexia, Ynes Enriquetta Julietta (b. May 24, 1870, Georgetown, Washington, D.C., U.S.—d. July 12, 1938, Berkeley, Calif.), American botanical collector and explorer whose discoveries helped to clarify and complete botanical records.

The descendant of Mexican-Americans living in Texas, she lived in Texas, Philadelphia, and Mexico City before moving to San Francisco in 1908, having recently been widowed. Mexia was a social worker before entering the University of California as a special student at the age of 51. There she developed an enthusiasm for botany, and in 1925 she began a series of journeys to remote locations in South and Central America and Alaska. On those travels she collected some 150,000 botanical specimens, finding one new genus of Compositae (*Mexianthus mexicanus*) and more than 500 new species of plants, many of which were named in her honour.

Mexicali, city, capital of Baja California Norte state, northwestern Mexico. It lies in the Mexicali Valley, an extension of the Imperial Valley of the United States, in the extreme northeastern portion of Baja California. The city lies across the Mexico-U.S. border from Calexico, Calif. Its name, formed from the first two syllables of Mexico and California, was chosen as a gesture of international friendship. Improved irrigation of the Mexicali Valley, land redistribution (1937), and a duty-free zone franchise (1937–67) brought capital, immigration, and better transport facilities to the city. Its economy, which is no longer entirely dependent upon tourism, is based chiefly on the processing and distribution of long-staple cotton and varieties of fruits, vegetables, and cereals. The Autonomous University of Baja California was established in the city in 1957. It is easily accessible by highway, railroad, and air from the southwestern United States and from many points in Mexico. Mexicali has experienced phenomenal growth in the 20th century. Pop. (2000 prelim.) 550,000.

Mexican hairless, breed of toy dog that is probably descended from hairless Chinese dogs which were taken to Mexico in the late 16th century. A rather long-legged dog, the Mexican hairless generally weighs 10 pounds (4.5 kg) or less. It is hairless except for a topknot and some fuzz on its long tail; its soft skin is pink, slate, or gray in colour. The breed, which is known as the Chinese dog in Mexico, is not formally recognized by the American Kennel Club.

Mexican hat dance, a popular Mexican folk dance, a form of jarabe (*q.v.*).

Mexican jumping bean, the seed of certain Mexican shrubs, especially those of the genus *Sebastiania,* of the spurge family (Euphorbiaceae), that contain larvae of a small olethreutid moth (*Laspeyresia saltitans*). The movements of the larvae feeding on the pulp within the seed, which are intensified by warmth, give the seed the familiar jumping movement.

Mexican lion: *see* puma.

Mexican process (silver production): *see* patio process.

Mexican Revolution (1910–20), a long and bloody struggle among several factions in constantly shifting alliances which resulted ultimately in the end of the 30-year dictatorship in Mexico and the establishment of a constitutional republic. The revolution began against a background of widespread dissatisfaction with the elitist and oligarchical policies of Porfirio Díaz, which favoured wealthy landowners and industrialists. When Díaz in

1908 said that he welcomed the democratization of Mexican political life and appeared ambivalent about running for his seventh reelection as president in 1910, Francisco Madero emerged as the leader of the Antireeleccionistas and announced his candidacy. Díaz had him arrested and declared himself winner after a mock election in June, but Madero, released from prison, published his *Plan de San Luis Potosí* from San Antonio, Texas, calling for a revolt on November 20. The revolt was a failure, but it kindled revolutionary hope in many quarters. In the north, Pascual Orozco and Pancho Villa mobilized their ragged armies and began raiding government garrisons. In the south, Emiliano Zapata waged a bloody campaign against the local caciques (rural political bosses). In the spring of 1911 the revolutionary forces took Ciudad Juárez, forced Díaz to resign, and declared Madero president.

Madero's regime faltered from the start. Zapata turned against him, angered at his failure to effect the immediate restoration of land to dispossessed Indians. Orozco, initially a supporter of Madero, was also dissatisfied with the slow pace of reform under the new government and led a revolutionary movement in the north. The U.S. government then turned against Madero as well, fearing that the new president was too conciliatory to the rebel groups and concerned about the threat that civil war in Mexico was posing to American business interests there. Tensions reached a peak when yet another faction of rebel forces, led by Félix Díaz (the former dictator's nephew), clashed with federal troops in Mexico City under the command of Victoriano Huerta. On Feb. 18, 1913, after the ninth day of that melee (known as *La Decena Trágica,* or "The Ten Tragic Days"), Huerta and Díaz met in the office of U.S. Ambassador Henry Lane Wilson and signed the so-called "Pact of the Embassy," in which they agreed to conspire against Madero and to install Huerta as president. Huerta assumed the presidency the following day, after arresting Madero, who was assassinated a few days later.

Opposition to Huerta's drunken and despotic rule grew in the north, and an uneasy alliance was formed between Pancho Villa, Álvaro Obregón, and Venustiano Carranza, whose *Plan de Guadalupe* called for Huerta's resignation. In the spring and summer of 1914, the rebel forces converged on Mexico City, forcing Huerta into exile. Carranza declared himself president on August 20, over Villa's objections. A state of anarchy and bloodshed ensued until Villa, Obregón, and Zapata held a convention at which it was agreed that the rivalry between Villa and Carranza made order impossible, and they elected Eulalio Gutiérrez interim president. Villa retained the support of Zapata and backed Gutiérrez. Obregón, however, re-allied himself with Carranza and routed Villa in a bloody battle in April 1915 at Celaya. Thereafter, both Zapata and Villa lost ground, and Villa, blaming his defeat on U.S. President Woodrow Wilson's support of Carranza, launched a vendetta against Americans in Mexico and in U.S. border towns. His raid on Columbus, N.M., which claimed the lives of 18 Americans, prompted President Wilson to order General John J. Pershing into the Mexican hills in futile pursuit.

Carranza, president again, presided over the writing of the Constitution of 1917, which conferred dictatorial powers on the president but gave the government the right to confiscate land from wealthy landowners, guaranteed workers' rights, and limited the rights of the Roman Catholic church. Carranza remained in power by eliminating those who opposed him (Zapata was assassinated in 1919), but in 1920 opposition reached a climax when he tried to break up a railroad strike in Sonora. Deserted by virtually all his supporters, including Obregón, he was killed attempting to flee the capital on May 21. Adolfo de la Huerta became interim president until Obregón was elected in November.

Many historians regard 1920 as the end of the revolution, but sporadic violence and clashes between federal troops and various rebel forces continued until the reformist president, Lázaro Cárdenas, took office in 1934 and "institutionalized" the reforms that were fought for during the revolution and were legitimized in the Constitution of 1917.

Mexican Revolutionary Party, Spanish PARTIDO REVOLUTIONARIO MEXICANO, former name (1938–46) of Mexico's major political party, the Institutional Revolutionary Party (*q.v.*).

Mexican tulip poppy: *see* golden cup.

Mexican War, also called MEXICAN-AMERICAN WAR, Spanish GUERRA DE 1847, or GUERRA DE ESTADOS UNIDOS A MEXICO ("War of the United States Against Mexico"), war between the United States and Mexico (April 1846–February 1848) stemming from Mexican anger at the United States' annexation of Texas in 1845 and from a dispute over whether Texas ended at the Nueces River (Mexican claim) or the Rio Grande (U.S. claim). The war—in which U.S. forces were consistently victorious—resulted in the United States' acquisition of more than 500,000 square miles (1,300,000 square km) of Mexican territory extending westward from the Rio Grande to the Pacific Ocean.

Mexico severed relations with the United States in March 1845, shortly after the U.S. annexation of Texas. In September President James K. Polk sent John Slidell on a secret mission to Mexico City to negotiate the disputed Texas border, settle U.S. claims against Mexico, and purchase New Mexico and California for up to $30,000,000. Mexican officials, aware in advance of Slidell's intention of dismembering their country, refused to receive him. When Polk learned of the snub, he ordered troops under General Zachary Taylor to occupy the disputed area between the Nueces and the Rio Grande (January 1846).

On May 9, 1846, Polk began to prepare a war message to Congress, justifying hostilities on the grounds of Mexican refusal to pay American claims and its refusal to negotiate with Slidell. That evening he received word that Mexican troops had crossed the Rio Grande on April 25 and attacked Taylor's troops, killing or injuring 16 of them. In his quickly revised war message—delivered to Congress on May 11—Polk claimed that Mexico had "invaded our territory and shed American blood on American soil."

Congress overwhelmingly approved a declaration of war on May 13, but the United States entered the war divided. Democrats, especially those in the Southwest, strongly favoured the conflict. Most Whigs viewed Polk's motives as conscienceless land grabbing. And Abolitionists saw the war as an attempt by the slave states to extend slavery and enhance their power when additional slave states were created out of the soon-to-be-acquired Mexican lands.

Following its original plan for the war, the United States sent its army on the Rio Grande, under Taylor, to invade the heart of Mexico while a second force, under Colonel Stephen Kearny, was to occupy New Mexico and California. Kearny's campaign into New Mexico and California encountered little resistance, and the residents of both provinces appeared to accept American occupation with a minimum of resentment. Meanwhile, Taylor's army fought several battles south of the Rio Grande, captured the important city of Monterrey, and defeated a major Mexican force at the Battle of Buena Vista (*q.v.*) in February 1847. But Taylor showed no enthusiasm for a major invasion of Mexico, and on several occasions he failed to pursue the Mexicans vigorously after defeating them. In disgust, Polk revised his war strategy. He ordered General Winfield Scott to take an army by sea to Veracruz, capture that key seaport, and march inland to Mexico City. Scott took Veracruz in March after a siege of three weeks and began the march to Mexico City. Despite some Mexican resistance, Scott's campaign was marked by an unbroken series of victories, and he entered Mexico City on Sept. 14, 1847. The fall of the Mexican capital ended the military phase of the conflict.

Polk had assigned Nicholas Trist, chief clerk in the State Department, to accompany Scott's forces and to negotiate a peace treaty. But after a long delay in the formation of a new Mexican government capable of negotiations, Polk grew impatient and recalled Trist. Trist, however, disobeyed his instructions and on Feb. 2, 1848, signed the Treaty of Guadalupe Hidalgo. Under the terms of this treaty, Mexico ceded to the United States nearly all the territory now included in the states of New Mexico, Utah, Nevada, Arizona, California, Texas, and western Colorado for $15,000,000 and U.S. assumption of its citizens' claims against Mexico.

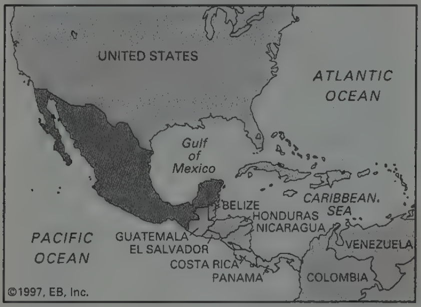
Zachary Taylor emerged a national hero and succeeded Polk as president in 1849. The war reopened the slavery-extension issue, which had been largely dormant since the Missouri Compromise. On Aug. 8, 1846, Representative David Wilmot of Pennsylvania attempted to add an amendment to a treaty appropriations bill. The Wilmot Proviso—banning slavery from any territory acquired from Mexico—was never passed, but it led to acrimonious debate and contributed greatly to the rising sectional antagonism. The status of slavery in the newly acquired lands was eventually settled by the Compromise of 1850, but only after the nation had come perilously close to civil war.

Mexicana Airlines, Spanish in full CIA. MEXICANA DE AVIACIÓN, SA (CMA), oldest airline in North America, founded in 1924 in Tampico, Mex., and now headquartered in Mexico City.

The company began as a cargo carrier, carrying payrolls to the oil fields out of Tampico. The first scheduled service began in 1928, linking Mexico City, Tuxpan, and Tampico, followed in the same year by service between Mexico City, Veracruz, and Mérida. The Mexico City–Tampico–Brownsville route opened in 1929, piloted by Charles A. Lindbergh.

In the course of succeeding decades, the routes and services expanded, and the ownership of the airline by Pan American Airways rose and then fell (to accord with new Mexican laws limiting foreign ownership). In 1967 Pan American yielded its remaining stock in the airline. The Mexican government was the majority shareholder in the company from 1982 to 1990, when it sold the airline to private investors. By the late 20th century Mexicana was providing service to more than 30 cities in Mexico and various cities in the United States, the Caribbean, Central America, and Europe.

Mexico, officially UNITED MEXICAN STATES, Spanish MÉXICO, or ESTADOS UNIDOS MEXICANOS, also spelled MÉJICO, northernmost and the third largest country of Latin America. Situated in the southwestern part of mainland North America and roughly triangular in shape, Mexico stretches more than 1,850 miles (3,000 km) from northwest to southeast. Its width varies from more than 1,200 miles (1,900 km) in the north to less than 135 miles (215 km) at the Isthmus of Tehuantepec in the south. Mexico is bordered by the United States to the north, Belize and Guatemala to the southeast, the Gulf of Mexico and the Caribbean Sea to the east, and the Pacific Ocean to the south and west. The capital, Mexico City, is one of the largest cities in the world. Area 756,066 square miles (1,958,201 square km). Pop. (1995 est.) 91,145,000.



Mexico

A brief treatment of Mexico follows. For full treatment, *see* MACROPAEDIA: Mexico.

For current history and for statistics on society and economy, *see* BRITANNICA BOOK OF THE YEAR.

The land. Mexico is a country of extraordinary physical variety: the core of the country is a high plateau rimmed by mountains on the east, west, and south; coastal plains separate the mountains from the sea on the east and west. There are two major peninsulas—Yucatán in the southeast (200 miles [320 km] wide) and Baja California in the northwest (25 to 150 miles wide). Also part of Mexican territory are the volcanic Revillagigedo Islands in the Pacific Ocean, about 300 miles (480 km) south of the tip of Baja California and 450 miles (725 km) west of the coastal port of Manzanillo.

Most of Mexico is occupied by the central Mexican Plateau. This plateau is enclosed by two high cordilleras—the Sierra Madre Occidental on the west and the Sierra Madre Oriental on the east—and by the Cordillera Neo-Volcánica on the south. The Mexican Plateau averages 4,000 feet (1,200 m) in elevation in the north and 7,000 to 9,000 feet (2,000 to 2,700 m) in the central part of the country. The Cordillera Neo-Volcánica to the south has the nation's highest peaks, Citlaltépetl (also called Orizaba; 18,701 feet [5,700 m]) and Popocatépetl (17,883 feet [5,452 m]). Farther south, the Sierra Madre del Sur range extends along the southern Pacific Coast to the Isthmus of Tehuantepec, where it joins the complex mountain ranges of the Sierra de Soconusco and the Chiapas Highlands.

The Gulf Coastal Plain extends some 900 miles (1,450 km) along the Gulf of Mexico from the Texas border to the Yucatán Peninsula. It is fringed by beaches, sandbars, swamps, and lagoons. The narrow and discontinuous Pacific Coastal Plain (more than 800 miles [1,300 km] long and 60 to 100 miles [100 to 160 km] wide) contains good natural harbours, such as those of Acapulco and Manzanillo. The coastal lowlands of the Yucatán Peninsula have a limestone karst topography with sinkholes and caverns. Mexico's rivers are short and swift-flowing, except for the Rio Grande (called in Mexico the Río Bravo del Norte) on the Texas border and the Papaloapan, which enters the Gulf of Mexico south of Veracruz.

Southern Mexico is subject to volcanic activity and frequent earthquakes, such as the disastrous earthquakes that struck Mexico City in 1985 and the Pacific coastal states in 1995. El Chichón volcano, 400 miles (650 km) southeast of Mexico City, erupted in 1982, causing hundreds of deaths and major damage to crops and livestock.

Mexico's physical diversity is also expressed in its climate. Lowlands and hills below 3,000 feet (900 m) are classed as *tierra caliente* ("hot land") and have a mean annual temperature of about 77° F (25° C). The tropical highlands lying at 3,000 to 6,000 feet (1,800 m) are classed as *tierra templada* ("temperate land") and have a mean temperature of 66° F (19° C); the central plateau and the Chiapas Highlands, 6,000 to 7,000 feet (2,100 m), are classed as *tierra fría* ("cold land") and have a mean temperature of 63° F (17° C). The highest peaks, above about 14,000 feet (4,300 m), are classed as *tierra helada* ("frozen land"). Half of Mexico is predominantly arid and receives less than 24 inches (600 mm) of precipitation annually; two-fifths of its area is semiarid, and less than one-tenth is humid. Rainfall ranges from less than 10 inches (250 mm) in the arid north-northwest, to 40 to 115 inches (1,000 to 2,900 mm) in the coastal plains, and to more than 200 inches (5,000 mm) in the Chiapas Highlands.

Plant and animal life vary greatly with climate and topography. Cactus, agaves, and yucca predominate in the arid northern, northwestern, and central regions. In the south and east, in Yucatán, and on the western coasts, rain forests and savannah are prominent. The south-central mountains and the ranges of the Sierra Madre (at elevations below 13,000 feet [4,000 m]) support coniferous and mixed forests. On the southern coasts, large mangrove swamps are common. Birds, reptiles, insects, and a variety of mammals (such as monkeys, jaguars, tapirs, and anteaters in the tropical south and armadillos, deer, pumas, and coyotes in the arid north) are plentiful.

The people. About three-fifths of Mexico's total population is mestizo (mixed European and Indian stock), nearly one-third is American Indian, and almost all of the rest are of European ancestry. Roman Catholics comprise about nine-tenths of the population, and Protestants account for most of the remainder. Spanish is the official language. A small percentage of the total population speaks only an Indian language; nonetheless, more than 50 Indian languages are spoken.

One of the most important characteristics of Mexico's population since 1940 has been its rapid rate of growth, which is considered undesirable by the government because it puts intense pressure on the country's developing economy. Despite governmental programs begun in the early 1970s to educate the populace about family planning, and despite a slowing of the rate of natural increase during the 1980s, the birth rate remains unacceptably high. Abortion is legally restricted but widely practiced. Emigration (mostly to the United States, and much of it illegal) for economic reasons has been widespread.

Although the life expectancy of 67 years for males and 73 years for females is relatively high for a developing country, infant mortality also is still high. More than one-third of the population is younger than 15 years of age. Although the overall population density is relatively high, the geographic distribution of the population is uneven. Nearly three-fourths of the population is urban. The country's largest cities are Mexico City, Guadalajara, Ciudad Nezahualcóyotl, and Monterrey.

The economy. Mexico has a mixed economy based largely on wholesale and retail trade, manufacturing, agriculture, and petroleum extraction. The gross national product (GNP) is not growing as rapidly as the population; the GNP per capita, however, is consistently one of the highest in Latin America.

The primary sector (agriculture, forestry, and fishing) accounts for less than one-tenth of the gross domestic product (GDP) and employs about one-fourth of the workforce. Agricultural output has been kept low by the prevalence of small farming plots. Arable land represents about one-eighth of the total land area. Irrigation is inadequate. The government has promoted the development of collective farms in an effort to increase agricultural output, but Mexico is not agriculturally self-sufficient, and the country has been a net importer of grains since 1980; malnutrition affects a sizable portion of the population, especially young children.

Corn (maize), wheat, rice, and beans are the leading staples. Sugarcane, sorghum, bananas, tomatoes, oranges, and potatoes are also major crops. Coffee, cotton, and fruits and vegetables are exported. Cattle and pigs are the major livestock. Mexico is also one of the world's largest producers of natural honey. Forests cover more than one-fourth of the total land area and mainly produce coniferous roundwood. Fishing is an important industry, and frozen prawns are an export item.

Mexico has a wide variety of natural resources and an enormous power potential in its petroleum reserves and hydroelectric capacity. Its proven crude-oil reserves rank seventh in the world, and natural-gas reserves also are substantial. The production of petroleum contributes one-fourth of the government's revenue. Coal reserves in northeastern Coahuila state are of exceptionally high quality. About three-fourths of Mexico's electricity is generated from petroleum and other fossil fuels; waterpower provides nearly all the remainder.

Mexico is the world's largest producer of silver, bismuth, and celestite and is also a leading producer of arsenic, fluorspar, antimony, cadmium, lead, mercury, zinc, sulfur, and gypsum. There are reserves of gold, graphite, mercury, iron ore, and copper. Although mining is highly developed, it accounts for only a small fraction of the GDP. In the late 20th century the government privatized numerous mining enterprises.

Manufacturing accounts for almost one-fourth of the GDP and employs about one-seventh of the workforce. The petrochemical industry has grown rapidly as a result of expanding petroleum production. Leading manufactures include processed foods, chemical products, transport vehicles, electrical machinery, printing and paper products, textiles, metal products, and iron and steel products. Tourism is a major industry and source of foreign exchange.

Union activity is legal, and most unions are affiliated with the Congress of Labour (Congreso del Trabajo; CT), which was founded in 1966. The CT, in turn, is closely associated with the dominant political party, the Institutional Revolutionary Party (Partido Revolucionario Institucional; PRI).

Expenditures by the federal government based on expanding petroleum revenues increased by about one-third in 1979 and by almost two-thirds in 1980. Declining international prices for petroleum sharply reduced the government's revenue in the early 1980s, however, and resulted in both large deficits and extensive cuts in federal spending. A drastic cut in imports together with scaled-down wage increases, the elimination of consumer subsidies, and lower exchange rates resulted in a positive balance of payments beginning in the early 1980s. Mexico's external public debt was still one of the largest in the world in the mid-1990s, however, and the sluggish economy was hampered by high rates of inflation. In the 1980s and '90s the government relaxed some of the legal restrictions that had curtailed foreign investment.

Government and social conditions. Mexico is a federal republic. The Constitution of 1917 provides for the separation of powers among the executive, legislative, and judicial branches. The executive head is the president, who is directly elected to a six-year term and may serve only once. The president has broad powers of appointment and can legislate in certain economic and financial matters. Legislative power is vested in a bicameral legislature, consisting of a 500-member Chamber of Deputies and a 128-member Senate. Deputies serve for three years and senators for six, and election to two consecutive terms is prohibited. The candidates of the dominant PRI won every presidential election, as well as nearly all gubernatorial, legislative, and local elections, from 1929 to 2000. The judicial power rests in federal courts, headed by the Supreme Court of Justice, and a tier of state jurisdictions.

Presidents of Mexico from 1917

name	term
Venustiano Carranza*	1917–20
Adolfo de la Huerta	1920
Álvaro Obregón	1920–24
Plutarco Elías Calles	1924–28
Emilio Portes Gil	1928–30
Pascual Ortíz Rubio	1930–32
Abelardo L. Rodríguez	1932–34
Lázaro Cárdenas	1934–40
Manuel Ávila Camacho	1940–46
Miguel Alemán	1946–52
Adolfo Ruiz Cortines	1952–58
Adolfo López Mateos	1958–64
Gustavo Díaz Ordaz	1964–70
Luis Echeverría Álvarez	1970–76
José López Portillo	1976–82
Miguel de la Madrid	1982–88
Carlos Salinas de Gortari	1988–94
Ernesto Zedillo Ponce de León	1994–2000
Vicente Fox Quesada	2000–

*Claimed the presidency as early as 1914.

Mexico's standard of living is close to subsistence among most of the rural population and the urban poor. There is a shortage of medical personnel and equipment in rural areas. Life expectancy is about 75 years for women and 69 for men. The leading causes of death are heart diseases, cancers, and accidents.

Mexico's literacy rate is about 85 percent. Six-year primary education is compulsory and free, yet more than one-third of the population over 15 has had little or no primary schooling, and another third lacks a complete secondary education. The largest institutions of higher education are the National Autonomous University of Mexico, the University of Guadalajara, and the National Polytechnic Institute.

Almost all newspapers are published in Spanish and are mainly privately owned but operate under government regulation. The most influential dailies include *Excélsior, Novedades,* and *El Universal,* all published in Mexico City. Radio and television broadcasts are received throughout Mexico, and Internet use is expanding rapidly.

Cultural life. Folk arts in Mexico have remained vigorous and widely practiced. Particularly notable among handicrafts are the clay pottery made in the valley of Oaxaca and the bird and animal figures made in the village of Tomala. Colourfully embroidered cotton garments, cotton or wool rebozos (shawls) and serapes (outer garments), and colourful baskets and rugs are seen everywhere. Folk music has been one of the major art forms throughout Mexico's history. Accompanied by guitar and trumpets, singers dressed as *charros* (cowboys) perform at festivals and on special occasions.

Mexican painting achieved international renown during the 20th century. The painters Diego Rivera, José Clemente Orozco, and David Alfaro Siqueiros became famous for their wall-sized public murals depicting the history and culture of their native land in crowded and vigorous figurative compositions. Mexican literature in the early 20th century dealt largely with the Mexican Revolution. There was in the late 20th century a more universal literature with characters and themes that have made the best writers, including such authors as Juan José Arreola, Carlos Fuentes, and the poet Octavio Paz, accessible to an international audience. Among other important figures are the composer Carlos Chávez and the dramatist Rodolfo Usigli. The National Institute of Fine Arts and the Symphony Orchestra of Mexico have been given notable government support, as have various ballet groups.

History. Hunter-gatherer peoples are thought to have inhabited Mexico more than 20,000 years ago. The beginnings of village farming are evident between 1500 and 900 BC More complex cultures began to form between 900 and 300 BC, and from AD 100 to 900 some of these crystallized into great civilizations, such as the Olmec, Toltec, Mayan, and Aztec. At the time of the Spanish conquest, the Aztec, who rose to prominence about 1200, were the rulers of much of Mexico.

Diego de Velázquez de Cuéllar, the conqueror of Cuba, laid the foundation for the Spanish conquest of Mexico by sending Francisco Hernández de Córdoba to explore the Yucatán coast and Hernán Cortés to explore Mexico. In a campaign lasting two years Cortés conquered the Aztecs, capturing their capital city, Tenochtitlán, in 1521. Cortés established Mexico City on the site of the Aztec capital. In 1526 Francisco de Montejo conquered the remnants of the Maya civilization.

From the time of Spanish conquest until independence was declared in 1821, Mexico was part of the viceroyalty of New Spain. Following the War of the Spanish Succession (1701–13), Mexico's colonial status changed as a new ruling family, the Bourbons, instituted several French-based administrative reforms aimed at increasing Spain's economic return from its colonies. Despite authoritarian rule and heavy taxes, there was little resistance to Spanish rule prior to the 19th century. Two insurrections, one led by Miguel Hidalgo y Costilla (1810–11) and the other by José María Morelos y Pavón (1814–15), were crushed. The independence movement then became a guerrilla war led by Vicente Guerrero.

In 1821 Guerrero and Agustín de Iturbide, the commander of royalist troops, negotiated a status quo independence from Spain, and a congress was elected. A military rebellion forced Iturbide to leave the country in 1823, and the congress declared Mexico a republic. A federal constitution was adopted in 1824, and Manuel Félix Fernández, better known as Guadalupe Victoria, was elected the first president. A liberal revolt placed Antonio López de Santa Anna in power in 1833; he subsequently was several times president of Mexico.

In 1845 the U.S. government voted to annex Texas, and in the ensuing Mexican War, Santa Anna's armies were defeated and Mexico City was captured by the United States. The Treaty of Guadalupe Hidalgo (1848) ceded nearly all the territory now included in Arizona, western Colorado, Nevada, Utah, Texas, California, and New Mexico to the United States.

In 1857 a new constitution was promulgated as the basis for *La Reforma* ("The Reform"), led by Benito Juárez, in an effort to abolish the remnants of colonialism. In the civil war (1858–61) between conservatives, who opposed the constitution of 1857, and liberals led by Juárez, the latter were victorious despite the attempts of the French to establish a monarchy in Mexico; Juárez then became the president of Mexico.

In 1876 Porfirio Díaz led a rebellion that placed him in the presidency until he was unseated in 1911, although there was a period (1880–84) during which a comrade assumed the office. Díaz established order and a workable government by means of his autocratic rule; however, his later years in power were marred by an increasingly inequitable distribution of wealth in the country and by mounting hardships for Mexico's small farmers and agricultural labourers.

In 1911 Francisco I. Madero, another revolutionary, succeeded to the presidency; but the revolution that had begun with his rise to power did not stop, as peasant and labour groups demanded more reform. A succession of rebellions and coups continued until the Partido Nacional Revolucionario (PNR; National Revolutionary Party), dominated by revolutionary and reformist politicians from northern Mexico, was established in 1929; it continued to control Mexico without interruption until 2000. In 1938 the PNR was renamed the Partido Revolucionario Méxicano (PRM; Party of the Mexican Revolution) and in 1946 the Partido Revolucionario Institucional (PRI).

From the 1920s to the '40s the PRI and its political forebears instituted a wide range of social and economic reforms under the leadership of a series of able and determined Mexican presidents. In the late 1930s, for example, President Lázaro Cárdenas carried out sweeping land reforms and formed the Confederación de Trabajadores de México, a labour confederation made up of smaller labour unions. Following World War II, the government placed heavy emphasis on economic growth. During the mid-1970s, Mexico emerged as one of the major petroleum-producing countries. By the end of Portillo's term, however, Mexico had accumulated a huge external debt because of the government's unrestrained borrowing on the strength of its petroleum revenues. With the subsequent decline in world oil prices during the mid-1980s, Mexico faced the prospect of a severe financial crisis. Efforts to ameliorate the government's financial situation and to encourage broad-based economic growth were carried out by subsequent presidents. Notable among such efforts was the liberalization of the economy in the 1980s and '90s, including the privatization of several state-owned companies.

From the mid-1990s President Ernesto Zedillo faced an economic crisis, public demonstrations in Mexico City, and ongoing civil unrest in the southern state of Chiapas. He also oversaw political and electoral reforms that loosened the PRI's hold on power. The party subsequently lost key electoral races, including the presidential election of 2000, which was won by Vicente Fox of the opposition National Action Party, thus ending 71 years of uninterrupted rule by the PRI.

The country has continued to grapple with such issues as economic control and development (notably the petroleum sector and the evolution of trade relations with the United States), the spectre of further civil unrest, corruption and violence stemming from the drug trade, and a partly reshaped political scene.

México, also spelled MÉJICO, state, on the Central Plateau, Mexico, almost completely surrounding the Federal District (which comprises Mexico City). The general elevation of the state's area of 8,245 square miles (21,355 square km)—more than 10,000 feet (3,000 m) above sea level—ensures a cool, healthful climate, which, with fertile soils and plentiful rainfall, has resulted in a dense population. The state contains many preconquest ruins, among them Tenayuca, Malinalco, and the great centre of San Juan Teotihuacán, covering 8 square miles (21 square km), about 30 miles (50 km) northeast of central Mexico City. The state capital is Toluca (*q.v.*).

Much of the northern part of the state lies in the Valley of Mexico, or Anáhuac, a circular lacustrine plain and intermontane basin from which most of the lakes have disappeared, leaving only swamps, sodden meadows, and lagoons. Chief among these bodies are Zumpango, San Cristóbal, Xaltocan, Xochimilco, and Texcoco, the latter three lying partly in the Federal District. The stream flow into and out of the basin was altered greatly by the opening in 1900 of the Tequixquiac tunnel, conducting water eventually to the Gulf of

Mexico, and by the system of tunnels and tubes completed in 1951, which provided the state and the Federal District with drinking water and hydroelectric power.

Services, agriculture (cereals, especially corn [maize]; maguey [agave, source of pulque]; coffee; sugarcane; and fruits), mining, and manufacturing (including assembly plants, aluminum processing, and ironworks and steelworks) are the principal mainstays of the economy. Rail and highway systems are well developed. Pop. (2000 prelim.) 13,083,359.

Mexico, city, seat of Audrain county, central Missouri, U.S. It is situated on the South Fork of the Salt River. Founded (1836) by the Reverend Robert C. Mansfield and James H. Smith, it was named for a tavern sign reading "Mexico that-a-way." Its commercial development was stimulated by the arrival (1858) of the railroad. Ulysses S. Grant was appointed a brigadier general of the Union Army there in 1861. With the establishment of the Western Stove Lining Works (1887), the fireclay industry became the city's economic mainstay. Agriculture, light manufacturing, and the breeding of saddle horses on the surrounding bluegrass pastures, are important. The Audrain County Historical Society Museum displays materials on the American Saddlebred horse. The Missouri Military Academy was established in Mexico in 1889. Inc. 1857. Pop. (1999 est.) 11,355.

Mexico, Gulf of, Spanish GOLFO DE MÉXICO, body of water on the southeastern coast of North America, connected to the Atlantic Ocean by the Straits of Florida and to the Caribbean Sea by the Yucatán Channel. It is bounded on the northwest, north, and northeast by the United States, on the west, south, and southeast by Mexico, and on the east by Cuba.

A brief treatment of the Gulf of Mexico follows. For full treatment, *see* MACROPAEDIA: Atlantic Ocean.

Oval in shape, the gulf covers an area of some 600,000 square miles (1,550,000 square km). The deepest point is in the Mexico Basin (Sigsbee Deep), which lies 17,070 feet (5,203 m) below sea level. The Gulf Stream, a riverlike current of warm water, enters from the Caribbean Sea through the Yucatán Channel and flows out to the Atlantic Ocean via the Straits of Florida; it is the principal current moving oceanic waters into and out of the gulf. The Mississippi and the Rio Grande are the major rivers draining into the gulf. The Gulf of Mexico's salinity varies from about 36 parts per 1,000 in open waters to as few as 14 to 20 per 1,000 in the north near the outflow of the Mississippi. In winter, surface-water temperatures range from 64° F (18° C) in the north to 76° F (24° C) in the south off the Yucatán coast; in summer the temperatures can reach 90° F (32° C). From June through October hurricanes can develop in the gulf from tropical storms spawned in the South Atlantic.

The gulf serves as a major source of food, energy, and raw minerals; its coastal waters are also much used for recreation and for disposing of wastes. Red snapper, flounder, shrimp, mullet, oyster, and crab provide the basis for commercial fishing in the gulf; tarpon and king mackerel are caught for sport. Oil and natural-gas reserves on the continental shelf alone are enormous. The major ports on the gulf are Veracruz in Mexico and Galveston, New Orleans, Pensacola, and Tampa in the United States.

Mexico, National Autonomous University of, Spanish UNIVERSIDAD NACIONAL AUTÓNOMA DE MÉXICO, byname UNAM, government-financed coeducational institution of higher education in Mexico City founded in 1551. The original university building, dating from 1584, was demolished in 1910, and the university was moved to a new campus in Mexico City in 1954.

The National University was founded as the Royal Pontifical University by Antonio de Mendoza, the first viceroy of New Spain. From 1553 to 1867, when it was closed by the government of Benito Juárez, the university was controlled by the Roman Catholic church. After 1867 a number of independent professional schools—law, medicine, engineering, and architecture—were established by the government. In 1910 under the government of Porfirio Díaz, these separate schools were coordinated into the National University of Mexico. In the 1920s all Mexican universities were placed under government control, but the National University was given administrative autonomy in 1929. Between July and December of 1968, the university was one of the centres of student demonstrations to protest government policies, and in September of that year the campus was occupied by the military. Although there are still accusations of government interference in university affairs, the university officially maintains its administrative independence. Students still occasionally carry out major demonstrations and strikes at UNAM, such as those sparked in 1999 by the university's proposal to charge tuition and fees; a limited number of students forced the university to remain closed until February 2000.

The National University has faculties of accounting and business administration, architecture, chemistry, dentistry, economics, engineering, law, medicine, philosophy and letters, political and social sciences, professional studies, psychology, sciences, and veterinary medicine and zoology. It also has national schools of music, nursing and obstetrics, plastic arts, and social work. The university enrolls more than 425,000 undergraduate and graduate students.

Mexico Basin, triangular-shaped ocean area covering a large portion of the floor of the Gulf of Mexico. The basin lies northwest of the Campeche Bank, approximately between 22° and 26° N and 89° and 95° W. Depths range beyond 11,000 feet (3,400 m) in much of the area, with Sigsbee Deep (17,070 feet [5,203 m]) being the deepest point. In the middle of the basin, the Sigsbee Knolls form a series of hills that are believed to be reflections of underlying salt domes rising above the generally flat basin floor.

Mexico City, Spanish MÉXICO, or CIUDAD DE MÉXICO, ancient (Nahua, or Aztec) TENOCHTITLÁN, city, capital of the Federal District (*q.v.*) and of Mexico. The city, which is one of the oldest metropolises in the Western Hemisphere, is the political and economic centre of the country and has been a focus of Latin-American culture since the 16th century. It is one of the world's most populous cities and metropolitan areas.

A brief treatment of Mexico City follows. For full treatment, *see* MACROPAEDIA: Mexico City.

Located in the southern part of the Valley of Mexico, Mexico City occupies an ancient plain (once a lake) that is surrounded by mountains. The small islands in the lake were gradually unified through land reclamation to form one large island, a process that began after the Aztecs settled there. Constant flooding later necessitated filling and draining the lakes of the valley floor until the city merged with the mainland. This accounts for the soft silt subsoil that underlies the city and that has proved quite unstable during earthquakes such as the one in 1985, which killed 9,500 people.

Mexico City's expansion is limited by mountains on all sides. The mountains block the circulation of air past the city; the resultant trapping of automotive exhaust, industrial smoke, sulfur dioxide and other volcanic emissions from nearby Mount Popocatépetl (including major eruptions during the late 1990s), and airborne dust has made air pollution a serious health problem. The greater metropolitan area has spread beyond the original limits of the Federal District of Mexico into the neighbouring state of Mexico.

Although the area is overwhelmingly urban, some places in the south remain agricultural. Mexico City's tropical, high-elevation (7,350 feet [2,240 m]) climate lacks a winter season. The weather is cool and dry, except in the May–September rainy season; the annual median temperature is 64° F (18° C).

Mexico City dominates the national economy, generating about one-third of all industrial production. Major city industries include construction; the manufacture of chemicals, plastics, cement, and yarns and textiles; and tourism. Most major finance, mortgage, and insurance companies are based in the city, which is also headquarters for Mexico's stock exchange and banking establishments.

At the centre of the original Aztec city of Tenochtitlán, the Spaniards created a planned town, placing the main public buildings around the former ceremonial city centre, now called the Zócalo (officially, Plaza de la Constitución). The Zócalo remains the hub of Mexico City's life. The great Metropolitan Cathedral stands nearly on the spot of the former main Aztec temple, and the viceroy's palace (now the National Palace) was built over the ruins of the palace of Montezuma. Running southwestward and then westward from the old colonial city centre is the city's main thoroughfare, the Paseo de la Reforma, while the Avenida Insurgentes is the city's main north-south street.

Mexico City gradually expanded, but until 1930 its growth was haphazard; after that year a series of planning commissions reorganized the metropolis. Despite wholesale destruction of many parts of the old city, plazas such as that of Santo Domingo preserve their original atmosphere. The metropolitan area has grown markedly beyond the 16 *delegaciones* (administrative units) that make up the city and Federal District. The Mexican government relinquished direct control of the district in 1997 in an effort to improve urban planning, services, and accountability. That year Cuauhtémoc Cárdenas Solorzano was elected to a two-year term as the district's first mayor.

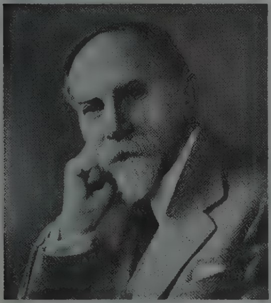
The predominant part of the population is mestizo (of mixed European and Indian descent). Many live in the poorer northern sections, in slum districts called *ciudades perdidas* ("lost cities"), or in *colonias* ("neighbourhoods") of the capital. Continued migration from rural areas has given the city a more Indian character, however. Most of the middle- and high-income groups, which are usually of European parentage, live in the western part of the city or in newly developed suburbs to the south. Mexico City's population continues to grow at a rapid rate.

The National Autonomous University of Mexico (founded 1551) and the National Polytechnic Institute (1936), the College of Mexico (1940), Metropolitan Autonomous University (1973), and Ibero-American University (1943) are the outstanding institutions of higher learning. Museums include the remarkable National Museum of Anthropology.

Mexico City is the hub of the nation's transportation network. An extensive railway network radiates from the capital, and major highways lead to the United States, the Guatemalan frontier, Atlantic ports, and the Pacific coast. The Benito Juárez International Airport lies in the eastern suburbs. Area city and Federal District, 571 square miles (1,479 square km); metropolitan area, 883 square miles (2,286 square km). Pop. (2000 prelim.) city, 8,591,309; (1996 est.) metropolitan area, 16,908,000.

Meyer, Adolf (b. Sept. 13, 1866, Niederweningen, Switz.—d. March 17, 1950, Baltimore), influential American psychiatrist from 1900 to 1940, much of whose teaching has been incorporated into psychiatric theory and practice in the United States, Britain, and other English-speaking nations.

When Meyer emigrated to the United States in 1892, he was already exceptionally well-trained in neuroanatomy and neurophysiology. In the United States he became acquainted with the thought of the psychologist William James, the philosopher-educator John Dewey, and others who were molding sociological and philosophical tradition in the United States. He fused these various influences into a concept of human behaviour that he called ergasiology, or psychobiology, which seeks a complete integration of the psychological and biological study of human beings.



Adolf Meyer

By courtesy of the Johns Hopkins University, Baltimore

As neuropathologist at the Eastern Hospital for the Insane, Kankakee, Ill. (1893–95), Meyer emphasized the importance of taking accurate case histories of patients. Before widespread recognition of the theories of Sigmund Freud, he began suggesting that childhood sexual feelings may precipitate serious mental problems. Gradually he decided that the disorder in mental illness results essentially from personality dysfunction rather than brain pathology. He was chief pathologist of the mental institution at Worcester, Mass. (1895–1902), and then became director of pathology for the Pathological Institute of the New York State Hospital Service, Ward's Island (1902–10), and professor of psychiatry at the Cornell University Medical College, Ithaca, N.Y. (1904–09). As he became more aware of the importance of social environment in the development of mental disorders, his wife (*née* Mary Potter Brooks) began visiting patients' families. Her interviews are considered the first effort in psychiatric social work.

In 1910 Meyer became professor of psychiatry at Johns Hopkins University (Baltimore) and later director of its Henry Phipps Psychiatric Clinic (1914). Until he retired in 1941, he impressed generations of students with the idea that, in the diagnosis and treatment of mental illness, account must be taken of the patient as a whole person. His work appears in his *Collected Papers*, 4 vol. (1950–52), and *Psychobiology* (1957).

Meyer, Conrad Ferdinand (b. Oct. 11, 1825, Zürich—d. Nov. 28, 1898, Kilchberg, Switz.), important Swiss writer noted for his historical tales and his poetry.

After completing his schooling, Meyer began to study law but suffered from depression, which compelled him to enter a mental home for a time. A long stay in French Switzerland, largely in Lausanne, gave him a thorough knowledge of French literature and culture; he also took up history, studying abroad in Paris and Italy. Rome, and especially the work of Michelangelo, was one of the decisive experiences in his life; Michelangelo's monumental style became an ideal that he attempted to realize in his own poetry. He passed the rest of his life in Zürich or nearby, where, with no settled profession and of independent means, he was able to devote himself to his writing. From 1877 he had a country house at Kilchberg, near Zürich. In 1892 depression once again forced him into a mental home for a year, and afterward he did no more creative work.

Conrad Ferdinand Meyer, etching by Karl Stauffer-Bern, 1887

By courtesy of the trustees of the British Museum; photograph, J.R. Freeman & Co. Ltd.

Meyer began to write rather late, and his total output was relatively slender. After two unimportant collections of poetry (*Zwanzig Balladen,* 1864; *Romanzen und Bilder,* 1870), he achieved his first success with a work of permanent importance, the powerful poem *Huttens Letzte Tage* (1871). The narrative poem *Engelberg* (1872) was followed by his 11 *Novellen,* or prose narratives, among which are *Das Amulett* (1873), *Der Heilige* (1880; *The Saint*), *Das Leiden eines Knaben* (1883), *Die Hochzeit des Mönchs* (1884; *The Monk's Wedding*), *Die Versuchung des Pescara* (1887), and *Angela Borgia* (1891). His *Gedichte* ("Poems") were first collected in 1882.

The material of Meyer's historical narratives is taken almost entirely from the periods of the Renaissance and the Reformation. From these eras he takes passionate men of action as his main characters, and through their struggles and tribulations Meyer examines such larger problems as the prevalence of injustice, the power of conscience, and the meaning of destiny. The stories are often lightly shot through with irony. *Der Heilige,* about the conflict between Thomas Becket and Henry II of England, is generally regarded as the best of the *Novellen.* In his poetry Meyer laid great stress on polished form. He dispensed entirely with the direct expression of feeling and in an almost brittle tone presents a terse figurative motif (generally provided by history or the mountains of his own country) to which he gives symbolic value. Meyer is considered by many to be the second most important Swiss writer after Gottfried Keller.

Meyer, Eugene (b. Oct. 31, 1875, Los Angeles—d. July 17, 1959, Mt. Kisco, N.Y., U.S.), influential leader in American political and social life and publisher of *The Washington Post* from 1933 to 1946.

Upon graduating from Yale University (1895), Meyer worked in various European cities for two years learning the banking business. Soon after his return he established his own prosperous investment-banking firm. He was an influential financier when President Woodrow Wilson in 1917 named him an adviser to the government on nonferrous metals. He later served as managing director of the War Finance Commission under Wilson and in various high-ranking positions under the next six presidents. For Herbert Hoover he drafted legislation creating the Reconstruction Finance Corporation (1932) and became its first chairman. He was the first president of the International Bank for Reconstruction and Development (the World Bank), founded in 1946.

In 1910 he had married Agnes Ernst. In 1933, when he bought *The Washington Post,* he installed her as vice president. She was by that time an influential author and journalist, noted for her work in the areas of health, education, and social conditions. Meyer served as publisher of the *Post* from 1933 until 1940 and as editor and publisher from 1940 to 1946. Under his direction the paper more than tripled its circulation and developed a strong editorial page and a tradition of responsible journalism. In 1947 Meyer turned over active management of the paper to his son-in-law Philip L. Graham, who had married the Meyers' daughter Katharine.

Meyer, Kuno (b. Dec. 20, 1858, Hamburg—d. Oct. 11, 1919, Leipzig), German scholar of the Celtic languages and editor whose translations made him the chief interpreter of early Irish literature for English and German readers.

In 1884 Meyer became a lecturer in German at University College, later the University of Liverpool, and published his English translation of *Aislinge Meic Conglinne* (English title, *The Vision of MacConglinne,* 1892), an irreverent medieval parody of the religious "vision," a popular genre of ancient Irish literature. About the time he became professor of Celtic studies, he began publishing, with Alfred Nutt, his translation of *Imram Brain* (English title, *The Voyage of Brân,* 2 vol., 1895–97), an early Irish narrative of a voyage to the Other World. In 1903 he established the School of Irish Learning, Dublin, and the following year founded its journal, *Ériu* ("Ireland"). He also established German reviews of Celtic studies and was a principal contributor to them. He became professor of Celtic studies at the Friedrich-Wilhelms-Universität, Berlin, in 1911, when the second edition of his *Selections from Ancient Irish Poetry* was published. He also published *Learning in Ireland in the Fifth Century* (1913).

Meyer, (Julius) Lothar (b. Aug. 19, 1830, Varel, Oldenburg [Germany]—d. April 11, 1895, Tübingen), German chemist who, independently of Dmitry Mendeleyev, developed a periodic classification of the chemical elements. Though originally educated as a physician, he was chiefly interested in chemistry and physics.

In 1859 Meyer began his career as a science educator, holding various appointments before serving as professor of chemistry at the University of Tübingen (1876–95). His book *Die modernen Theorien der Chemie* (1864; "Modern Chemical Theory"), a lucid treatise on the fundamental principles of chemical science, contained a preliminary scheme for the arrangement of elements by atomic weight and discussed the relation between the atomic weights and the properties of the elements. This influential work was often enlarged and went into many editions. In about 1868 Meyer prepared an expanded table, similar in many ways to Mendeleyev's table published in 1869. It was not until 1870, however, that Meyer published his own table, a graph relating atomic volume and atomic number and clearly showing the periodic relationships of the elements. He did not claim priority for his achievement, and he admitted that he had been reluctant to predict the existence of undiscovered elements as Mendeleyev had done.

Meyer worked in several areas of chemistry, but much of his activity grew out of his preoccupation with the classification of the elements. He worked on recalculating a number of atomic weights and made use of the periodic table for predicting and studying related elements' chemical properties.

Meyer, (Marie-)Paul(-Hyacinthe) (b. Jan. 17, 1840, Paris—d. Sept. 7, 1917, Paris), French language and literary scholar and one of the great authorities on the Medieval French and Provençal languages, also noted for his literary histories and critical editions of many medieval works.

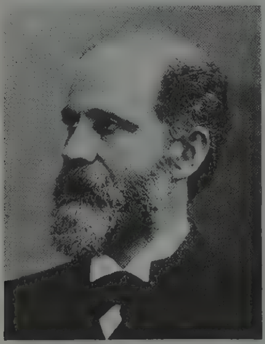
Attached to the manuscript department of the Bibliothèque National, Paris, from 1863, Meyer became professor of southern European languages and literatures at the Collège de France (1876) as well as director of the École des Chartes (school of paleography) in 1882. His initial studies related to Old Provençal literature, but he subsequently explored many areas of Romance literature. Among his works are *Les Derniers Troubadours de la Provence* (1872; "The Last Troubadours of Provence") and *La Chanson de la croisade contre les Albigeois,* 3 vol. (1875–79; "Song of the Crusade Against the Albigensians"). His critical editions include *Histoire,* 3 vol. (1882–1902; "History"), of Guillaume le Maréchal.

Meyer, Ray, byname of RAYMOND JOSEPH MEYER (b. Dec. 18, 1913, Chicago), U.S. collegiate basketball coach with the most team victories of active coaches in the early 1980s.

Meyer played basketball at St. Patrick's High School (Chicago) and at Notre Dame University (South Bend, Ind.; B.A. 1938), where he was forward (1936–38) and captain (1937–38). He then served as an assistant coach at Notre Dame (1940–42). He was head coach at De Paul University (Chicago) from 1942 until his retirement in 1984. In his career he won 724 games with a .671 winning percentage. Meyer was named coach of the year by the National Association of Basketball Coaches in 1979. He took 20 teams to the National Collegiate Athletic Association (NCAA) and National Invitational Tournament (NIT) championships, and won the NIT championship in 1945. Meyer was elected to the Basketball Hall of Fame in 1978.

Meyer, Viktor (b. Sept. 8, 1848, Berlin—d. Aug. 8, 1897, Heidelberg, Baden), German chemist who contributed greatly to knowledge of both organic and inorganic chemistry.

Meyer studied under the analytic chemist Robert Bunsen, the organic chemist Emil Erlenmeyer, and the physicist Gustav Kirchhoff at the University of Heidelberg, where he received his Ph.D. in 1867 and where he later succeeded Bunsen (1889–97). Meyer earlier had served as professor of chemistry at the Zürich Polytechnic Institute (1872–85) and the University of Göttingen (1885–89).



Viktor Meyer
Historia-Photo

Devising a method of determining the vapour densities of inorganic substances at high temperatures (1871), Meyer found that diatomic molecules of iodine and bromine dissociate into atoms upon heating. In 1872 he discovered the aliphatic nitro compounds. Originator of the term stereochemistry, the study of molecules identical in chemical structure but possessing different spatial configurations (stereoisomers), Meyer discovered (1878) the oximes (organic compounds all containing the $>\mathrm{C{=}NOH}$ group) and demonstrated their stereoisomerism. He also coined the term steric hindrance to signify the energy barrier to rotation of different parts of an organic molecule brought about by the presence in the molecule of bulky side groups.

A keen observer, he converted the failure of a lecture demonstration into his discovery (1882) of thiophene, a sulfur-containing organic compound resembling benzene in its chemical and physical properties.

Meyer-Lübke, Wilhelm (b. Jan. 30, 1861, Dübendorf, Switz.—d. Oct. 4, 1936, Bonn), Swiss-German linguist whose comparative studies of the Romance languages and the popular spoken Latin from which they developed revolutionized Romance linguistics. Adhering to the tenets of the Neogrammarian school of linguistics, he advocated rigorous research methodology.

After teaching at the University of Jena (1887–90), he joined the faculty of the University of Vienna, where he remained until his appointment at the University of Bonn (1915). An important early work was his historical-critical Italian grammar (1891). The work that established his reputation as a comparativist, however, was the *Grammatik der romanischen Sprachen,* 4 vol. (1890–1902; "Grammar of the Romance Languages"). Most successful in methodology, Meyer-Lübke reached his peak in the *Einführung in das Studium der romanischen Sprachwissenschaft* (1901; "Introduction to the Study of Romance Linguistics"). He also published a spate of manuals and monographs on Old Sardinian, Old Portuguese, Catalan, and Romanian. His wide influence has continued to the present. In the 1960s a number of his works were reissued, and a revision of his great *Romanisches etymologisches Wörterbuch* ("Romance Etymological Dictionary"), which was originally published between 1911 and 1920, appeared in 1968.

Meyerbeer, Giacomo, original name JAKOB LIEBMANN MEYER BEER (b. Sept. 5, 1791, Tasdorf, near Berlin—d. May 2, 1864, Paris), German opera composer who established in Paris a vogue for spectacular romantic opera.

Born of a wealthy Jewish family, Meyerbeer studied composition in Berlin and later at Darmstadt, where he formed a friendship with C.M. von Weber. His early German operas, produced at Munich, Stuttgart, and Vienna, were failures, and after a journey to Paris and London he settled in 1816 in Italy, where he produced five operas in the style of Rossini. The best of these was *Il crociato* (Venice, 1824), given the following year in London and Paris. His first French opera, written in association with Eugène Scribe, was *Robert le Diable* (Paris, 1831), produced on an extremely lavish scale and calculated to appeal to the current romantic taste for medievalism, the supernatural, and the macabre. Its success was immediate, establishing this work as the model of French grand opera. *Les Huguenots* was similarly successful in 1836. In 1842 Meyerbeer temporarily returned to Berlin, where he became music director to the King of Prussia and where he prompted the production of Wagner's *Der fliegende Holländer.* During this period he wrote a German opera, *Ein Feldlager in Schlesien* (1844), in which Jenny Lind took the principal part. His third romantic opera on a libretto of Scribe, *Le Prophète,* was given in Paris in 1849. He then turned to a lighter style and produced two works in the tradition of the opéra comique, *L'Etoile du nord* (1854) and *Le Pardon de Ploërmel* (1859). His last opera, *L'Africaine,* was in rehearsal at the time of his death.

Meyerbeer enjoyed an enormous vogue in his day, but his reputation, based on his four Paris operas, did not survive long. Yet he exercised a considerable influence on the development of opera by his conception of big character scenes, his dramatic style of vocal writing, and his original sense of orchestration—particularly his novel use of the bass clarinet, the saxophone, and the bassoon. Berlioz came under his influence, and operas such as Verdi's *Don Carlos* and Puccini's *Turandot* are traced to Meyerbeer not only for their spectacular elements but also for their effective manipulation of ensembles and arias. A number of his operas, most notably *L'Africaine,* were revived in the 20th century, and a ballet suite, *Les Patineurs,* based on *Le Prophète,* was arranged by Constant Lambert.

Meyerhof, Otto (b. April 12, 1884, Hanover, Ger.—d. Oct. 6, 1951, Philadelphia), German biochemist who shared with Archibald V. Hill the Nobel Prize for Physiology or Medicine in 1922 for research on the chemical reactions of metabolism in muscle. His work on the glycogen-lactic acid cycle remains a basic contribution to the understanding of muscular action, despite revisions resulting from the later research of others.

After receiving his M.D. from the University of Heidelberg (1909), Meyerhof held posts in physiology and physical chemistry at Kiel and other German universities. From 1929 to 1938 he headed the department of physiology at the Kaiser-Wilhelm-Institut für Medizinische Forschung at Heidelberg. After two years in Paris, he served as research professor at the University of Pennsylvania. He lectured widely in England and the U.S. and wrote *The Chemical Dynamics of Life Phenomena* (1924).

Meyerhold, Vsevolod Yemilyevich (b. Feb. 9 [Jan. 28, old style], 1874, Penza, Russia—d. Feb. 2, 1940, Moscow), Russian theatrical producer, director, and actor whose provocative experiments in nonrealistic theatre made him one of the seminal forces in modern theatre.

Meyerhold, 1933
Harlingue—H. Roger-Viollet

Meyerhold became a student in 1896 at the Moscow Philharmonic Dramatic School under the guidance of Vladimir Nemirovich-Danchenko, cofounder of the Moscow Art Theatre. Two years later, Meyerhold joined the Moscow Art Theatre and there began to formulate his avant-garde theories of symbolic, or "conditional," theatre. In 1906 he became chief producer at the theatre of Vera Komissarzhevskaya, a distinguished actress of the time, and staged a number of Symbolist plays that employed his radical ideas of nonrepresentational theatre. For his presentation of Henrik Ibsen's *Hedda Gabler* in 1906, Meyerhold rebelled against the stylized naturalism popularized by Konstantin Stanislavsky's art theatre and instead directed his actors to behave in puppetlike, mechanistic ways. This production marked the beginning of an innovative theatre in Russia that became known as biomechanics (*q.v.*). Meyerhold's unorthodox approach to the theatre led him to break with Komissarzhevskaya in 1908. Thereafter, drawing upon the conventions of commedia dell'arte and Oriental theatre, he went on to stage productions in Petrograd (St. Petersburg). During 1920–35 Meyerhold achieved his greatest artistic success as a director, beginning with Fernand Crommelynck's *Le Cocu magnifique* (1920; *The Magnificent Cuckold*) and ending with his controversial production in 1935 of Aleksandr Pushkin's story "Pikovaya Dama" ("The Queen of Spades").

Although he embraced the Russian Revolution of 1917, his fiercely individualistic temperament and artistic eccentricity brought reproach and condemnation from Soviet critics. He was accused of mysticism and neglect of Socialist Realism. Meyerhold refused to submit to the constraints of artistic uniformity and defended the artist's right to experiment. In 1939 he was arrested and imprisoned. Weeks later, his actress-wife, Zinaida Raikh, was found brutally murdered in their apartment. Nothing more was heard of him in the West until 1958, when his death in 1942 was announced in the *Great Soviet Encyclopaedia;* in a later edition the date was changed to 1940.

Meyers Enzyklopädisches Lexikon, in full MEYERS ENZYKLOPÄDISCHES LEXIKON IN 25 BÄNDEN, MIT 100 SIGNIERTEN SONDERGEITRÄGEN, German encyclopaedia published in 25 volumes in Mannheim, W.Ger., from 1971 to 1979. The encyclopaedia was first published in Leipzig as the *Meyers Grosses Konversations-Lexikon* in 46 volumes in 1840–52. Subsequent editions occupied fewer volumes, the 4th edition (1885–90), for example, appearing in 17 volumes. The 8th edition was strongly influenced by Nazi ideology and was incompletely published in 1936–42 in nine volumes.

The 9th edition, bearing the current title, marked a return to the quality and standards achieved by the earlier editions. Their scholarly, unbiased approach is once again evident in the modern set, which combines about 250,000 brief dictionary-like entries with lengthier articles accompanied by extensive bibliographies. *Meyers* is copiously illustrated with thousands of small high-quality photographs and other illustrations. Its geographic articles are detailed and have maps and charts. Biographies include those of living persons. The 100 special signed contributions mentioned in the full title are lengthy essays on major topics, whose authors are identified on the title page of each volume. An atlas appeared in 1974.

Meyerson, Émile (b. Feb. 12, 1859, Lublin, Pol., Russian Empire [now in Poland]—d. Dec. 4, 1933, Paris, France), Polish-born French chemist and philosopher of science whose concepts of rational understanding based on realism and causalism were popular among scientific theorists in the 1930s.

Educated in classical science and chemistry under Robert Wilhelm Bunsen in Germany, Meyerson emigrated to Paris (1882), where he became an industrial chemist, foreign editor for the Havas news agency, and, later, director of the Jewish Colonization Association for Europe and Asia Minor. Although he had no formal university connection, his erudite works—especially *Identité et réalité* (1908; *Identity and Reality*), *De l'explication dans les sciences,* 2 vol. (1921; "On Explanation in the Sciences"), and *Du cheminement de la pensée,* 3 vol. (1931; "On the Ways of Thought")—convinced scholars that scientific philosophy is understood only by analyzing the history of science. He extended his views to such other areas as quantum theory, philosophical and primitive thought, and relativity theory, as in *La Déduction relativiste* (1925; "Relativist Deduction").

Meymaneh, also spelled MAIMĀNA, town, northwestern Afghanistan. It lies at the northern foot of the Torkestān Mountain Range at an elevation of 2,850 feet (870 m). The town serves an agricultural area irrigated from the Qeyṣār River and also handles the trade in Karakul sheep with nomads. Meymaneh is linked with neighbouring towns by highways, but they are impassable in places during spring floods. Meymaneh was the capital of a semiautonomous Uzbek khanate until its subjection by the emir of Afghanistan in 1868. In 1885 a Russo-Afghan boundary commission formally allotted the khanate to Afghanistan. Pop. (1988 est.) 45,100.

Meynell, Alice, in full ALICE CHRISTIANA GERTRUDE MEYNELL, née THOMPSON (b. Sept. 22, 1847, Barnes, near London, Eng.—d. Nov. 27, 1922, London), English poet and essayist.

Much of Meynell's childhood was spent in Italy, and about 1872 she converted to Roman Catholicism, which was reflected in her writing. Encouraged by Alfred Tennyson and Coventry Patmore, she published her first volume of poems, *Preludes,* in 1875.

One sonnet, "My Heart Shall Be Thy Garden," brought her the friendship of Wilfrid Meynell (1852–1948), whom she married in 1877, bearing him eight children. She continued to pursue her literary activities, helping her husband, who edited the *Weekly Register,* and in 1883 they launched *Merry England* (1883–95), a monthly magazine for which she wrote many essays. Francis Thompson became known through their magazine, after they had aided and befriended the destitute poet.

Alice Meynell, detail of a drawing by John Singer Sargent, 1894; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

Meynell's verse is marked by its simple vocabulary and religious sincerity, and it communicates a gentle mournfulness and a sense of the passing of time. Her poetry was so popular that she was mentioned as a possible poet laureate upon the death of Tennyson.

Meynell, Sir Francis, in full SIR FRANCIS MEREDITH WILFRID MEYNELL (b. May 12, 1891, London, Eng.—d. July 10, 1975, Lavenham, Suffolk), English book designer particularly associated with the fine editions of Nonesuch Press, publications that were notable for the use of modern mechanical means to achieve results that rivaled the printing of handpresses.

The son of Wilfrid and Alice Meynell, he was educated at Trinity College, Dublin. In 1914 he set up the Romney Street Press, a handpress that published two books; and from 1916 to 1923 he managed the Pelican Press, which set type for advertisements and printed political pamphlets. One of the works issued by Pelican was *Typography* (1923), which is significant as a type specimen book and as an essay on book production. In 1923 he founded the Nonesuch Press, about which he once said, "Our stock in trade has been the theory that mechanical means could be made to serve fine ends; that the machine in printing was a controllable tool." One of the outstanding achievements of the press was a seven-volume edition of Shakespeare, published in 1929–33.

From 1946 (the year in which he was knighted) to 1958, Meynell served as director general of the Cement and Concrete Association while also continuing to design fine books. His own works include *Seventeen Poems* (1945), *Poems and Pieces* (1961), and his autobiography, *My Lives* (1971).

Mezhdurechensk, also spelled MEŽDURE-ČENSK, city, Kemerovo *oblast* (province), central Russia. It is located where the Usa River flows into the Tom River, in the upper Tom valley. Developed as the coal-mining settlement of Olzheras in the Tom-Usinsky region of the Kuznetsk Basin in the 1950s, it was renamed and incorporated as a town in 1955. In appearance it is a typical heavy-industrial "new town," with coal mining as its main activity. Pop. (1994 est.) 107,400.

Mézières (France): *see* Charleville-Mézières.

Mézières, Philippe de, Mézières also spelled MAIZIÈRES (b. *c.* 1327, Mézières, France—d. May 29, 1405, Paris), French nobleman and author who championed the last of the Crusades.

Born of poor nobility, Mézières was at first a soldier of fortune in Italy, serving Lucchino Visconti, lord of Milan, and then Andrew of Hungary, in Naples. Joining the Crusade led by Humbert II, he was knighted after defending Smyrna (modern İzmir, Turkey) against Turkish assault in 1346. When Humbert's army disbanded, he made his way to Jerusalem, arriving in 1347. He conceived the idea of a new order of knighthood, Ordre de la Passion ("Order of the Passion"), whose members would be spiritually distant from worldly preoccupations and devoted to conquering the holy places. Although he later drew up a prospectus for this order, it never became a reality.

In 1347 Mézières went to Cyprus, where he found a kindred spirit in the son of the king of Cyprus, the future Peter I. He returned to France, again as a soldier of fortune. When Peter acceded to the throne of Cyprus in 1359, Mézières was made chancellor, and the two set off for Europe to win support for a new Crusade. The Crusade, finally launched against Egypt, culminated in the sack of Alexandria (October 1365). When Peter was assassinated in Cyprus in January 1369, Mézières was in Venice, where he remained until 1372. He then went to Avignon, where he worked to establish in western Europe the feast of the Presentation of the Virgin. He went to Paris and in 1373 was made a member of the royal council by Charles V and preceptor to his son, the future Charles VI. After the death of Charles V, he was compelled, with the other counselors of the late king, to retire. In 1380 he withdrew to the Celestine monastery in Paris, continuing to exert an influence on public affairs. Later he allied himself with Louis d'Orléans, brother of Charles VI.

Mézières's major writings are the *Vita Sancti Petri Thomasii* (1659), the life of the legate Peter Thomas; his prospectus on the Order of the Passion, *Nova religio passionis* (1367–68; revised and enlarged 1386 and 1396); and *Le Songe du vieil pèlerin* (1389; "The Old Pilgrim's Dream"), an elaborate allegory containing autobiographical elements and advocating peace with England in the interests of the Crusades.

mezuzah, also spelled MEZUZA (Hebrew: "doorpost"), plural MEZUZOTH, MEZUZOT, MEZUZAHS, or MEZUZAS, small folded or rolled parchment inscribed by a qualified calligraphist with scriptural verses (Deuteronomy 6:4–9, 11:13–21) to remind Jews of their obligations toward God. The parchment is placed in a metal, wooden, or glass case so that the word Shaddai ("Almighty") can usually be seen on the back of the parchment. After a special blessing is recited, the mezuzah is firmly fixed to the main doorpost of the home (to the right as one enters). It is a custom with some Jews to kiss the mezuzah as they pass it. The wearing of a mezuzah on a chain around the neck is a practice of relatively recent origin.

Mezuzah, German, *c.* 1810; in the Jewish Museum, New York City

Jewish Museum, New York City—Art Resource/EB Inc.

mezza majolica, majolica also spelled MAIOLICA, in pottery, an earthenware body dipped into clay slip and covered with a lead glaze, superficially resembling true majolica, or tin-glazed earthenware. In German it is sometimes known as *halb-fayence* ("half faience"). Both terms are misnomers; the ware is more correctly classified as sgraffito. That is, it is decorated by incision through the slip to reveal differently coloured clay beneath.

Mezza majolica dish with incised decoration and painted with coloured lead glazes, northern Italy, *c.* 1480; in the Victoria and Albert Museum, London

By courtesy of the Victoria and Albert Museum, London; photograph, EB Inc.

Mezza majolica was produced in Italy from the late 15th until the 18th century, the main centre being Bologna. Since the glaze used was lead rather than tin, as in true majolica, it had a tendency to run when fired, causing a blurring of the design that, though not always unpleasant aesthetically, was, at best, unpredictable. The method of decoration, sometimes used in conjunction with glazes coloured green and manganese, is technically related to certain Chinese and Korean objects. The technique was practiced by Byzantine potters in Constantinople and made its appearance in Italy about 1500.

mezzadria (land tenure): *see* métayage.

mezzo-soprano (Italian: "half-soprano"), in vocal music the range between the soprano (*q.v.*) and the alto, usually encompassing the A below middle C and the second F or G above middle C. The term is often abbreviated to "mezzo."

Mezzogiorno, economically underdeveloped region roughly coextensive with the former Kingdom of Naples (*see* Naples, Kingdom of); in current Italian administrative usage, it is a mainland subregion consisting of the modern southern Italian regions of Abruzzi, Molise, Campania, Puglia, Basilicata, and Calabria and an insular subregion composed of Sicily and Sardinia. Mezzogiorno is the Italian term for "midday" or "noon," and southern Italy is known as the Mezzogiorno because of the intensity of sunshine there at midday.

The Normans ruled southern Italy between 1130 and 1198 and were succeeded by the German Hohenstaufen. The French Angevins ousted the Hohenstaufen in 1266 and greatly expanded the power of the feudal nobility. Alfonso V of Aragon conquered southern Italy between 1420 and 1442 and established the Dogana della Mene delle Pecore ("Custom of the Sheep") to levy taxes on sheep and other livestock. The Dogana reduced the number of small farmers and agricultural labourers in southern Italy by favouring the conversion of cropland to pasture.

Southern Italy and Sicily were established as an independent kingdom under the Spanish Bourbons in 1734; only limited reforms were introduced, and most southern Italians were tied to some form of feudal obligation as late as 1786. Small-scale land reform was implemented near Manfredonia in Puglia in 1806 and was followed by a series of projects to reclaim marshland and improve drainage.

The Mezzogiorno continued to be dominated by the owners of large estates after the unification of Italy in 1861, and the social and economic backwardness of the south became the subject of the Letteratura Meridionalista ("Southern Literature") in the late 19th century. Large-scale land reform was not implemented in southern Italy until 1946, and many large estates remain intact. The Cassa per il Mezzogiorno, a development fund for the south, was established as a separate ministry of the Italian government in 1950 and receives funds from the parliament to invest in the social and economic development of southern Italy, Sicily, and Sardinia. Private investment in the industrial development of the south is channeled through the Association for the Development of Industry in the Mezzogiorno, which was created in 1946.

Southern Italy is dominated by the Apennine Range, and up to one-half of the land is too steep for any form of cultivation. Coastal plains are generally narrow and poorly drained and are limited to the environs of the cities of Naples and Salerno, Foggia, and Taranto. Malaria was prevalent in the marshy plains well into the 20th century and was not fully eradicated until after World War II. Limestone and other soft rocks susceptible to erosion predominate in the Apennines; centuries of overcutting and overgrazing forests and scrubland have stripped topsoil from the mountains and hills and have left behind a raw landscape of steep slopes and deeply eroded gullies. Annual precipitation rarely exceeds 20 inches (510 mm) and falls almost entirely in torrential winter downpours that further intensify soil erosion. Irrigation and hydroelectric development are limited because most rivers dry up during the summer.

Southern Italy's population is concentrated in the coastal towns, which have grown at the expense of villages in the Apennines. Rows of small new houses have been built throughout the lowlands reclaimed from marsh. The southern Italian population's rate of natural increase exceeds that of northern Italy but has been offset in large part by the immigration of workers to industrial centres in northern Italy, France, Switzerland, and Germany.

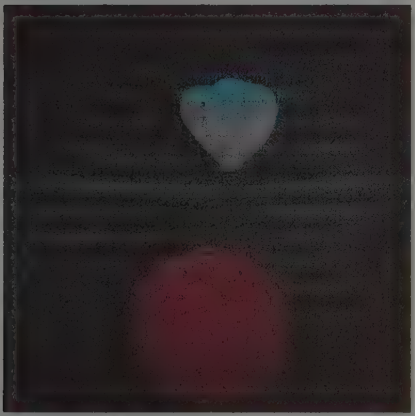
The per capita income of southern Italy lags behind that of northern Italy, and agriculture continues to employ a disproportionately high percentage of the southern work force. Land reform has favoured sharecroppers and labourers previously employed on large estates and has been accompanied by the creation of agricultural cooperatives and subsidiary rural roads throughout the Mezzogiorno; thousands of new farmhouses have also been built. Chief crops in this region include wheat, olives, grapes, peaches, apricots, pears, and various vegetables.

The Cassa has invested heavily in reforestation and the expansion and modernization of irrigation, roads, railways, and harbours. Four dozen industrial centres have been established with assistance from the Cassa; the European Investment Bank of the European Economic Community has also subsidized the industrialization of the Mezzogiorno. Economic planners have favoured the development of heavy industries in the south; such industries, however, employ relatively few workers, and they have been unable to attract ancillary industries. Iron, steel, machine tools, agricultural machinery, and petrochemicals are produced in the industrial triangle of Bari, Brindisi, and Taranto; industries around Naples are more diversified and produce textiles and various consumer goods, iron, steel, Olivetti office machinery, Pirelli cables, Alfa Romeo automobiles, and ships. Relatively few industries have been located in the Apennine Range. Tourist facilities are concentrated along the coast.

Illiteracy is fairly common in the Mezzogiorno and is highest in Calabria, where it is several times higher than the national average. The standard of living in southern Italy lags behind that in northern Italy, and thousands of households lack motor vehicles, telephone service, and other modern conveniences. Workers on large estates commonly live in a *corte,* or *cortile,* which is an agglomeration of crowded tenements around a rectangular courtyard; stables and barns are at ground level, and several stories of tenements rise above. Farmsteads are usually built of stone on a rectangular plan of two stories and are roofed at a slight angle with tile or slate. The traditional farmstead of Apulia is the conical *trullo* built of stone from a cylindrical base. Cave dwellings are common in Matera province.

Numerous towns in Calabria were settled by Albanians and host celebrations in honour of Skanderbeg, the national hero of Albania. The *Primavera albanese,* the Albanian springtime, is widely celebrated in Cosenza province. Calabrian dialects preserve a number of Greek words. Apulian cuisine shows Spanish influences and relies heavily on olive oil and fine wines.

mezzotint, also called BLACK MANNER, a method of engraving a metal plate by systematically and evenly pricking its entire surface with innumerable small holes that will hold ink and, when printed, produce large areas of tone. The pricking of the plate was originally done with a roulette (a small wheel covered with sharp points), but later an instrument called a cradle, or rocker, was used. It resembles a small spade with a toothed edge, and its cutting action throws up rough ridges of metal called burrs. The burrs are scraped away in places intended to be white in the finished print. In the 20th century, the plate is often roughened by working over it in several directions with a carborundum stone.



"Papillon," mezzotint by Yozo Hamaguchi, 1967; in the collection of the artist
By courtesy of Yozo Hamaguchi

The term mezzotint (from Italian *mezza tinta,* "halftone") derives from the capability of the process to produce soft, subtle gradations of tone. Used alone, however, mezzotint designs are often indistinct and, consequently, engraved or etched lines are introduced to give the design greater definition.

Although the process of mezzotint was invented in Holland by the German-born Ludwig von Siegen during the 17th century, it was soon practiced enthusiastically and almost exclusively in England. The technique is laborious and, consequently, unsuitable for original work. But its rich blacks, its subtle gradations of tone, and especially its adaptability to making colour prints made it ideal for the reproduction of paintings. During the 17th, 18th, and early 19th centuries, mezzotints were the only means most people had of becoming acquainted with the paintings of major artists. After the invention of photography in the 19th century, mezzotint was rarely used, although in the 20th century the French artist Georges Rouault and the English printmaker Stanley William Hayter each made several plates. Its most distinguished mid-20th-century advocate, Yozo Hamaguchi, a Japanese artist living in Paris, developed techniques for printing colour mezzotint, and other artists, such as Mario Avati of Great Britain and Merlyn Evans of France, have mastered it.

Mfecane, also spelled DIFAQANE ("The Crushing"), series of Zulu and other Nguni wars and forced migrations in the second and third decades of the 19th century that changed the demographic, social, and political configuration of southern and central Africa and parts of eastern Africa. It was set in motion by the rise of the Zulu military kingdom under Shaka (1787–1828), who revolutionized Nguni warfare. The rise of Shaka's kingdom, which took place during a time of drought and social unrest, was itself part of a wider process of state-formation in southeast Africa, which probably resulted from intensified competition over trade at Delagoa Bay. The pattern of the Mfecane, in which tribe was set against tribe over an ever-increasing radius, was highly successful in areas weakened by overpopulation and overgrazing.

In South Africa itself, the Mfecane caused immense suffering and devastated large areas as refugees scrambled to safety in mountain fastnesses, or were killed; this eased the way for white expansion into Natal and the Highveld. In the Cape Colony, it greatly increased pressures on the eastern frontier as refugees known as Mfengu crowded in on the peoples of the Transkei. At the same time, however, as a result of the Mfecane, some of the most formidable kingdoms to oppose white penetration were created—the Basuto, Swazi, and Ndebele and Gaza (of Mozambique).

The impact of the Mfecane was felt far beyond South Africa, as peoples fled from Shaka's armies as far as Tanzania and Malaŵi (the Ngoni) in the northeast, and Barotseland, in Zambia, to the northwest (the Kololo).

Mfengu, also called FINGO, people living in Eastern Cape province of South Africa and traditionally speaking a Xhosa language (one of the Bantu languages).

The Mfengu are descendants of refugees from the Mfecane in Natal, largely of Hlubi, Bhele, and Zizi origin, who made their way to the eastern Cape, where they were succoured by local chiefs. In the wars of 1835, 1846, and 1851–53, the Mfengu fought on the British side and were granted lands in the frontier districts of the Transkei and Ciskei, at Xhosa expense and in order to act as a buffer against further Xhosa invasions of the colony. With their tribal structures shattered during the Mfecane, the Mfengu were receptive from an early date to Christianity and Western education, and in the 19th century many became wealthy peasant-farmers, providing some of the first Western-type political leaders among Cape Africans. In the 20th century many Mfengu demanded their own Bantustan, or black state, in the lands granted them by the British in the 19th century, which were incorporated in the Cape Colony in 1879.

Some Mfengu still follow traditional ways of life, the men herding cattle and the women raising crops. Other Mfengu, however, are a part of the modern economy, employed as businessmen, civil servants, lawyers, and teachers in the large cities.

M'fumbiro Mountains (Africa): *see* Virunga Mountains.

MG42, German general-purpose machine gun, used as a standard weapon by many armies around the world.

The MG42 was designed in Germany in 1938, and it was placed in action on all fronts by mid-1942. Its original calibre was 7.92 mm, but when West Germany entered the North Atlantic Treaty Organization (NATO), the weapon's bore was modified to fire the NATO standard rifle and machine-gun cartridge of 7.62 mm. The MG42 was redesignated the MG1 by the West German army after its modification in calibre; guns that had been reworked from the old to the new calibre were then called MG2, and a further modification to facilitate antiaircraft use was styled MG3. The gun without a butt, for tripod mounting, is 109.7 cm (43.2 inches) long with a barrel 56.5 cm (22.25 inches) long. With a butt, for use with a bipod, the gun is 122.5 cm (48.25 inches) long. It weighs (without bipod) 10.5 kg (23.1 pounds). The MG42 is fed by a metal link belt at a cyclic rate of fire of 700–1,300 rounds per minute. It is air-cooled and has a quick-change barrel.

MGB, former Soviet intelligence and counterintelligence agency, one of the forerunners of the KGB (*q.v.*).

Mhow, city, western Madhya Pradesh state, central India. It lies on the southern Mālwa Plateau, the watershed of the Chambal and Narmada river basins. The city, formerly a large British cantonment, was founded in 1818. It remains an important cantonment and has an airport; dairy farming is a major industry. There is a government college affiliated with the University of Indore. Pop. (1991 prelim.) cantonment, 74,852; metropolitan area, 83,649.

MI-5, formally SECURITY SERVICE, intelligence agency charged with internal security and domestic counterintelligence activities of the United Kingdom. It is authorized to investigate any person or movement that might threaten the nation's security.

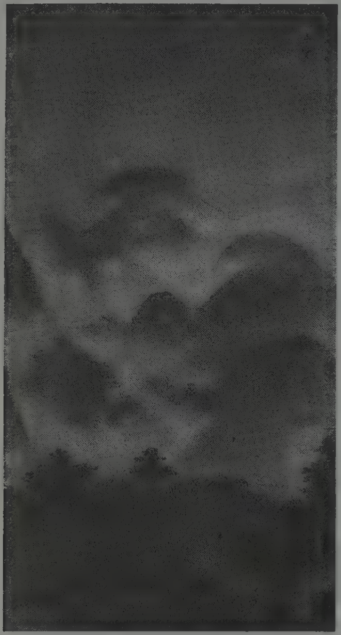
MI-5's earliest antecedent was a secret service formed in 1569 by Sir Francis Walsingham, who later became secretary of state to Elizabeth I. The need for centralized control of intelligence functions was first expressed early in the 20th century. MI-5 was formed in 1909 to identify and counter German spies then working in Britain, which it did with great effect. It was placed under the command of Vernon Kell, then a captain in the British army. Kell retired as a major general in 1924 and was later knighted, but remained in charge of the agency until 1940. (The "MI-5" label developed during this period because it was then "section five" of "military intelligence.") MI-5 is responsible for domestic counterespionage but has no powers of arrest, which devolve instead on Scotland Yard.

Articles are alphabetized word by word, not letter by letter

MI-6, formally SECRET INTELLIGENCE SERVICE, British government agency responsible for the collection, analysis, and appropriate dissemination of foreign intelligence. MI-6 is responsible for the conduct of espionage activities outside British territory. It has existed in various forms since the establishment of a secret service in 1569 by Sir Francis Walsingham, who became secretary of state to Queen Elizabeth I. It was constituted in its present form by Commander (later Sir) Mansfield Cumming in 1912 as World War I approached. In the 1930s and 1940s it was considered the most effective intelligence service in the world. During the rise of Nazi Germany, MI-6 conducted espionage operations in Europe, Latin America, and much of Asia. (The "MI-6" label developed during this period because it was then "section six" of "military intelligence.")

When the United States entered World War II, the British agency helped train personnel of the U.S. Office of Strategic Services and has since cooperated with the successor Central Intelligence Agency (CIA). The revelation in the mid-1950s that MI-6 had been penetrated by British double agents who had served the Soviet Union since the 1930s stirred wide public consternation. Details of MI-6 operations and relationships seldom appear in the British press. The agency has the power to censor such stories through the use of "D" notices under the Official Secrets Act. MI-6 reports to the Foreign Office.

Mi Fei, Pinyin MI FEI, original name (Wade-Giles romanization) MI FU, also called YÜAN-CHANG, HAI-YÜEH WAI-SHIH, or HSIANG-YANG MAN-SHIH (b. 1051—d. 1107, Huai-yang, Kiangsu province, China), scholar, poet, calligrapher, and painter, one of the dominant figures in Chinese art. He followed an official career but never rose high in the civil service and frequently changed posts. In 1103 he was made a doctor of philosophy, and in 1104 he became a professor of painting and calligraphy. Of his extensive writings—poetry, essays on the history of aesthetics, and criticism of painting—a considerable amount survives.



"Tower of the Rising Clouds," colour on silk by Mi Fei; in the Freer Gallery of Art, Washington, D.C.

By courtesy of the Smithsonian Institution, Freer Gallery of Art, Washington, D.C.

Life. Mi Fei was born of a family that had held high office in the early years of the Sung dynasty (960–1279). Because his mother had been the wet nurse of the emperor Ying Tsung (reigned 1063/64–67/68), he was brought up within the Imperial precincts, mixing freely with the Imperial family. As a young boy, Mi Fei showed precocious talent, particularly in calligraphy. Although he expressed a distaste for the formal lessons prescribed for a future official, he displayed a lively intelligence by his quickness in understanding learned argument, an aptitude for excitingly original poetry, and an ability in painting and calligraphy.

In later life Mi Fei had a checkered official career, with frequent changes of post. He began as a reviser of books in the Imperial library and subsequently served in three posts outside the capital of K'ai-feng, in the Honan Province. In 1103 he was appointed a doctor of philosophy and was briefly military governor of Wu-wei in the province of Anhwei. He returned to the capital in 1104 to serve as a professor of painting and calligraphy, taking this opportunity to present to the Emperor a painting by his son, Mi Yu-jen. He then undertook the position of a secretary to the Board of Rites before setting out on his final appointment as military governor of Huai-yang, in Kiangsu Province, in which post he died at the age of 57. He was buried in Tan-t'u, in Kiangsu Province, under an epitaph written for him by Mi Yu-jen. Mi Fei was married and had five sons, of whom only the two eldest survived infancy, and eight daughters.

Works. Mi Fei's writings were extensive. A collection of his poetry, the *Shan-lin chi*, has been lost, but still existing are the *Pao-chang tai-fang lu* ("Critical Description of Calligraphics in Mi Fei's Collection"), and *Hua shih* ("Account of Painting"), containing records of his own and others' collections of paintings, essays on aesthetic history, and criticism of paintings. There also exist three posthumous collections of his writings, *Pao-chin yingkuang chi* ("Literary Works of Mi Fei"), *Hai-yüeh ming-yen* ("Remarks on Calligraphy"), and *Hai-yüeh t'i-pa* ("Inscriptions and Colophons by Mi Fei").

Throughout Mi Fei's life, the workings of a highly individualistic temperament were evident. This was manifested in his fastidious attention to cleanliness, his preference for the clothes of ancient Chinese dynasties, and his love for strange rocks and ink stones, which he collected. To this eccentricity of personality must also be attributed his comparative failure in his official career. Despite his undoubted ability, his friendship with the leaders of both principal political factions (the poet-statesman Wang An-shih and Su Tung-p'o), and his family connections, he never rose to any office higher than that of a second-class secretary to the Board of Rites. The reason, his epitaph states, was that "he could not endure to bow and scrape before the world." An example of this upstanding independence is his attitude toward art collectors; he divided them into two classes, busybodies and connoisseurs—utterly deriding the former as illiterate and intent simply on making a name for themselves.

As an artist, Mi Fei is best known for his calligraphy and landscape painting. His calligraphic style rejected what was inaccessibly unusual or flamboyant and was formed by patient and catholic study of the great Chinese calligraphers of the past. His theoretical writings in the *Shu shih* and *Hai-yüeh ming-yen,* which contain some of the most penetrating remarks written on the subject of calligraphy, indicate that Mi Fei believed in respect for historic styles suffused with the calligrapher's own creative talent. Most of all he valued spontaneity and self-expression, eschewing the contrived and saccharine.

Mi Fei's paintings, such as "Tower of the Rising Clouds" (Freer Gallery of Art, Washington, D.C.), represented a break with the past. Before the period of the Sung dynasty, landscape painting in China had depended essentially on line for its description of the world. Mi Fei, however, was concerned with depicting the misty rivers and hills of the lake district of Honan Province and introduced a technique of extremely moist washes and horizontal texture strokes. Later known as "Mi dots" (*Mi tien*), this technique rendered a vivid impression of that rainy and cloud-clad Chinese region. This technique of "splashed ink" (*p'o-mo*) was Mi Fei's own invention; it attracted enthusiastic contemporary attention and remained a compelling influence throughout the history of Chinese painting.

(C.S.-y.)

Mi Hsi (in Chinese mythology): *see* Fu Hsi.

Mi-Sinai tune, in the music of the Ashkenazic (Yiddish-vernacular) Jews, any of a group of melodically fixed chants for the liturgy of the High Holy Days and other festivals. Developed in the Rhineland in the 12th–15th centuries, they were held in such high esteem that they became known as Mi-Sinai ("from Mount Sinai"). Their texts, written during a period of repression, are often mystical or express longing for the Messiah.

Musically, the Mi-Sinai tunes are among the finest achievements of Jewish music. They represent a thorough integration into traditional Jewish music of elements borrowed from European music. Thus, there can be discerned in the melodies rhythmically and tonally modified fragments from compositions of the 14th-century French composer Guillaume de Machaut, the 15th-century Burgundians, German secular minnesinger song, French and German folk song, and Gregorian chant; these borrowed elements, however, can be discovered only on painstaking examination. The melodies also draw on a number of commonly recurring melismas (melodic fragments with several notes on one vowel) that had gained nonmusical connotations through strong associations with specific Hebrew texts.

Miacis, genus of extinct carnivores found as fossils in deposits of early to late Eocene age in North America and of late Eocene age in Europe and Asia (the Eocene Epoch began 54,000,000 years ago and lasted 16,000,000 years). *Miacis* is representative of a group of early carnivores, the miacids, that were the ancestors of the modern carnivores. Miacids retain primitive characteristics present in the creodonts, an older group of mammalian carnivores, such as low skulls, long, slender bodies, long tails, and short legs. *Miacis* retained the primitive number of teeth, 44, although some reductions in this number were apparently in progress; some of the teeth are reduced in size. The hind limbs were longer than the forelimbs, and the pelvis was very doglike in form and structure. Some specialized traits are present in the vertebrae. *Miacis* and related forms had brains that were relatively larger than those of the more primitive creodonts; the increase in brain size as compared with body size probably reflects an increase in intelligence. *Miacis* was probably a forest dweller that preyed upon smaller animals; it was very weasel-like in form.

Miami, Algonkian-speaking Indians who lived in the area of what is now Green Bay, Wis., U.S., when first encountered by Europeans in the 17th century. They had also established settlements around the southern end of Lake Michigan in northeastern Illinois and northern Indiana and on the Kalamazoo River in Michigan; they continued to expand as far as Detroit and Ohio, but they later withdrew from their eastern territories and settled in Indiana.

The Miami social system was based on exogamous clans, with clan chiefs serving as members of the village council; one of their number was elected civil chief. A separate war chief was chosen on the basis of ability in leading raids. At the time of the first French contact, the Miami were divided into six bands, of which two, the Wea and the Piankashaw, later became separate tribes.

The staple of the Miami diet was a particular type of maize (corn) that was considered superior to that cultivated by their neighbours. During the summer they occupied permanent agricultural villages; they moved to the prairies in winter for communal bison hunts. In addition to mat-covered dwellings, each village had a large house in which councils and ceremonies were held. A major feature of Miami religion was the Midewiwin, or Grand Medicine Society, a secret religious organization whose members were believed to be able to secure supernatural aid for tribal welfare, as well as being able to cure the sick. Sacred medicine bundles of magical objects were important in many rites and ceremonies.

In the 19th century the Miami ceded most of their lands to the U.S., with one band remaining in Indiana and the rest removing to a reservation in Oklahoma in 1867.

Miami, city, transportation and business hub of southeastern Florida, U.S., and seat (1844) of Miami-Dade county. It is a leading resort and Atlantic Ocean port situated on Biscayne Bay at the mouth of the Miami River. The Everglades area is a short distance to the west. Greater Miami, the state's largest urban concentration, comprises all of the county, which includes Miami Beach (across the bay), Coral Gables, Hialeah, North Miami, and many smaller municipalities; together these make up the southern section of Florida's "Gold Coast."

History. Spaniards in the 16th century found a village of Tequesta Indians on the site. The name Mayaimi, probably meaning "big water" or "sweet water," may have referred to Lake Okeechobee or to local Native Americans who took their name from the lake. In 1567 the Spanish established a mission there as part of a futile attempt to subdue the Tequesta. After the United States acquired Florida from Spain (1821), Fort Dallas was built (1836) as a base during the Seminole Wars. Settlers—among them Julia D. Tuttle, known as the "mother of Miami"—gradually moved into the area.

In 1896 Henry M. Flagler extended his Florida East Coast Railway to the site. Flagler had been convinced to extend the railroad after a freeze during the winter of 1894–95 destroyed most of Florida's citrus crop; Tuttle reportedly sent him a fresh orange blossom to prove that the freeze had not reached Miami. Flagler dredged the harbour, started constructing the Royal Palm Hotel, and promoted tourism. Miami was incorporated the same year.

During the Florida land boom in the early and mid-1920s, the city's population more than tripled, but the collapse of this speculation, compounded by a devastating hurricane in 1926, dampened Miami's fortunes for more than a decade. Miami Beach underwent a brief construction boom in the mid-1930s, but this came to an end when, during World War II, soldiers replaced tourists at the oceanfront hotels, and long stretched of beach were converted to rifle ranges. After the war, many soldiers returned to the Miami area to live, and in the 1950s and '60s Latin American immigrants, particularly those from Cuba, began to arrive in large numbers. During the 1980s Miami gained a reputation as a centre of the illegal drug trade, and several acts of violence were directed against foreign tourists in the early 1990s; however, by the end of the 20th century tourism was rebounding. In 1992 Hurricane Andrew caused some 50 deaths and considerable property damage to areas of the county just south of Miami, although the city itself was spared.

The modern city. The downtown skyline of Miami now features a collection of gleaming, glass-walled skyscrapers accented with neon lighting at night. The city's close relationship to Latin America is especially well represented in its ethnic neighbourhoods. Several hundred thousand Cuban refugees have settled in the area since 1959, particularly in the Little Havana district, just west of downtown. Its annual Calle Ocho festival (March) draws large crowds of visitors. Little Haiti, to the north of downtown, developed after Haitian refugees began arriving in the 1990s.

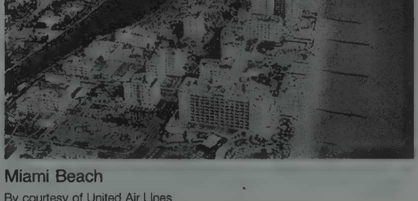
A subtropical climate helps to make Miami one of America's great winter resorts, and tourism is a major part of the city's economy. The miles of beaches are lined with glittering skyscraper hotels and are dotted with marinas, yacht clubs, and golf courses. The city is also a centre of international banking and finance, business services, manufacturing (including apparel, medical equipment, pharmaceuticals, printing, and metal products) and international commerce. The Port of Miami handles international shipping and is a world leader in cruise ship operations. Miami International Airport also handles international cargo going mostly to Latin America and the Caribbean.

The Miami Seaquarium, Vizcaya Museum and Gardens (1916; estate of industrialist James Deering), and Parrot Jungle and Gardens are among the area's many attractions. There are museums of history, art, and science, as well as several theatre, music, and dance organizations. Scuba diving, boat tours in the Everglades, and sport fishing are among the many popular outdoor activities, as are sailing regattas and fishing tournaments. The city is home to several professional sports teams, including the Florida Marlins (baseball), Miami Dolphins (American football), and Miami Heat (basketball), and the annual Orange Bowl Festival (January) features a parade and college football game. Biscayne and Everglades national parks are nearby.

Metropolitan Miami has many institutions of higher education, including the University of Miami (1925) in Coral Gables, Barry University (1940) in Miami Shores, St. Thomas University (1961), Florida Memorial College (1879), International Fine Arts College (1965), Miami-Dade Community College (1960), and Florida International University (1972), site of the National Hurricane Center. The city also is a world leader in marine study. Located there are the famed University of Miami-affiliated Rosenstiel School of Marine and Atmospheric Science and federal oceanographic laboratories. Pop. (2000) city, 362,470; Miami PMSA, 2,253,362; Miami–Fort Lauderdale CMSA, 3,876,380.

Miami, city, seat (1907) of Ottawa county, northeastern Oklahoma, U.S., in the Ozark foothills on Neosho River near Grand Lake (Lake O' the Cherokees; impounded by Grand River Dam). Originally a trading post called Jimtown and renamed in 1890 for the Miami Indian tribe whose reservation was close by, it was laid out in 1891. The community, which is in a cattle-raising and dairying region, developed rapidly as a commercial centre when lead and zinc were discovered nearby in 1905. Miami is the seat of Northeastern Oklahoma Agricultural and Mechanical College (1919). Inc. 1910. Pop. (2000) 13,704.

Miami Beach, city, Miami-Dade county, southeastern Florida, U.S. It lies on a barrier island between Biscayne Bay and the Atlantic Ocean, just east of Miami. The area was originally inhabited by Tequesta and later by Seminole Indians. Until 1912 the site was a mangrove swamp. John S. Collins, Carl Fisher, and others pioneered real estate development there, and a bridge was built across the bay (followed by a causeway in 1920). Dredging subsequently added land area to the island. The city was incorporated in 1915 as Ocean Beach and renamed Miami Beach the following year.



Miami Beach
By courtesy of United Air Lines

Growth was hindered by the collapse of the Florida land boom, a hurricane in 1926, and the onset of the Great Depression. By the mid-1930s, however, the city's fortunes had reversed, fueled by the construction of numerous Art Deco-style buildings. Growth boomed after World War II, and the region developed as a retirement area and tourist destination.

Miami Beach is now a year-round luxury resort, with no industries and no transportation facilities other than its road links to Miami. It has museums of art and of Jewish culture. South Beach, one of Miami Beach's most popular spots, has a large district of restored Art Deco buildings. Biscayne National Park is just south. Pop. (2000) 87,933.

Miami Herald, The, morning daily newspaper published in Miami, generally considered the dominant paper in South Florida and one of the most respected in the United States, unrivaled in its coverage of Latin America.

The *Herald* was established in 1910 and was known in its early years as a "reporter's paper" because of the freedom of expression it gave many of its writers. The paper also gained a reputation for its hard-hitting exposés and its thorough coverage of Miami's large Spanish-speaking community.

John S. Knight acquired the *Herald* in 1937 while building what would become one of the largest U.S. newspaper chains, the Knight–Ridder group. In 1946 he started an English-language international edition with circulation in more than 20 Latin-American countries.

The *Herald* has long crusaded against organized crime and other community problems, and it is widely noted for its outstanding local reporting. Its editorial stance is often conservative in tone, but it is progressive in social terms and vigorously independent politically.

Miami River, also called GREAT MIAMI RIVER, river issuing from Indian Lake, Logan county, west central Ohio, U.S., and flowing south-southwest past Dayton, Middletown, and Hamilton to enter the Ohio River west of Cincinnati after a course of 170 miles (274 km). Its chief tributaries are the Stillwater, Mad, and Whitewater rivers. After severe flooding in 1913, the Miami Conservancy District was established (1915) and an extensive system of levees and basins was built.

Miami Seaquarium, marine park, on Virginia Key, in Miami, Fla., U.S., that has one of the world's largest collections of marine animals, composed of some 10,000 specimens. Opened in 1955, the 38-acre (15-hectare) park provides marine life exhibits as well as animal shows featuring killer whales, dolphins, and sea lions. Manatee and shark exhibits include presentations on the animals. The park has a 750,000-gallon (2,840,000-litre) main aquarium tank filled with reef fishes, sea turtles, and eels; 26 smaller aquarium tanks showcase other marine life. There are also exhibits on rainforest and mangrove habitats. The Seaquarium provides conservation, research, and educational programs. Rescue and rehabilitation efforts help whales, dolphins, sea turtles, and especially manatees that have been injured in the wild. A feature of the park allows visitors to interact individually with dolphins in the water.

Miāni, Battle of (Feb. 17, 1843), engagement between a British force of about 2,800 troops under Sir Charles Napier and a host of more than 20,000 followers of the *amīrs* of

Sindh ending in a British victory and the annexation of most of Sindh. Complaints had been made against the *amīrs*' attitude toward the British during the First Anglo-Afghan War (1839–42). Instead of leaving settlement to the British resident, the British gave full civil and military powers to Napier in September 1842. Napier forced on the *amīrs* an onerous new treaty and provocatively seized and razed the desert fortress of Imamgarh. A popular upsurge then led to open war. At Miāni the British prevailed. The army of the *amīrs* was scattered, and Sindh, except for the state of Khairpur, was annexed.

Miānwāli, city and district, Sargodha division, Punjab Province, Pakistan. The city, the district headquarters, lies just east of the Indus River; it is connected by road and rail with Multān and Rāwalpindi. Founded in 1868, it was constituted a municipality in 1903–04. Institutions include a hospital and government colleges affiliated with the University of the Punjab.

Miānwāli district (area 5,403 sq mi [13,994 sq km]), constituted in 1901, comprises the greater portion of the Sind Sāgar Doāb (the country lying between the Indus and Jhelum rivers) and the Īsa Khel subdistrict on the west bank of the Indus. It consists of a fertile tract along the Indus River and the vast barren upland (Thal) that forms the greater part of the district. Cotton, wheat, barley, and sorghums are the chief crops; sheep and camel breeding is widespread. Pop. (1998 prov.) city, 79,996; (1981) district, 1,377,000.

Mianyang (China): *see* Mien-yang.

Miao, also spelled MEO, self-designation HMONG, HMUNG, or HMU, mountain-dwelling people of China elsewhere known usually as Hmong. Most of the Miao of China and the related peoples of northern Vietnam, Laos, and Thailand speak a Hmong-Mien (Miao-Yao) language that is traditionally classified as a member of the Sino-Tibetan language family. (This relationship is still supported by Chinese scholars, although it is not widely shared by linguists outside of China.)

The Miao consist of 70 or 80 different groups, who are distinguished by differences in dialect, dress, and culture. They live chiefly in the provinces of Kweichow (Guizhou), Hunan, Szechwan (Sichuan), and Yunnan, and in Kwangsi Chuang Autonomous Region (Guangxi Zhuangzu Zizhiqu). Ethnic Miao in China—not counted by language—numbered more than 8,000,000 at the turn of the 21st century. Smaller numbers are found in Southeast Asia, and tens of thousands have immigrated to the United States, France, French Guiana, and Australia.

The related Hmong of Southeast Asia are concentrated in the northern areas of Vietnam and Laos. Those in Vietnam are sometimes divided into groups distinguished by the costumes of the women (*e.g.,* White Hmong, Blue Hmong, Black Hmong, Red Hmong, Flowery Hmong). The Hmong (H'moong) of Thailand live mainly in the northern provinces. As elsewhere, they are often distinguished by the colour of their dress, the majority being Blue or White.

Most Miao live in single-story houses built directly on the ground. Agriculture is the chief means of subsistence for all of the groups, who grow corn (maize) and rice on burned-over forest land in the hills. Opium, which is sold in the markets, remains a significant cash crop.

There is little indigenous political organization above the village level. In religion most Hmong and Miao venerate spirits, demons, and ancestral ghosts. Their shamans exorcise malevolent spirits, and priests perform ceremonial functions. Animal sacrifice is widespread.

Miao-li, *shih* (town) and seat of Miao-li *hsien* (county), northwestern Taiwan, 19 mi (31 km) southwest of Hsin-chu city, in the northern part of the island's western coastal plain. Situated on the west bank of the Hou-lung Hsi (river), the town is a market centre for watermelons, sugarcane, and citrus fruits produced in the surrounding agricultural region. Miao-li is the site of a large liquid ammonia plant and is also the operations centre of the nearby Miao-li oil field. It is connected by the Chungshan freeway and the West Line railway to Taipei, Taiwan's capital, in the northeast and to the port of Kao-hsiung in the south. Pop. (1998 est.) 90,041.

Miao-Yao languages, also called HMONG-MIEN LANGUAGES, family of languages spoken chiefly in southern China, northern Vietnam, Laos, and Thailand. Although some linguists have proposed higher level genetic relationships to several language families—including Sino-Tibetan, Tai-Kadai, Austronesian, and Austroasiatic—no genetic relationships between Hmong-Mien and other language families have been conclusively demonstrated.

Most Miao-Yao speakers belong to the Miao and Yao nationalities, two minority ethnic groups in China (although not all Miao or Yao people speak a Miao-Yao language). Under pressure from the dominant Han Chinese population, waves of Miao and Yao speakers migrated to Southeast Asia during the 19th and early 20th centuries. Another wave of migration followed the end of the Vietnam War in the 1970s, when tens of thousands of Southeast Asian Hmong and Mien emigrated to the United States, France, French Guiana, and Australia. At the turn of the 21st century, the total number of Miao-Yao speakers worldwide was believed to be more than 12,000,000.

Miaoulis, Andreas Vokos (b. 1769, Negropont, Euboea, Greece—d. June 24, 1835, Athens), patriot who successfully commanded the Greek revolutionary naval forces during the Greek War of Independence (1821–30).

Miaoulis amassed a fortune from his wheat-shipping business during the Napoleonic Wars and devoted it to the Greek independence struggle against the Turks. In 1822 he was given command of the principal Greek naval forces and between May 1825 and January 1826 defeated the Turks in engagements off Modon, Cape Matapan, Suda, and Cape Papas. After the war he led a faction of the influential pro-English party; later his opposition to the pro-Russian president of Greece, Ioánnis Kapodístrias, and support for the antigovernment rebels of the isle of Hydra moved him to seize the government naval arsenal at Poros (July 27, 1831) and burn the government fleet (Aug. 13, 1831). He later served on the commission that offered the Greek crown to Otto (later called Otho) of Bavaria and was made vice admiral shortly before his death.

Miass, city, Chelyabinsk *oblast* (province), west central Russia, on the Miass River. Miass was founded in 1773 as a copper- (and later iron-) smelting centre. The modern city is important for the production of commercial vehicles and for gold mining in the vicinity. On the northern outskirts is the Ilmen Mineralogical Nature Reserve, established in 1920. Pop. (1997 est.) 167,000.

mica, any of a group of hydrous potassium, aluminum silicate minerals. It is a type of phyllosilicate, exhibiting a two-dimensional sheet or layer structure. Among the principal rock-forming minerals, micas are common in all three major rock varieties—igneous, sedimentary, and metamorphic.

A brief treatment of micas follows. For full treatment, *see* MACROPAEDIA: Minerals and Rocks.

Micas may contain various metals besides potassium and aluminum in significant amounts. Such metals include magnesium, lithium, manganese, titanium, and ferrous and ferric iron. Structurally, each mica layer consists of one octahedral and two tetrahedral units. The tetrahedral unit is a network of silicon-bearing tetrahedrons, each sharing three oxygen atoms with other tetrahedrons. The shared oxygen atoms are near-planar, as are the silicon and unshared apex oxygen atoms. The net silicon-to-oxygen ratio of this tetrahedral unit is $(Si_2O_5)^{-2}$; aluminum may substitute for silicon. The other structural unit of the mica layer is a two-dimensional array of aluminum- or magnesium-containing octahedrons with the composition $(Al_2O_4(OH)_2)^{-4}$ or $(Mg_3O_4(OH)_2)^{-4}$. This octahedral unit lies between and shares apical oxygen atoms with two tetrahedral units. Fluorine may substitute for hydroxide (OH). With trivalent ions (*e.g.,* aluminum) only two-thirds of the available octahedral sites are filled, whereas for divalent ions (*e.g.,* magnesium) all octahedral sites are filled; these two mica types are called di-octahedral and tri-octahedral micas, respectively. Individual mica layers are weakly bonded to adjacent layers by potassium, sodium, or calcium atoms which are 12-coordinated to oxygen; electrical charges are balanced by the substitution of aluminum for silicon in tetrahedral sites. Mica layers can be stacked in several relative orientations with or without a regular repetitive sequence, the former resulting in a larger unit cell than for the ideal structure. The weak bonding between mica layers accounts for the perfect cleavage.

The composition of mica minerals can first be based on di- or tri-octahedral layer and then on octahedral species as well as interlayer species. Thus the general formula can be written as $X_2Y^{4-6}Z_8O_{20}(OH,F)_4$. Here X is the interlayer cation (calcium, sodium, potassium); Y the octahedral cation (aluminum, ferric iron, lithium, magnesium, ferrous iron); and Z the tetrahedral cation (silicon, aluminum).

The micas are widespread minerals easily recognized by their cleavage, which gives rise to a relatively soft mineral. Muscovite, the most abundant variety of mica, is common in acid igneous rocks such as granites; it also frequently forms very large "books" in pegmatites. In metamorphic rocks muscovite commonly occurs at lower grades but reacts to form alkali feldspar and sillimanite at higher grades. Two other principal types of mica are biotite and phlogopite. Unlike the latter, biotite contains more iron than magnesium, resulting in its characteristic brown to black colour. It is very common in granites and intermediate igneous rocks such as gabbros and norites and often forms mica-rich biotite schists during the metamorphism of sediments containing large amounts of iron. Phlogopite is found in ultrabasic rocks, which reflects its high magnesium content. Samples of phlogopite have been discovered in kimberlites, suggesting that it may be a store for volatiles in deep-seated rocks. One other major variety of mica, lepidolite, occors in granitic pegmatites in which lithium is enriched. Fine-grained micas intermixed with clays occur in sediments both as detrital minerals and as the result of diagenesis of clays. Typically these micas are muscovite and glauconite.

Micas have various industrial uses. Those varieties containing little iron are employed as thermal or electrical insulators in appliances and certain electrical devices such as capacitors. In ground form, micas are used in the manufacture of wallpaper, roofing paper, and paint. Ground micas also serve as fillers, lubricants, absorbents, and packing material.

Micah, Book of, the sixth of 12 Old Testament books that bear the names of the Minor Prophets, grouped together as The Twelve in the Jewish canon. According to the superscription, this Judaean prophet was active during the last half of the 8th century BC.

The book is a compilation of materials some of which come from a period considerably later than Micah's time. The threats in chapters 1–3 and 6–7:7 are usually attributed to Micah, but the promises in chapters 4–5 and 7:8–20 are generally dated several centuries later. Some of the promises seem to presuppose the fall of Jerusalem and the subsequent Babylonian Exile (6th century BC), but it is possible that some promises date from before the exile or from Micah himself. The exalted view of Zion in 4:1-4 and the messianic character of 5:2–4 reflect the ideology of the Zion cult in Jerusalem before the exile.

Micah's threats are directed against idolaters, those who oppress the little man, priests and prophets who use their profession for financial gain, and leaders who pervert equity and abhor justice. The promises emphasize the importance of Zion, where Yahweh or his royal regent reigns over a kingdom of peace, and of the return from exile for Israel as well as for Judah.

micelle, in physical chemistry, a loosely bound aggregation of several tens or hundreds of atoms, ions (electrically charged atoms), or molecules, forming a colloidal particle—*i.e.*, one of a number of ultramicroscopic particles dispersed through some continuous medium. Micelles are important in the chemistry of surfaces—*e.g.*, the power of soap solutions to disperse organic compounds insoluble or only slightly soluble in water is explained as a property of micelles.

Michael, Hebrew MIKHAʾEL, Arabic MĪKHĀʾIL, in the Bible and the Qurʾān, one of the archangels. He is repeatedly depicted as the "great captain," the leader of the heavenly hosts, the warrior helping the children of Israel; and early in the history of the Christian church he came to be regarded as helper of the church's armies against the heathen. He holds the secret of the mighty "word" by the utterance of which God created heaven and earth and was "the angel who spoke to [Moses] on Mount Sinai" (Acts 7:38). The numerous representations of Michael in art reflect his character as a warrior: he is shown with a sword, in combat with or triumph over a dragon, from the story in the Book of Revelation (Apocalypse).

The feast of St. Michael, which originated in Phrygia, is kept in both East and West on September 29. In the Roman Catholic Church the feast of the Appearing (or Apparition) of St. Michael the Archangel is kept on May 8. According to legend, this appearance took place on Mt. Gargano, in Apulia, *c.* 492, and the mountain became an important medieval pilgrimage site.

Michael, name of rulers grouped below by country and indicated by the symbol •.

BYZANTINE EMPIRE

• Michael I RHANGABE (d. *c.* 843), Byzantine emperor from 811 to 813.

The son-in-law of the emperor Nicephorus I, Michael was proclaimed emperor by a coup d'etat, despite the claims of Nicephorus' son Stauracius, who had been mortally wounded in Bulgaria. Under the influence of the abbot and theologian Theodore Studites, Michael supported the proponents of the use of religious images, or icons. He recognized Charlemagne's title of emperor (Western, Holy Roman) in return for the cession to Byzantium of Venice and other cities on the Adriatic.

When in 812 Krum, the Bulgarian khan, captured the Byzantine city of Develtus and transported its inhabitants to Bulgaria, Michael was unable to deal with the Bulgarians immediately because of an Iconoclast revolt that aimed to replace him with a son of the former emperor Constantine V. After Michael had suppressed the insurrection, however, Krum offered to conclude peace, but the terms offered seemed unacceptable to Theodore Studites, and on his advice Michael declined the proposal. Krum then renewed hostilities, capturing the city of Mesembria in November 812.

The following year Michael defeated the Bulgarians in several engagements, but on June 22, 813, he lost the Battle of Versinikia near Adrianople, as a result of the desertion of the troops of one of his generals, Leo the Armenian. Leo then deposed Michael and himself ascended the throne as Leo V. Michael retired to a monastery on one of the Princes Islands.

• Michael II (b. Amorium, Diocese of Asia—d. October 829), Byzantine emperor and

Micas

name formula	colour	lustre	Mohs hardness	specific gravity	habit or form	cleavage	refractive indices	crystal system	remarks
biotite $K_2(Fe^{+2},Mg)_{6-4}(Fe^{+3},Al,Ti)_{0-2}[Si_{6-5}Al_{2-3}O_{20}]O_{0-2}(OH,F)_{4-2}$	black to deep brown, reddish brown, or green	vitreous	2½–3	2.8–3.2	tabular or short pseudorhombohedral prisms	1 perfect, platy	$\alpha = 1.565–1.625$ $\beta = 1.605–1.696$ $\gamma = 1.605–1.696$	monoclinic	continuous variation between biotite and phlogopite
chloritoid $(Fe^{+2},Mg,Mn)_2(Al,Fe^{+3})Al_3O_2(SiO_4)_2(OH)_4$	dark green	pearly	6½	3.5–3.8	commonly in coarsely foliated masses; also sheaf-like aggregates; tabular crystals	1 perfect, platy	$\alpha = 1.713–1.730$ $\beta = 1.719–1.734$ $\gamma = 1.723–1.740$	monoclinic, triclinic	
clintonite $Ca_2(Mg_{4.6}Al_{1.4})[Si_{2.5}Al_{5.5}O_{20}](OH)_4$	colourless, yellow, green, reddish brown	pearly submetallic	3½ or 6 depending on crystal face	3.0–3.1	pseudorhombohedral crystals	1 perfect, platy	$\alpha = 1.643–1.648$ $\beta = 1.655–1.662$ $\gamma = 1.655–1.663$	monoclinic	xanthophyllite is the same as clintonite except for optical orientation
glauconite $(K,Na,Ca)_{1.2-2.0}(Fe^{+3},Al,Fe^{+2},Mg)_{4.0}[Si_{7-7.6}Al_{1-0.4}O_{20}](OH)_4 \cdot nH_2O$	green, yellowish or bluish green		2	2.4–3.0	fine-grained, rounded aggregates of small, badly formed sheets	1 perfect	$\alpha = 1.546–1.63$ $\beta = 1.57–1.66$	monoclinic	
illite $K_{1-1.5}Al_4[Si_{7-6.5}Al_{1-1.5}O_{20}](OH)_4$	white; various pale colours	earthy	1–2	2.7 (less with absorbed water)	aggregates of small flakes	1 perfect	$\alpha = 1.545–1.66$ $\gamma = 1.57–1.66$	monoclinic	forms a solid solution series with both muscovite and montmorillonite
lepidolite $K_2(Li,Al)_{5-6}[Si_{6-7}Al_{2-1}O_{20}](OH,F)_4$	purple and pink to colourless	pearly	2½–4	2.8–2.9	aggregates of short prisms or small flakes; large tabular crystals	1 perfect, platy	$\alpha = 1.525–1.548$ $\beta = 1.551–1.585$ $\gamma = 1.554–1.587$	monoclinic	forms a solid solution series with muscovite
margarite $Ca_2Al_4[Si_4Al_4O_{20}](OH)_4$	grayish pink; pale yellow, pale green	pearly or vitreous	3½–4½	3.0–3.1	translucent aggregates of thin plates	1 perfect, platy	$\alpha = 1.630–1.638$ $\beta = 1.642–1.648$ $\gamma = 1.644–1.650$	monoclinic	
muscovite $K_2Al_4[Si_{6-7}Al_{2-1}O_{20}](OH,F)_4$	light shades of brown, green, or red to colourless	vitreous to silky or pearly	2–2½	2.8–3.0	large tabular blocks (called books); pseudo-hexagonal crystals; fine-grained aggregates	1 perfect, platy	$\alpha = 1.552–1.574$ $\beta = 1.582–1.610$ $\gamma = 1.587–1.616$	monoclinic	doubly refractive; highly resistant to acids; forms solid solution series with both lepidolite and illite
paragonite $Na_2Al_4[Si_6Al_2O_{20}](OH)_4$	colourless; pale yellow	vitreous	2½	2.9	fine-grained, massive, scaly aggregates	1 perfect, platy	$\alpha = 1.564–1.580$ $\beta = 1.594–1.609$ $\gamma = 1.600–1.609$	monoclinic	
phlogopite $K_2(Mg,Fe)_6[Si_6Al_2O_{20}](OH,F)_4$	yellow to brown or reddish brown	pearly	2–2½	2.8–2.9	scales or plates	1 perfect, platy	$\alpha = 1.530–1.590$ $\beta = 1.557–1.637$ $\gamma = 1.558–1.637$	monoclinic	thin plates show asterism; continuous variation between phlogopite and biotite

founder of the Amorian, or Phrygian, dynasty who attempted to moderate the Iconoclastic controversy that divided 9th-century Byzantium.

Rising from humble origins, Michael became a military commander. He was a comrade-in-arms of Leo the Armenian, who later became Emperor Leo V (813). When, in 803, Bardanes Turcus and Nicephorus I were fighting over the imperial throne, Leo and Michael at first supported Bardanes but later deserted him and joined the cause of Nicephorus. Years later, after Leo had ascended the throne, Michael incurred the suspicion of his former friend and was imprisoned on a charge of treason. On Dec. 24, 820, he was sentenced to death and ordered to be thrown into a furnace, but on the following day, his partisans assassinated Leo and proclaimed Michael emperor.

Shortly before Michael ascended the throne, however, a soldier named Thomas the Slavonian raised a rebellion, and it was not until the end of 823 that Michael succeeded in suppressing this revolt, which so weakened the resources of the empire that it was unable to resist later Arab onslaughts. The Arabs conquered Crete (826 or 827) and parts of Sicily (827–829).

Michael II, coin, 9th century; in the British Museum
Peter Clayton

Although Michael was an Iconoclast (a member of the party opposed to the use of religious images, or icons), in practice he followed a policy of toleration. He even freed prisoners who had been jailed for their devotion to icons and recalled former patriarch Nicephorus, Theodore Studites, and other theologians who had been exiled for that reason.

• **Michael III,** byname MICHAEL THE AMORIAN, or THE DRUNKARD (b. 838, Constantinople—d. Sept. 23, 867, Constantinople), Byzantine emperor—last of the Amorian, or Phrygian, dynasty—whose reign was marked by the restoration of the use of icons in the Byzantine Church, and by successful campaigns against the Arabs and Slavs.

Michael became a child emperor (Jan. 20, 842) upon the death of his father, Theophilus. A council of regency was set up, in which the dowager empress, Theodora, and her chief minister, Theoctistus, were the leading figures. The following year the use of icons was restored but with a conciliatory ecclesiastical policy toward the Iconoclasts. Also beginning in 843, campaigns undertaken against the Slavs in Greece and against the Arabs in Asia Minor, the Aegean, and the Nile Delta met with some success.

Michael III, coin, 9th century; in the British Museum
Peter Clayton

After a quarrel with his mother, Michael connived at the murder of Theoctistus by his maternal uncle Bardas (November 855) and in March 856, with the help of Bardas, took over direct control of the government. When Theodora attempted to resume power, she and her daughters were relegated to a convent.

Bardas became the moving spirit in the new regime. A university was organized in Constantinople. Patriarch Ignatius, who had supported Theodora, was pressured into resigning (858); his followers, however, appealed to the Pope, who ordered his reinstatement (863). Because Michael refused to depose the new patriarch, Photius, a schism with Rome resulted.

Byzantine forces continued to win victories over the Arabs, and in the campaign of 859, which reached at least as far as the Euphrates River, Michael himself led the troops. On another campaign in 860, Michael was forced to return to Constantinople, which had come under Russian siege. The invaders, however, probably withdrew before the Emperor returned with his army. About this time Michael fell increasingly under the influence of his chamberlain, Basil the Macedonian, who poisoned the Emperor's mind against Bardas. Thus, Michael acquiesced in the murder (April 865) of Bardas by Basil. In May 866 he made Basil co-emperor. In the following year Basil had Michael assassinated and became emperor.

Although Michael was unstable and extremely cruel, many modern historians believe he was not so incompetent or so dissolute as the epithet "the Drunkard" would imply. This more modern view is supported to some extent by his record of victories over the Arabs. His faults were probably exaggerated by Byzantine historians who sought to find extenuating circumstances for the murder of Michael by Basil and his supporters.

• **Michael IV,** byname MICHAEL THE PAPHLAGONIAN (d. Dec. 10, 1041, Constantinople), Byzantine emperor during whose seven-year reign an important treaty was signed with the Fāṭimid Caliphate of Egypt, temporary gains were made in Sicily, and a revolt in Bulgaria was suppressed.

A man of humble origin, Michael owed his elevation to his brother John the Orphanotrophus, an influential and capable eunuch, who brought him to court where the old Macedonian empress Zoe fell in love with him and married him on the death of her husband, Romanus III, in April 1034.

A 30 years' peace was signed with the Fāṭimid Caliphate (*c.* 1037), thus ending a period of hostilities. Byzantium and Egypt each agreed not to aid the enemies of the other. The Byzantine emperor received permission to renovate the Church of the Holy Sepulchre in Jerusalem at his own expense, and he might also have received the right to appoint the patriarch of Jerusalem. In return, Michael released 5,000 Muslim prisoners.

During Michael's reign, Byzantine conquests were made in Sicily, including the capture of Messina (1037) and Syracuse (1040); but these were only temporary. In the Balkans, Michael failed to subdue the ruler of Zeta, but he quelled a rebellion in the Bulgarian provinces.

When Michael ascended the throne, he was suffering from epilepsy, a condition that continually worsened. When he returned from the Bulgarian campaign, he was mortally ill, and he retired to the monastery of SS. Cosmas and Damian.

• **Michael V** CALAPHATES (Greek: Caulker) (d. after 1042), Byzantine emperor (1041–42). The nephew of Michael IV, Michael Calaphates was adopted by his uncle's elderly wife, Empress Zoe. Several months after his accession to the throne (Dec. 10, 1041), he exiled Zoe to a convent. An uprising erupted, however, and to stem it Michael hurriedly recalled her. Nevertheless, his political opponents had him deposed, blinded, and sent to a monastery.

• **Michael VI** STRATIOTICUS (fl. mid-11th century), Byzantine emperor who in his one-year reign (1056–57) failed to control the military aristocracy, which deposed him.

The empress Theodora, the last ruler of the Macedonian dynasty, had chosen Michael, an elderly official, as her successor. On her death (Aug. 21, 1056), Michael became emperor. His policies, however, antagonized the military leaders in Asia Minor, who proclaimed Isaac Comnenus emperor on June 8, 1057. Comnenus marched on Constantinople and defeated Michael's supporters on August 20, and Michael abdicated 11 days later.

Peter Clayton

• **Michael VII** DUCAS, also called MICHAEL VII PARAPINACES (b. 1059, Constantinople—d. 1078, Ephesus, Samos, Byzantine Empire), Byzantine emperor whose policies hastened the conquest of Asia Minor by the Turks.

The eldest son of Constantine X Ducas, Michael was a minor on his father's death (May 21, 1067), and his mother assumed the regency. Because of the dangerous military and political situation, she soon married the military commander Romanus Diogenes, who was crowned co-emperor as Romanus IV in January 1068. On the defeat of Romanus by the Seljuq Turks at Manzikert in 1071, Michael was proclaimed sole emperor (October 24).

When a Norman mercenary, Roussel de Bailleul, rebelled and attempted to set up a separate kingdom in Asia Minor, the Byzan-

Michael VII Ducas, coin, 11th century; in the British Museum

tines called on the Turks for assistance in subduing him, facilitating the Turkish conquest of Asia Minor and the establishment of the Sultanate of Rūm.

Michael increasingly fell under the influence of Nicephoritzes, an official who attempted to create a state monopoly in grain. His policy not only angered the great landowners but also led to higher prices and discontent among the people. When rioting broke out in Constantinople, two rival commanders, Nicephorus Bryennius and Nicephorus Botaneiates, marched on the capital to claim the throne. Michael abdicated (March 31, 1078) and became a monk.

• **Michael VIII** PALAEOLOGUS (b. 1224?, Nicaea—d. Dec. 11, 1282, Thrace), Nicaean emperor (1259–61) and then Byzantine emperor (1261–82), who in 1261 restored the Byzantine Empire to the Greeks after 57 years of Latin occupation and who founded the Palaeologan dynasty, the last and longest lived of the empire's ruling houses.

Early years. A scion of several former imperial families (Ducas, Angelus, Comnenus), Michael passed a rather uneventful boyhood, seemingly marked primarily by fantasies of himself recovering Constantinople from the Latins; he spent much of his youth living in the imperial palaces at Nicaea and Nicomedia.

Michael VIII Palaeologus, detail of a Greek manuscript, 14th century; in the Bavarian State Library, Munich (Codex Monacensis Graecus 442)

By courtesy of the Bayerisches Staatsbibliothek, Munich

His remarkable resourcefulness and talent for intrigue were revealed early. At the age of 21 he was charged by the emperor John III Vatatzes of Nicaea with treasonous conduct against the state, a charge from which he extricated himself by the force of his wit. Later, on the death of the emperor Theodore II Lascaris in 1258, Michael was chosen regent for Theodore's six-year-old son, John Lascaris. Gradually usurping more and more authority, Michael seized the throne and early in 1259 was crowned emperor after shunting aside and blinding the rightful heir, his charge, John. Faced with rebellion by Lascarid supporters in Asia Minor, Michael succeeded, in the eyes of many Greeks, in legitimating his rule by retaking Constantinople from the Latins. Whether as the result of Michael's carefully planned ruse or of accident, or both, the great city fell to his general in July 1261. Although the Greeks generally were exultant, a few realized that the centre of gravity had shifted from Asia Minor to Europe. In the long run this concern with Europe was to prove fateful, for it led to the neglect of the frontiers in the East and with that neglect eventually to the conquest and settlement of all of Asia Minor by the Turks.

Defense against Latin rivals. From the first, Michael's hold on the throne was precarious, surrounded as it was on all sides by Latins desirous of restoring Latin rule. Especially active was Baldwin II of Courtenay, the last Latin emperor of Constantinople. In his manoeuvres to recover his throne from Michael, Baldwin finally entered into a diplomatic and matrimonial alliance with a man who was the West's ablest diplomat—in his machinations almost the equal of Michael himself—Charles of Anjou, brother of St. Louis of France. At papal invitation, Charles had advanced into southern Italy, expelled the last representatives of the imperial House of Hohenstaufen, Manfred and Conradin, and then from Palermo and Naples almost at once fixed his gaze across the Balkans onto Constantinople. To quote a chronicler, "he aspired to the monarchy of the world, hoping thereby to recreate the great empire of Julius Caesar by joining East and West."

Threatened by this grand design was not only Michael but the papacy as well; should Charles succeed in the conquest of Constantinople, the pope would become a mere puppet of Charles in Italy. Hence development of an alliance between Michael and the papacy was logical, and it took shape in two decades of intricate negotiations for religious union between Rome and Constantinople. In exchange for the papal promise to restrain Charles from attacking Constantinople, Michael promised to bring about religious union of the Greek Church with Rome. That promise provoked the violent opposition of most of Michael's own people, who opposed union on doctrinal grounds; specifically they objected to such parts of the Latin liturgy as the *Filioque* (procession of the Holy Spirit from the Son and the Father) and the use of the azyme (unleavened bread). Perhaps more important, most of them refused to accept papal ecclesiastical supremacy, which they felt, however obscurely, would lead to restoration of Latin political domination and possibly even cultural assimilation to the Latins.

Union of Eastern and Latin churches. Despite all the obstacles, union was nevertheless finally pronounced at the second Council of Lyons in 1274. Though the Orthodox East was coerced into accepting union, immediately after Michael's death (1282) the Greek Church declared the union invalid and a fraud. The Greeks had objected to the council on the grounds that not all the Eastern patriarchs or their representatives had been present, that no discussion on problems separating the two churches had taken place, and that no subsequent council had declared that of Lyons ecumenical. Nevertheless, for political reasons, Michael had struggled to maintain the union. But when Charles of Anjou finally managed to enthrone his own candidate, Martin IV, as pope in 1281, Martin at once excommunicated Michael and at the same time pronounced Charles's projected expedition against Byzantium a "Holy Crusade" against the "schismatic" Greeks. Included in the vast network of alliances erected by Charles to conquer the Greek East were not only Sicily, parts of Italy, Greek Lascarid dissidents, various Slavs of the Balkans, Baldwin, France, and Venice but also the papacy. Venice's aim in particular was to recover the broad trading privileges it had exercised in the days of the Latin Empire and to oust its arch foe, the Genoese, from the lucrative Greek markets.

The diplomatic duel between Charles and Michael was intensified, with Charles striving unceasingly to prepare his troops and navy. He even launched an attack across the Adriatic on Berat (in modern Albania) under the French general Sully but was repulsed by Michael. What Michael had on his side—the result of his consummate diplomatic ability—was (for a time) the papal alliance, a secret agreement with the Hohenstaufen supporters in Sicily, the support of Genoa, and finally, most important, a secret alliance with the son-in-law of Manfred, King Peter III of Aragon. The denouement to this remarkable contest was the outbreak on March 30/31, 1282, of the Sicilian Vespers, the massacre of the French signalling the revolt against Charles. Byzantium was saved from a second occupation by the Latins.

Assessment. At his death, which occurred soon afterward, Michael thus left an intact empire to his son Andronicus II. But it cannot be denied that his policy of using ecclesiastical union to stave off Charles's attack on his capital and the deep opposition that policy provoked among the Byzantine population established a fateful precedent for later Byzantine history. Moreover, by focussing his attention too exclusively on Europe, his policy helped to lead to Ottoman occupation of all of Asia Minor and ultimately to the capture of Constantinople itself. Nevertheless, Michael's positive accomplishments cannot be overlooked. He gave Byzantium two centuries more of life, rebuilt the capital, and reestablished the University of Constantinople. His sponsorship of a general revival of learning led to the important Byzantine "Renaissance" in the 14th and 15th centuries. (D.Ge.)

Geanakoplos, *Emperor Michael Palaeologus and the West, 1258–1282: A Study in Byzantine-Latin Relations* (1959), with full bibliography. The most recent edition of Michael's so-called autobiography is H. Gregoire, "Imperatoris Michaelis Palaeologi, 'De Vita Sua'," *Byzantion,* 29–30:447–476 (1959–60). For further references, see G. Ostrogorsky, *Geschichte des Byzantinischen Staates* (1940; *History of the Byzantine State,* 1956); and S. Runciman, *The Sicilian Vespers: A History of the Mediterranean World in the Later Thirteenth Century* (1958).

• **Michael IX** PALAEOLOGUS (b. *c.* 1277—d. Oct. 12, 1320, Thessalonica, Byzantine Empire), Byzantine co-emperor with his father, Andronicus II, from 1295 who, despite his efforts in fighting the Turks and in resisting the encroachments of the Catalan mercenaries, was unable to reverse the decline of the empire.

In 1303, Byzantium employed as mercenaries the Catalan Company, led by Roger de Flor, which soon began attacking and robbing Byzantines and Turks alike. Hoping to get rid of them, Michael arranged the murder of Roger de Flor in the imperial palace in April 1305. The Catalans then rebelled and ravaged the countryside of Thrace for several years before moving on to Thessaly.

Michael died before his father and, thus, never reigned as sole emperor.

POLAND

• **Michael** WIŚNIOWIECKI, Polish in full MICHAŁ KORYBUT WIŚNIOWIECKI (b. July 31, 1640, Lwów, Pol.—d. Nov. 10, 1673, Lwów), king of Poland (1669–73), whose reign was marked by struggles between the pro-Habsburg and pro-French political factions.

A native Pole and descendant of Korybut, brother of King Władysław II Jagiełło, Michael was freely elected by the unanimous vote of the Polish nobility; but he was chosen chiefly for the merit of his father, Jérémi Wiśniowiecki, a great border magnate who had victoriously kept down the Cossacks, and he proved to be a passive tool in the hands of the Habsburgs. In view of this, the French party rallied round Jan Sobieski, a military commander of rising fame. The dissensions between the two camps cost Poland a new defeat at the hands of the united Turks and Cossacks. Sealed by the Treaty of Buczacz (Buchach; 1672), by which all Polish Ukraine came under Turkish suzerainty, this defeat was wiped out only by a brilliant victory of Sobieski's at Khotin (1673), which also, after King Michael's early death, carried him to the throne (as John III Sobieski) against an Austrian candidate.

PORTUGAL

• **Michael** (b. Oct. 26, 1802, Queluz, Port.—d. Nov. 14, 1866, Brombach, Baden), younger son of King John VI of Portugal, regent of Portugal from February 1828 and self-proclaimed king from July 1828 to 1834, though his royal title was not everywhere recognized.

Michael went with the rest of the royal family to Brazil in 1807, escaping from Napoleon's armies, but returned with them in 1821 to Portugal. He was then—and remained—much under the influence of his Spanish mother, Queen Carlota Joaquina. On his return, King John VI accepted the liberal constitution of 1821, but Queen Carlota refused to take the oath. When in 1823 the French overthrew the radical regime in Spain, Michael led a military rebellion that dissolved the discredited Cortes in Portugal. His father promised an amended constitution but appointed liberal ministers, and on April 30, 1824, Michael again led a military rebellion. When it faltered, his father reluctantly exiled him to Vienna (June 1824). When John VI died (March 10, 1826), his elder son, Peter, emperor of Brazil, became Peter IV of Portugal but constitutionally abdicated in favour of his daughter Maria, then seven years of age. She was to marry Michael, who was to accept Peter's constitutional Charter. Michael swore to accept the Charter, returned to Portugal, and assumed the regency (Feb. 22, 1828); however, he promptly fell under his mother's influence, settled old scores, and had himself proclaimed king (July 7, 1828). He was so recognized by the Holy See, Spain, the United States, and Russia but not by the liberal monarchies. In 1830 the Duke of Wellington's government in Britain was about to recognize him, but it fell. In 1831 Peter abdicated in Brazil, returned to Europe, and initiated a civil war. Michael lost Porto, but the struggle was protracted; he was finally forced by foreign intervention to leave Lisbon and surrendered at Évora-Monte on May 26, 1834. He renounced the throne, departed for Genoa (where he cancelled his renunciation), and settled in Italy and Germany.

ROMANIA

• **Michael** (b. Oct. 25, 1921, Sinaia, Rom.), king of Romania and, during World War II, a principal leader of the coup d'etat of August 1944, which severed Romania's connection with the Axis powers.

Michael
Camera Press

After his father—the future king Carol II—had been formally excluded from the royal succession by an act of state (January 1926), Michael was proclaimed king of Romania under a three-member regency on the death of his grandfather, King Ferdinand (July 20, 1927). But upon the return of Carol from exile (June 1930), the regency was dissolved, and Michael was reduced to the rank of crown prince. With Carol's abdication in September 1940, Michael again became king but was in effect a prisoner of the newly established military dictatorship of Gen. Ion Antonescu. Michael was strongly influenced by his mother, Queen Helen, who at this time was recalled from a 10-year exile. Becoming the focus of opposition against the Antonescu regime, he arrested the dictator on Aug. 23, 1944, signalling the overthrow of the military government. From the end of World War II in 1945, he strenuously opposed the Communists' accession to power in Romania but was ultimately forced to abdicate on Dec. 30, 1947, and go into exile, finally settling near Geneva (with his wife, Anne de Bourbon-Parma) and becoming an executive for a U.S. brokerage firm.

RUSSIA

• **Michael,** Russian in full MIKHAIL FYODOROVICH ROMANOV (b. July 22 [July 12, old style], 1596—d. July 23 [July 13, O.S.], 1645, Moscow), tsar of Russia from 1613 to 1645 and founder of the Romanov dynasty, which ruled Russia until 1917.

Son of Fyodor Nikitich Romanov (later the Orthodox patriarch Philaret), Michael was related to the last tsar of the Rurik dynasty, Fyodor I (reigned 1584–98) through his grandfather Nikita Romanov, who was Fyodor's maternal uncle. When the *zemsky sobor* (assembly of the land) met in 1613 to elect a new tsar after the Time of Troubles—a period of chaotic internal disorders, foreign invasions, and a rapid succession of rulers following the death of Fyodor I—it chose Michael Romanov as tsar (February 1613).

Novosti Press Agency

Emissaries came from Moscow to the monastery near Kostroma where Michael was living with his mother—who had been compelled to become a nun during the reign of Boris Godunov (ruled 1598–1605)—and in March he accepted the offer of the throne with great reluctance.

Only 16 years old and poorly educated at the time of his coronation on July 21 (July 11, O.S.), 1613, Michael at first allowed his mother's relatives to gain control of governmental affairs. Although they promoted their personal interests, they also restored order to Russia, suppressed internal uprisings, and made peace both with Sweden (Treaty of Stolbovo, 1617) and with Poland (Truce of Deulino, 1618).

In 1619 Michael's father, who had been forced to become a monk under the name Philaret (Filaret) in 1601 and had later been taken to Poland, was released from captivity. Upon his return to Russia, he was installed as patriarch of the church and Michael's co-ruler. From then until his death in 1633, he dominated Michael's government, which increased diplomatic, commercial, and cultural contact with western Europe, made extensive use of the *zemski sobor* as a popular consultative body, employed a variety of means to solve Russia's continuing financial dilemmas, reformed the structure of local government to increase the authority of the central administration, and strengthened the institution of serfdom. When his father died, Michael's maternal relatives again played prominent roles in his government until he died and left his throne to his son Alexis.

SERBIA

• **Michael III,** Serbo-Croatian in full MIHAILO OBRENOVIĆ (b. Sept. 16 [Sept. 4, old style], 1823, Kragujevac, Serbia—d. June 10 [May 29, O.S.], 1868, Kosutnjak, near Belgrade), prince of Serbia (1839–42, 1860–68) and modern Serbia's most enlightened ruler, who instituted the rule of law and attempted to found a Balkan federation aimed against the Ottoman Empire.

The second son of Miloš Obrenović, Michael succeeded to the Serbian throne on the death of his elder brother, Milan, on July 8, 1839, but fled into exile after a revolt in 1842. Having travelled widely, he returned on his father's restoration to the throne (1858), served as commander in chief of the army, and became prince again on Miloš' death in 1860. An enlightened, though increasingly authoritarian, ruler, Michael gradually freed Serbia from Turkish controls until all Ottoman soldiers had left the country in 1867. Nevertheless his Balkan League, designed to unite all South Slavs against Turkey, collapsed soon after his death. In domestic affairs, Michael reformed the judicial system, revised the electoral laws, and instituted a regular conscript army (1861), for which Russia furnished supplies; he also established a state mortgage bank (1862), the Serbia Learned Society (1864), the first Serbian coinage since the Middle Ages (1868), and the national theatre. His reign was cut short by his assassination.

WALACHIA

• **Michael,** byname MICHAEL THE BRAVE, Romanian MIHAI VITEAZUL, original name MIHAI BASARAB (b. 1558—d. Aug. 19, 1601, Torda, Walachia), Romanian national hero, prince of Walachia, who briefly united much of the future national patrimony under his rule.

Acceding to the princely throne of Walachia in 1593, Michael submitted in May 1595 to the suzerainty of the prince of Transylvania, Sigismund Báthory, in order to secure support against Ottoman rule. He routed the Turks at Călugăreni (August 1595) and Giurgiu (October 1595). In 1598 he took an oath of fealty to the Habsburg emperor, Rudolf II, and also concluded a peace with the Turks. The following year he attacked his new Transylvanian suzerain, Andreas Báthory, and defeated him at Şelimbăr (October 1599). Having now proclaimed himself prince of Transylvania, Michael next conquered Moldavia (May 1600) and assumed the title of "prince of Ungro-Walachia, Transylvania, and Moldavia." In September of that year, however, the troops of Emperor Rudolf divested him of Transylvania, while Polish forces wrested Moldavia from his control the following month. Reconciled to the Emperor in 1601, he helped suppress a Magyar rebellion at Gorăslău (August 1601) but was put to death shortly thereafter on the order of the imperial general Giorgio Basta. During the 19th century Michael acquired the reputation among Romanian nationalists as the father of his people.

Michael CERULARIUS (b. *c.* 1000, Constantinople—d. Jan. 21, 1059, Madytus, near Constantinople), Greek Orthodox patriarch of Constantinople from March 1043 to November 1058 who figured prominently in the events leading to the Schism of 1054, the formal severing of Eastern Orthodoxy from Roman Catholicism.

Although Cerularius was educated for the civil service rather than for an ecclesiastical career, he was named patriarch in 1043 by the Byzantine emperor Constantine IX Monomachus. Cerularius' ambitious desires for political power, coupled with his inflexible belief in the autonomy of the Eastern Church, led him to thwart Constantine's attempts to ally the Byzantine and Roman empires in defense against the Normans. In 1052, partly in response to concessions that Constantine made to Pope Leo IX, Cerularius decided to force the Latin churches in his diocese to use the Greek language and liturgical practices; when they refused to do so, he ordered them closed.

In 1054, when Pope Leo sent three legates to Constantinople to negotiate an alliance with the Byzantine Empire, Cerularius again obstructed Constantine's and Leo's efforts by refusing to meet with the legates. In the midst of these negotiations, however, Pope Leo died, and one of his legates, the French cardinal Humbert of Silva Candida, took advantage of the papal vacancy to retaliate against Cerularius. On July 16, 1054, Humbert entered Constantinople's cathedral, Hagia Sophia, and excommunicated Cerularius and his clergy. In response, Cerularius convened a Holy Synod and excommunicated all the legates. Constantine's efforts to effect a reconciliation failed, and the schism between Rome and Constantinople was final.

Cerularius continued to flex his political muscles, ultimately constraining Constantine to support the schism. He had less control, however, over Constantine's successor, Emperor Isaac I Comnenus, who dethroned Cerularius in 1058 and drove him into exile. Cerularius died soon thereafter.

Michaelis, Georg (b. Sept. 8, 1857, Haynau, Prussia—d. July 24, 1936, Bad Saarow-Pieskow, Ger.), German politician and imperial chancellor during World War I, whose government was completely dependent on the military supreme command and lasted only 15 weeks.

A Prussian civil servant from 1879, Michaelis taught at the German school of law in Tokyo (1885–89), re-entered the Prussian civil service in 1892, and became undersecretary of state in the Finance Ministry in 1909. During World War I he headed the department for grain supply (from 1915), and in early 1917 was appointed Prussian state commissioner for food supply. After the fall of the government of Theobald von Bethmann Hollweg during the summer of 1917, the military supreme command, headed by Paul von Hindenburg and Erich Ludendorff, Germany's actual rulers, chose Michaelis to form a new government (July 14, 1917). Totally unqualified for the chancellorship, Michaelis could maintain himself only with the backing of the army. He was evasive on the Reichstag's (federal lower house) demand for acceptance of its peace resolution of July 19 (indicating that Germany wanted no annexations) and refused to make any concessions in the negotiations following Pope Benedict XV's peace proposals (Aug. 16, 1917). His downfall was engineered by the Reichstag majority parties after Michaelis blamed the Independent Social Democratic Party for the naval mutiny during the summer of 1917. Of no further use to the military and without parliamentary support, Michaelis was forced to resign on Oct. 31, 1917. Heading the administration of Pomerania from March 1918 to April 1919, Michaelis was later chiefly engaged in Protestant church organizations and projects for student welfare.

Michaelis, 1919

Michaelis-Menten hypothesis, a general explanation of the velocity and gross mechanism of enzyme-catalyzed reactions. First stated in 1913, the hypothesis assumes the rapid, reversible formation of a complex between an enzyme and its substrate (the substance upon which it acts to form a product). It also assumes that the rate of formation of the product, *P*, is proportional to the concentration of the complex. The velocity of such a reaction is greatest when all the sites at which catalytic activity can take place on the enzyme molecules (active sites) are filled with substrate; *i.e.,* when the substrate concentration is very high. These relationships provide the basis for all kinetic studies of enzymes and also have been applied to investigations of the effects of carriers upon the transport of substances through cell membranes.

Michaeliskirche (Hildesheim, Ger.): *see* Sankt Michael.

Michaelmas, Christian feast of St. Michael the Archangel, celebrated in the Western churches on September 29 and in the Eastern (Orthodox) Church on November 8. In the Roman Catholic Church, it is the Feast of SS. Michael, Gabriel, and Raphael, archangels; in the Anglican Church, its proper name is the Feast of St. Michael and All Angels.

The cult of St. Michael began in the Eastern Church in the 4th century and spread to Western Christianity by the 5th century; the date of May 8 commemorates the dedication of a sanctuary to St. Michael at Monte Gargano in Italy in the 6th century. Because of St. Michael's traditional position as leader of the heavenly armies, veneration of all angels was eventually incorporated into his cult.

During the Middle Ages, Michaelmas was a great religious feast and many popular traditions grew up around the day, which coincided with the harvest in much of western Europe. In England it was the custom to eat a goose on Michaelmas, which was supposed to protect against financial need for the next year. In Ireland, finding a ring hidden in a Michaelmas pie meant that one would soon be married.

Michajlovka (city, Russia): *see* Mikhaylovka.

Michał (Polish personal name): *see under* Michael.

Michaux, André (b. March 7, 1746, Satory, Fr.—d. Nov. 13, 1802, Tamatave, Madagascar), French botanist who spent 12 years studying the plants of North America.

From 1779 to 1781 Michaux travelled in England, Spain, and in the Auvergne region of south central France, studying the plants of these areas. In 1782 the French government sent him to Persia to collect plants and grains, which he brought back to France in 1785. He was then sent to North America to collect plants for the depleted forest of Rambouillet, southwest of Paris. He stocked the two nurseries with plants he collected from what are now the Southeastern and Midwestern states. Shipwrecked on his return trip to Paris in 1797, he lost most of the plants he had collected. In 1800 he went to Madagascar, where he contracted a fever from which he died.

Michaux, Henri (b. May 24, 1899, Namur, Belg.—d. Oct. 18, 1984, Paris), Belgian-born French lyric poet and painter whose domain was the inner world revealed by dreams, fantasies, or hallucinogenic drugs.

He travelled to Asia and South America as a sailor, living intermittently in Paris, where he eventually settled in 1922. There he became a teacher for a time and then was employed as secretary to the poet Jules Supervielle. Michaux attracted attention with his poems *Qui je fus* (1927; "Who I Was") and held his first painting show in 1937. In 1941 André Gide wrote a study that made his poetry very popular for a time. Michaux became a French citizen in 1955.

Michaux's view of the human condition was bleak; his poems emphasize the impossibility of making sense of life as it impinges on the individual. Against the futility of real life Michaux set the richness of his imagination, and the contradictions of his Surrealistic images serve as a foil to the absurdity of existence. Some of Michaux's poetry is cast in the form of deceptively flippant verse with playful rhymes. At other times Michaux presented his themes in prose poems. Michaux himself prepared three volumes of selections from his works, *L'Espace du dedans* (1944; "The Space Within"), *Ailleurs* (1948; "Elsewhere"), and *La Vie dans les plis* (1950; "Life Within the Folds"). English translations include *Selected Writings* (1968) by Richard Ellman and *Poems* (1967) by Ted Savory.

Miche, Jean-Claude (b. Bruyères-en-Vosges, Fr.—d. Dec. 1, 1873, Saigon), French Roman Catholic missionary who was instrumental in securing a French protectorate over Cambodia in 1863.

On arriving in Cochinchina (now part of southern Vietnam) in 1836, Father Miche was promptly condemned to death by the Vietnamese emperor, Minh Mang, who objected to Christian missionary activity in his realm. Miche was soon captured and remained imprisoned until his rescue on March 19, 1843.

In 1856, at the instigation of the French consul Louis-Charles de Montigny, Father Miche tried unsuccessfully to get the Cambodian king, Duong, to accept French help in ridding Cambodia of Siamese domination. By 1863–64 he had gained the confidence of Duong's successor, King Norodom, and he and a naval officer, Ernest Doudart de Lagrée, induced the King to allow the French to establish a protectorate over his domain in opposition to Siam.

Miche was named chief apostolic vicar of Cambodia in 1864 and spent the remaining years of his life in missionary activities. He compiled a Latin-Cambodian dictionary and also wrote a number of letters in *Annales de la propagation de la foi* (1863; "Annals of the Propagation of the Faith"), which give an account of events of the times.

Michel, Hartmut (b. July 18, 1948, Ludwigsburg, W.Ger.), German biochemist who, along with Johann Deisenhofer and Robert Huber, received the Nobel Prize for Chemistry in 1988 for their determination of the structure of certain proteins that are essential for photosynthesis.

Michel earned his doctorate from the University of Würzburg in 1977. In 1979 he joined the staff of the Max Planck Institute for Biochemistry in Martinsried, Ger., where he conducted his award-winning research. He became head of the Max Planck Institute for Biophysics in Frankfurt am Main in 1987.

It was Michel's preliminary work, done in the period from 1978 to 1982, that cleared the way for the three scientists' joint research. They wanted to determine the three-dimensional structure of a four-protein complex (called a photosynthetic reaction centre) that is crucial to the process of photosynthesis in certain bacteria. Michel performed the hitherto impossible feat of reducing the protein complex to a pure crystalline form, thus making it possible to determine the protein's structure atom-by-atom by means of X-ray diffraction techniques.

Michel, Louise, in full CLÉMENCE-LOUISE MICHEL (b. May 29, 1830, Vroncourt-la-Côte, France—d. Jan. 10, 1905, Marseille), French anarchist who fervently preached revolutionary socialist themes. Rejecting parliamentary reform, she believed in sensational acts of violence and advocated class war.

Louise Michel
J.E. Bulloz

Liberally educated and trained as a teacher, Michel developed her revolutionary ideas while teaching (1866–70) at Montmartre, in Paris. During the German siege of Paris (1870–71), she worked in the ambulance service and in 1871 fought zealously with the National Guard defending the Paris Commune against the Versailles troops. After the defeat of the Commune she was court-martialed and sentenced to prison.

Freed by the amnesty of 1880, Michel renewed her revolutionary campaign and lectured throughout France, but she was imprisoned for three years for inciting a riot. From 1886 to 1896 she lived in London, always keeping in touch with revolutionary developments on the Continent. In 1896 she returned to France and lectured on revolutionary themes until her death. Her writings reveal a strong sense of social consciousness. Besides her *Mémoires* (1886), she published both poetry and prose.

Michel-Lévy, Auguste (b. Aug. 7, 1844, Paris, France—d. Sept. 27, 1911, Paris), French mineralogist and petrologist, one of the pioneers of microscopic petrology.

Michel-Lévy was a brilliant student. His interest turned to geology, and in 1862 he matriculated at the Polytechnic School, then entered the School of Mines, from which he graduated at the head of his class in 1867. From 1870 he made his career with the government Geological Map Service, serving as its director from 1887 until his death. He was named to the Academy of Sciences in 1896.

Michel-Lévy proposed the use of birefringence to study minerals in thin section and measured this property for many minerals. He also developed statistical techniques to describe the chemical composition of feldspars; his methods have been applied to other minerals. He formulated the first classification of igneous rocks that considered mineralogy, chemical composition, and texture. With Ferdinand Fouqué, Michel-Lévy studied and experimented widely in the synthesis of igneous rocks. They showed that the same molten mixture yields rocks of different mineralogy, depending on the conditions of crystallization, and that the rate of cooling determines crystal size. Together they wrote *Minéralogie micrographique: roches éruptives françaises,* 2 vols. (1879; "Micrographic Mineralogy: French Igneous Rocks") and *Synthèse des minéraux et des roches* (1882; "Synthesis of Minerals and Rocks"). With Alfred Lacroix he wrote *Tableaux des minéraux des roches* (1889) and *Les Mineraux des roches* (1888).

Michelangeli, Arturo Benedetti (b. Jan. 5, 1920, Brescia, Italy—d. June 12, 1995, Lugano, Switz.), Italian pianist best known for his interpretations of Romantic music, particularly that of Claude Debussy.

Michelangeli began studying violin at the age of 3 and entered Milan Conservatory at the age of 10 as a piano student of Giuseppe Anfossi. After his graduation in 1933, he turned briefly to medical studies. In 1939 he won first prize at the Geneva International Piano Competition. He served in the Italian air force during World War II. His debuts in London (1946) and New York (1948) won critical acclaim, and he embarked upon an international career. He founded and directed the International Pianists Academy at Brescia from 1964 to 1969; among his students were Martha Argerich and Maurizio Pollini. In his playing Michelangeli displayed consummate technique marked by great clarity and control of tone colour and counterpoint.

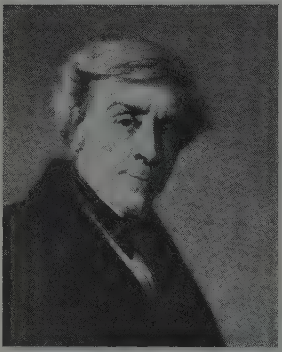
Michelangelo, in full MICHELANGELO DI LODOVICO BUONARROTI SIMONI (b. March 6, 1475, Caprese, Republic of Florence [Italy]—d. Feb. 18, 1564, Rome, Papal States), Italian Renaissance sculptor, painter, architect, and poet who exerted an unparalleled influence on the development of Western art.

A brief treatment of Michelangelo follows. For full treatment, *see* MACROPAEDIA: Michelangelo.

In 1488 Michelangelo was apprenticed to the painter Domenico Ghirlandajo, from whom he learned the technique of fresco and panel painting. In Rome (1496–1501) he sculpted a number of works; one of his most famous, the "Pietà," is now in St. Peter's Basilica, Vatican. On his return to Florence in 1501, Michelangelo started work on a gigantic marble "David" and completed it in 1504. Michelangelo's output in these years was prolific; he executed three tondi (circular representations) of the Madonna (two sculptures, one painting; *c.* 1503–05), the cartoon of the "Battle of Cascina" for the Hall of Five Hundred of the Palazzo Vecchio in Florence (1504), and, at Rome (1505–06), worked on the tomb of Pope Julius II, who commissioned him to paint the ceiling of the Sistine Chapel (1508–12). After Julius' death, he again worked on the pope's monument (completed 1545), of which his great statue "Moses" forms a part.

In 1514 he designed the front of a small chapel in Castel Sant'Angelo, Rome, and in 1520 the mortuary chapel of the Medici family in San Lorenzo in Florence. The statues of the Medici tomb rank beside the "Moses" as Michelangelo's greatest achievements in sculpture, although after 14 years' work (1520–34) he left it for pupils to complete. In Rome he painted "The Last Judgment," a powerful fresco in the Sistine Chapel (1534–41). Michelangelo's architectural works include his Mannerist masterpiece, the Laurentian Library (1523–59), Florence, and parts of the facade of the Palazzo Farnese (1547). As chief architect of St. Peter's, he designed that basilica's monumental dome. His writings, including many sonnets, constitute a compelling spiritual autobiography.

Michelet, Jules (b. Aug. 21, 1798, Paris, France—d. Feb. 9, 1874, Hyères), French nationalist historian best known for his monumental *Histoire de France* (1833–67). Michelet's method, an attempt to resurrect the past by immersing his own personality in his narrative, resulted in a historical synthesis of great dramatic power.



Michelet, detail of an oil painting by Thomas Couture; in the Carnavalet Museum, Paris
Giraudon—Art Resource

Michelet was the son of a modest printer who managed to give Jules an education. A brilliant student, Michelet at 29 was teaching history and philosophy at the École Normale Supérieure. He had already published textbooks and a translation (1827) of Giambattista Vico's *Scienza nuova* ("New Science"). The July Revolution (1830) confirmed Vico's influence on Michelet in stressing man's own part in the making of history, conceived as a continuous struggle of human freedom against fatality. This, the main theme of the *Introduction à l'histoire universelle* (1831), was to underlie Michelet's later writings.

After the *Histoire romaine,* 2 vol. (1831), Michelet devoted himself to medieval and modern history; his appointment as head of the historical section of the Record Office in the same year provided him with unique resources for carrying out his monumental life's work, the *Histoire de France.* The first six volumes (1833–43) stop at the end of the Middle Ages; they include the "Tableau de la France," in which the emergence of France as a nation is seen as a victory over racial and geographic determinism; they also include his treatment of Joan of Arc as the very soul of France and the living symbol of his own patriotic and democratic ideals.

Michelet deliberately threw his intimate self into his narrative, convinced that this was the way to achieve the historian's ultimate aim: the resurrection (or re-creation) of the past. Such a resurrection must be integral: all the elements of the past—artistic, religious, economic, as well as political—must be brought back, intertwined, as they once were, in a living synthesis. Arbitrary and overambitious as the undertaking seems, Michelet's compassionate genius and romantic imagination enabled him to conjure up an effective evocation, unsurpassed for poetic and dramatic power.

Toward the end of this period, which was marked by private crises reflected in his work (the death of his first wife, in 1839, and of his friend Mme Dumesnil, in 1842, cast shadows over whole periods of his *Histoire de France*), Michelet turned away from Christianity and began to profess a messianic belief in democratic progress. His increasing hostility to the church, expressed in his lectures at the Collège de France, eventually brought him into conflict with the Jesuits and caused his lectures to be suspended in January 1848.

A month later, the revolution that he had heralded in *Le Peuple* (1846) seemed to bring about the realization of his dreams. But they were soon shattered: in 1852 Michelet, having refused allegiance to the Second Empire, lost his posts. In 1847 he had interrupted the sequence of the *Histoire de France* to write the *Histoire de la révolution française,* 7 vol. (1847–53). He visualized the French Revolution as a climax, as the triumph of *la Justice* over *la Grâce* (by which he meant both Christian dogma and the arbitrary power of the monarchy). These volumes, written at a feverish pace, are a vivid, impassioned chronicle.

Michelet then resumed the *Histoire de France* from the Renaissance to the eve of the revolution (11 vol., 1855–67). Unfortunately, his hatred of priests and kings, his hasty or abusive treatment of documents, and his mania for symbolic interpretation continually distort these volumes into hallucinations or nightmares. Also thus distorted is *La Sorcière* (1862), an apology for witches considered as godforsaken souls, victims of the antinatural interdictions of the church.

A new and happier inspiration produced a series of books on nature: *L'Oiseau* (1856); *L'Insecte* (1858); *La Mer* (1861); *La Montagne* (1868). They reflect the influence of his second marriage to Athénaïs Mialaret, 30 years his junior, in 1849; written in a lyrical vein, they contain some of the most beautiful pages of a supreme prose writer. *L'Amour* (1858) and *La Femme* (1860), written under the same influence, are erotic and didactic.

The Franco-German War of 1870 shattered Michelet's idealism and his illusions about Germany. After his death, in 1874, his widow tampered with his diaries, and their publication as a whole was begun only in 1959 (*Journal,* vol. 1, 1959, vol. 2, 1962; *Écrits de jeunesse,* 1959). They record his travels through Europe, and, above all, they give a key to his personality and illuminate the relationship between his intimate experiences and his work. (J.J.Se.)

(1923, reprinted 1975), a classic biography, though incomplete; Stephen A. Kippur, *Jules Michelet: A Study of Mind and Sensibility* (1981), on his life and thought; Oscar A. Haac, *Jules Michelet* (1982), a guide to his works, with detailed summaries and commentary; Roland Barthes (ed.), *Michelet* (1987), a translation of a critical anthology of Michelet's works; and Edward K. Kaplan, *Michelet's Poetic Vision: A Romantic Philosophy of Nature, Man, and Woman* (1977), a study of his nonhistorical writings.

Michelin, in full COMPAGNIE GÉNÉRALE DES ÉTABLISSEMENTS MICHELIN, leading French manufacturer of tires and other rubber products. Headquarters are at Clermont-Ferrand.

Founded in 1888 by the Michelin brothers, André (1853–1931) and Édouard (1859–1940), the company manufactured tires for bicycles and horse-drawn carriages before introducing pneumatic tires for automobiles in the 1890s. To show that demountable pneumatic tires could be used successfully on motor vehicles, the Michelins equipped a car with such tires held onto the rims by bolts and entered and drove it in the 1895 Paris–Bordeaux road race. Although they did not win the race, they created popular interest in pneumatic tires. Their company became a major producer of tires in Europe. In 1948 Michelin was the first to introduce steel-belted radial tires.

The company established its first foreign plant at Turin, Italy, in 1906 and today operates facilities in a number of countries. Michelin was reorganized as a holding company in 1951, with interests in tires, other rubber products, and synthetic rubber.

The company also publishes an international series of travel guides known as Michelin guides (French: Guide Michelin) and a series of road maps. The guides were initiated by André Michelin, whose aim was to promote tourism by car and thus to support his tire industry. The first Red Guide (1900), an aid to travel in France, was a pocket-size, alphabetical listing of French towns of interest that were large enough to contain hotels and garages. It included the prototypical rating symbols for which Michelin has become famous; this now-extensive list of symbols indicates such features of lodgings as comfort level (from luxurious to modest comfort) and the presence of such amenities as swimming pools, gardens, tennis courts, and air conditioning. The Red Guide also includes restaurant ratings, noting those that provide serviceable but inexpensive meals as well as a select few (indicated by the presence of three stars) that provide "cooking worth a special journey." In 1957 the company began publishing Red Guides to other western European countries, including guides to Spain and Portugal, Italy, Great Britain and Ireland, the Benelux countries (Belgium, Netherlands, and Luxembourg), and West Germany.

In addition to the Red Guides, the most popular of the Michelin guides, Michelin offers supplementary Green Guides, which can be of aid to the traveler in search of more information on the museums, natural wonders, and other points of interest in a region. Michelin also publishes a great number of highly detailed and informative maps.

Michell, John (b. 1724, Nottinghamshire, Eng.—d. April 21, 1793, Thornhill, Yorkshire), British geologist and astronomer who is considered the father of seismology, the science of earthquakes.

In 1760, the year in which he was elected a fellow of the Royal Society of London, Michell finished writing "Conjectures Concerning the Cause, and Observations upon the Phænomena of Earthquakes," in which he presented the conclusions from his study of the disastrous Lisbon earthquake of 1755. He showed that the focus of that earthquake was underneath the Atlantic Ocean, and he proposed that the cause of earthquakes was high-pressure steam, created when water comes into contact with subterranean fires. His contributions to astronomy included the first realistic estimate of the distance between the Earth and a star and the suggestion, later verified by the British astronomer John Herschel, that binary stars are physically close to and in orbit around one other.

Michell became Woodwardian professor of geology at the University of Cambridge in 1762 and rector of Thornhill in 1767. In 1750 he had published a major work on artificial magnets. He may have conceived the principle of the torsion balance independently of the French physicist C.-A. Coulomb. He hoped to use this instrument to determine the mean density of the Earth. Although he died before finishing his work, it was carried on by the British physicist Henry Cavendish in his determination of *G,* the gravitational constant (a measure of the strength of gravity).

Michelozzo, in full MICHELOZZO DI BARTOLOMMEO, Michelozzo also spelled MICHELOZZI (b. 1396, Florence—d. 1472, Florence), architect and sculptor, notable in the development of Florentine Renaissance architecture.

Michelozzo studied with the celebrated sculptor Lorenzo Ghiberti, in whose workshop he acquired the skills of a bronze founder. After 1420 they collaborated on the "St. Matthew" for the church of Or San Michele, Florence. In 1427 Michelozzo and the sculptor Donatello established a partnership, active until 1438, to build several architectural-sculptural tombs. They also collaborated on the pulpit (designed 1428) in Prato cathedral.

Throughout his career Michelozzo was closely associated with his principal patrons, the Medicis, and he followed Cosimo de' Medici into exile at Venice in 1433. Upon Cosimo's triumphant return to power in Florence in 1434, Michelozzo's architectural career began in earnest with several important commissions. In 1436 he began the complete rebuilding of the ruined monastery of San Marco at Florence. The elegant library he built for the monastery became the model for subsequent libraries throughout 15th-century Italy. In 1444–45 he directed the similar reconstruction of the large complex of church buildings at Santissima Annunziata, also in Florence. Michelozzo also temporarily succeeded Filippo Brunelleschi as architect for the cathedral of Florence upon the latter's death in 1446.

Michelozzo produced several innovations in the design of the Florentine palazzo, or palace. The basic plan called for a blocklike structure, usually three stories high, with a central open court. On the exterior the three stories were separated by horizontal string courses, and the rustication of the stonework was different in each story. The building was capped by a bold overhanging cornice. These features are outstanding in the palazzo that Michelozzo built in Florence for Cosimo de' Medici (1444–59; now called the Palazzo Medici-Riccardi), one of the finest examples of early Renaissance architecture.

In his later years Michelozzo restored several villas for the Medicis and worked as an engineer in Ragusa (now Dubrovnik, Croatia) and on the Greek island of Chios.

Michels, Robert (b. Jan. 9, 1876, Cologne—d. May 3, 1936, Rome), German-born Italian political sociologist and economist, noted for his formulation of the "iron law of oligarchy," which states that political parties and other membership organizations inevitably tend toward oligarchy, authoritarianism, and bureaucracy.

Born into a wealthy German bourgeois family, Michels became a socialist and spent most of his life teaching in Italy; he held academic positions at the universities of Turin, Basel, and Perugia. In his major work, *Zur Soziologie des Parteiwesens in der modernen Demokratie* (1911; *Political Parties: A Sociological Study of the Oligarchical Tendencies of Modern Democracy*), he set forth his ideas on the inevitable development of oligarchies, even in organizations committed to democratic ideals, because of such organizational needs as rapid decisionmaking and full-time activity. In his later writings Michels came to view this elitist rule as not only inevitable but also desirable, and he did not oppose the rise of Fascism in Italy. His *Corso di sociologia politica* and other writings were translated into English as *First Lectures in Political Sociology* (1949).

Michelsen, (Peter) Christian (Hersleb Kjerschow) (b. March 15, 1857, Bergen, Nor.—d. June 28, 1925, Fjøsanger, near Bergen), Norwegian statesman who, as prime minister, proclaimed his country's separation from Sweden in 1905.

Michelsen began his career as a lawyer; later he started his own shipping firm, which became one of the largest in Norway. A member of the Storting (parliament) from 1891, he adhered at first to the "Pure" Left Party but later broke with it and in 1903 was returned to the Storting as a member of the Coalition Party (conservatives and moderate liberals). In February 1905 he abandoned the coalition ministry of G.F. Hagerup in protest against Hagerup's extremely moderate policy in the growing conflict with Sweden. On March 11 Michelsen was appointed prime minister in a new coalition; thenceforth he was the unquestioned leader of the Norwegians in the conflict that led to the dissolution of the union with Sweden and the establishment of the new Kingdom of Norway under King Haakon VII. Michelsen remained in office until Oct. 28, 1907, when he retired because of illness.

Michelson, A(lbert) A(braham) (b. Dec. 19, 1852, Strelno, Prussia—d. May 9, 1931, Pasadena, Calif., U.S.), German-born U.S. physicist who established the speed of light as a fundamental constant and pursued other spectroscopic and meteorological investigations. He received the 1907 Nobel Prize for Physics.

Michelson
By courtesy of the University of Chicago

Michelson came to the United States with his parents when he was two years old. From New York, the family made its way to Virginia City, Nev., and San Francisco, where the elder Michelson prospered as a merchant.

At 17, Michelson entered the United States Naval Academy at Annapolis, Md., where he did well in science but was rather below average in seamanship. He was graduated in 1873, then served as science instructor at the academy from 1875 until 1879. In 1878 Michelson began work on what was to be the passion of his life, the accurate measurement of the speed of light. He was able to get useful values with homemade apparatus. Feeling the need to study optics before he could be qualified to make real progress, he travelled to Europe in 1880 and spent two years in Berlin, Heidelberg, and Paris, resigning from the navy in 1881. Upon his return to the United States, he determined the velocity of light to be 299,853 kilometres (186,329 miles) per second, a value that remained the best for a generation. When it was bettered, Michelson bettered it.

While in Europe, Michelson began constructing an interferometer, a device designed to split a beam of light in two, send the parts along perpendicular paths, then bring them back together. If the light waves had, in the interim, fallen out of step, interfererence fringes of alternating light and dark bands would be obtained. From the width and number of those fringes, unprecedently delicate measurements could be made, comparing the velocity of light rays travelling at right angles to each other.

It was Michelson's intention to use the interferometer to measure the Earth's velocity against the "ether" that was then thought to make up the basic substratum of the universe. If the Earth were travelling through the light-conducting ether, then the speed of the light travelling in the same direction would be expected to be equal to the velocity of light plus the velocity of the Earth, whereas the speed of light travelling at right angles to the Earth's path would be expected to travel only at the velocity of light. His earliest experiments in Berlin showed no interference fringes, however, which seemed to signify that there was no difference in the speed of the light rays, and, therefore, no Earth motion relative to the ether.

In 1883 he accepted a position as professor of physics at the Case School of Applied Science in Cleveland and there concentrated his efforts on improving the delicacy of his interferometer experiment. By 1887, with the help of his colleague, American chemist Edward Williams Morley, he was ready to announce the results of what has since come to be called the Michelson-Morley experiment. Those results were still negative; there were no interference fringes and apparently no motion of the Earth relative to the ether.

It was perhaps the most significant negative experiment in the history of science. In terms of classical Newtonian physics, the results were paradoxical. Evidently, the speed of light plus any other added velocity was still equal only to the speed of light. To explain the result of the Michelson-Morley experiment, physics had to be recast on a new and more refined foundation, something that resulted, eventually, in Albert Einstein's formulation of the theory of relativity in 1905.

In 1892 Michelson, after serving as professor of physics at Clark University at Worcester, Mass., from 1889, was appointed professor and the first head of the department of physics at the newly organized University of Chicago, a position he held until his retirement in 1929. From 1923 to 1927 he served as president of the National Academy of Sciences. In 1907 he became the first American ever to receive a Nobel Prize in the sciences, for his spectroscopic and meteorological investigations.

Michelson advocated using some particular wavelength of light as a standard of distance (a suggestion generally accepted in 1960) and, in 1893, measured the standard metre in terms of the red light emitted by heated cadmium. His interferometer made it possible for him to determine the width of heavenly objects by matching the light rays from the two sides and noting the interference fringes that resulted. In 1920, using a 6-metre (20-foot) interferometer attached to a 254-centimetre (100-inch) telescope, he succeeded in measuring the diameter of the star Betelgeuse (Alpha Orionis) as 386,160,000 km (300 times the diameter of the Sun). This was the first substantially accurate determination of the size of a star.

In 1923 Michelson returned to the problem of the accurate measurement of the velocity of light. In the California mountains he surveyed a 35-km pathway between two mountain peaks, determining the distance to an accuracy of less than 2.5 cm. He made use of a special eight-sided revolving mirror and obtained a value of 299,798 km/sec for the velocity of light. To refine matters further, he made use of a long, evacuated tube through which a light beam was reflected back and forth until it had travelled 16 km through a vacuum. Michelson died before the results of his final tests could be evaluated, but in 1933 the final figure was announced as 299,774 km/sec, a value less than 2 km/sec higher than the value accepted in the 1970s. (I.A.)

BIBLIOGRAPHY. Full-length studies of Michelson include Bernard Jaffe, *Michelson and the Speed of Light* (1960); and Dorothy Michelson Livingston, *The Master of Light* (1973), a well-written biography by Michelson's daughter that contains interesting anecdotal detail.

Michelson–Morley experiment, an attempt to detect the velocity of the Earth with respect to the hypothetical luminiferous ether, a medium in space proposed to carry light waves. First carried out in 1881 by physicists A.A. Michelson and E.W. Morley in the United States, the test was later refined by them and by many others.

The procedure depended on a Michelson interferometer, a sensitive optical device that compares the optical path lengths for light moving in two mutually perpendicular directions. It was reasoned that, if the speed of light were constant with respect to the proposed ether through which the Earth was moving, that motion could be detected by comparing the speed of light in the direction of the Earth's motion and the speed of light at right angles to the Earth's motion. No difference was found. This null result seriously discredited the ether theories and ultimately led to the proposal by Albert Einstein in 1905 that the speed of light is a universal constant.

Michener, James A(lbert) (b. Feb. 3, 1907?, New York, N.Y., U.S.—d. Oct. 16, 1997, Austin, Texas), U.S. novelist and short-story writer who, perhaps more than any other single author, made foreign environments accessible to Americans through fiction. Best known for his novels, he wrote epic and detailed works classified as fictional documentaries.

Michener was a foundling discovered in Doylestown, Pa. He was adopted by Mabel Michener and raised as a Quaker. In his teens he ran away from home and eventually became a teacher and editor. He served as a naval historian in the South Pacific from 1944 to 1946, and his early fiction is based on this area. He won a Pulitzer Prize in 1948 for the collection *Tales of the South Pacific* (1947), which presented the world of the South Pacific as exotic and foreign yet still part of the brotherhood of man.

Michener's novels were typically massive in scope, and he researched them extensively. A Michener novel such as *Hawaii* (1959) traditionally opens with the earliest history of an area—the geology, flora, and fauna—and ultimately encompasses the people who settle and rule there. He might spend years preparing a book, as he did in Spain for *Iberia: Spanish Travels and Reflections* (1968). His books were extremely popular, offering the reader a carefully and elaborately created world. In his later years, Michener turned his interest to American landscapes, in *Centennial* (1974) and *Chesapeake* (1978). *The Covenant* (1980) concerned South Africa and the background of apartheid. Another massive opus was *Space* (1982) in which he tried, with mixed results, to fictionally chronicle the U.S. space program. Not all of Michener's works were fictional. *The Fires of Spring* (1949) was autobiographical, as was his 1992 memoir, *The World Is My Home*. His last completed book was *A Century of Sonnets* (1997).

Michener in later life was a great philanthropist, contributing millions of dollars to universities and the Authors League Fund.

Michiel, Vitale II (d. 1172, Venice), doge of Venice who ruled during an important crisis in the Venetian Republic's relations with the Byzantine Empire and whose assassination led to a significant revision of the Venetian constitution.

Elected at the beginning of the Guelf–Ghibelline (papal–imperial) struggle, Vitale II maintained strict neutrality in spite of Venice's Guelf leanings. He relaxed this policy in 1160 during the siege of Milan by the emperor Frederick I Barbarossa, when he sent supplies to the Milanese.

Vitale's actions were an indication of the growing independence of Venice, which was nominally subject to the Byzantine Empire. In 1166 the Byzantine emperor Manuel I Comnenus sought to reimpose the old relationship by requesting a Venetian subsidy to help pay the costs of defense against Norman Sicily. But Venice's own relations with Sicily were good, and Vitale refused to pay the subsidy. Subsequently he ordered Venetian merchants to avoid Byzantine ports, for fear of reprisals, and then revoked the ban on Constantinople's assurances of his countrymen's safety. Suddenly on March 12, 1171, however, Comnenus ordered all Venetians in his empire arrested and their ships and goods seized.

Vitale was reluctant to go to war, but public sentiment forced his hand, and he led a fleet against Comnenus. Plague decimated the crews, and half of the ships had to be burned to keep them from the enemy. When the rest of the fleet returned to Venice, it spread plague among the populace. Holding the Doge responsible for the disasters, a mob assassinated him. The turmoil ended with changes in the constitution of the Venetian Republic limiting the power of the doge and people and increasing that of the wealthy oligarchic families.

Michigan, constituent state of the United States of America, lying in the Middle West, in the north-central United States, surrounded almost entirely by the Great Lakes. It is bounded on the north by Lake Superior, across from which is the Canadian province of Ontario; on the east by Lakes Huron and Erie and the southern tip of Ontario province; on the south by Ohio and Indiana; and on the west by Lake Michigan and Wisconsin. The capital is Lansing.

A brief treatment of Michigan follows. For full treatment, *see* MACROPAEDIA: United States of America: *Michigan.*

Michigan's original inhabitants were mainly Algonquian-speaking Indians. The French settled parts of the area in the 17th century, founding Sault Ste. Marie in 1668 and Detroit in 1701; fur trading was their primary activity. The English gained control of Michigan in 1763, the Americans in 1783, though the English maintained a presence until 1796 and actually recaptured Detroit in the early years of the War of 1812. After that war, settlement accelerated, and Michigan became the 26th state in 1837.

Michigan is divided into two large land segments: the Upper and Lower peninsulas. The western region of the Upper Peninsula is part of the Superior Upland, a rugged, mineral-rich area where elevations reach more than 1,900 feet (579 m). The remainder of the state is part of the Central Lowland, a mildly rolling area comprising largely denuded white-pine forests and sandy soil, though a fertile clay soil abounds in the south. The climate, which is tempered by the Great Lakes, is mild. Though the Upper Peninsula is cooler, the difference in temperature range between far northern and far southern cities is not excessive. In July, the average temperature in Sault Ste. Marie is 64° F (18° C); in Detroit, 73° F (23° C). The corresponding January averages are 14° to 16° F (−10° to −8.9° C) and 26° F (−3° C). Southern Michigan is the wettest part of the state; the average annual precipitation for the entire state is 31 inches (787 mm). The coastal strip along Lake Michigan receives an unusually large snowfall from westerly storms moving across the lake.

From its French period, Michigan had a sizable Roman Catholic population that was augmented by later waves of immigrants from Poland and Italy. The Upper Peninsula attracted a number of Finns and Cornishmen, and western Michigan was settled extensively by Dutch who brought their Reformed religious tradition with them. Germans settled throughout the state, but the Irish population remained largely urban. The migration of blacks to Michigan has been significant. In 1980 the state was nearly 13 percent black, but the city of Detroit was more than 63 percent black. Hispanic, Arab, and Asian immigrants constituted increasingly significant elements of the urban population in the 1980s. Michigan's rate of growth from 1970 to 1980 exceeded that of the other heavily industrial states in the Middle West but was still well below the national average. The city of Detroit continued to lose population—20 percent between 1970 and 1980—but the Detroit metropolitan area still represented almost half of the state's total population.

Agriculture is important but has not been as important as manufacturing during the 20th century. Grains are grown in the south, potatoes in the north. Fruit is grown along the coastal strip of Lake Michigan. The Upper Peninsula is rich in copper and iron ores, and mining is a mainstay of its economy.

Tourism has become a major industry, but manufacturing remains the basis of Michigan's economic strength. The automobile industry has long been synonymous with Detroit. Machinery, fabricated metals, food products, and chemicals are other major manufactures.

Water transportation is still important; exports are shipped from Detroit harbour, and metal ores (especially iron) travel by way of the Great Lakes. Railways date from 1836. The state is well served by roads and highways.

Detroit is the cultural centre of Michigan, with a symphony orchestra and the Institute of Arts. There are some 90 colleges and universities in the state, including the University of Michigan, opened in 1837. The Gerald R. Ford Museum in Grand Rapids and the Gerald R. Ford Library in Ann Arbor are relatively recent additions to the state's cultural resources. Local ethnic festivals include Holland's Tulip Time Festival and Frankenmuth's Bavarian Festival. Area 58,527 square miles (151,586 square km). Pop. (2000) 9,938,444.

Michigan, Lake, third largest of the five Great Lakes of North America and the only one lying wholly within the United States. Bordered by the states of Michigan (east and north), Wisconsin (west), Illinois (southwest), and Indiana (southeast), it connects with Lake Huron through the Straits of Mackinac in the north. The lake is 321 miles (517 km) long (north to south); it has a maximum width of 118 miles (190 km) and a drainage basin of about 45,500 square miles (118,000 square km), exclusive of its surface area, which is 22,300 square miles (57,757 square km). With a mean surface elevation of 579 feet (176 m) above sea level, the lake has a maximum depth of 923 feet (281 m). Currents are slight, with a generally southward drift along the western side, a northward drift along the eastern side, and at times counterclockwise swirls in the southern basin and around the Beaver Island group in the north. Approximately 100 streams flow into the lake, only a few of which are of appreciable size. The Manistee, Pere Marquette, White, Muskegon, Grand, Kalamazoo, and St. Joseph rivers enter the lake from the east. The Fox and Menominee rivers flow into Green Bay, a northwestern arm of the lake. The Chicago River flowed into the southwestern end of the lake but was reversed in 1900 so that it now drains through the Chicago Sanitary and Ship Canal into the Des Plaines River at Joliet, Ill. The northern end of the lake contains all of the islands, the largest of which is Beaver Island, Michigan.

The land adjacent to Lake Michigan is low and gently rolling, but wave-cut bluffs of rock occur in many places. Sand dunes are common along the southeastern shore, notably at the Indiana Dunes National Lakeshore and State Park, where prevailing winds blow sand inland. The moderating influence of the lake accounts for the noted fruit-growing region along its eastern shore.

Lake Michigan is part of the Great Lakes–St. Lawrence Seaway and, thus, handles international commerce. Although ice in the harbours limits navigation from mid-December through mid-April, the open lake rarely freezes over, and railway-car ferry service across the lake is maintained between some ports throughout the year.

The southern end of the lake abuts a great industrial complex centred on Chicago, which consumes large quantities of waterborne raw materials, principally iron ore, coal, and limestone; these are handled at the ports of Calumet (South Chicago) Harbor in Illinois and at Indiana (East Chicago) Harbor and Gary in Indiana. Some of the iron ore is loaded at Escanaba, Mich., on the lake's northern shore; but most is brought from the Lake Superior region. Milwaukee and Green Bay, Wis., are centres of distribution of coal from Lake Erie ports. Grain is shipped from Milwaukee and Chicago. Other major lake ports include Michigan City (Ind.); Waukegan (Ill.); Kenosha, Racine, and Manitowoc (Wis.); and Manistee, Ludington, Muskegon, Grand Haven, and Benton Harbor (Mich.).

The restocking of lake trout and the introduction of coho salmon have rejuvenated recreational and commercial fishing on the lake while also greatly reducing the population of alewives (small saltwater fish that entered the Great Lakes via the St. Lawrence Seaway and created many problems when large numbers died off in springtime). Although pollution is threatening the ecological balance of the lake, popular summer-resort areas dot its shores.

In 1634 the French explorer Jean Nicolet became the first European to see Lake Michigan. The Jesuit Claude-Jean Allouez began missionary work among the Indians of Green Bay and the Fox River in 1668. The French explorer Louis Jolliet and the French missionary Jacques Marquette mapped the lake's western shore from Green Bay to Chicago in 1673. Robert Cavelier, sieur de La Salle, also of France, brought the first sailing ship to the lake in 1679, but it was lost in a storm on its return eastward with a cargo of furs. La Salle later established a trading post near St. Joseph, Mich. The name of the lake is from the Algonquian Indian term *michigami,* or *misschiganin,* meaning "big lake."

Michigan, University of, state university of Michigan. It originated as a preparatory school in Detroit in 1817 and moved to Ann Arbor in 1837. It began to offer postsecondary instruction in 1841 and is now one of the leading research universities of the world. Branch campuses were opened in 1956 (Flint) and 1959 (Dearborn).

Though not a land-grant university in the sense of being a product of the Morrill Act of 1862, the University of Michigan profited from federal grants of land in 1826 and 1836. Under the vigorous presidencies of Henry P. Tappan (1852–63), who consciously adopted European and especially German models and fostered teaching education, and James Burrill Angell (1871–1909), Michigan became a leader in broadening higher education. It established the first medical school west of the Alleghenies and offered the first course in American history in any college. It was among the first colleges to admit women (1870) and blacks (1868). Angell succeeded in reorganizing the university to include all the principal professional schools and a graduate school. He also broadened the curriculum to include electives.

The university consists of the College of Literature, Science, and the Arts and of professional schools in architecture, art, business administration, dentistry, education, engineering, law, library science, medicine, music, natural resources, nursing, pharmacy, public health, and social work.

Special facilities and programs include the Institute for Social Research, the Survey Research Center, the Gerald R. Ford Presidential Library, the Phoenix Laboratory (which houses a two-megawatt nuclear reactor), a hospital complex, a broadcasting station, the Aerospace Engineering Laboratory, a naval tank for ship design studies, Great Lakes research ships and research aircraft; museums; and solar research observatories in Michigan and Hawaii.

Michigan City, city, La Porte county, northern Indiana, U.S. The city is situated on the southern end of Lake Michigan, 25 mi (40 km) east-northeast of Gary. It was laid out in 1830 by Maj. Isaac Elston as the terminus of the Michigan Road (whence its name) from the Ohio River. Once a major lumber port, it is now one of the state's leading vacation spots, near the Indiana Dunes National Lakeshore (1966), as well as an industrial centre. Manufactures include Pullman cars (started in 1852 when the railroad arrived) and mining equipment. Steel mills constructed in the 1960s at nearby Burns Harbor are part of a growing industrial complex. The Old Lighthouse (1858), one of the first on the Great Lakes, is now a museum. The Indiana State Prison (1860) is in the city. Purdue University North Central Campus is at Westville, 5 mi south, and International Friendship Gardens, 1½ mi east, has plantings representative of many nations. Inc. 1836. Pop. (1990) 33,822.

Michinaga (Japanese regent): *see* Fujiwara Michinaga.

Michoacán, state, west central Mexico, bounded by the Pacific Ocean on the south-southwest; the states of Colima, Jalisco, and Guanajuato on the northwest and north; Méhoxico on the east; and Guerrero on the south. The state's territory of 23,138 sq mi (59,928 sq km) rises from a narrow coastal plain to the Sierra Madre Occidental. It lies in an area of great volcanic activity: Mt. Jorullo arose during an eruption in an agricultural region in 1759, and in 1943 Paricutín suddenly appeared near Uruapan, the eruption that formed it continuing into 1952. The most important rivers draining to the Pacific are the Lerma, on the northwestern frontier, and the Balsas–Tepalcatepec, on the southern frontier, both of which have large-scale irrigation projects. The fertile mountain valleys are cool and healthful, but the coastal plain is hot and unhealthful. The state has two large lakes: Chapala, bordering Jalisco state, and Pátzcuaro, in a popular resort area where fishermen use lightweight, gracefully framed nets called butterfly nets.

Butterfly-net fishing off Janitzio Island on Lake Pátzcuaro, Michoacán state, Mexico
Art Resource

In the 1530s the Dominican Vasco de Quiroga established the first successful missions among the Tarascan Indians around Lake Pátzcuaro, in which, influenced by Thomas More's *Utopia,* he sought to organize a cooperative commonwealth. Crafts taught then survive today, and Quiroga's name is still venerated in the region. Michoacán produces a wide range of forest products, tropical crops, grains, minerals, oil, and sulfur. It is well served by highway, air, and rail routes. Important cities of the state are Morelia (*q.v.*), the capital; Uruapan; Zamora; and Pátzcuaro. The population is chiefly mestizo and Tarascan Indian. Pop. (1990 prelim.) 3,534,042.

Michurin, Ivan Vladimirovich (b. Oct. 27 [Oct. 15, Old Style], 1855, Vershino estate, near Dolgoye, Russia—d. June 7, 1935, Michurinsk, Russian S.F.S.R.), Russian horticulturist who earned the praise of the Soviet government by developing more than 300 new types of fruit trees and berries in an attempt to prove the inheritance of acquired characteristics. When Mendelian genetics came under attack in the Soviet Union, Michurin's theories of hybridization, as elaborated by T.D. Lysenko, were adopted as the official science of genetics by the Soviet regime, despite the nearly universal rejection of this doctrine by scientists throughout the world.

Michurinsk, also spelled MIČURINSK, formerly (until 1932) KOZLOV, city, Tambov *oblast* (province), western Russia, on the Lesnoy Voronezh River. Founded in 1636 as a fortress named Kozlov, it was chartered in 1779. Locomotive repair works reflect its junction position, and there are vegetable- and fruit-processing industries. It is a horticulture centre, with an institute founded by the Soviet scientist I.V. Michurin, who lived there until 1935 and after whom the city is named. Pop. (1991 est.) 109,400.

Miciński, Tadeusz (b. Nov. 9, 1873, Łódź, Pol., Russian Empire—d. February 1918, near Chirikova, Russia), writer, poet, and playwright of the Neoromantic period of Polish literature, a forerunner of Expressionism and Surrealism.

Miciński studied philosophy at the University of Kraków, traveled in Germany and Spain, and was influenced by Polish messianism and by Friedrich Nietzsche and Fyodor Dostoyevsky. Miciński's passionate metaphysical concerns led him to an obsessive concentration on the problem of good and evil. His major works are strange and fantastic depictions of imaginary societies in which human embodiments of moral opposites engage in combat, using the weapons of mystical awareness and revolutionary political action. His novel *Nietota. Księga tajemna Tatr* (1910; "Nietota: The Secret Book of the Tatra Mountains") is an imaginary re-creation of Polish life at the beginning of the 20th century. In the apocalyptic visions of his novel *Xiądz Faust* (1913; "Father Faust"), Miciński predicted that Polish–Russian brotherhood would come about through revolution. At the end of World War I Miciński was assassinated in the chaos of the Russian Revolution while he was helping to organize the Polish armed forces.

Micius (Chinese philosopher): *see* Mo-tzu.

Mickey Mouse, one of the most popular and famous characters of Walt Disney's animated cartoons. He was introduced in *Steamboat Willie* (1928), the first animated cartoon with sound. Mickey Mouse was created by Walt Disney; he was customarily drawn by Ub Iwerks, but his voice was provided by Disney himself. Mickey was often portrayed with a girlfriend, named Minnie Mouse. Mickey was a cheerful and mischievous anthropomorphic rodent who went on to star in more than one hundred cartoon shorts and became a virtual cult figure. In 1932 Disney was given an Honorary Award by the Academy of Motion Picture Arts and Sciences for the creation of Mickey Mouse.

Mickiewicz, Adam (Bernard) (b. Dec. 24, 1798, Zaos'ye, near Novogrudek, Belorussia, Russian Empire—d. Nov. 26, 1855, Constantinople), one of the greatest poets of Poland and a lifelong apostle of Polish national freedom.

Mickiewicz, detail of an oil painting by Aleksander Kamiński, 1850
By courtesy of the Polska Akademia Nauk, Instytut Sztuki, Warsaw

Born into an impoverished noble family, Mickiewicz studied at the University of Vilnius between 1815 and 1819; in 1817 he joined a secret patriotic student organization, the Filomaci, later incorporated in the Filareci.

His first volume of poems, *Poezja I* (1822; "Poetry I"), included ballads, romances, and an important preface explaining his admiration for these western European forms and his desire to transplant them to Polish soil. *Poezja II* (1823) contained parts two and four of his *Dziady* ("Forefather's Eve"), in which he combined folklore and mystic patriotism to create a new kind of Romantic drama. With the other Filareci, Mickiewicz was arrested in 1823 and sentenced to deportation to Russia for spreading Polish nationalism; he worked in Moscow and was befriended by most of the leading Russian writers, including Pushkin. In 1825 he visited the Crimea and soon after published his erotic *Sonety Krymskie* (1826; "Sonnets from the Crimea"). *Konrad Wallenrod* (1828) is a poem describing the wars of the Teutonic Order with the Lithuanians but actually representing the age-old feud between Poland and Russia.

Mickiewicz was finally able to leave Russia on the grounds of ill health in 1829. He traveled throughout Germany but missed participating in the unsuccessful Polish insurrection of 1830. In the third part of *Dziady* (1833; *Dziady III*), which he completed in 1832, Mickiewicz views Poland as fulfilling a messianic role among the nations of western Europe by its national embodiment of the Christian themes of self-sacrifice and eventual redemption. In 1832 he settled in Paris and there wrote, in biblical prose, the *Księgi narodu polskiego i pielgrzymstwa polskiego* ("Books of the Polish Nation and its Pilgrimage"), a moral interpretation of the history of the Polish people. His masterpiece, the great poetic epic *Pan Tadeusz* (1834; *Master Thaddeus*), describes the life of the Polish gentry in the early 19th century through a fictional account of the feud between two families of Polish nobles. The poem conveys perfectly the ethos of an archaic society in which the ideals of chivalry are still alive and shows the effect of the Napoleonic myth on honest and simple minds, to whom the French emperor is an instrument of Providence.

He was appointed professor of Latin literature at the University of Lausanne (Switzerland) in 1839 but resigned a year later to teach Slavonic literature at the Collège de France. He remained there until 1844, when he was suspended for teaching the mystical doctrines of the mesmerist Andrzej Towiański. In early 1848 he went to Rome to persuade the new pope to support the cause of Polish national freedom. Between March and October 1849 he edited the radical newspaper *La Tribune des Peuples* ("People's Tribune"). Napoleon III relieved him of his post at the Collège de France in 1852 but appointed him librarian at the Arsenal. In September 1855 he was sent to Turkey by Prince Adam Czartoryski to mediate between factions of Poles preparing to fight on the side of the Allies in the Crimean War, but he did not survive the trip. In 1890 his remains were reburied in the vault of Wawel cathedral in Kraków, where many Polish kings are laid to rest.

Mickiewicz was the principal poet of Polish Romanticism. His love lyrics, succinct and charged with emotion and meaning, raised the image of woman to ideal heights previously unknown in Polish poetry. With his exalted patriotism, mystical feeling, and passionate appreciation of the positive aspects of Polish life, he came to epitomize the Polish spirit for succeeding generations of his nation's writers.

Micmac, the largest of the Indian tribes occupying Canada's eastern Maritime provinces (Nova Scotia, New Brunswick, and Prince Edward Island). Because their Algonkian dialect differs greatly from that of their neighbours, the speculation is that they were latecomers to the area in prehistoric times. Historically, they were probably the Indians whom John Cabot first encountered in 1497. Although early chroniclers described them as fierce and warlike, they were among the first Indians to accept Jesuit teachings and to intermarry with the settlers of New France. In the 17th and 18th centuries they were allies of the French against the English, frequently descending to raid the New England frontiers. In the late 20th century their descendants, mixed with whites, numbered some 10,000 and lived generally as poor labourers.

The Micmac formed a confederacy of several clans (Micmac: "Allies"), each clan having its own symbols and its own chief, though leadership was not strong. Generally, even their war leaders were simply those demonstrating exceptional prowess. There were apparently no hereditary social classes, and slavery did not exist (male war prisoners were usually tortured to death, and captured women and children were assimilated into the tribe).

The Micmac were seasonally nomadic. In winter they hunted caribou, moose, and small game; in summer they fished, gathered shellfish, and hunted seals on the coasts. Winter dwellings were conical wigwams covered with birch bark or skins; summer dwellings were varied, usually oblong wigwams, relatively open-air. Clothing was typical of the eastern woodlands: loincloths for men, sheaths for women, and robes for both, with notable use of fringe. They were expert canoeists.

Their ceremonies were reported to be elaborate, but little is known of the nature of their rituals and religious beliefs.

Micon, also spelled MIKON (fl. 5th century BC), Greek painter and sculptor, a contemporary and pupil of Polygnotus, who, with him, was among the first to develop the treatment of space in Greek painting.

As a painter Micon is known for the mural painting on the Stoa Poikile ("Painted Portico") on the Agora at Athens and for the paintings at the Theseum at Athens. Micon and his teacher Polygnotus worked on the Stoa Poikile together, beginning shortly after 460 BC. While Polygnotus executed the central composition for the Stoa Poikile, Micon executed the "Amazonomachy," or the "Battle of Theseus and the Amazons," placed to the right of Polygnotus' work. This work apparently marked an important advance in the rendering of space, perspective, and distance by means of the placement of figures within a composition. The painting procured Micon a considerable reputation among his contemporaries. Micon began to work on the Theseum soon after 475 BC. Among the subjects represented there were the "Battle of the Centaurs and Lapiths" and the "Death of Theseus." Micon's innovations helped initiate the decline of Greek vase (pottery) painting because the small, curving surfaces of pots would not permit the spatial elaboration that was possible on the flat, wall-sized pictorial surfaces used by muralists.

microbiology, scientific study of microorganisms, a diverse group of simple life forms including protozoans, algae, molds, bacteria, and viruses. Research in microbiology is concerned with the structure, function, and classification of such organisms and with ways of controlling and exploiting their activities.

A brief treatment of microbiology follows. For full treatment, *see* MACROPAEDIA: Biological Sciences.

The foundations of microbiology were established during the last half of the 19th century. The French biologist and chemist Louis Pasteur determined the role of bacteria in fermentation and disease, and the German physician Robert Koch discovered a procedure for proving that a specific organism causes a specific disease. Other investigators soon developed elaborate methods and laboratory equipment with which they revealed the ubiquity, diversity, and powerful effects of microorganisms.

Many major advances have occurred in microbiology since the mid-20th century. A multitude of disease-causing microorganisms have been identified and the means of controlling their harmful effects developed. Research has, moreover, uncovered effective means of channeling the activities of various microorganisms so as to benefit medicine, industry, and agriculture. Molds, for example, are employed to produce enzymes and antibiotics, most notably penicillin. Certain bacteria also are cultivated on a large scale because they are useful in the commercial production of lactic acid, the derivatives of which are used as solvents and as a means of treating anemia and calcium deficiency. The field of genetic engineering (*q.v.*) led to entirely new industrial applications of bacteria, since some of those organisms that had been genetically altered were capable of synthesizing insulin and other biochemicals of great medical value.

microburst, pattern of intense winds that descends from rain clouds, hits the ground, and fans out horizontally. Microbursts are short-lived, usually lasting from about 5 to 15 minutes, and they are relatively contained, usually affecting an area of 0.6 to 1.9 miles (1 to 3 km) in diameter. They are often but not always associated with thunderstorms or strong rains. By causing a sudden divergence in wind direction or speed—a condition known as wind shear—microbursts create a particular hazard for airplanes at takeoff and landing because the pilot is confronted with a rapid and unexpected shift from headwind to tailwind.

In arid places the rain that is often associated with microbursts has evaporated before the downdraft reaches the ground; dry microbursts thus afford virtually no visible clue to their presence. Wet microbursts, typical of more humid areas, generally produce a visible rain shaft. The mechanics of the microburst phenomenon are not yet completely understood. Their existence was first observed in 1974 by Tetsuya Theodore Fujita, a Japanese-American meteorologist working at the University of Chicago.

microcephaly, condition of abnormal smallness of the head. Microcephalic individuals are usually severely retarded both mentally and developmentally. Primary microcephaly results when the brain itself is abnormally small (microencephaly), so that there is no stimulus for the vault to grow. It also occurs when all the cranial sutures fuse prematurely, precluding brain growth. Irradiation of the abdomen in pregnant women or maternal (and via the placenta, fetal) infection with German measles or toxoplasmosis during the first three months of pregnancy may sometimes produce a microcephalic child. Microcephaly of greater or lesser degree also accompanies various genetic syndromes such as Hurler's syndrome and some chromosomal disorders.

microclimate, any climatic condition in a relatively small area, within a few metres or less above and below the Earth's surface and within canopies of vegetation.

The strongest gradients and cyclical patterns of temperature and humidity occur just above and below the terrestrial surface. Complexities of microclimate are necessary for the existence of a variety of life forms because, although any single species may tolerate only a limited range of bioclimate, strongly contrasting microclimates in close proximity provide a total environment in which many species of flora and fauna can coexist and interact.

Microclimatic conditions depend on such factors as temperature, humidity, wind and turbulence, dew, frost, heat balance, and evaporation. The effect of soil type on microclimates is considerable. Sandy soils and other coarse, loose, and dry soils, for example, are subject to high maximum and low minimum surface temperatures. The surface reflection characteristics of soils are also important; soils of lighter colour reflect more and respond less to daily heating. Also strongly influencing the microclimate is the ability of the soil to absorb and retain moisture, which depends on the composition of the soil and its use. Vegetation, too, can insulate the soil below and reduce temperature variability. Sites of exposed soil then exhibit the greatest temperature variability.

Topography can affect the vertical path of air in a locale and, therefore, the relative humidity and air circulation. For example, air ascending a mountain undergoes a decrease in pressure and often releases moisture in the form of rain or snow. As the air proceeds down the leeward side of the mountain, it is compressed and heated, thus promoting drier, hotter conditions there. An undulating landscape can also produce microclimatic variety through the air motions produced by differences in density.

The microclimates of a region are strongly bound to the average moisture, temperature, and winds of the climate in general and to latitude, elevation, and season. Weather and climate are sometimes, in turn, influenced by microclimatic conditions, especially by variations in surface characteristics. Wet ground, for example, promotes evaporation and increases atmospheric humidity. The drying of bare soil, on the other hand, creates a surface crust that inhibits ground moisture from diffusing upward, which promotes the persistence of the dry atmosphere. Microclimates control evaporation from surfaces and influence precipitation, and so are important to the hydrologic cycle—*i.e.,* the processes involved in the circulation of the Earth's waters.

The initial fragmentation of rocks in the process of rock weathering and the subsequent soil formation are largely dependent on the prevailing microclimate, for the fracturing of rocks is accomplished by the frequent freezing of water trapped in their porous parts. The final weathering of rocks into the clay and mineral constituents of soils is largely a chemical process; however, such microclimatic conditions as relative warmth and moisture influence the rate and degree of weathering.

microcline, a common feldspar mineral, one form of potassium aluminosilicate ($KAlSi_3O_8$) that occurs in volcanic rock. Green specimens are called amazonstone, which is sometimes used as a gem. Microcline forms multiple-twinned crystals and two sets of fine, tapering lamellae at right angles to each other; this tartan twinning distinguishes it from other feldspars. Microcline is found at Baveno, Italy; Kragerø, Nor.; Madagascar; and, as amazonstone, in the Urals, Russia, and Florissant, Colo., U.S. For detailed physical properties, *see* feldspar (table).

Microcline is the form of potassium feldspar that is stable at the lowest temperatures. Its structure differs from that of orthoclase because of a different distribution of silicon and aluminum atoms in its aluminosilicate crystal framework. Microcline exhibits a variation in symmetry. Individual specimens range from those that are triclinic (three unequal axes inclined obliquely to one another) to those that are barely distinguishable from monoclinic (three unequal axes, only one of which is inclined obliquely).

Microcline forms a series of mixtures with the plagioclase albite, the sodium atoms of which replace the potassium atoms in the microcline structure. The intermediate members of the series are called microcline–microperthites and exhibit unmixing (separation) of the sodium and potassium phases into minute intergrowths of distinct crystals of the pure compounds. It has been suggested that this chemical variation might also influence the symmetry.

Micrococcus, genus of spherical bacteria in the family Micrococcaceae that is widely disseminated in nature. Micrococci are microbiologically characterized as gram-positive cocci, 0.5 to 3.5μm (micrometres; 1μm$=10^{-6}$ metre) in diameter.

Micrococci are usually not considered pathogenic. They are normal inhabitants of the human body and may even be essential in keeping the balance among the various microbial flora of the skin. Some species are found in the dust of the air (*M. roseus*), in soil (*M. denitrificans*), in marine waters (*M. colpogenes*), and on the skin or in skin glands or skin-gland secretions of vertebrates (*M. flavus*). Those species found in milk, such as *M. luteus, M. varians,* and *M. freudenreichii,* are sometimes referred to as milk micrococci and can result in spoilage of milk products.

microcomputer, any of a class of small digital computers whose central processing unit (CPU) is contained on a single integrated semiconductor chip. A microcomputer uses a single microprocessor (*q.v.*) for its CPU, which performs all logic and arithmetic operations. The system also contains a number of associated semiconductor chips that serve as the main memory for storing program instructions and data and as interfaces for exchanging data of this sort with peripheral equipment—namely, input/output devices (*e.g.,* keyboard, video display, and printer) and auxilliary storage units. Smaller microcomputers first marketed in the 1970s contain a single chip on which all CPU, memory, and interface circuits are integrated.

As large-scale integration and then very-large-scale integration have progressively increased the number of transistors that can be placed on one semiconductor chip, so the processing capacity of microcomputers using such single chips has grown commensurately. During the 1980s microcomputers came to be used widely in other applications besides video games and other relatively simple computer-based recreations. Increasingly powerful microcomputers began to be used in personal computer systems and workstations, for instance. High-performance microcomputer systems are used widely in business, in engineering, in "smart" or intelligent machines employed in the factory and office, and in military electronics systems.

In the early 1990s, small computers that fit in a pocket yet provide the power of a desktop personal computer were introduced. These pocket, or palm-sized, computers are distinguished by their high portability, enhanced performance, and low cost. *See also* digital computer.

microcopy: *see* microform.

microcosm (from Greek *mikros kosmos,* "little world"), a Western philosophical term designating man as being a "little world" in which the macrocosm, or universe, is reflected. The ancient Greek idea of a world soul (*e.g.,* in Plato) animating the universe had as a corollary the idea of the human body as a miniature universe animated by its own soul. The notion of the microcosm dates, in Western philosophy, from Socratic times (Democritus specifically referred to it)—*i.e.,* from the 5th century BC. Propagated especially by the Neoplatonists, the idea passed to the Gnostics, to the Christian scholastics, to the Jewish Kabbalists, and to such Renaissance philosophers as Paracelsus. The supposed analogy between the whole and its parts served not only to develop a cosmology in which the reality of the individual received due attention but was also fundamental to astrology and other fields in which belief in a metaphysical relationship between man and the rest of nature is postulated. In later philosophy the monadology of G.W. Leibniz presented a comparable view of man and the universe; and, in the 19th century, Rudolf Lotze chose *Mikrokosmus* as the title of his major work on the theory of knowledge and reality.

microcredit, also called MICROBANKING, a means of extending credit, usually in the form of small loans with no collateral, to nontraditional borrowers such as the poor in rural or undeveloped areas.

This approach was institutionalized in 1976 by Muhammad Yunus, an American-educated Bangladeshi economist who had found that a significant percentage of the world's population lacked the means to borrow money, build their trades, and rise out of poverty. Yunus set out to solve this problem by founding the Grameen Bank (*q.v.*) in Bangladesh. The Grameen approach is unique because the small loans are guaranteed by members of the borrower's community; pressure within the group encourages borrowers to pay back the loans in a timely manner. Grameen's clients are among the poorest of the poor, many of whom had relied on a barter economy to meet their daily needs.

The success of microloans in Bangladesh led to similar programs in other developing nations, including Bolivia and Indonesia. An alternative approach to Grameen-style lending is stepped lending, in which a borrower begins with a very small loan, repays it, and qualifies for successive loans at higher values.

microcrystalline wax, any petroleum-derived plastic material that differs from paraffin waxes in having much finer and less-distinct crystals and higher melting point and viscosity. Microcrystalline waxes are used chiefly in laminated-paper products, in coatings and linings, and in adhesives, sealing compositions, and various types of polishes.

In contrast to paraffins, microcrystalline waxes may vary widely in character depending on the crude-oil source and the method and degree of refinement. Some are ductile, like beeswax; others are hard and brittle; and still others crumble easily during handling. The melting-point range is higher than that of paraffin wax, with commercial grades ranging from 63° to 93° C (145° to 200° F). The colour of microcrystalline waxes ranges from creamy white to dark brown. Decolorization is difficult, and these waxes' odour and taste may be undesirable in some applications.

Microcrystalline waxes may be made from the residue of crude petroleum by refining; or they may be made from petroleum jelly by removing the oil with a solvent. Their physical properties may be controlled by the temperature of the solvents. Methods of separation include solvent dilution, chilling, centrifuging, filtering, and various combinations of these.

Chemically, microcrystalline waxes consist of saturated aliphatic hydrocarbons.

Microcycas, a genus of palmlike cycads (plants of the family Cycadaceae), native to Cuba. The only species, corcho (*M. calocoma*), is columnar in habit and occasionally branched; it reaches heights of 9 m (30 feet) or more and is often mistaken for a palm.

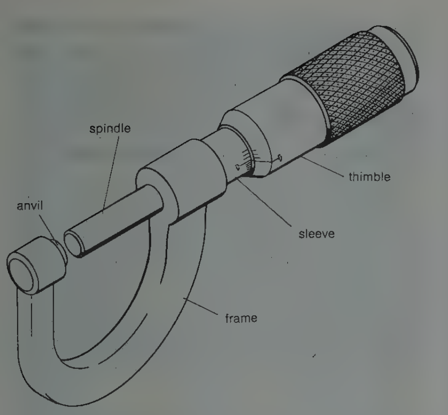
microeconomics, study of the economic behaviour of individual consumers, firms, and industries and the distribution of total production and income among them. It considers individuals both as suppliers of labour and capital and as the ultimate consumers of the final product, and it analyzes firms both as suppliers of products and as consumers of labour and capital. Microeconomics seeks to analyze the market or other type of mechanism that establishes relative prices among goods and services and allocates society's resources among their many alternative uses. *Compare* macroeconomics.

microfauna, small, often microscopic animals, especially those inhabiting the soil, an organ, or other localized habitat. Single-celled protozoans, small nematodes, small unsegmented worms, and tardigrades (eight-legged arthropods) are the most common components of microfauna. Many inhabit water films or pore spaces in leaf litter and in the soil, feeding on smaller microorganisms that decompose organic material.

microform, also called MICROCOPY, or MICRORECORD, any process, photographic or electronic, for reproducing printed matter or other graphic material in a much-reduced size, which can then be re-enlarged by an optical apparatus for reading or reproduction. Microform systems provide durable, extremely compact, and easily accessible file records.

The science of microphotography burgeoned in the late 20th century, with scores of processes and a variety of miniaturizations being introduced. Generally speaking, a microform may be in the form of continuous media, such as roll or cartridge microfilm, or in that of individual and physically separate records, such as film chips (microfilm containing coded microimages, to be used in automatic retrieval systems) or microfiche (a sheet of microfilm displaying at the top a title or code readable with the naked eye). Use of the microform permits considerable space saving. The microform usually utilizes photographic techniques; however, other methods such as video magnetic tape recording have been used. Most microform techniques also permit the document file to be duplicated easily for dissemination or filing in different places.

micrometer, in full MICROMETER CALIPER, instrument for making precise linear measurements of dimensions such as diameters, thicknesses, and lengths of solid bodies; it consists of a C-shaped frame with a movable jaw operated by an integral screw. The fineness of the measurement that can be made depends on the lead of the screw—*i.e.,* the amount the spindle moves toward or away from the anvil



Micrometer

in one revolution and the means provided for indicating fractional parts of a revolution. The accuracy of the measurements depends on the accuracy of the screw-nut combination.

micrometre, also called MICRON, metric unit of measure for length equal to 0.001 mm, or about 0.000039 inch. Its symbol is μm. The micrometre is commonly employed to measure the thickness or diameter of microscopic objects, such as microorganisms and colloidal particles. Minute distances, as, for example, the wavelengths of infrared radiation, are also given in micrometres.

Micronesia, ethnogeographic grouping of Pacific Islands encompassing the generally small islands and island groups of Kiribati (formerly the Gilbert Islands), Guam, Nauru, the Commonwealth of the Northern Marianas, the Federated States of Micronesia (Yap, Pohnpei [Ponape], Chuuk [Truk], and Kosrae of the Caroline Islands), the Republic of the Marshall Islands, and the Republic of Palau (Belau). Located, for the most part, northward from the Equator, Micronesia (from Greek *mikros,* "small," and *nēsoi,* "islands") includes the westernmost of the Pacific Islands.

A brief treatment of Micronesia follows. For information about regional aspects of Micronesia, *see* MACROPAEDIA: Pacific Islands.

The island arcs of Micronesia rise abruptly from the deep ocean and comprise volcanic mountain ranges built up from lava from the fractured ocean floor. When the mountain mass rises above the ocean surface, the resulting islands have topography that is generally rugged, with sharp peaks, ridges, cliffs, and (on those with streams) canyons and waterfalls. Termed "high islands" because of their high elevations, these islands are often fringed with coral reefs. By contrast, "low islands" are composed exclusively of coral formations, which result in either single coral islands or, more commonly, coral atolls. Kwajalein Atoll in the Marshalls is the world's largest coral atoll.

Mangrove and tropical forests and scrubland constitute most of the ground cover on the islands. Native species of animals include snakes, lizards, and numerous species of birds. A greater variety of both flora and fauna is found on the high islands. The reefs and lagoons abound in lobsters, shrimps, clams, oysters, octopuses, turtles, and innumerable species of fish.

Western Micronesia (comprising Palau and the Mariana Islands) was probably settled by peoples from Indonesia or the Philippines some 3,500 years ago, and eastern Micronesia was possibly settled from eastern Melanesia at about the same time.

Among the high-island cultures of Micronesia there are seven major cultures: the Chamorros, most of whom live on the four southernmost of the Marianas; the Palauans; the Yapese; the Chuukese, of the dozen or so islands in the Chuuk Lagoon; the Pohnpeians; the Kosraeans; and some of the Nauruans. The two distinctive low-island cultures are those of the Marshall Islands and the Gilberts (composing Kiribati).

Settlement patterns of the Micronesians were typified by the dispersed, extended-family homestead. Those who inhabited the larger atolls generally lived along the lagoon side. Most Micronesian communities had meeting-houses and canoe houses (for storage). At the time of European contact, Micronesian extended families lived in thatched, one-room houses. Communities were small and were located near a stream, a lagoon, or the sea.

Except for the Yapese, Micronesians generally followed a system of matrilineage. They commonly channeled their social, economic, and political activities along lines of mutual aid and obligation among local groups related by blood or marriage. Male heads of various kin groups acted as leaders within the community.

Early Micronesians lived by subsistence horticulture and fishing; horticulture was a more likely enterprise on the high islands and fishing among the atoll inhabitants. Fish, breadfruit, bananas, pandanus, taro, tropical yams, and coconut were widely distributed and served as the main foods.

Land was the most important property among the Micronesians. On the larger high islands, some of the interior land was communally owned. Feasts were an important aspect of island life, providing one of many types of exchange common in Micronesia.

The Micronesians were polytheists, believing in several high gods, a large number of spirits attached to specific localities or credited with performing specific functions, and a number of ancestors and deceased neighbours who could sometimes make contact with their living descendants and friends.

Much of Micronesian art was ephemeral, consisting of singing, dancing, storytelling, and body painting. Few permanent artifacts remain. Contact with European culture had a great effect on Micronesian arts. Traditional sports, dance, and music are performed more often at the instigation of curious outsiders than for members of the local communities.

The Austronesian languages of the varied populations of Micronesia are mutually unintelligible. Polynesian languages are spoken by the inhabitants of the Ellice Islands and some isolated atolls. English is also widely spoken.

In recent times substantial movements of indigenous population have occurred within Micronesia, generally from the low islands to the nearest high island.

The economies of most Micronesian islands still are based largely on subsistence farming and fishing. The principal cash crop on most islands is coconuts (which are dried for copra). Guam and some other large islands rear some cattle and water buffalo, but pigs and chickens predominate on all the islands. Milk and dairy products must be imported by most of the islands.

There are no sizable mineral deposits in Micronesia except phosphates, which have been mined only on Nauru. Many islands use coral limestone for cement and other construction materials. In general, local industries are limited to processing agricultural commodities such as copra, coconut oil, and fish and to producing furniture, small boats, bottled soft drinks, and handicrafts.

Construction is concentrated on projects sponsored by the military on islands associated with the United States and on roads, housing, and basic infrastructure elsewhere. The periodic devastation wrought by typhoons requires that all Micronesian islands have facilities for repair and maintenance.

Tourism is of growing importance as air transport is extended. Touring by boat is especially popular throughout Micronesia.

The first European colonies in Micronesia were established by Spain in 1668. After the loss of its Pacific colonies, Spain sold the islands to Germany between 1885 and 1899. Japan occupied the islands in 1914 and was granted a mandate in 1920 by the League of Nations to govern them. The islands were heavily fortified by the Japanese before World War II and were occupied by the United States after bitter fighting in 1944. The United Nations granted a trusteeship mandate to the United States in 1947.

A three-branch government patterned on the U.S. federal government was created in 1968. In 1973–74 the Congress of Micronesia adopted guidelines for a constitutional convention that would lead to independence. Regional differences led to a division of the islands into four constituencies when the proposed constitution was voted on in 1978. The Kosrae, Pohnpei, Chuuk, and Yap districts approved it and formed the Federated States of Micronesia. Of the districts that rejected the constitution, the Northern Marianas chose commonwealth status with the United States in 1978. The Marshall Islands voted for an independent constitution in 1979. By 1991 the status of Palau alone remained uncertain.

Micronesia, officially FEDERATED STATES OF MICRONESIA, republic of the western Pacific Ocean, comprising the island states (from west to east) of Yap, Chuuk (Truk), Pohnpei (Ponape), and Kosrae, all in the Caroline Islands. The capital is Palikir on the island of Pohnpei. Area 271 square miles (701 square km). Pop. (1991 est.) 111,000.

A brief treatment of Micronesia follows. For full treatment, *see* MACROPAEDIA: Pacific Islands.

For current history and for statistics on society and economy, *see* BRITANNICA BOOK OF THE YEAR.

The land. The more than 600 islands and islets may be divided into two groups: to the east (in Chuuk, Pohnpei, and Kosrae states) are islands formed of coral caps on mountains of volcanic origin rising from the ocean floor; and to the west (in Yap state) are continental islands formed by folds in the Earth's crust that rise above the surface of the ocean. Yap island and six islands in the Chuuk group rise to more than 500 feet (150 m), and Kosrae and Pohnpei islands have peaks above 2,000 feet (600 m). The remaining formations in the Federated States consist mostly of low-lying atolls having sand islands on top of a coral reef, the whole enclosing a lagoon. There are also a few isolated coral islands. Pohnpei is the largest of the republic's islands, with an area of 129 square miles (334 square km). The islands and atolls extend about 1,750 miles (2,800 km) east-west and about 600 miles (965 km) north-south.

The climate is tropical, with a mean annual temperature of 81° F (27° C). Rainfall gradually decreases from east to west, from 200 inches (5,000 mm) on Pohnpei to about 120 inches (3,000 mm) on Yap. Numerous typhoons originate in the area each year. On the high islands of Kosrae, Pohnpei, and the Chuuk group, vegetation consists of mangrove swamps on the shore and of grassland, forest, or scrub ascending to the rain forests of the central mountain areas. On the coral atoll islands and Yap, the predominant vegetation is coconut and pandanus palms and breadfruit trees.

The people. The indigenous people of the Federated States are Micronesian and exhibit great diversity in physical types, cultures, and languages. The people of Kapingamarangi and Nukoro atolls, situated southwest of Pohnpei, have a Polynesian culture. Approximately one-half of the country's population lives on Pohnpei, Weno (Moen) in the Chuuk group, and Yap. Pohnpei alone has about 27 percent of the total population, and the islands in the Chuuk group (including Weno) have approximately 50 percent; Kosrae also has a relatively large population. The majority of the people live in traditional villages and are predominantly Christian. Malayo-Polynesian languages and English are widely spoken in the islands.

The economy. Subsistence farming and fishing are the principal economic activities. The staple crops are breadfruit, taro, coconuts, and bananas; yams, cassava, and sweet potatoes are grown on some of the high islands. The main source of revenue is U.S. government grants, which account for an estimated 70 percent of the gross national product (GNP). Copra exports and income from the sale of fishing rights, both mostly to Japan, are additional sources of revenue. Black pepper is grown on Pohnpei for export, and there is some tourism. Imports include rice and other foodstuffs and manufactured goods.

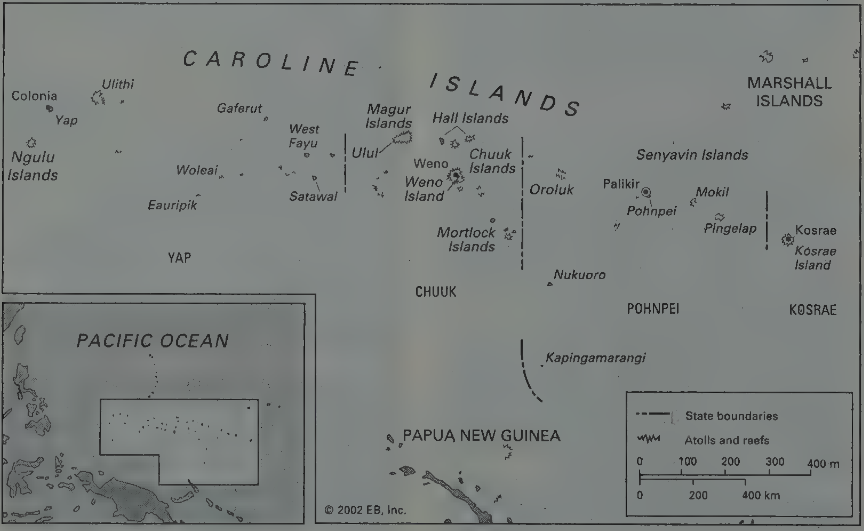
Transportation among the islands and atolls is by boat or air. The major commercial ports are at Takatik near Pohnpei, Kosrae, Colonia on Yap, and Weno. International airports and television stations are located on Yap, Pohnpei, and Weno.

Government and social conditions. The government of the Federated States of Micronesia consists of a president and vice president elected by the unicameral National Congress, which is made up of one at-large senator from each state, with four-year terms, and single-district senators, with two-year terms, elected on the basis of population. Each of the four local state governments has a popularly elected governor and a unicameral legislature.

Under the terms of the Compact of Free Association with the United States, which was signed by the Federated States of Micronesia in 1982, the United States is responsible for internal security and defense and provides financial assistance to the republic. The compact's articles also allow for the islands to become fully independent or to alter their status with the United States at any time, based on approval through a plebiscite.

There are hospitals on Yap, Weno, Pohnpei, and Kosrae and dispensaries on the inhabited islands. Each inhabited atoll and large island has at least one primary school. Yap, Ulithi, Weno, Weipat (Chuuk group), Pohnpei, and Kosrae have secondary schools. The Community College of Micronesia (established 1970; formerly the Micronesian Teacher Education Center) is on Pohnpei.

History. The islands that make up the Federated States were probably settled by people from eastern Melanesia some 3,500 years ago. The islands were colonized by Spain in the 17th century and eventually came under Japanese rule after World War I. They were taken by American forces during World War II. In 1947 the area encompassed by the four states, then divided into three districts, became part of the United Nations Trust Territory of the Pacific Islands, administered by the United States. Under the constitution of the Federated States of Micronesia, the country became an internally self-governing federation in 1979. The Federated States, in 1982, signed a Compact of Free Association with the United States, which was endorsed by referendum in 1983 and by U.S. law in 1985. Micronesia was admitted as a member of the United Nations in 1991.



Federated States of Micronesia

Micronesian languages, group of mutually unintelligible languages belonging to the Eastern, or Oceanic, branch of the Austronesian (Malayo-Polynesian) language family and most closely related to the Melanesian and Polynesian languages. The seven languages in the Micronesian group, all closely related, are the Nuclear Micronesian languages, including Marshallese, Gilbertese, Chuukese, Pohnpeian, Kosraean, Carolinean, and Ulithian. Two more languages of Micronesia that belong to the Polynesian group are Nukuoro and Kapingamarangi. Two languages spoken in Micronesia appear to be most closely related to the Western, or Indonesian, branch of the Austronesian languages—Chamorro, closely similar to the languages of the Philippines, and Palauan, the affinities of which are less certain but clearly Indonesian.

In addition, two Micronesian languages, Yapese and Nauruan, are of uncertain relation to the Nuclear Micronesian group. Nuclear Micronesian languages are similar in phonology and close enough in structure to show their close interrelationship, but vocabulary items generally show few similarities, with less than 25 percent of the total vocabulary similar within closely related languages.

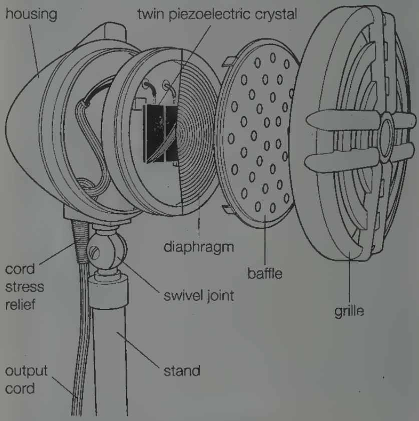
micronutrient: *see* trace element.

micropegmatite, quartz and alkali feldspar intergrowth so fine that it can be resolved only under the microscope; it is otherwise indistinguishable from the coarser intergrowths known as graphic granite. The quartz-feldspar interfaces are planar, and the quartz areas tend to be triangular in cross section. These patches of quartz are in parallel optical orientation, and it was long supposed that they were actually continuous, either above or below the plane of observation; a detailed study of the coarser intergrowths common in many pegmatites indicated, however, that the various quartz patches usually are separate individuals. Both the angular (runic, or letterlike) character of the quartz areas and their optical parallelism are evidently crystallographic responses to growth conditions.

Micropegmatite often occurs in granite and diabase and composes all or a large part of granophyre. Where the intergrowth is coarse enough and sufficiently abundant to permit chemical analysis, the bulk composition averages about 25 percent quartz and 75 percent feldspar. This composition often is that of granites and rhyolites. In diabase, micropegmatite may be interstitial, forming pods (roughly cylindrical cigar-shaped aggregates), seams, or veins.

microphone, device for converting acoustic power into electric power that has essentially similar wave characteristics. While those on telephone transmitters comprise the largest class of microphones, the term in modern usage is applied mostly to other varieties.

Apart from telephone transmitters, microphones are most widely applied in hearing aids, sound-recording systems (principally magnetic and digital tape recorders), dictating machines, and public-address systems. Microphones are extensively used in communications systems, radio or wire, to provide better response quality than with conventional telephone transmitters, or for hands-free operation.



Cross section of a crystal microphone
EB Inc.

In a microphone, sound waves (sound-pressure variations in the air) are converted into corresponding variations in electric current in two operations that take place almost simultaneously. In the first, the sound wave impinges on a slightly flexible surface (diaphragm), causing it to move to and fro in a manner corresponding to the movement of the air particles. In the second, the diaphragm by its motion causes a corresponding change in some property of an electric circuit. Depending on the type of microphone, displacement of the diaphragm may cause variations in the resistance of a carbon contact (carbon microphone), in electrostatic capacitance (condenser microphone), in the motion of a coil (dynamic microphone) or conductor (ribbon microphone) in a magnetic field, or in the twisting or bending of a piezoelectric crystal (crystal microphone; *see* Figure). In each case, motion of the diaphragm produces a variation in the electric output. By proper design, a microphone may be given directional characteristics so that it will pick up sound primarily from a single direction (unidirectional), from two directions (bidirectional), or more or less uniformly from all directions (omnidirectional).

microprocessor, any of a type of miniature electronic device that contains the arithmetic, logic, and control circuitry necessary to perform the functions of a digital computer's central processing unit (*q.v.*). In effect, this kind of integrated circuit can interpret and execute program instructions as well as handle arithmetic operations.

The microprocessor was developed in the late 1970s as a result of large-scale integration (LSI), which made it possible to pack thousands of transistors, diodes, and resistors onto a silicon chip less than 0.2 inch (5 mm) square. During the early 1980s very-large-scale integration (VLSI) vastly increased the circuit density of microprocessors. A single VLSI circuit holds hundreds of thousands of electronic components on a chip identical in size to the LSI circuit.

The production of inexpensive microprocessors enabled computer engineers to develop microcomputers. Such computer systems are smaller than portable television sets but have enough computing power to perform many business, industrial, and scientific tasks. The microprocessor also permitted the development of so-called intelligent terminals, such as automatic teller machines and point-of-sale terminals employed in retail stores. The microprocessor also provides automatic control of industrial robots, surveying instruments, and various kinds of hospital equipment. It has brought about the computerization of a wide array of consumer products, including programmable microwave ovens, self-tuning television sets, and electronic games. In addition, some automobiles feature microprocessor-controlled ignition and fuel systems designed to improve performance and fuel economy.

microrecord: *see* microform.

microscope, instrument for producing enlarged images of extremely small objects. With the aid of a scanning tunneling microscope, objects as small as atoms may be seen and studied. Microscopes are indispensable in many scientific fields.

A brief treatment of microscopes follows. For full treatment, *see* MACROPAEDIA: Microscopes.

The simplest microscope comprises a single lens. Such magnifiers were in use by the mid-15th century, and by 1674 the Dutch naturalist Antonie van Leeuwenhoek had produced lenses powerful enough to enable him to observe bacteria 2–3 micrometres in diameter.

In the compound microscope an additional lens is employed to enlarge the image produced by a primary lens. This instrument was invented in the Netherlands between 1590 and 1609, but it did not come into universal use until after 1830, when the English microscopist Joseph Lister established the theoretical principles that made possible the construction of lenses free of chromatic and spherical aberration. By the end of the 19th century there were available microscopes that achieved resolution equal to the theoretical limit set by numerical aperture and the wavelengths of visible light and ultraviolet radiation.

In 1924 the French physicist Louis de Broglie showed that a beam of electrons may be considered as a form of wave motion having a much shorter wavelength than that of light. Based on that idea, the electron microscope, in which specimens are illuminated by an electron beam that is focused by an electrostatic or electromagnetic field, was developed in the 1930s. Modern electron microscopes provide detailed images at magnifications of more than 250,000. The field lenses of electron microscopes, however, suffer the same defects as do the glass lenses of optical microscopes, including chromatic and spherical aberrations. High-frequency sound waves (above the range of human hearing) have wavelengths comparable to those of visible light. This understanding led to use of sound rather than optical waves in microscopy. Although the idea dates to the 1940s, the first working acoustic microscopes were not developed until the 1970s. Because sound waves can penetrate opaque materials, acoustic microscopes are capable of providing images of the internal structures, as well as the surfaces, of many objects that cannot be viewed with an optical microscope.

The scanning tunneling microscope, introduced in the early 1980s, measures variations in an electric current that is generated between the microscope probe and the surface of a specimen. The image of the surface that is produced is of such high resolution that individual atoms can be seen.

microscopic reversibility, principle of, principle formulated about 1924 by the American scientist Richard C. Tolman that provides a dynamic description of an equilibrium condition. Equilibrium is a state in which no net change in some given property of a physical system is observable; *e.g.,* in a chemical reaction, no change takes place in the concentrations of reactants and products, although the Dutch chemist J.H. van't Hoff had already recognized that this condition results from the equality of the forward and backward rates of a reversible reaction. According to the principle of microscopic reversibility, at equilibrium there is continuous activity on a microscopic (*i.e.,* atomic or molecular) level, although on a macroscopic (observable) scale the system may be considered as standing still. There is no net change favouring any one direction, because whatever is being done is being undone at the same rate. Thus, for a chemical reaction at equilibrium, the amount of reactants being converted to products per unit time is exactly matched by the amount being converted to reactants (from products) per unit time. The principle of microscopic reversibility, when applied to a chemical reaction that proceeds in several steps, is known as the principle of detailed balancing. Basically, it states that at equilibrium each individual reaction occurs in such a way that the forward and reverse rates are equal.

Microsoft Corporation, leading developer of personal-computer software systems and applications. The company also publishes books and multimedia titles, and offers electronic mail services. It has sales offices throughout the world but does virtually all of its research and development at its corporate headquarters in Redmond, Wash., U.S.

In 1975 William H. Gates and Paul G. Allen, two boyhood friends from Seattle, converted BASIC, a popular mainframe programming language, for use on an early personal computer (PC), the Altair. Shortly afterward Gates and Allen founded Microsoft, deriving the name from the words "microcomputer" and "software." During the next few years they refined BASIC and developed other programming languages. In 1980 International Business Machines (IBM) asked Microsoft to produce the essential software, or operating system for its first personal computer, the IBM PC. Microsoft purchased an operating system from another company, modified it, and renamed it MS-DOS (Microsoft Disk Operating System). MS-DOS was released with the IBM PC in 1981. Thereafter, most manufacturers of personal computers licensed MS-DOS as their operating system, generating vast revenues for Microsoft; by the early 1990s it had sold more than 100 million copies of the program and defeated rival operating systems such as CP/M, which it displaced in the early 1980s, and later OS/2. Microsoft deepened its position in operating systems with its Windows graphical command program, whose third version, released in 1990, gained a wide following. By 1993, Windows 3.0 and its subsequent versions were selling at a rate of one million copies per month, and nearly 90 percent of the world's PCs ran on a Microsoft operating system. In 1995, the company released Windows 95, which for the first time fully integrated MS-DOS with Windows and effectively matched in ease of use Apple Computer's Macintosh OS. It also became the leader in productivity software such as word-processing and spreadsheet programs, outdistancing long-time rivals Lotus and WordPerfect in the process

Microsoft dramatically expanded its electronic publishing division, created in 1985 and already notable for the success of its multimedia encyclopaedia, *Encarta.* It also entered the information services and entertainment industries with a wide range of products and services, most notably the Microsoft Network and MSNBC (a joint venture with the National Broadcasting Company, a major American television network).

As a result, by the mid-1990s Microsoft, which became a publicly owned corporation in 1986, had become one of the most powerful and profitable companies in American history. It consistently earned profits of 25 cents on every sales dollar, an astonishing record; net income topped $2.1 billion in the company's fiscal year ending June 30, 1996. However, its rapid growth in a fiercely competitive and fast-changing industry spawned resentment and jealousy among rivals, some of whom complained that the company's practices violated U.S. laws against unfair competition. Microsoft and its defenders countered that, far from stifling competition and technical innovation, its rise had encouraged both and that its software had consistently become less expensive and more useful. A U.S. Justice Department investigation concluded in 1994 with a settlement in which Microsoft changed some sales practices that the government contended enabled the company to unfairly discourage OS customers from trying alternative programs. The following year, the Justice Department successfully challenged Microsoft's proposed purchase of Intuit, the leading maker of financial software for the PC.

Partly because of its stunning success in PC software, Microsoft was slow to realize the commercial possibilities of network systems and the Internet. In 1993 it released Windows NT, a landmark program that tied disparate PCs together and offered improved reliability and network security. Sales were initially disappointing, but by 1996 Windows NT was hailed as the likely standard for PC networking, challenging Novell's NetWare. Microsoft did not move into Internet software until a new venture, Netscape, Inc., had introduced Navigator, a Web "browser" program that simplified the once-arcane process of navigating the World Wide Web. In a violent change of course, Microsoft quickly developed its own browser, Internet Explorer, made it free, and moved aggressively to persuade computer makers and Internet service providers to exclusively distribute it. By 1996 Microsoft was bundling Explorer with Windows OS and had begun the process of integrating Explorer directly into Windows. In response, Netscape accused Microsoft of violating its 1995 consent decree and sued; these efforts helped to persuade the U.S. Department of Justice to reopen a broad investigation of Microsoft.

In 1999, following a trial that lasted 30 months, a judge found Microsoft in violation of the Sherman Antitrust Act and ordered the breakup of the company. In 2001 an appeals court overturned the breakup order but still found the company guilty of illegally trying to maintain a monopoly.

microsporidian, any parasitic protozoan of the phylum Microsporidia (Microspora), found mainly in cells of the gut epithelium of insects and the skin and muscles of fish. They also occur in annelids and some other invertebrates. Infection is characterized by enlargement of the affected tissue.

Microsporidians have minute spores (2 to 20 micrometres, or 0.00008 to 0.0008 inch) that contain a single polar filament and the infective parasite (sporoplasm). When spores are ingested by a new host, the organisms enter the gut epithelium and reach specific tissues through the bloodstream or the body cavity. In the host cells they grow and repeatedly divide asexually. The mature parasites (trophozoites) eventually give rise to sexually produced zygotes that produce new spores. The species *Nosema bombycis* causes the disease pébrine in silkworms (*see* Nosema).

microsurgery, also called MICROMANIPULATION, or MICRURGY, the specialized surgical technique of observing through a compound microscope when operating on minute structures of the human body. Microsurgery has made possible significant advances in surgery on humans, especially in delicate operations on the inner ear, eye, brain, and nerve fibres and small blood vessels in general. The technique also has applications in research on cells, cell constituents, and embryos and is used in various other biomedical areas of study.

In microsurgery, the surgeon observes the body structure he is operating on through a microscope rather than by gazing directly at it. Some operating microscopes are equipped with television cameras so the progress of the operation can be observed on a television monitor. An entire repertoire of tiny precision instruments has been developed for use in microsurgery.

Micromanipulative techniques were first applied to surgery in the 1920s for use on the delicate bones of the inner ear. The techniques had been expanded by the 1950s to include surgery on tiny blood vessels and nerve strands. Microsurgery has made possible operations that otherwise simply could not be performed. Most dramatically, severed limbs or digits can be reattached to the body through the microsurgically guided reconnection of severed muscles, tendons, blood vessels, and nerve fibres. Repairs of the eye's retina, the removal of previously inaccessible tumours from the brain and spinal cord, and a host of other feats can also be performed.

microtonal music, music using tones that are not an exact number of semitones (half steps) apart. The smallest interval between two keys on a piano (*e.g.,* between B and C, F and F♯, A♭ and A) is the semitone, an interval also measured as 100 "cents." There are thus 12 equal semitones, or 1,200 cents, to the octave.

Much of the world's music, however, of both past and present times, uses intervals greater or smaller than 100 cents. In music not derived from the western European artistic traditions of the past 300 years or so, microtonal intervals often result from the use of tones that, in intonation, are close to the tones of the natural harmonic series (a sequence of overtones faintly audible above a fundamental note), an intonation not found in the tones of the piano. The Hindu scale divides the octave into 22 intervals, and most East Asian music has a tonal vocabulary of 12 tones generated in a cycle of fifths.

Some Western composers and music theorists have assumed as a starting point the octave as divided into 12 equal semitones of 100 cents each and have suggested the use of microtonal intervals derived from it—*e.g.,* intervals of a quarter tone (50 cents), sixth tone (33.3 cents), 12th tone (16.7 cents), and 16th tone (12.5 cents). In this last case, the octave would consist of 96 equal divisions, and the modern semitone would equal eight of them in sequence; *e.g.,* between B and C would lie eight equal 16th-tone intervals.

Even in Western music, microtonal intervals of one sort or another appear to have been used at least from the time of the ancient Greeks onward; many theorists of the past have written about microtonal music in either observing musical practices of their time or making speculative suggestions for composers to take up. Among the better-known modern composers of microtonal music are Charles Ives, Harry Partch, Julián Carrillo, Alois Hába, and Krzysztof Penderecki.

microtubule, fine, membrane-bounded tubular structure of indefinite length, found within animal and plant cells. Microtubules have several functions. They help give shape to many cells and are major components of cilia and flagella (cellular locomotory projections). They participate in the formation of spindle fibres during cell division (mitosis). They also assist the flow of materials from the cell bodies of nerve cells toward the ends of those cells' axons.

microwave, electromagnetic radiation having a frequency within the range of 1 gigahertz to 1 terahertz (10^9–10^{12} cycles per second) and a wavelength between 1 mm and 1 m.

microwave oven, also called ELECTRONIC OVEN, appliance that cooks food by means of high-frequency electromagnetic waves called microwaves. A microwave oven is a relatively small, boxlike oven that raises the temperature of food by subjecting it to a high-frequency electromagnetic field. The microwaves are absorbed by water, fats, sugars, and certain other molecules, whose consequent vibrations produce heat. The heating thus occurs inside the food, without warming the surrounding air; this greatly reduces cooking time, and baking and other cooking tasks that require hours in a conventional oven can be completed in minutes in a microwave oven. Microwave ovens generate radiation at a frequency of about 2,450 megahertz by means of a magnetron, which is a kind of electron tube.

Since the heating occurs by an absorption process, microwave ovens tend to cook certain foods unevenly or at different rates. For example, moist foods cook faster than less moist ones, and moist outer layers tend to absorb most of the radiation before it can reach inner sections, which remain uncooked. Microwave ovens also cannot brown or crisp foods on the outside. Most types of glass, Styrofoam (trademark), polyethylene, paper, and similar materials do not absorb the microwaves and hence do not heat up. Foods cannot be cooked in metal vessels in a microwave oven, however, because the metal blocks out the microwaves. Microwave ovens are subject to safety standards that ensure minimal levels of radiation leakage from them, and no significant health hazards are associated with such leakages.

Mictlantecuhtli, stone figure of Totonac origin from the Remojadas region, Mexico, *c.* AD 900; in the Museum of Anthropology, Jalapa, Mexico

By courtesy of the Museo Nacional de Antropologia, Mexico City

Mictlantecuhtli, Aztec god of the dead, usually portrayed with a skull face. With his wife, Mictecacíhuatl, he ruled Mictlan, the underworld. The souls of those whose manner of death failed to call them to various paradises (*i.e.,* for those dead by war, sacrifice, childbirth, drowning, lightning, and certain diseases) made a four-year journey, fraught with trials, through the nine hells of Mictlan. In the last, where Mictlantecuhtli dwelt, they disappeared or found rest.

Mičurinsk (Russia): *see* Michurinsk.

Mid-Atlantic Ridge, submarine ridge lying along the north-south axis of the Atlantic Ocean; it occupies the central part of the basin between a series of flat abyssal plains that continue to the margins of the continental coasts. The Mid-Atlantic Ridge is in effect an immensely long mountain chain extending for about 10,000 miles (16,000 km) in a curving path from the Arctic Ocean to near the southern tip of Africa. The ridge is equidistant between the continents on either side of it. The mountains forming the ridge reach a width of 1,000 miles. These mountains sometimes reach above sea level, thus forming the islands or island groups of the Azores, Ascension, St. Helena, and Tristan da Cunha, among others.

Running along the crest of the Mid-Atlantic Ridge is a long valley about 50 to 75 miles (80 to 120 km) wide. This rift contains the zone of seafloor spreading, in which molten magma from beneath the Earth's crust continuously wells up, cools, and is progressively pushed away from the ridge's flanks. This phenomenon is evinced by the fact that the crustal material on either side of the Mid-Atlantic Ridge is notably younger than that farther away from the ridge. Because of seafloor spreading, the movement of the ocean floor and of the continents outward from the ridge is resulting in an increasing widening of the Atlantic Basin at about 1 to 10 cm (0.5 to 4 inches) a year. Apart from seafloor spreading, the Mid-Atlantic Ridge is also the site of volcanic activity and earthquakes along part of its length.

Mid Bedfordshire, district, administrative county of Bedfordshire, south-central England. The district lies almost entirely within the historic county of Bedfordshire, but a small area north of Sandy belongs to the historic county of Cambridgeshire. Predominantly rural, Mid Bedfordshire extends across a broad valley within the River Ouse catchment basin and is crossed by a low ridge oriented northeast to southwest. The eastern half of the district is a principal market gardening area for Greater London. The sandy soils in the eastern part of Mid Bedfordshire are intensively cultivated with brussels sprouts, potatoes, and peas around the market parishes of Biggleswade, Sandy, Potton, and Maulden. Wheat and barley are also grown, and dairy cattle are raised in the district. Brick making constitutes an important economic activity in the northwest, where there are heavy clay beds. Woburn Abbey in the southwest is an 18th-century mansion that was built on the former site of a Cistercian abbey. Biggleswade and Ampthill are the administrative centres of the district. Area 195 square miles (504 square km). Pop. (1998 est.) 123,000.

Mid Devon, district, administrative and historic county of Devon, southwestern England, located between the bleak moorlands of Exmoor and Dartmoor. Mid Devon is a heavily dissected interior plateau 400 to 800 feet (120 to 245 m) in elevation. It has variable soil types suited for grassland cultivation, except in the south-central area where the merging Exe, Culm, and Yeo river valleys are cultivated with cereals, potatoes, fodder crops, and early-season vegetables. Large numbers of sheep and dairy and beef cattle are grazed throughout the district. Tiverton, the district seat on the River Exe, was one of the first settlements established by the Anglo-Saxons after their 7th-century conquest of southwestern England. Tiverton became a major centre of the woolen trade (both kerseys and worsteds) between the mid-14th and early 19th century. The contemporary town continues to be a textile centre, manufacturing elastic nets and woven nylon as well as lace. Area 353 square miles (915 square km). Pop. (1998 est.) 67,400.

Mid Glamorgan, former county (1974–96) of South Wales. The region is now incorporated into the unitary council areas of Bridgend, Caerphilly, Cardiff, Merthyr Tydfil, Rhondda Cynon Taff, and Vale of Glamorgan.

Mid-Indian Ridge, submarine ridge of the Indian Ocean that is connected to the Mid-Atlantic Ridge; both are segments of the worldwide mid-oceanic ridge system. Entering the Indian Ocean from the South Atlantic, the Mid-Indian Ridge extends north to a point near Rodrigues Island, where it divides into two parts: one segment continues northward toward the Gulf of Aden, where it connects with the East African Rift System; the second branch extends southeast toward the Macquarie Islands. Between the Gulf of Aden and Rodrigues Island, the Mid-Indian Ridge bears the name Carlsberg Ridge. The ridge is associated with a belt of earthquake epicentres and, hence, is seismically active. This fact is further observed in its rough relief and thin sediment cover.

Mid Suffolk, district, administrative and historic county of Suffolk, southeastern England. It occupies the central part of the county and is mainly an agricultural area of low, rolling hills. Cereals, sugar beets, cattle, and pigs are intensively raised. The district contains many small villages and medieval churches. Stowmarket, Mid Suffolk's principal market town, lies 12 miles (19 km) northwest of Ipswich; it also has a light industrial base. The small community of Needham Market is the administrative centre. Area 336 square miles (871 square km). Pop. (1998 est.) 81,900.

Mid Sussex, district, administrative county of West Sussex, historic county of Sussex, southeastern England. It occupies an area in central Sussex. Mid Sussex extends from The Weald, a sandstone area of hilly grasslands and woodlands in the north, across undulating grasslands of the Ouse and Adur river valleys in the centre, to the steep chalk scarps of the north-facing South Downs in the extreme south, inland from the English Channel. Haywards Heath, the district seat, and Burgess Hill, both commuter stops on the Brighton-to-London railway, are residential centres with a light-industrial base. The town (parish) of East Grinstead in The Weald is an older market centre and suburban community that also has a light-industrial base. Mixed farming occurs throughout the district. Area 129 square miles (333 square km). Pop. (1998 est.) 127,100.

Midas, in Greek and Roman legend, king known for his foolishness and greed. The stories of Midas, part of the Dionysiac cycle of legends, were first elaborated in the gay burlesques of the Athenian satyr plays. The tales are familiar to modern readers through the late classical versions, such as those in Ovid's *Metamorphoses.*

According to the myth, Midas captured Silenus, the satyr and companion of the god Dionysus. For his kind treatment of Silenus Midas was rewarded by Dionysus with a wish. The king wished that all he touched might turn to gold, but when his food became gold and he nearly starved, he realized his error. Dionysus then granted him release by having him bathe in the Pactolus River (in modern Turkey), an action to which the presence of alluvial gold in that stream is attributed.

In another story the king was asked to judge a musical contest between Apollo and the satyr Marsyas. When Midas decided against Apollo, the god changed his ears into those of an ass. Midas concealed them under a turban and made his barber swear to tell no living soul. The barber, bursting with his secret, whispered it into a hole in the ground. He filled in the hole, but reeds grew from the spot and broadcast the sibilant secret—"Midas has ass's ears"—when the wind blew through them.

Midas (fl. 700 BC?), king of Phrygia (an ancient district in west-central Anatolia), first mentioned in extant Greek literature by Herodotus as having dedicated a throne at Delphi, before Gyges—*i.e.,* before or little after 700 BC. Later reports that he married a daughter of Agamemnon, king of Aeolic Cyme, and that Midas, or Midacritus, traded with a western Tin Island, suggest the picture of a real king with commercial interests. The name Midas appears on the facade of one of the great rock-cut monuments of the upper Sangarius (Sakarya) region (in present-day northwestern Turkey); and before 700 BC Assyrian troops fought in the Taurus region (in southern Turkey) with the troops of "Mita of Mushki," probably the same Midas, known there as king of a more easterly people, the Moschi (the biblical Meshech).

The name Midas was probably dynastic, alternating in Phrygia with Gordieus. Both names are perpetuated in those of towns near the upper Sangarius, "Midas city" (Midaeion, or Midaeum) being about 60 miles (97 km) west of the more famous Gordium.

Middelburg, *gemeente* (commune) and capital, Zeeland *provincie,* southwestern Netherlands, on the former Walcheren Island. Named for its central position on the island, Middelburg was a flourishing medieval town that traded in wine and cloth and that later prospered through the activities of the Dutch East India Company. It was one of the first towns captured by the Sea Beggars (Dutch insurgents against Spain) in 1574. It was inundated during World War II, but most of the damage has been repaired. Tourism and metal and textile industries are the main sources of income. Landmarks (all restored since 1945) include the town hall (about 1512); the Abbey of St. Nicholas (founded 1150), now the seat of the provincial government; and the 16th-century New Church. Pop. (1999) 44,481.

middle age, period of human adulthood that immediately precedes the onset of old age. Though the age period that defines middle age is somewhat arbitrary, differing greatly from person to person, it is generally defined as being between the ages of 40 and 60. The physiological and psychological changes experienced by a middle-aged person centre on the gradual decline of physical abilities and the awareness of mortality. In middle age, the relative potencies of past, present, and future are altered as the individual increasingly directs effort to the process of reminiscence and recollection of the past, rather than anticipation of the future. If approached constructively, middle age can prepare an individual for a satisfying and productive old age. *See also* psychological development.

Middle Ages, the period in European history from the collapse of Roman civilization in the 5th century AD to the period of the Renaissance (variously interpreted as beginning in the 13th, 14th, or 15th century, depending on the region of Europe and on other factors). The term and its conventional meaning were introduced by Italian humanists, who were engaged in a revival of classical learning and culture, and the notion of a thousand-year period of darkness and ignorance separating them from the ancient Greek and Roman world served to highlight the humanists' own work and ideals. In a sense, the humanists invented the Middle Ages in order to distinguish themselves from it. The Middle Ages nonetheless provided the foundation for the transformations of the humanists' own Renaissance.

A brief treatment of the Middle Ages follows. For full treatment, *see* MACROPAEDIA: European History and Culture.

The sack of Rome by Alaric the Visigoth in AD 410 had enormous impact on the political structure and social climate of the Western world, for the Roman Empire had provided the basis of social cohesion for most of Europe. Although the Germanic tribes that forcibly migrated into southern and western Europe in the 5th century were ultimately converted to Christianity, they retained many of their customs and ways of life; the changes in forms of social organization they introduced rendered centralized government and cultural unity impossible. Many of the improvements in the quality of life introduced by the Romans, such as a relatively efficient agriculture, extensive road networks, water-supply systems, and shipping routes, decayed substantially, as did artistic and scholarly endeavours. This decline persisted throughout the period of time sometimes called the Dark Ages (also called Late Antiquity, or the Early Middle Ages), from the fall of Rome to about AD 1000, with a brief hiatus during the flowering of the Carolingian court established by Charlemagne. Apart from that interlude, no large kingdom arose in Europe to provide stability. The only force capable of providing a basis for social unity was the Roman Catholic church. The Middle Ages therefore present the confusing and often contradictory picture of a society trying to structure itself politically on a spiritual basis. This attempt came to an end with the rise of artistic, commercial, and other activities anchored in the secular world in the period just preceding the Renaissance.

After the dissolution of the Roman Empire, the idea arose of Europe as one large church-state, called Christendom. Christendom was thought to consist of two distinct groups of functionaries, the sacerdotium, or ecclesiastical hierarchy, and the imperium, or secular leaders. In theory these two groups complemented each other, attending to people's spiritual and temporal needs, respectively. Supreme authority was wielded by the pope in the first of these areas and by the emperor in the second. In practice the two institutions were constantly sparring, disagreeing, or openly warring with each other. The emperors often tried to regulate church activities by claiming the right to appoint church officials and to intervene in doctrinal matters. The church, in turn, not only owned cities and armies but often attempted to regulate affairs of state.

During the 12th century a cultural and economic revival took place; many historians trace the origins of the Renaissance to this time. The balance of economic power slowly began to shift from the region of the eastern Mediterranean to western Europe. The Gothic style developed in art and architecture. Towns began to flourish, travel and communication became faster, safer, and easier, and merchant classes began to develop. Agricultural developments were one reason for these developments; during the 12th century the cultivation of beans made a balanced diet available to all social classes for the first time in history. The population therefore rapidly expanded, a factor that eventually led to the breakup of the old feudal structures.

The 13th century was the apex of medieval civilization. The classic formulations of Gothic architecture and sculpture were achieved. Many different kinds of social units proliferated, including guilds, associations, civic councils, and monastic chapters, each eager to obtain some measure of autonomy. The crucial legal concept of representation developed, resulting in the political assembly whose members had *plena potestas*—full power—to make decisions binding upon the communities that had selected them. Intellectual life, dominated by the Roman Catholic church, culminated in the philosophical method of Scholasticism, whose preeminent exponent, St. Thomas Aquinas, achieved in his writings on Aristotle and the Church Fathers one of the greatest syntheses in Western intellectual history.

The breakup of feudal structures, the strengthening of city-states in Italy, and the emergence of national monarchies in Spain, France, and England, as well as such cultural developments as the rise of secular education, culminated in the birth of a self-consciously new age with a new spirit, one that looked all the way back to classical learning for its inspiration and that came to be known as the Renaissance.

Middle America, the isthmian tract between the southern Rocky Mountains and the northern tip of the Andes (or, generally, from the southern border of the United States to the northern border of Colombia), marking the territory transitional from North America to South America. The difference between this designation and "Central America" is that Middle America includes Mexico and the Caribbean islands.

Middle America Trench, submarine depression in the Pacific Ocean off the western coast of Central America. Extending northwest-southeast for more than 1,700 miles (2,750 km) from central Mexico to Costa Rica, the trench reaches a maximum depth of 21,880 feet (6,669 m) and covers a total area of 37,000 square miles (96,000 square km). The shallower northern section of the trench tends to curve along the coast of Mexico, paralleling the break in the continental shelf, while the deeper southern section follows a more linear course. The southern section of the trench is usually associated with active volcanism on land, as, for example, the eruption in 1982 of El Chichón volcano in southern Mexico; the trench floor in this area is relatively irregular.

Middle Anglia, a province of Anglo-Saxon England lying between East Anglia and Mercia. It certainly comprised the basins of the Nene, Welland, and Great Ouse, with the districts west of the fens and probably extended into present Oxfordshire. Parts of the area were settled early, but nothing is known of its political history until 653, when it was subject to Mercia, under the rule of Penda's son, Peada. St. Guthlac, who was born there, belonged to the Mercian royal family. Peada introduced Christianity, but no permanent see was created until 737, when one was established at Leicester. St. Wilfrid administered the province in his exile of 691–705.

The province contained the religious foundations of Peterborough, Ely, Oundle, and Crowland.

Middle Atlas (mountains, Morocco): *see* Moyen Atlas.

Middle Comedy, style of drama that prevailed in Athens from about 400 BC to about 320 BC. Preoccupied with social themes, Middle Comedy represents a transition from Old Comedy, which presented literary, political, and philosophical commentary interspersed with scurrilous personal invective, to New Comedy, with its gently satiric observation of contemporary domestic life. Aristophanes' last play, the *Plutus,* is an extant work that reflects this transition. Antiphanes and Alexis were preeminent Middle Comedy dramatists, but none of their plays has survived.

middle-distance running, in athletics (track and field), races that range in distance from 800 m (roughly one-half mile) to 3,000 m (almost 2 miles). In international competitions, middle-distance races include the 800 m, the 1,500 m (the metric mile), and the 3,000 m (a steeplechase event for men, but a regular run for women). In English-speaking countries, until the second half of the 20th century, the 880 yards (half mile) and the mile were run as the equivalents of the 800 m and the 1,500 m.

Middle-distance races are set apart from the sprint (dash) races of 200 m (about 650 feet) or less by the pacing required; dashes are run at top speed the entire length of the race, whereas middle-distance races require that the athletes maintain a plateau pace that allows for a final spurt of speed, or kick.

An early favourite among middle-distance races was the mile, which in the first half of the 20th century was run in times exceeding four minutes. Breaking the "four-minute barrier" was considered unlikely. On May 6, 1954, however, the 25-year-old Roger Bannister of Great Britain set a record of 3 min 59.4 s in a dual meet at Oxford. With increasingly controlled climatic and surface conditions and increasingly accurate timing devices, however, the record was lowered many times thereafter. *See* Sporting Record: *Athletics. See also* Olympic Games.

Middle East, the lands around the southern and eastern shores of the Mediterranean Sea, extending from Morocco to the Arabian Peninsula and Iran and sometimes beyond. The central part of this general area was formerly called the Near East, a name given to it by some of the first modern Western geographers and historians, who tended to divide the Orient into three regions. Near East applied to the region nearest Europe, extending from the Mediterranean Sea to the Persian Gulf; Middle East, from the Gulf to Southeast Asia; and Far East, those regions facing the Pacific Ocean.

The change in usage began to evolve prior to World War II and tended to be confirmed during that war, when the term Middle East was given to the British military command in Egypt. Thus defined, the Middle East consisted of the states or territories of Turkey, Cyprus, Syria, Lebanon, Iraq, Iran, Palestine (now Israel), Jordan, Egypt, The Sudan, Libya, and the various states of Arabia proper (Saudi Arabia, Kuwait, Yemen, Oman, Bahrain, Qatar, and the Trucial States, or Trucial Oman [now United Arab Emirates]. Subsequent events have tended, in loose usage, to enlarge the number of lands included in the definition. The three North African countries of Tunisia, Algeria, and Morocco are closely connected in sentiment and foreign policy with the Arab states. In addition, geographic factors often require statesmen and others to take account of Afghanistan and Pakistan in connection with the affairs of the Middle East.

Occasionally Greece is included in the compass of the Middle East because the Middle Eastern (then Near Eastern) question in its modern form first became apparent when the Greeks rose in rebellion to assert their independence of the Ottoman Empire in 1821 (*see* Eastern Question). Turkey and Greece, together with the predominantly Arabic-speaking lands around the eastern end of the Mediterranean, were also formerly known as the Levant (*q.v.*).

Use of the term Middle East, nonetheless, remains unsettled, and some agencies (notably the United States State Department and certain bodies of the United Nations) still employ the term Near East.

Middle English language, the vernacular spoken and written in England from about 1100 to about 1500, the descendant of the Old English language and the ancestor of Modern English.

The history of Middle English is often divided into three periods: (1) Early Middle English, from about 1100 to about 1250, during which the Old English system of writing was still in use; (2) the Central Middle English period from about 1250 to about 1400, which was marked by the gradual formation of literary dialects, the use of an orthography greatly influenced by the Anglo-Norman writing system, the loss of pronunciation of final unaccented *-e,* and the borrowing of large numbers of Anglo-Norman words; the period was especially marked by the rise of the London dialect, in the hands of such writers as John Gower and Geoffrey Chaucer; and (3) Late Middle English, from about 1400 to about 1500, which was marked by the spread of the London literary dialect and the gradual cleavage between the Scottish dialect and the other northern dialects. During this period the basic lines of inflection as they appear in Modern English were first established. Among the chief characteristic differences between Old and Middle English were the substitution of natural gender in Middle English for grammatical gender and the loss of the old system of declensions in the noun and adjective and, largely, in the pronoun.

The dialects of Middle English are usually divided into three large groups: (1) Southern (subdivided into Southeastern, or Kentish, and Southwestern), chiefly in the counties south of the River Thames; (2) Midland (corresponding roughly to the Mercian dialect area of Old English times) in the area from the Thames to southern South Yorkshire and northern Lancashire; and (3) Northern, in the Scottish Lowlands, Northumberland, Cumbria, Durham, northern Lancashire, and most of Humberside and West and North Yorkshire.

Middle Himalayas (Asia): *see* Lesser Himalayas.

Middle Passage, in the days of the African slave trade to the New World, the middle part of the slave's journey—*i.e.,* the crossing of the Atlantic Ocean. From about 1518 to the mid-19th century, millions of African men, women, and children made the 21–90-day voyage aboard grossly overcrowded sailing ships manned by crews mostly from Great Britain, the Netherlands, Portugal, and France. Slaver captains anchored chiefly off the Guinea Coast for a month to a year to gather their cargoes of from 150 to 600 persons. Then began a long period of continuous danger, with raids at port by hostile tribes, threats of slave mutiny, epidemics, attack by pirates or enemy ships, and bad weather. During the Middle Passage, male slaves were kept constantly shackled to each other or to the deck to prevent mutiny, of which 55 detailed accounts were recorded between 1699 and 1845.

So that the largest possible cargo might be carried, the captives were wedged horizontally, spoon fashion, with 6 feet by 16 inches (183 by 41 cm) being the average space allotted per person. Unable to stand erect or turn over, many slaves died in this position. If bad weather or equatorial calms prolonged the journey, the twice-daily ration of water plus either boiled rice, millet, cornmeal, or stewed yams was greatly reduced, resulting in near starvation and attendant illnesses. In the daytime, weather permitting, captives were brought on deck for exercise or for "dancing the slaves" (forced jumping up and down). At this time, conscientious captains insisted that the sleeping quarters be scraped and swabbed by the crew; but in bad weather the oppressive heat and noxious fumes in the unventilated and unsanitary holds caused fevers and dysentery, with a high mortality rate. Deaths during the Middle Passage, caused by epidemics, suicide, "fixed melancholy," and mutiny, have been estimated at 13 percent. So many bodies of dead or dying Africans were jettisoned into the ocean that sharks regularly followed the slave ships on their westward journey.

The Middle Passage supplied the New World with its major work force and brought enormous profits to international slave traders. At the same time, it exacted a terrible price in physical and emotional anguish on the part of the uprooted Africans; it was distinguished by the callousness to human suffering it developed among the traders.

Middle Rhine Highlands, also called RHENISH SLATE MOUNTAINS, German RHEINISCHES SCHIEFERGEBIRGE, mountainous highlands lying mainly in northwestern Germany but also extending westward as the Ardennes through southeastern Belgium and northern Luxembourg, with an overlap into eastern France beyond the Meuse River. The Highlands form a greatly varied plateau with areas of rugged relief, as in the Eifel and the Rothaargebirge in the region of Sauerland, though these nowhere exceed 3,000 feet (900 m). Other highlands include the Taunus, the Hunsrück south of the Mosel River, and the Westerwald.

Although slates and sandstones are the main rocks, there are volcanic outcrops and considerable areas of limestone where the relief is smoother, the soils more fertile, and the land more densely settled. The plateau is dissected by the gorge of the Rhine River and the deep meanders of its tributaries (notably, the Mosel), and in the western portion the Meuse River flows from south to north. *See also* Ardennes (plateau).

Middle Stone Age: *see* Mesolithic period.

Middle Way, Sanskrit MADHYAMA-PRATIPADĀ, Pāli MAJJHIMA-PATIPADĀ, in Buddhism, complement of general and specific ethical practices and philosophical views that are said to facilitate enlightenment by avoiding the extremes of self-gratification on one hand and self-mortification on the other. *See* Eightfold Path.

Middle West, also called MIDWEST, or NORTH CENTRAL STATES, region, northern and central United States, lying midway between the Appalachian and Rocky mountains and north of the Ohio River and the 37th parallel. The Middle West, as defined by the federal government, comprises the states of Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin. Actually composed of two regions, the Northwest Territory, or the Old Northwest, and the Great Plains, the Middle West has become more an idea than a region: an area of immense diversity but somehow consciously representative of a national average.

The Northwest Territory entered the United States in 1783 at the conclusion of the American Revolution and was organized under a series of ordinances that set the precedent for the admission of future territories into the Union. The Great Plains entered the United States in 1803 as part of the Louisiana Purchase. The Plains were to develop primarily agriculturally, but the Northwest Territory, blessed with both fertile soil and valuable natural resources (coal, oil, iron ore, and limestone), would develop both industrially and agriculturally.

Emerging transportation arteries, first canals and then railroads, linked the Middle West with Eastern markets and firmly established it as part of the industrially expanding North, thus concluding a process begun in 1787 when slavery was outlawed in the Northwest Territory. The region was not without its Southern sympathizers, however, as a number of its settlers, particularly in the Ohio River valley, had migrated from the South; but the Middle West was to give to the brewing sectional crisis not only a new political party (the Republicans) that was devoted to the nonextension of slavery but also two of the Union's staunchest defenders: Abraham Lincoln and Stephen A. Douglas.

After the American Civil War, the growth experienced by the Middle West was dramatic. Transportation, immigration, and industrialization all played a part. By 1890 Chicago, not even 60 years old, had become the second largest city in the country, and the Middle West accounted for 29 percent of the country's manufacturing employment and nearly one-third of its value added by manufacture. The Great Plains, however, developed more slowly. Westward migration tended to skip the Plains for the West Coast, and it was not until the late 1800s, when most American Indians had been subjugated, barbed-wire fencing had been introduced, and railroads had penetrated the interior, that the Plains experienced rapid settlement by farmers, ranchers, and tradesmen.

The influence of the Middle West on national life has been significant. In the 1870s, it was the main area of activity of the Granger movement and a hotbed of labour agitation. It provided some of the most prominent figures of the Progressive movement and was home for many of America's most famous industrial giants. It was an innovator in architecture and retailing, a potent force in the settlement-house movement, a centre of temperance activity, and an inspiration to a new school of naturalistic writers.

Unique in American life, the Middle West has fused the raw and expansive muscle of an urban industrial establishment with the sturdy conservatism of a rural hinterland. But like its neighbours to the northeast, the Middle West's growth rate has lagged behind that of the country as a whole.

Despite regional economic shifts adverse to the Middle West, the region has continued to be the most important economic region in the country, leading all other sections in value added by manufacture and in total value of farm marketings.

Middlebury, town ("township"), seat of Addison county, west-central Vermont, U.S. The area was granted in 1761, together with Salisbury and New Haven, and named for its location midway between the other two. Settled in 1773 by Benjamin Smalley, the settlement was temporarily abandoned (1778–83) because of Tory and Indian attacks. Middlebury College (noted for its summer Writers' Conference) was chartered in 1800, and the Congregational Church in the town was built in 1806–09. Vermont's marble-quarrying industry began there in 1803, but only light manufacturing has succeeded it; recent business growth has centred on ski and summer resort development. The famous Morgan horses are bred at a nearby farm, managed by the University of Vermont. Pop. (1990) 8,034.

Middlesboro, officially MIDDLESBOROUGH, city, Bell county, southeastern Kentucky, U.S. It lies in a valley at the western end of the Cumberland Gap near where the borders of Kentucky, Tennessee, and Virginia meet. Despite its location on the old Wilderness Road through a natural pass in the mountains, the site was not settled until 1889. It was developed by English investors as an iron and steel centre and named after Middlesbrough (now Teesside), Yorkshire, Eng. Their company went bankrupt, however, when the London bank Baring Brothers and Company failed in 1893. The city eventually recovered as a centre for the important eastern Kentucky coalfields. Middlesboro is also a trade centre for tobacco and cattle. Industries include tanning, food processing, and the manufacture of plastic pipe, elastic webbing, and mobile homes. It is a tourist gateway to the Cumberland Gap National Historic Park to the east. Kentucky Ridge State Forest is north, and Fern Lake, with a wild-game sanctuary, is south. Inc. 1890. Pop. (1990) 11,328.

Middlesbrough, district (borough), county of Cleveland, England, with an area of 21 square miles (54 square km). It is situated on the south bank of the River Tees, at the head of its estuary, 7 miles (11 km) from the North Sea.

When the Stockton and Darlington Railway was extended east of Stockton in 1830 to the site where Joseph Pease had acquired land to develop a new coal-exporting port, Middlesbrough came into being; it was the first town in England to owe its existence to a railway. The new town was laid out on a regular grid on a site of 32 acres (13 hectares) alongside the new port. The impetus given by the coal trade was reinforced in spectacular fashion after 1850 by the discovery of ironstone on nearby Eston Beacon, and blast furnaces and ironworks crowded into Middlesbrough and adjacent sites alongside the Redcar Railway (1846).

Primary metallurgy has left Middlesbrough for spacious estuary sites farther east, but Middlesbrough retains important heavy engineering works. Its dock (1843) still handles general cargo, and some new lighter industries, including telephone equipment, have diversified its industrial employment.

As the industrial conurbation has extended, Middlesbrough has become the focus of its organization. Additional roads and bridges have been built across the river at Middlesbrough (one in 1976), and the town has emerged as the commercial and cultural capital of Cleveland. The shopping centre lies south of the old town of 1830, and Riverside Park occupies industrial sites in the former Ironmasters' District. Pop. (1986 est.) 144,300.

Middlesex, ancient county of England, most of which, for local government purposes, became part of Greater London in 1965.

The River Thames was the key to the history of Middlesex. From about 8000 BC, traders and settlers used the Thames as their waterway. Earliest settlements established are of the Iron Age (*c.* 500 BC) at sites at Brentford and Heathrow. In the 1st century BC, Belgic tribes had established themselves in southeastern England, and Middlesex formed part of the Catuvellauni territory. The Romans established stations at what became Staines and Brentford. In the early 5th century the Saxons began to colonize the area. Positioned as it was between the East and West Saxons, the region soon obtained its modern name (meaning "middle Saxons"); the earliest written record of it is in the form *Middelseaxan,* in a charter of 704.

From early times, Middlesex was dominated by the City of London, which in the 12th century obtained the right of appointing the sheriff of the county. It was for centuries the county retreat of royalty and wealthy London merchants. The most outstanding building is the royal palace of Hampton Court; other mansions include Osterley, Syon, and Swakeleys.

In 1888, Middlesex lost 50 sq mi (130 sq km) and 2,500,000 inhabitants to the county of London; and the administrative county of Middlesex was set up. Middlesex acquired its own sheriff, and the site of the Guildhall in Parliament Square, Westminster, was deemed still in the county of Middlesex for the purpose of holding sessions of the peace.

Nine of the 32 London boroughs established (April 1, 1965) under the 1963 London Government Act were created wholly or in part from former Middlesex authorities, namely, Hounslow, Hillingdon, Ealing, Brent, Harrow, Haringey, Enfield, Richmond upon Thames, and Barnet. The urban districts of Staines and Sunbury-on-Thames were transferred to Surrey, and Potters Bar to Hertfordshire. Under the Administration of Justice Act (1964) the Middlesex area of Greater London is deemed a county for purposes of law. The name Middlesex continues to be used for postal districts and in the names of many county institutions and organizations.

Middlesex, Lionel Cranfield, 1st earl of (b. 1575—d. 1645), lord treasurer of England under King James I (ruled 1603–25). Although most historians regard him as James's most competent finance minister, he fell from power because his efforts at economy offended all factions in the government.

Middlesex, detail of a painting by Daniel Mytens; in the collection of Lord Sackville

Cranfield spent his early career as a London merchant and financier. In 1612 he became acquainted with the lord privy seal, Henry Howard, earl of Northampton, and through Northampton's patronage, he was made surveyor general of the customs (1613).

After Northampton's death in 1614, Cranfield attached himself to the royal favourite, George Villiers, who eventually became the powerful duke of Buckingham. By 1620 Buckingham had found Cranfield a position on the privy council, where he quickly acquired a reputation as a financial reformer, though he was unsuccessful in his warnings to James I about the dangers of monopolies. Cranfield became lord treasurer in 1621 and a year later was created earl of Middlesex.

As minister in charge of finances, Middlesex was somewhat successful in increasing the King's revenues, but he soon alienated both James and Buckingham by his attempts to reduce royal expenditures. He opposed war with Spain on financial grounds, and, as a consequence, a prowar Parliament led by Buckingham and Prince Charles (later King Charles I) impeached him in 1624. Cranfield warned Buckingham of the dangers of such a precedent and told the Prince that he would one day "have his belly full of Parliaments." Found guilty of maladministration and corruption, Middlesex was fined and temporarily imprisoned. He spent the rest of his life in retirement, receiving a full pardon from King Charles I in 1626. See R.H. Tawney, *Business and Politics Under James I: Lionel Cranfield As Merchant and Minister* (1958), and Menna Prestwich, *Cranfield* (1966).

Middleton, Arthur (b. June 26, 1742, near Charleston, S.C.—d. Jan. 1, 1787, Goose Creek, S.C., U.S.), British American planter, legislator, signer of the Declaration of Independence, and one of the leaders in the controversies leading up to the American Revolution (1775–83).

Arthur Middleton, detail of an engraving by J.B. Longacre after a portrait by B. West

By courtesy of the Library of Congress, Washington, D.C.

After completing his education in England, Middleton returned to South Carolina in 1763 and was elected to the colonial legislature. In 1775–76 he was a member of the Council of Safety, a committee that directed leadership for the colony's preparations for revolution. He served on the legislative committee that drafted the South Carolina state constitution and was a delegate to the Continental Congress (1776–78).

At the siege of Charleston (1780) he served in the militia, was taken prisoner when the city fell to the British, and was sent to St. Augustine, Fla., as a prisoner of war. After being exchanged in July 1781, he was a member of the Continental Congress (1781–83), the South Carolina legislature (1785–86), and on the original board of trustees of the College of Charleston.

Middleton, Charles Middleton, 2nd earl of (b. *c.* 1640—d. 1719), Jacobite supporter of James II of England and of James Edward, the Old Pretender.

Eldest son of the 1st Earl, he held several offices under Charles II and James II, being envoy extraordinary at Vienna and afterwards joint secretary for Scotland. In 1684 he became an English secretary of state, and with Richard Graham, Viscount Preston, he had the difficult task of managing the House of Commons for James II. He was loyal to James after the King fled to France, although he remained in England, where, as the leader of the moderate Jacobites, he sought to bring about a restoration by peaceful means.

In 1693 the Earl joined the exiled King at Saint-Germain, where he became his secretary of state; afterwards he held the same office at the court of James Edward, the Old Pretender, in Flanders and in Lorraine. He was partly responsible for the unsuccessful expedition of the Jacobites to Scotland in 1707, and he resigned his office as secretary in 1713. Middleton had been created earl of Monmouth by the Pretender, for his titles in Britain had been declared forfeited in 1695. The Earl had been a Protestant, although a lukewarm one, until 1701, when he yielded to the dying wish of James II and joined the Roman Catholic Church.

Middleton, Sir Hugh (Welsh merchant and politician): *see* Myddelton, Sir Hugh.

Middleton, John Middleton, 1st earl of (b. *c.* 1619—d. June 1674, Tangier), Scottish Royalist during the reigns of Charles I and Charles II.

In early life he served as a soldier in France. Later, although he fought against Charles I in both England and Scotland, being especially prominent at the Battle of Philiphaugh and in other operations against the great Montrose, he held a high command in the Scottish army that marched to rescue Charles I in 1648, and he was taken prisoner after the Battle of Preston. He joined Charles II when that monarch reached Scotland in 1650, but he was soon at variance with the party that at that time was dominant in church and state and was restored to favour only after doing a public penance at Dundee. He was a captive for the second time after the Battle of Worcester, where he commanded the Royalist cavalry, but he escaped from the Tower of London to Paris.

In 1653 Middleton was chosen by Charles II to head the projected rising in Scotland. He reached that country in February 1654, but the insurrection was a complete failure. Its leader, who cannot be held responsible for this result, remained in Scotland until 1655, when he rejoined Charles II, who made him an earl in 1656. He returned to England with the King in 1660 and was appointed commander in chief of the troops in Scotland and lord high commissioner to the Scottish Parliament, which he opened in January 1661. He was an ardent advocate of the restoration of episcopacy, this being one reason that led to serious dissensions between the Earl of Lauderdale and himself, and in 1663 he was deprived of his offices. He was afterwards (from 1667) governor of Tangier, where he died.

Middleton, T(homas) F(anshaw) (b. Jan. 28, 1769, Kedleston, Derbyshire, Eng.—d. July 8, 1822, Calcutta), noted Anglican missionary who was the first bishop of Calcutta and founder of Bishop's College there.

Middleton served various parishes in England from his ordination as a priest in 1792 to 1812, when he became archdeacon of Huntingdon. Widely recognized as a biblical scholar after publication of his study *The Doctrine of the Greek Article Applied to the Criticism and Illustration of the New Testament* (1808), Middleton was consecrated in 1814 as bishop of Calcutta. In that position he was responsible for overseeing Anglican missionary work in both Australia and all of India. Despite his strict Anglicanism, he readily licensed the Society for Promoting Christian Knowledge, a German Lutheran group, to perform missionary work in his see. In 1820 he established Bishop's College at Calcutta to train mission-

BBC Hulton Picture Library

aries and teachers for the growing Anglican Church in India. Middleton's *Sermons* were published posthumously in 1824.

Middleton, Thomas (b. April 1570?, London—d. July 4, 1627, Newington Butts, Surrey, Eng.), late-Elizabethan dramatist who drew men as he saw them, with comic gusto or searching irony.

By 1600 Middleton had spent two years at Oxford and had published three books of verse. He learned to write plays by collaborating with Thomas Dekker, John Webster, and others for the producer Philip Henslowe.

Thomas Middleton, detail of a woodcut from "Two New Plays" by Middleton, 1657

By courtesy of the trustees of the British Museum; photograph, J.R. Freeman & Co. Ltd.

A popular playwright, he was often commissioned to write and produce lord mayor's pageants and other civic entertainments, and in 1620 he was appointed city chronologer. His chief stage success was *A Game at Chaess* (1625), in which the Black King and his men, representing Spain and the Jesuits, are checkmated by the White Knight, Prince Charles. This political satire drew crowds to the Globe until the Spanish ambassador protested and James I suppressed the play.

His masterpieces are two tragedies, *Women beware Women* (1621?, published 1657) and *The Changeling* (1622, with William Rowley; published 1653).

Middleton's comedies picture a society dazzled by money in which most men grasp for all they can get, by any means. *Michaelmas Terme* (1605?, published 1607) is one of the richest in irony. In *A Tricke to Catch the Old-one* (1606?, published 1608) two rival usurers are so eager to score over each other that both are taken in by a clever nephew. In *A Mad World, My Masters* (1604?, published 1608) a delightful old country gentleman prides himself on his generosity to all except his grandson and heir.

A Chast Mayd In Cheape-side (1613?, published 1630), an exuberant comedy, makes fun of naive or complacent London citizens. In *The Roaring Girle* (1604–10?, with Dekker; published 1611)—who prefers her freedom to marriage—Middleton depicts the notorious criminal Moll Frith, who dressed as a man.

The tragicomedies are farfetched in plot but strong in dramatic situations. In *A Faire Quarrell* (1616?, with Rowley, published 1617), Captain Ager, with his conflicts of conscience, is one of Middleton's few heroes.

Most of Middleton's other plays are comedies. He collaborated with Dekker in *The Honest Whore* (1604), and with Rowley and Massinger in *The Old Law* (1618?, published 1656).

Middletown, city, coextensive with the town (township) of Middletown, Middlesex county, central Connecticut, U.S., on the Connecticut River. Settled in 1650 and incorporated as a town in 1651, it occupies the site of the Indian village of Mattabesec (Mattabesett) and was named for its position between the upstream towns and the river mouth. The city, chartered in 1784, consolidated with the town in 1923. Middletown was a seaport and shipbuilding centre in the 18th and 19th centuries, a base of the "triangular trade" (in rum, slaves, and molasses) with Africa and the West Indies and, later, of the China clipper trade. The first official pistol-maker to the U.S. government, Simeon North, had his factory here in 1799. With the coming of the steamship, Middletown declined as a port. Its diversified economy includes agriculture and the manufacture of textiles, machinery, and chemicals. In 1955 the Atomic Energy Commission erected an experimental laboratory in Middletown. It is the seat of Middlesex Community College (1966) and Wesleyan University (1831). The Submarine Library and Museum housing submarine memorabilia is located in town. The Powder Ridge Ski area is nearby as is the 900-ac (364-ha) Hubbard Park. Pop. (1990) city, 42,762; Middletown PMSA, 90,320.

Middletown, city, Orange county, southeastern New York, U.S., on the Wallkill River, 60 mi (97 km) northwest of New York City. Settled in 1756, it was organized around the local Congregational Church in 1785 and named for its midway location between the Hudson and Delaware rivers. Until 1798 it was in Ulster County. It became headquarters for several turnpike companies, and, after 1843, the terminal of the Erie Railroad (later Erie Lackawanna Railway, now part of Conrail [Consolidated Rail]). Located in a dairy and fruit-growing region, it serves as a gateway to a mountain and lake resort area and has light industries, including the manufacture of clothing, leather goods, and machinery. Middletown is the home of the Orange County Community College (1950). Inc. village, 1848; city, 1888. Pop. (1990) 24,160.

Middletown, city, Butler county, southwestern Ohio, U.S., on the Miami River (bridged). With nearby Hamilton, it forms a standard metropolitan statistical area. Founded in 1802, it was named for its location midway between Dayton (35 mi [56 km] north) and Cincinnati. It soon became a lively agricultural trading community, with its products (wheat, corn, tobacco, livestock, fruits, and vegetables) transported to Cincinnati and New Orleans via freight wagons, river flatboats, and the Miami and Erie Canal boats. Four railroads—the Baltimore and Ohio, the Big Four, the Erie, and the Pennsylvania—arrived later. Early industrial development centred on tobacco, paper, and steel. George M. Verity built a mill (1900) that produced sheet steel by the continuous rolling process. The tobacco factories declined, but paper and steel industries have continued to flourish. Airplane and missile parts and machinery are also manufactured. A branch campus (1966) of Miami University (Oxford, Ohio) is in Middletown. Inc. city, 1883. Pop. (1990) city, 46,022; Hamilton-Middletown PMSA, 291,479.

Middletown, town (township), Newport county, Rhode Island, U.S., on Rhode (Aquidneck) Island, Narragansett Bay. It was named for its location between the other two towns on the island, Newport and Portsmouth. Closely related to Newport, from which it was set off and incorporated in 1743, Middletown has developed as a residential suburb of that city. The surrounding area is predominantly agricultural (dairy and potato farms and nurseries). Middletown is the home of St. George's School for boys (1896) and the site of historic Whitehall, built (1729) by Bishop George Berkeley, an Irish philosopher who lived there from 1729 to 1731. The Norman Bird Sanctuary and Museum is nearby. Pop. (1990) 19,460.

middot (Hebrew: "measure," or "norms"), in Jewish hermeneutics or biblical interpretation, methods or principles used to explicate the meaning of biblical words or passages to meet the exigencies of new situations. Though the rules, or norms, were probably developing in early Hellenistic Judaism, the first known *middot* were compiled by Rabbi Hillel in the 1st century BC. Following the 7 norms compiled by Hillel were the 13 rules of Rabbi Ishmael ben Elisha (*c.* AD 100) and the 32 rules of Rabbi Eliezer ben Yose the Galilaean (*c.* AD 150). These *middot* remained normative for more than 1,000 years in Judaism.

Among the more prominent *middot* are the *kol wa-ḥomer* ("how much more"), in which the interpreter proceeds from a minor to a major premise, and the *gezera shawa* (comparison of similar expressions, or laws), in which an inference is made by analogy. The *kol wa-ḥomer* rule is limited by the principle of *dayyo* ("it is sufficient") so that the interpreter will not go beyond the conclusion warranted by the premise. In the New Testament, Jesus applied this rule in the Sermon on the Mount (Matthew 5–7): "If you then, who are evil, know how to give good gifts to your children, how much more [*kol wa-ḥomer*] will your Father who is in heaven give good things to those who ask him!" (Matt. 7:11).

In addition to the rules of rabbis Hillel, Ishmael, and Eliezer, other rules were developed and found acceptance. Some of the rules, such as *noṭariqon* ("shorthand"), allowed for arbitrary interpretations. According to *noṭariqon,* each letter of a word may be regarded as the initial letter of another word, so that a word in a text might be read as an entire sentence. Another principle, *al tiqre . . . ella*ʾ ("do not read . . . but"), allows the interpreter to exchange one vowel or consonant for another. *Gematria* (*q.v.*), in which each letter of a word stands for a number that, when added to the others, yields a meaningful sum total, was used not only by rabbis but also by early Christian theologians, such as Origen of Alexandria in the 3rd century AD.

Mide (Ireland): *see* Meath.

Midfaʿi, Jamil al- (b. 1890, Baghdad—d. 1959), statesman, several times prime minister of Iraq.

Midfaʿi attended the engineering college in Istanbul and became an artillery officer in the Turkish Army, from which he deserted in 1916 to join the Arab forces that had risen in revolt in Arabia under the direction of Sharīf Ḥusayn. Later, from a base in Syria, Midfaʿi launched raids into Iraq, where there was considerable opposition to the British rule that had been imposed there at the end of World War I. When in 1921 an independent government was formed in Iraq, he returned and subsequently occupied important provincial governorships in which he showed honesty, moderation, and ability. He represented an important group of army officers that had served in the Arab revolt and that later became the backbone of the newly founded Iraqi kingdom.

Midfaʿi became minister of the interior and later president of the chamber (1930). He was twice briefly prime minister in 1933 and 1934, then minister of defense, and again prime minister in 1937 for a period of barely maintained order and acute financial difficulty. During these years he became allied with a group of politicians who supported Great Britain and opposed the growing influence of Nazi Germany. In 1941 this group forced the regent, ʿAbd al-Ilāh, into exile, and Midfaʿi chose to accompany him. The monarchy, however, was soon restored, and he returned to become prime minister once more. In the postwar years he was largely eclipsed by the power of the Iraqi statesman Nuri as-Said and was in retirement in 1958 when a military coup overthrew the monarchy.

Midgard, also spelled MIDGARDR (Old Norse: Middle Abode), also called MANNA-HEIM

("Home of Man"), in Norse mythology, the Middle Earth, the abode of mankind, made from the body of the first created being, the giant Aurgelmir (Ymir). According to legend, the gods killed Aurgelmir, rolled his body into the central void of the universe, and began fashioning the Midgard. Aurgelmir's flesh became the land, his blood the oceans, his bones the mountains, his teeth the cliffs, his hair the trees, and his brains (blown over the earth) became the clouds. Aurgelmir's skull was held up by four dwarfs, Nordri, Sudri, Austri, and Vestri (the four points of the compass), and became the dome of the heavens. The sun, moon, and stars were made of scattered sparks that were caught in the skull.

Midgard is situated halfway between Niflheim on the north, the land of ice, and Muspelheim to the south, the region of fire. Midgard is joined with Asgard, the abode of the deities, by Bifrost, the rainbow bridge.

midge, also called CHIRONOMID, NONBITING MIDGE, or GNAT (family Chironomidae), any of a group of tiny two-winged flies (order Diptera). Although they resemble mosquitoes, midges are harmless and do not have scales on wings or body; in addition, the pattern of wing veins differs from that of mosquitoes, and the small mouthparts are not elongated into a sucking tube. The male antennae are feathery. Midges are usually found around ponds or streams in late afternoon and evening in swarms that produce a humming sound. Midges may breed in water or manure or under tree bark.

Midge (Chironomidae)

N.A. Callow

The wormlike aquatic larvae, soft-bodied and often bloodred, are commonly known as bloodworms. They are important food for aquatic animals, especially trout and young salmon. The nonbiting midge is related to the biting midge (*q.v.*). For the family Cecidomyiidae (Itonididae), *see* gall midge.

midget, in human anatomy, a person of very small stature whose bodily proportions, intelligence, and sexual development are within the normal range. Diminutive stature occurs sporadically in families the rest of whose members are of ordinary size. The children of midgets are usually of ordinary height and proportions. *See also* dwarfism; pygmy.

midget-car racing, form of automobile racing, popular in the United States, in which miniature front-engine racing cars compete on ¼- or ½-mile dirt or paved tracks. Races are short, usually no more than 25 miles (40 km). Cars are of limited engine displacement, varying according to engine type—*e.g.,* 114 cubic inches (1,870 cubic cm) for an overhead cam model, 76 cubic inches (1,245 cubic cm) if supercharged. The sport originated in the 1930s among racing enthusiasts who could not afford to race and maintain full-size cars. Racing is under the direction of a division of the United States Auto Club. *See also* karting; automobile racing.

midget moth, any member of the approximately 300 species in the cosmopolitan family Nepticulidae (sometimes called Stigmellidae), containing some of the smallest members of the order Lepidoptera. Most have long and pointed wings generally covered with scales and spinelike hairs; the wingspan is from 3 to 6 mm (⅛ to ⅖ inch).

Most nepticulid larvae are leaf miners, although some species produce galls on plants. Pupation occurs either inside larval galleries or within thick, silken cocoons constructed in rubbish piles or in loose soil.

Midgley, Thomas, Jr. (b. May 18, 1889, Beaver Falls, Pa., U.S.—d. Nov. 2, 1944, Worthington, Ohio), American engineer and chemist who discovered the effectiveness of tetraethyl lead as an antiknock additive for gasoline.

The son of an immigrant inventor from London, Midgley grew up in Pennsylvania and Ohio and graduated from Cornell University (1911). He held various jobs before joining the research staff of the Dayton (Ohio) Engineering Laboratories Company (Delco) in 1916. He served as vice president of the Ethyl Gasoline Corporation from 1923, vice president of Kinetic Chemicals, Inc., from 1930, and director of the Ethyl-Dow Chemical Company from 1933. From 1940 to 1944 he was a director and vice president of the Ohio State University Research Foundation. He also served as head of one branch of the National Defense Research Committee during World War II.

Midgley's research on the problem of engine knock made him a pioneer in the study of internal combustion, and in 1921 he discovered tetraethyl lead. His investigation of problems arising from the use of lead additives led him to the demonstration that bromine could be extracted from seawater.

During World War I Midgley also developed the control systems for the aerial torpedo, a propeller-driven device somewhat like the buzz bomb of World War II. His search for a nontoxic, nonflammable refrigerant culminated within three days in his discovery of dichlorodifluoromethane, which was commercially introduced under the trade name Freon-12. Freon-12 and several related compounds came into universal use as refrigerants and later found wide application as aerosol propellants.

Midgley conducted extensive research on the composition of natural and synthetic rubbers and discovered one of the first catalysts for "cracking" (breaking down) hydrocarbons.

Midhat Paşa (b. October 1822, Constantinople, Ottoman Empire [now Istanbul, Tur.]—d. May 8, 1883, Aṭ-Ṭāʾif, Arabia [now in Saudi Arabia]), twice Ottoman grand vizier who was known for his honest ability, his administrative reforms, and his initiation of the first constitution of the Ottoman Empire (1876).

Son of a *qāḍī* (judge), Midhat was trained for an administrative career. He joined the office of the grand vizier, eventually becoming the second secretary to the Grand Council. His enemies arranged for him to be given (1854) the nearly impossible task of halting the revolt and brigandage rampant in Rumelia, in the Balkans, where he achieved startling success. After restoring order to Bulgaria (1857), he spent six months' study leave in Europe.

In 1861 Midhat was made a vizier and entrusted with the government of Niš, where his reforms were so successful that Sultan Abdülaziz charged him to help prepare a scheme for their adoption in other parts of the empire. After reorganizing the Council of State, he was made governor of Baghdad (1869), where his success was as impressive as at Niš. Midhat took a bold step in 1872. In an interview with the absolutist sultan, he expressed opposition to the grand vizier Mahmud Nedim's antireform policies. The sultan thereupon appointed him grand vizier in place of Mahmud Nedim. Too independent for the court, however, Midhat remained in power only three months. He was later made minister of justice and then president of the Council of State.

Deteriorating conditions in the empire in 1876 led to a coalition of Midhat, the grand vizier, and the minister of war that deposed Sultan Abdülaziz on May 30 and placed his nephew Murad V on the throne; Murad's insanity led to his deposition in August, and he was replaced by his brother Abdülhamid II. Midhat again became grand vizier, and, mainly at his urging, the empire's first constitution was promulgated on December 23, guaranteeing a broad range of democratic freedoms. In the following February, however, he was dismissed and ordered to leave the country. He was recalled again the next year and appointed governor of Smyrna. In May 1881 the sultan again ordered his arrest, and, although he escaped and appealed to the European powers to intervene for him, he gave himself up shortly afterward. At his trial he was found guilty of having caused the death of the deposed Sultan Abdülaziz and sentenced to death. On British intercession the sentence was commuted to life banishment. Midhat spent the last days of his life in Aṭ-Ṭāʾif, where he was probably murdered.

Midi, cultural region encompassing the southern French regions of Aquitaine, Languedoc, and Provence. The Midi is bounded by Spain and the Pyrenees to the south and by Italy and the Alps to the northeast. The southern flank of the Massif Central extends into Languedoc. Lowlands include the Aquitaine Basin and the plains of Languedoc and the Rhône Basin. A Mediterranean climate prevails throughout most of the Midi. The northern boundaries of the Midi roughly coincide with the limit of the cultivation of olive trees.

The Midi was not politically united during the European Middle Ages and was not fully incorporated into France until 1860, when the house of Savoy relinquished the county of Nice. Catalan culture entered the Midi through Roussillon, and Italian influences penetrated by way of Nice.

Midi Canal, also called LANGUEDOC CANAL, French CANAL DU MIDI, or CANAL DU LANGUEDOC, major link in the inland waterway system from the Bay of Biscay to the Mediterranean. A landmark engineering work carried out in France in the 17th century, the Midi Canal connects Toulouse with the Mediterranean and provides a waterway to the Atlantic via the Aude and the Garonne. Rising 206 feet (63 m), via 26 locks, in its 32-mile (51.5-kilometre) journey to the summit of its route, it runs 3 miles (5 km) along the summit, then descends 114 miles (183.5 km) with a difference in elevation of 620 feet (189 m) taken up by 74 locks. The engineer, Pierre-Paul Riquet, overcame a rocky rise near Béziers by a daring innovation, employing black powder to blast a 515-foot (157-metre) tunnel, 22 feet (6.7 m) wide and 27 feet (8 m) high, the first canal tunnel ever so built, and the first use of explosives in underground construction. The canal was built between 1665 and 1681, with its final completion in 1692.

Midi-Pyrénées, *région,* southwestern France, encompassing the *départements* of Lot, Aveyron, Tarn, Tarn-et-Garonne, Gers, Hautes-Pyrénées, Haute-Garonne, and Ariège. The capital is Toulouse. The region has an area of 17,509 square miles (45,349 square km) and is bounded by the *départements* of Pyrénées-Atlantiques and Landes to the west, Lot-et-Garonne and Dordogne to the northwest, Corrèze and Cantal to the north, and Lozère, Gard, Hérault, Aude, and Pyrénées-Orientales to the east. Spain lies to the south. The Pyrenees rise in the south and cover much of Hautes-Pyrénées, Haute-Garonne, and Ariège. An oceanic climate prevails.

The region is sparsely populated. The population declined by more than 31 percent between 1851 and 1946, as in most of rural France outside the Paris region, and has subsequently increased at a rate well below the national average. Repatriated émigrés from northern Africa have accounted for much of the post-World War II increase. The population remains predominantly rural outside the urban areas of Toulouse, Tarbes, Albi, Castres, and Montauban.

Immigrants from Morocco and Tunisia have helped to expand the cultivation of wheat in the Aquitaine basin. Viticulture is largely limited to Condom and Eauze in Gers, Gaillac in Tarn, and Fronton in Haute-Garonne. Animal husbandry and forestry predominate in the Pyrenees.

The region's industries are underdeveloped. Electrometallurgy is concentrated in the valleys of the Pyrenees. Hydroelectric power is generated from the Neste and Ariège rivers in the Pyrenees and from the Truyère River and Lake Pareloup in the Massif Central. Pop. (1999) 2,551,687.

Midianite, also called ISHMAELITE, in the Old Testament, member of a group of nomadic tribes related to the Israelites and most likely living east of the Gulf of Aqaba in the northwestern regions of the Arabian Desert. They engaged in pastoral pursuits, caravan trading, and banditry, and their main contacts with the Israelites were from the period of the Exodus (13th century BC) through the period of the judges (12th–11th century BC). According to the Book of Judges, the Israelite chieftain Gideon drove the Midianites into western Palestine, after which they largely disappear from the biblical narrative.

According to the Book of Genesis, the Midianites were descended from Midian, who was the son of the Hebrew patriarch Abraham by the latter's second wife, Keturah. Jethro, priest-leader of the Midianite subtribe known as the Kenites, and his daughter Zipporah (a wife of Moses), influenced early Hebrew thought: it was Yahweh, the lord of the Midianites, who was revealed to Moses as the God of the Hebrews.

Midland, town, Simcoe county, south-central Ontario, Canada. It is located on Midland Bay, an arm of Georgian Bay on Lake Huron. It was surveyed in 1872 and became a village in 1878 and a town in 1887. Midland has large harbour installations and grain elevators and is a customs port and a steamship terminal for the Georgian Bay resorts.

Just east on the Wye River is the reconstructed Fort-Sainte-Marie, which from 1639 to 1649 was the Jesuit mission headquarters for the Huron region. It was one of the first European settlements in inland Canada and had Ontario's first hospital, school, and farm. Nearby are Little Lake Park, with a replica of a Huron Indian village and a museum, and the Wye Marsh Wildlife Centre. Pop. (2001) 16,214.

Midland, city, seat (1850) of Midland county, east-central Michigan, U.S. It lies along the Tittabawassee River, just west of Bay City. It originated in the 1830s as a lumbering settlement and was named for the county (located in the middle of the Lower Peninsula). Brine deposits formed the basis of the city's chemical industry, which was the world's largest producer of bromine by 1888. In 1890 Herbert H. Dow formed a company in Midland based on his own method of bromine extraction, and the city expanded with its growth. Dow Chemical Company formed the basis of the city's economy, producing a wide range of industrial, agricultural, and consumer chemicals. The city is noted for its modern architecture, including many buildings designed by Alden B. Dow, Herbert's son and a student of Frank Lloyd Wright. Attractions include the Midland Center for the Arts and Dow Gardens. Inc. village, 1869; city, 1887. Pop. (2000) city, 41,685; Saginaw–Bay City–Midland MSA, 403,070.

Midland, city, seat (1885) of Midland county, western Texas, U.S. It lies on the southern edge of the High Plains, just northeast of Odessa. Founded in 1884 as a depot on the Texas and Pacific Railway, it was named for its position midway between El Paso and Fort Worth (300 miles [480 km] east).

Midland is the hub of a 12-county ranching region noted for Hereford cattle. It is also the financial and trade centre for the vast Permian Basin, which contains large quantities of oil, natural gas, anhydrite, salt, and potassium. Oil was discovered in 1923, and three years later the oil industry began moving into Midland. With tens of thousands of producing wells in the basin and hundreds of oil-company offices in the city, it became one of the nation's most important oil centres. Oil distribution, petrochemical industries, and livestock dominate the economy. Midland's Permian Basin Petroleum Museum traces the history and development of the basin, which was once an ancient sea. Midland College was founded in 1969. Inc. 1906. Pop. (2000) 94,996; Odessa-Midland MSA, 241,600.

Midland Bank PLC, formerly one of the leading commercial banks in the United Kingdom, acquired by HSBC Group (formerly the Hongkong and Shanghai Banking Corporation) in July 1992.

The bank was established as the Birmingham and Midland Bank in Birmingham in 1836. After absorbing several banks in the Midlands, it merged with the Central Bank of London in 1891 to form the London and Midland Bank. It attained national coverage by expansion and amalgamation; between 1891 and 1924 it made acquisitions throughout England, Wales, Ireland, and Scotland. The name Midland Bank Ltd. was adopted in 1923. By 1934 it was the world's largest deposit bank.

Midland's expansion slowed during and after World War II. In the 1960s and '70s it began to establish a presence in important financial centres overseas. In 1981 Midland acquired the California-based Crocker National Bank; it proved to be a disastrous investment. The Midland name was retained until 1999, when the bank was renamed HSBC Bank PLC. HSBC is based in London.

Midlands, region of central England, commonly subdivided into the East and the West Midlands. The East Midlands includes the historic and geographic counties of Lincolnshire, Northamptonshire, Derbyshire, Nottinghamshire, Leicestershire, and Rutland. The West Midlands comprises Staffordshire, Warwickshire, Shropshire, Herefordshire, and Worcestershire. Parts of the historic counties of Warwickshire, Worcestershire, and Staffordshire make up the metropolitan county of West Midlands. The West Midlands contains a concentration of large industrial cities, including Birmingham, Coventry, Leicester, Derby, Nottingham, Stoke-on-Trent, and Wolverhampton. Pop. (2001) 9,439,516.

Midlothian, council area and historic county in southeastern Scotland, south of the Firth of Forth. The historic county and council area cover somewhat different territories. The council area encompasses a suburban and rural area south and southeast of Edinburgh. The northern part of the council area occupies the low coastal plain bordering the Firth of Forth. The rest is gently rolling country that gradually slopes upward to the Moorfoot Hills in the south. The River Esk flows northward through the area to drain into the Firth of Forth. The council area lies entirely within the historic county, which also encompasses the southeastern portion of West Lothian council area, a hilly region south of the Moorfoot Hills surrounding the upper valley of Gala Water in the Scottish Borders council area, the town of Musselburgh in East Lothian council area, and most of the council area of the city of Edinburgh, including the city's historic core.

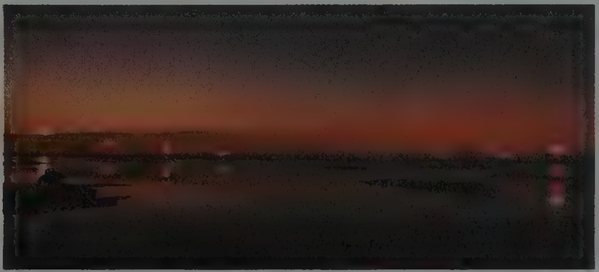
There are remains of prehistoric forts on several hilltops, and Roman settlements at Inveresk and Cramond probably lay along the main Roman road. Along with the rest of the Lothian region, Midlothian was held by the Angles of Northumbria, but in the 11th century AD King Malcolm II of Scotland (reigned 1005–34) conquered the area. Edinburgh became the capital of Scotland in the 15th century. Midlothian's history from that time is essentially that of Edinburgh, and until the 20th century the county was known as Edinburghshire.

Aside from the architectural riches of Edinburgh, Midlothian has the remains of many ecclesiastical buildings, including the great Cistercian abbey at Newbattle and a church of the Knights Templar at Temple. Numerous castles and country mansions built after 1400 survive, particularly near Edinburgh. Famous battle sites are at Pinkie (1547), Carberry Hill (1567), and Rullion Green (1666).

Crops raised in Midlothian include oats, barley, potatoes, turnips, and wheat, and dairy cattle and sheep are kept. The leading industrial sector is electronics manufacturing, concentrated in the suburban towns outside Edinburgh. Dalkeith is the administrative centre. Other large towns include Bonnyrigg, Loanhead, and Penicuik. Area council area, 137 square miles (355 square km). Pop. (2001) council area, 80,941.

Midnapore, also spelled MIDNAPUR, or MEDINIPUR, city, south-central West Bengal state, northeastern India. The city lies just north of the Kāsai River and is an agricultural-trade centre on the Grand Trunk Road from Calcutta to Amritsar. Kharagpur (*q.v.*), across the river, provides major rail connections. Rice milling and the manufacture of chemicals and silk cloth are the chief industries. Constituted a municipality in 1865, Midnapore is an educational centre, with numerous colleges affiliated with the University of Calcutta. Rice, corn (maize), legumes, and oilseeds are the chief crops grown in the surrounding area. Pop. (2001 prelim.) 153,349.

midnight Sun, the Sun, as seen in the Arctic or Antarctic, where the tilt of the Earth's axis,



Midnight Sun at Point Barrow, Alaska, at latitude 71° 23′ N; exposures made in August at half-hour intervals

© Ken Graham/Ken Graham Agency

relative to the plane of its orbit, produces at least one 24-hour period of daylight, and one of night, in every year. At the poles, both day and night are theoretically six months long, though the actual periods of light and dark are modified by the twilight periods. The effect of the tilt of the axis is seen in lower latitudes as a lengthening of daylight hours in the summer and their shortening in the winter.

Midrash (Hebrew: "Exposition," or "Investigation"), in Judaism, the method of biblical investigation in which oral tradition interprets and elaborates on the scriptural text. The term Midrash also denotes the large collections of Halakhic (legal) and Haggadic (nonlegal) materials deduced from the Hebrew Bible by this exegetical method.

A brief treatment of the Midrash follows. For full treatment, *see* MACROPAEDIA: Judaism.

The term *Midrash* is derived from the Hebrew root *darash,* which means "to search," or "to investigate," and indicates intensive study, or searching, of the spirit of a biblical passage, as opposed to its literal interpretation. Such "searching" became necessary because the Written Law, in the Pentateuch (the first five books of the Old Testament), required reinterpretation in the light of later historical conditions, and because of the disagreement between the Pharisees and Sadducees over the status of the Oral Law (*see* Pharisee).

Midrash thus began as a philological method of interpreting the literal meaning of biblical texts, but it developed into a complex interpretive system used to reconcile biblical contradictions, establish the scriptural bases for new laws, and bring new meaning to the scriptural text. Midrashic activity reached its height in the 2nd century CE (Common Era) with the schools of Rabbi Ishmael ben Elisha and Rabbi Akiba ben Joseph. The Talmud (scholarly interpretations of the Jewish Oral Law) quotes from all Midrashic collections (Midrashim) and uses all Midrashic rules of interpretation.

The Midrashim may be divided into two broad groups: (1) Halakha Midrash, which may be defined as the scholastic deduction of the Oral Law (*halakha*) from the Written Law; and (2) Haggada Midrash, which consists of homiletic works whose purpose is edification rather than legislation. Both seek to reveal the inner meaning of the Bible. Haggadic Midrash was highly esteemed, but it was not so authoritative as Halakhic. Halakhic Midrashim are often dull, legalistic, and sober; whereas Haggadic Midrashim are rarely dull, are often highly imaginative and edifying, and do not insist on sobriety.

Midway, Battle of (June 3–6, 1942), World War II naval battle, fought almost entirely with aircraft, in which the United States destroyed Japan's first-line carrier strength and most of its best trained naval pilots and ended the threat of further Japanese invasion in the Pacific.

Despite a setback in May 1942 in the indecisive Battle of the Coral Sea, the Japanese had continued with plans to seize Midway Island and bases in the Aleutians. Seeking a naval showdown with the numerically inferior U.S. Pacific Fleet, Adm. Yamamoto Isoroku sent out the bulk of the Japanese fleet, including four heavy and three light aircraft carriers, with orders to engage and destroy the American fleet and invade Midway. U.S. intelligence had divined Japanese intentions after breaking the Japanese naval code, however, and the Americans were ready: three heavy aircraft carriers of the U.S. Pacific Fleet were mustered. These ships were stationed 350 mi northeast of Midway and awaited the westward advance of Yamamoto's armada. Whereas the Japanese had no land-based air support, the Americans from Midway and from Hawaii could commit about 115 land-based planes.

The battle began on June 3, 1942, when U.S. bombers struck ineffectually at the Japanese carrier strike force about 220 mi southwest of the U.S. fleet. Early the next morning Japanese planes from the strike force attacked and bombed Midway heavily, while the Japanese carriers again escaped damage from U.S. land-based planes. But as the morning progressed the Japanese carriers were soon overwhelmed by the logistics of almost simultaneously sending a second wave of bombers to finish off the Midway runways, zigzagging to avoid the bombs of attacking U.S. aircraft, and trying to launch more planes to sink the now-sighted U.S. naval forces. A wave of U.S. torpedo bombers was almost completely destroyed during their attack on the Japanese carriers at 9:20 AM, but at around 10:30 AM 36 carrier-launched U.S. dive-bombers caught the Japanese carriers while their decks were cluttered with armed aircraft and fuel. The U.S. planes quickly sank three of the heavy Japanese carriers and one heavy cruiser. In the late afternoon U.S. planes sank the fourth heavy carrier, but Japanese aircraft badly damaged the U.S. carrier *Yorktown.* On June 6, a Japanese submarine fatally torpedoed the *Yorktown* and an escorting American destroyer. The Japanese, however, appalled by the loss of their carriers, had already begun a general retirement on the night of June 4–5 without attempting to land on Midway.

The Battle of Midway brought the Pacific naval forces of Japan and the United States to approximate parity and marked the turning point of the military struggle between the two nations.

Midway Islands, unincorporated territory of the United States in the central Pacific Ocean, 1,300 mi (2,100 km) northwest of Honolulu. The islands, near the western end of the Hawaiian archipelago, comprise a coral atoll with a circumference of 15 mi, enclosing two islands, Eastern (Green) and Sand. The land area is 2 sq mi (5 sq km). The climate is subtropical.

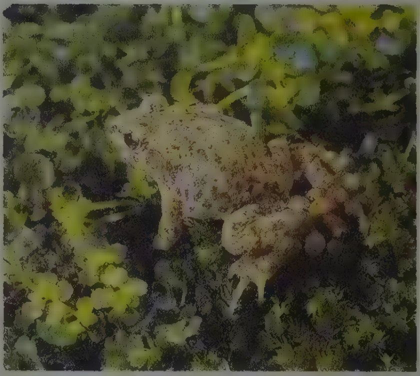
Reported and claimed for the United States in 1859 by Capt. N.C. Brooks, the atoll was first called Middlebrooks and then Brooks; the name Midway dates from the islands' formal annexation by the United States in 1867. In 1903 Pres. Theodore Roosevelt placed the islands under the control of the U.S. Navy, and Sand Island became a station of the Hawaii–Luzon submarine cable (1905). Transpacific aviation gave Midway new importance in 1936, when it was made a regular stop on the San Francisco–Manila mail run. In 1940 the U.S. Navy began work on an air and submarine base there. In World War II, the Battle of Midway (June 3–6, 1942), characterized mainly by the actions of carrier-based planes, marked the turning point of the Pacific war. After the war, Midway's importance as a commercial air base was reduced, and regular stops there were eliminated in 1950. That year also saw the reduction of Midway to a naval station and air facility. The islands comprise a National Wildlife Reserve, established to protect their abundant bird life. Pop. (2000) none.

Midwest (region, U.S): *see* Middle West.

Midwest City, Oklahoma county, central Oklahoma, U.S., an eastern residential suburb of Oklahoma City. It was founded in 1942 after activation of the Midwest Air Depot, now Tinker Air Force Base, headquarters for the Oklahoma City Air Logistics Center, adjoining the city to the south. The community was planned as a model city, with curvilinear street design and spacious parks, by builder and developer W.P. Atkinson with the approval of Air Force officials. Inc. 1943. Pop. (2000) 54,088.

Midwestern Regionalism, American literary movement of the late 19th century that centred on the realistic depiction of Middle Western small town and rural life. The movement was an early stage in the development of American Realistic writing. E.W. Howe's *Story of a Country Town* (1883) and Joseph Kirkland's *Zury* (1887) and *The McVeys* (1888) foreshadowed the stories and novels of Hamlin Garland, the foremost representative of Midwestern Regionalism. Garland wrote *Main-Travelled Roads* (1891) and *A Son of the Middle Border* (1917), examples of works that deal with the poverty and hardship of Middle Western rural life and that explode the myth of the pioneer idyll. Chicago was the focal point of Midwestern Realist activity; Garland lived in the city for a time, as did such others as Theodore Dreiser, Edgar Lee Masters, and Sherwood Anderson. These latter figures were writers from small towns in the Middle West who were deeply influenced by the regional movement of the 1890s and became the leading exponents of 20th-century Realism and Naturalism.

midwife toad (*Alytes obstetricans*), slow-moving, terrestrial amphibian (family Discoglossidae) found in western Europe and noted for the breeding behaviour of the species. The midwife toad is about five centimetres (two inches) long and plump, with warty, dull-gray skin. It mates on land and breeds throughout the spring and summer.



Male midwife toad (*Alytes obstetricans*) carrying eggs on back legs

Heather Angel

The midwife toad is nocturnal and thoroughly terrestrial. Toward evening the males reveal their presence by a clear whistling note. Mating takes place on land; the male seizes the female around the waist and stimulates her cloacal region with his toes until the eggs are forcibly expelled. The eggs are large and yellow, and produced in two rosarylike strands of gelatinous capsules. While the eggs are being extruded, the male positions himself and discharges milt (sperm-containing fluid) over them to effect fertilization. This having been accomplished, the male twists the egg strings around his legs and returns to his usual retreat, resorting to a short immersion in the water during exceptionally dry nights. When the time for hatching has come, after about three weeks, the male enters the water; the larvae, measuring slightly over a half inch, bite their way through their tough envelope, which is not abandoned by the father until all the young are liberated.

midwifery, the art and practice of attending upon women in childbirth. The profession of midwife must be one of the oldest, being clearly recognized in the earliest books of the Old Testament and an accepted element in the social structure in ancient Greece and Rome. But the old obstetrical learning, meagre as it was, disappeared in the Middle Ages, and the little that survived became adulterated by superstition. Childbirth in those days was associated with an appalling infant mortality and with grave danger to any mother who was unable to deliver herself expeditiously and unaided.

In Europe in the 17th century a slow and hesitant movement for the training of midwives began. In the 18th century, maternity hospitals appeared in the larger cities and became training centres for midwives. It was not until the 19th century that the training and control of midwives' practice were put on a statutory basis. The Netherlands, Scandinavia, Germany, and France all made early progress in this regard. In Great Britain, the first Midwives Act (1902) set up a Central Midwives Board to prescribe the training of student-midwives in hospitals, examine and license candidates, and regulate the practice of all such certified midwives. This was a great advance, for at that time the great majority of births in Great Britain were home births attended by midwives. The Midwives Act resulted in a steady rise in the professional skill of British midwives, most of whom were trained as state registered nurses (S.R.N.) before becoming state certified midwives (S.C.M.).

In the late 19th and early 20th century, advances in obstetrics and gynecology caused a great shift in childbearing from the home to the hospital in most Western nations. In the 1960s, however, a variety of economic and social factors spurred a renewed interest in the concerned, personal care provided by midwives and gave rise, in the United States, to the profession of nurse-midwife. A certified nurse-midwife (C.N.M.) is a registered nurse who has received professional training in midwifery and been certified by the American College of Nurse-Midwives. C.N.M.'s accept only those patients who can be expected to have a normal delivery. They do not perform operative deliveries, and if a delivery does prove difficult, a physician is usually called. C.N.M.'s deliver babies in hospitals, clinics, birthing centres, or, more rarely, at home. They provide prenatal and postnatal care, advise women about their reproductive health before and after pregnancy, and offer family-planning services and counseling.

Lay midwives, by contrast, usually have no professional training in midwifery, are unlicensed, and deliver babies at home. In developed nations, they have traditionally worked in isolated rural areas, but in developing countries they are much more common. Midwives of all sorts deliver about three-fourths of all the infants born throughout the world each year.

Mie, *ken* (prefecture), central Honshu, Japan, occupying part of the Kii Peninsula. It faces Ise Bay to the east and the Pacific Ocean to the south. The deeply indented Pacific coast, fringed with islands, and the ancient town of Ise form the central attractions of Ise-shima National Park in the prefecture. Sheltered inlets produce cultured pearls, lobster, and shrimp. The port of Toba is a tourist centre; offshore are the "Wedded Rocks," which are likened to Shintō deities and are joined by a large straw rope. Heavy industries in the prefecture produce chemicals, petroleum, iron, and steel. Traditional industries produce textiles, porcelain, lumber, cement, and glass. Tsu, on the west shore of Ise Bay, is the prefectural capital. Mie University, founded in 1949, is located there. Area 2,231 square miles (5,778 square km). Pop. (1994 est.) 1,827,000.

Ama (fisherwomen) who dive for pearl oysters, abalone, and edible seaweed, off the coast of Mie prefecture, Japan

Bob and Ira Spring

Mielziner, Jo (b. March 19, 1901, Paris, France—d. March 15, 1976, New York, N.Y., U.S.), American stage designer who, in more than 360 Broadway productions from 1924, introduced several devices that became standard in 20th-century theatrical staging. One of his innovations was the transparent skeletal framework setting of *Death of a Salesman* (1949), which allowed separate times and places to be shown simultaneously. Mielziner's success with works as diverse as *Hamlet* and the musical comedy *Annie Get Your Gun* was due both to his unusual technical ingenuity and to his grasp of the organic function of the total stage environment.

Mielziner studied at the National Academy of Design and the Art Students League of New York and at the Pennsylvania Academy of the Fine Arts in Philadelphia. He also attended school in Paris and Vienna, then returned to the United States to study under the stage craftsmen Robert Edmond Jones and Lee Simonson, then with the Theatre Guild. He was a collaborating designer of the Lincoln Center Repertory Theatre in New York City and the Los Angeles Music Center. He designed the setting in which Michelangelo's "Pietà" was exhibited in the Vatican Pavilion at the New York World's Fair (1964–65). After 1968 he served as chairman of the American Theater Planning Board and acted as a consultant on theatrical design.

Mien-yang, Pinyin MIANYANG, city in north-central Szechwan *sheng* (province), China. It is located on the Fou River, about 70 miles (110 km) northeast of Ch'eng-tu, at a point where the ancient route to Pao-chi and to Sian (Hsi-an) in Shensi province emerges into the northeast of the Ch'eng-tu Plain in Szechwan. This route is now followed by a railway line and highways connecting Mien-yang with Ch'eng-tu, Nan-ch'ung, and Chungking to the south.

The surrounding area, for which Mien-yang acts as the central market, is fertile, densely populated, and known for its silk production. Mien-yang has a large modern factory producing raw silk and shops for production of silk and cotton textiles on a minor scale. The area to the north was also a traditional centre of local ironworking. After the building of the now electrified Ch'eng-tu–Pao-chi railway, Mien-yang's steel industry was developed, using coal from Kuang-yüan in the northeast. Mien-yang is the chief supplier of food and other goods for the new industrial centre of Chiang-yu to the north, which also produces steel and cement. Pop. (1990 est.) 262,947.

Miercurea-Ciuc, Hungarian CSÍKSZEREDA, town, capital of Harghita *judeţ* (county), Romania. The town lies along the Olt River in the Ciuc Depression. It was an Iron Age settlement, and later Dacian and Szekler villages developed there; its history is presented in the county museum. Miercurea-Ciuc has become an important road focus and industrial town, producing timber products, tractors, clothing, and foodstuffs. The area has a tourist industry based on several small village spas in the Eastern Carpathian Mountains (particularly Tuşnad), hiking paths in the nearby Harghita Mountains, and the neighbouring pilgrimage centre of Şimleu. Magyars form a large majority of the population. Pop. (1992 prelim.) 46,029.

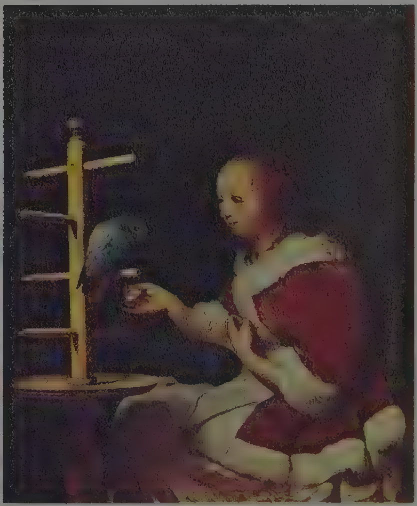
Mieres, town, Asturias *provincia* and *comunidad autónoma* ("autonomous community"), northwestern Spain. Mieres lies south-southeast of Oviedo city. Until 1836 it was governed by the municipal corporation of Lena, but since that time it has been an independent administrative entity. The town is a mining and industrial centre with iron, sulfur, hard and soft coal, and mercury mines nearby. It also has blast furnaces, steel furnaces, zinc smelters, and factories specializing in the manufacture and repair of motors and machinery for mining and for general industry. The parish church of San Juan, originally established by a grant of King Ordoño I of Asturias in AD 857, has Romanesque columns and capitals. Mieres is situated on the railway lines between Madrid and Gijón. Pop. (1991 prelim.) 53,379.

Mierevelt, Michiel Janszoon van, Mierevelt also spelled MIEREVELD, or MIERVELDT (b. May 1, 1567, Delft, Neth.—d. June 27, 1641, Delft), Dutch portrait painter patronized by the royalty of many European countries.

Mierevelt was the son of a goldsmith, who apprenticed him to the copperplate engraver J. Wierix. Anthonie van Blocklandt (called Montfoort), who had seen and admired two of Mierevelt's early engravings, invited him to enter his school at Utrecht. Mierevelt remained at Utrecht until the death of Montfoort (1583) and then settled at Delft. Devoting himself at first to still life, Mierevelt eventually took up portraiture. His portraits, usually small in size, are sincere in characterization and restrained in composition; his drawing is severe and the colour harmonious. The many commissions entrusted to him necessitated the employment of numerous assistants, by whom hundreds of portraits were turned out. Comparatively few of the 2,000 or more portraits (a contemporary attributes 10,000) that bear his name are wholly his handiwork.

Mieris, Frans van, THE ELDER (b. April 16, 1635, Leiden, Neth.—d. March 12, 1681, Leiden), Dutch painter, son of Jan van Mieris and chief member of a family of Leiden painters.

Mieris took service with Abraham Toorenvliet, a glazier who kept a school of design. He then studied with Gerrit Dou and Abraham van den Tempel and acquired a manner



"Woman with Parrot," painting on copper by Frans van Mieris the Elder; in the National Gallery, London

By courtesy of the trustees of the National Gallery, London; photograph, A.C. Cooper that had more of the finish of the exquisites of the Leiden *fijnischilders* ("fine painters") school than of the breadth of the disciples of Rembrandt. He seldom chose panels larger than 12–15 inches (30–38 cm) square. Characteristic of his art in its minute proportions is a shiny brightness and metallic polish. The subjects he treated best are those in which he illustrated the habits or actions of the wealthier classes, but he sometimes succeeded in homely incidents and in portraiture, and he occasionally ventured into allegory. His son Willem van Mieris (1662–1747) and his grandson Frans van Mieris the Younger (1689–1763) were also accomplished genre painters.

mierkat, also spelled MEERKAT, common name for certain carnivores of the civet family (Viverridae): the suricate (*q.v.*) and various mongoose (*q.v.*) species.

Mies van der Rohe, Ludwig, original name MARIA LUDWIG MICHAEL MIES (b. March 27, 1886, Aachen, Ger.—d. Aug. 17, 1969, Chicago, Ill., U.S.), German-born American architect whose rectilinear forms, crafted in elegant simplicity, epitomized the International Style (*q.v.*) of architecture.

Mies van der Rohe

Artemis Verlag und Verlag fur Architektur, Zurich

Early training and influence. Ludwig Mies (he added his mother's surname, van der Rohe, when he had established himself as an architect) was the son of a master mason who owned a small stonecutter's shop. Mies helped his father on various construction sites but never received any formal architectural training. At age 15 he was apprenticed to several Aachen architects for whom he sketched outlines of architectural ornaments, which the plasterers would then form into stucco building decorations. This task developed his skill for linear drawings, which he would use to produce some of the finest architectural renderings of his time.

In 1905, at the age of 19, Mies went to work for an architect in Berlin, but he soon left his job to become an apprentice with Bruno Paul, a leading furniture designer who worked in the Art Nouveau style of the period. Two years later he received his first commission, a traditional suburban house. Its perfect execution so impressed Peter Behrens, then Germany's most progressive architect, that he offered the 21-year-old Mies a job in his office, where, at about the same time, Walter Gropius and Le Corbusier were also just starting out.

Behrens was a leading member of the Deutscher Werkbund, and through him Mies established ties with this association of artists and craftsmen, which advocated "a marriage between art and technology." The Werkbund's members envisioned a new design tradition that would give form and meaning to machine-made things, including machine-made buildings. This new and "functional" design for the industrial age would then give birth to a *Gesamtkultur,* that is, a new universal culture in a totally reformed man-made environment. These ideas motivated the "modern" movement in architecture that would soon culminate in the so-called International Style of modern architecture.

In Berlin Mies was influenced by Behrens' emulation of the pure, bold and simple Neoclassic forms of the early 19th-century German architect Karl Friedrich Schinkel. It was Schinkel who became the decisive influence on Mies's search for an architecture of *Gesamtkultur.* Throughout his life, the elegant clarity of Schinkel's buildings seemed to Mies to embody most perfectly the form of the 20th-century urban environment. Another decisive influence was Hendrik Petrus Berlage, a pioneer of modern Dutch architecture, whom Mies met in 1911. Berlage's work inspired Mies's own love for brick, and the Dutch master's philosophy inspired Mies's credo of "architectural integrity" and "structural honesty." With regard to structural honesty, Mies would eventually go further than anyone else to make the actual rather than apparent or dramatized supports of his buildings their dominant architectural features.

Work after World War I. During World War I Mies served as an enlisted man, building bridges and roads in the Balkans. When he returned to Berlin in 1918, the fall of the German monarchy and the birth of the democratic Weimar Republic helped inspire a prodigious burst of new creativity among modernist artists and architects. Architecture, painting, and sculpture, according to the manifesto of the Bauhaus—the avant-garde school of the arts just established in Weimar—were not only moving toward new forms of expression but were becoming internationalized in scope. Mies joined in several modernist architectural groups at this time and organized many exhibitions, but there was virtually nothing for him to build. His foremost building of this period—an Expressionist memorial to the murdered communist leaders Karl Liebknecht and Rosa Luxemburg, dedicated in 1926—was demolished by the Nazis.

Mies's most important work of these years remained on paper. In fact, these theoretical projects, rendered in a series of drawings and sketches that are now in the New York Museum of Modern Art, foreshadowed the entire range of his later work. The Friedrichstrasse Office Building (1919) was one of the first proposals for an all steel-and-glass building and established the Miesian principle of "skin and bones construction." The "Glass Skyscraper" (1921) applied this idea to a glass skyscraper whose transparent facade reveals the building's underlying steel structure. Both of these building designs were uncompromising in their utter simplicity. Other theoretical studies explored the potentials of concrete and brick construction, and of de Stijl form and Frank Lloyd Wright concepts. Few unbuilt buildings surpassed them in the variety of ideas and in their influence on the development of the architecture of the time.

This influence was apparent at the first postwar Werkbund exposition at Weissenhof near Stuttgart in 1927. The exhibition consisted of a housing demonstration project planned by Mies, who had by then become the Werkbund's vice president. Europe's 16 leading modernist architects, including Le Corbusier and Mies himself, designed various houses and apartment buildings, 33 units in all. Weissenhof demonstrated, above all, that the various architectural factions of the early postwar years had now merged into a single movement—the International Style was born. Though not a popular success, the exposition was a critical one, and Europe's elite suddenly began to commission modern villas, such as Mies's Tugendhat House (1930) at Brno, Czech.

Perhaps Mies's most famous executed project of the interwar period in Europe was the German Pavilion (also known as the Barcelona Pavilion), which was commissioned by the German government for the 1929 International Exposition at Barcelona. It exhibited a sequence of marvelous spaces on a 175- by 56-foot (53.6- by 17-metre) travertine platform, partly under a thin roof, and partly outdoors, supported by chromed steel columns. The spaces were defined by walls of honey-coloured onyx, green Tinian marble, and frosted glass and contained nothing but a pool, in which stood a sculptural nude, and a few of the chairs Mies had designed for the pavilion. These cantilevered steel chairs, which are known as Barcelona chairs, became an instant classic of 20th-century furniture design.

In 1930 Mies was appointed director of the Bauhaus, which had moved from Weimar to Dessau in 1925. Between Nazi attacks from outside and left-wing student revolts from within, the school was in a state of perpetual turmoil. Though not cut out to be an administrator, Mies soon won respect as a stern but superb teacher. When the Nazis closed the school in 1933, Mies tried for a few months to continue it in Berlin. But modern design was as hopeless a cause in Hitler's totalitarian state as was political freedom. Mies announced the end of the Bauhaus in Berlin late in 1933 before the Nazis could close it.

Mies in America. Four years later, in 1937—again after working mainly on projects that were never built—Mies moved to the United States. Soon after he arrived in the country, he gained an appointment as director of the School of Architecture at Chicago's Armour Institute (later the Illinois Institute of Technology). Mies served as the school's director for the next 20 years, and, by the time he retired in 1958, the school had become world-renowned for its disciplined teaching methods as well as for its campus, which Mies had designed in 1939–41. A cubic simplicity marked the campus buildings, which could easily be adapted to the diversified demands of the school. Exposed structural steel, large areas of glass reflecting the grounds of the

The Lake Shore Drive Apartments, Chicago, designed by Mies van der Rohe; photographed in 1955

Ezra Stoller © Esto

campus, and a yellow-brown brick were the basic materials used.

The many commissions that his architectural office received after World War II gave Mies unique opportunities to realize large-scale projects, among them several high-rise buildings that are conceived as steel skeletons sheathed in glass curtain-wall facades. Among these major commissions are the Promontory Apartments in Chicago (1949), the Lake Shore Drive Apartments (1949–51) in that city, and the Seagram Building (1956–58) in New York City, a skyscraper office building with a glass, bronze, and marble exterior that Mies designed with Philip Johnson. These buildings exemplify Mies's famous principle that "less is more" and demonstrate, despite their austere and forthright use of the most modern materials, his exceptional sense of proportion and his extreme concern for detail. The International Style, with Mies its acknowledged leading master, reached its zenith at this time. The United States in the 1950s had a faith in material and technical progress that seemed similar to the earlier German notion of *Gesamtkultur.* Miesian-influenced steel-and-glass office buildings appeared all over the United States and indeed all over the world.

Late work. In the 1960s Mies continued to create beautiful buildings, among them the Bacardi Building in Mexico City (1961); One Charles Center office building in Baltimore (1963); the Federal Center in Chicago (1964); the Public Library in Washington, D.C. (1967); and, most Miesian of all, the Gallery of the Twentieth Century (later called the New National Gallery) in Berlin, dedicated in 1968. A heavy man, plagued by arthritis, Mies continued to live near Lake Michigan in Chicago until his death in 1969.

Although Mies attracted a great number of disciples, his indirect influence was perhaps of even greater importance. He is the only modern architect who formulated a genuinely contemporary and universally applicable architectural canon, and office buildings all over the world echo his concepts. His work eventually came under criticism in the 1970s for rigidity, coldness, and anonymity, but it was Mies's declared choice to accept the nature of 20th-century industrial society and express it in his architecture. (W.V.E./Ed.)

BIBLIOGRAPHY. Franz Schulze, *Mies van der Rohe: A Critical Biography* (1985), utilizes a wide array of sources and is well illustrated. Philip C. Johnson, *Mies van der Rohe,* 3rd ed., rev. (1978), is a scholarly and readable book that first introduced Mies to America. Peter Blake, *Mies van der Rohe* (1964), is detailed, personal, and authoritative. Werner Blaser, *Mies van der Rohe,* rev. ed. (1972), contains a fairly complete collection of photographs and drawings of Mies's work with his own brief introduction. David Spaeth, *Mies van der Rohe* (1985), provides an overview of his architectural career. Interpretations of his work are in Franz Schulze (ed.), *Mies van der Rohe* (1989), a collection of essays; and Fritz Neumeyer, *The Artless World: Mies van der Rohe on the Building Art* (1991).

Mieszko, name of rulers of Poland, grouped below chronologically and indicated by the symbol •.

•Mieszko I (b. *c.* 930—d. May 25, 992), Piast prince or duke of Poland (from *c.* 963), who brought Poland into Christendom and expanded the state to the Baltic Sea.

Mieszko accepted Christianity directly from Rome in 966 in order to resist forced conversion by the Germans and the incorporation of Poland into the Holy Roman Empire—the fate of Bohemia. Mieszko expanded the Polish state southward into Galicia at the expense of Bohemia and northward to the Baltic Sea through the incorporation of Pomerania.

•Mieszko II Lambert (b. 990—d. May 10, 1034), king of Poland from 1025 to 1034, grandson of Mieszko I. Somewhat deranged, he was dominated by his wife, the German Ryxa, and let the achievements of his father, Bolesław I, crumble. Much territory was lost to Bohemia and to the Holy Roman Empire. At his death, Poland fell into anarchy.

•Mieszko III, byname MIESZKO THE OLD, Polish MIESZKO STARY (b. 1126/27—d. March 13, 1202), prince of Great Poland from 1173 to 1177 and, during a period of civil war, in 1190/91 and 1194. The brother and successor of Bolesław IV, he was so brutal and despotic that he provoked a revolt of the magnates, who drove him out and tried, with mixed success, to replace him with his brother Casimir II.

mifepristone, drug used for inducing abortion in the first several weeks of pregnancy. Formerly called RU-486 (a name derived from French manufacturer Roussel-Uclaf and a serial number), mifepristone has been available in France for the termination of early pregnancy since 1988. In spite of demonstrated effectiveness and safety, the drug was not approved for use in the United States until 2000 due to protest from anti-abortion groups.

Mifepristone, administered in pill form, blocks the receptors for progesterone, a hormone necessary for the maintenance of pregnancy, and therefore results in the breakdown of the uterine lining. Two days later, the woman is given another drug, usually misoprostol, that induces uterine contractions, causing the uterine lining, along with the embryo, to be shed through the vagina. Along with the necessary effects of abdominal cramping and uterine bleeding, mifepristone may cause gastrointestinal disturbances, headache, and fatigue.

Mifraz̠ Shelomo (Egypt): *see* Ra's Naṣrānī.

Mifune Toshirō (b. April 1, 1920, Tsingtao, Shantung province, China—d. Dec. 24, 1997, Mitaka, near Tokyo, Japan), leading actor in the post-World War II Japanese cinema, known internationally for his flamboyant portrayals of samurai characters, especially in films directed by Kurosawa Akira.

During World War II, Mifune served in the Japanese army. In 1946 he had a small part in *Shin baka jidai* (1947; "These Foolish Times"), and in 1947 he achieved critical recognition and box-office success as the gangster in Kurosawa's *Yoidore tenshi* (1948; *Drunken Angel*). Mifune achieved international recognition for his portrayal of a bandit in the period film *Rashomon* (1950). He is best known for his popular portrayals of samurai in other period films, including *Shichinin no samurai* (1954; *Seven Samurai*), *Musashi Miyamoto* (1956), *Kakushitoride no san akunin* (1958; *The Hidden Fortress*), *Yojimbo* (1961), and *Sanjuro* (1962). He was a highly versatile actor and starred in pictures as diverse as a Japanese adaptation of William Shakespeare's *Macbeth,* titled *Kumonosu Djo* (1957; *Throne of Blood*); *Donzoko* (1957; *The Lower Depths*), based on the play by Maksim Gorky; *Tengoku to jigoku* (1957; *High and Low*), a detective thriller; and *Akahige* (1965; *Red Beard*), his last appearance in a film by Kurosawa.

Mifune Toshirō

Toho Movie Co., Japan

Among international productions Mifune appeared in are *Hell in the Pacific* (1969), *Tora! Tora! Tora!* (1969), *Soleil rouge* (1971; *Red Sun*), *Paper Tiger* (1975), and *Midway* (1976). He also performed in the American television production *Shogun* (1980).

MiG, officially ANPK IMENI A.I. MIKOYANA, formerly OKB-155, Russian aerospace design bureau that is the country's major producer of jet fighters. The design bureau is part of the state-owned multifirm aerospace complex VPK MAPO (Military-Industrial Complex–Moscow Aircraft Production). Headquarters are in Moscow.

The company originated in 1939 as a department within the Moscow-based design bureau of the aviation designer Nikolay N. Polikarpov. Put in charge was the engineer Artem I. Mikoyan, who made as his deputy a close colleague, Mikhail I. Gurevich; the two men remained associated throughout most of their careers. Their first design, a single-engine interceptor, first flew in 1940 and eventually bore the name MiG-1 ("MiG" being derived from the first letters of Mikoyan and Gurevich plus *i,* the Russian word for "and"). In 1942 the department was made an independent design bureau and given the name OKB-155.

After World War II the organization grew rapidly in size and influence. Using captured German technology, Mikoyan and Gurevich produced the first Soviet jet fighter, the MiG-9 (first flown 1946). During the Cold War, OKB-155 developed some of the U.S.S.R.'s most notable high-speed jet fighters, including the MiG-15 (1947), which shocked Western forces in the Korean War with its speed and agility; the MiG-17 (1950), which reached supersonic speeds in tests; the MiG-19 (1953), the first mass-produced Soviet supersonic fighter; and the MiG-21 (entered service 1958), capable of about twice the speed of sound. The design bureau produced more than 9,000 MiG-21s in as many as 32 versions for the Soviet Union and more than 40 other countries, and it licensed a version for production in China. The last major fighters designed under Mikoyan's leadership included the MiG-23 interceptor (entered service 1972), the first Soviet operational variable-wing jet fighter, and the MiG-25 interceptor (introduced 1970), capable of three times the speed of sound.

After Mikoyan died in 1970, the organization produced several new fighters, among them the MiG-29 attack light interceptor and the all-weather MiG-31 fighter-interceptor, both first flown in the 1970s. In the late 1980s its formal name became ANPK imeni A.I. Mikoyana (Aviation Scientific and Production Complex named after A.I. Mikoyan), but it remained commonly known as MiG.

Following the dissolution of the Soviet Union in 1991, MiG restructured its operations. In 1995 it combined with a number of aircraft production plants and the following year became incorporated into the giant VPK MAPO, which consolidated 12 major aerospace firms into a single entity focused on research and development, manufacturing, and marketing of aerospace products. To survive in a strained post-Communist economy, MiG turned to export sales of modernized versions of the MiG-29 and diversified modestly into the civilian passenger plane market. It continued to develop advanced fighter concepts, including the 1.42 (1.44I) multifunctional fifth-generation fighter (first flown 2000).

migmatite, in geology, rock composed of a metamorphic (altered) host material that is streaked or veined with granite rock; the name means "mixed rock." Such rocks are usually gneissic (banded) and acidic rather than basic in composition; they may occur on a regional scale in areas of high-grade metamorphism.

Many migmatites probably represent the partial fusion of the metamorphic host during extreme metamorphism; the components of the rock with the lower melting temperatures are fused and gather to produce the streaks of granite. The migmatites of some Precambrian metamorphic terrains may be the result of this process. Migmatite also can form near large intrusions of granite when some of the magma is injected into the neighbouring metamorphic rocks.

Mignard, Pierre, byname MIGNARD LE ROMAIN (b. Nov. 17, 1610, Troyes, France—d. May 13, 1695, Paris), painter in the classical French Baroque manner, known primarily for his court portraits.

In 1630 Mignard left the studio of Simon Vouet for Italy, where he spent 22 years and made a reputation that brought him a summons to Paris in 1657. Successful with his portrait of Louis XIV and in favour with the court, Mignard pitted himself against Charles Le Brun; he declined to enter the French Royal Academy, of which Le Brun was the head, and he organized the opposition to its authority. In spite of the deserved success of his decorations of the cupola of the Church of Val-de-Grâce (1664), Mignard was excluded from any great share in work for public projects, such assignments being under the control of the new academy. Mignard accordingly was chiefly active in portraiture; many of the beauties and celebrities of his day sat for him, including Molière, the Viscount de Turenne, Jacques Bossuet, the Marquise de Maintenon, the Marquise de Sévigné, and the Marquise de Montespan. His skill and graceful arrangements atoned for his want of originality and lack of character perception.

With the death of Le Brun (1690), Mignard deserted his allies and succeeded to all the posts held by his opponent. These late honours he did not long enjoy. He died while about to commence work on the cupola of the Hôtel des Invalides. His brother Nicolas Mignard (1606–68) and his nephew Paul Mignard (*c.* 1638–91) were also accomplished painters.

Migne, Jacques-Paul (b. Oct. 25, 1800, Saint-Flour, France—d. Oct. 24, 1875, Paris), French Roman Catholic priest who became one of the foremost 19th-century publishers of theological literature.

Migne studied theology at Orléans, France, where he was ordained priest in 1824. He was then assigned to the French parish of Puiseaux. In 1833 he went to Paris and started a newspaper, *L'Univers Religieux* ("The Religious World"). At Petit-Montrouge, near Paris, he opened (1836) a publishing house that produced vast collections of religious works at popular prices. The original establishment was destroyed by fire in 1868, but Migne subsequently founded a new house in Paris.

Migne, engraving by É. Tailland

Giraudon—Art Resource

Migne published, among other works, the *Collection intégrale et universelle des orateurs sacrés,* 99 vol. (1844–66; "Complete and Universal Collection of Sacred Orators"), and the *Encyclopédie Théologique,* 168 vol. (1845–66; "Theological Encyclopedia"). His most celebrated publication, however, is considered to be the *Patrologiae cursus completus* ("Complete Course of the Teachings of the Church Fathers"). This enormous series consists of *Patrologia Latina,* 217 vol. (1844–55; "Collection of the Latin Fathers"), the available works of Latin ecclesiastical writers up to the time of Pope Innocent III; and *Patrologia Graeca,* 162 vol. ("Collection of the Greek Fathers"; Greek text and Latin translation, 1857–66), the writings of Christian Greeks to 1439. The *Patrologiae* is invaluable because its vast scope contains many works nonexistent in other editions.

BIBLIOGRAPHY. R. Howard Bloch, *God's Plagiarist: Being an Account of the Fabulous Industry and Irregular Commerce of the Abbé Migne* (1994).

Mignet, François, in full FRANÇOIS-AUGUSTE-MARIE MIGNET (b. May 8, 1796, Aix-en-Provence, France—d. March 24, 1884, Paris), historian and archivist whose clarity of exposition influenced French historical studies in the 19th century.

Educated at Avignon, Mignet became professor there in 1815; he returned to Aix for his law studies and was called to the bar in 1818. His first work, the *Essai sur les institutions de Saint Louis,* was acclaimed by the Academy of Inscriptions and Belles-Lettres in 1821, but Mignet left academic life to enter political journalism in Paris. He was joined there by his friend Adolphe Thiers, the future president of France's Third Republic. He worked first on the staff of the *Courrier Français,* a journal that opposed the restoration of the monarchy, and then, with Thiers and Armand Carrel, he founded *Le National* in 1830. This newspaper was instrumental in precipitating the July Revolution, which resulted in the accession of Louis-Philippe as French king. Mignet gave up politics and journalism for historical work, and he was appointed keeper of the archives at the Foreign Ministry, holding this post until his resignation in 1848. Mignet was also elected to the Academy of Moral and Political Sciences in 1832, became its permanent secretary in 1837, and in 1836 was elected to the French Academy.

Mignet's writings include *Histoire de la révolution française,* 2 vol. (1824; "History of the French Revolution"); *Antonio Perez et Philippe II* (1845); *Histoire de Marie Stuart,* 2 vol. (1851; "History of Mary Stuart"), which made use of important unpublished documents; and the *Histoire de la rivalité de François I et Charles-Quint* (1875; "History of the Rivalry Between Francis I and Charles V"). A collection of diplomatic documents, *Négociations relatives à la succession d'Espagne sous Louis XIV,* 4 vol. (1835–42; "Negotiations Relating to the Spanish Succession under Louis XIV"), remains unfinished, but it contains an important introductory essay, reprinted in *Mémoires historiques* (1843; "Historical Memoirs").

Mignon, Abraham (b. June 21, 1640, Frankfurt am Main [Germany]—d. 1679, Wetzlar or Frankfurt am Main), German Baroque still-life painter.

Mignon studied with the still-life painter Jacob Marrel, who took him to Holland about 1660. Mignon then worked with Jan de Heem at Utrecht, where he joined the Guild of St. Luke in 1669. His flower pieces are marked by close observation, careful finish, and delicate handling. His favourite scheme was to introduce roses against a dark background. He also did detailed studies of the forest floor.

mignonette, any of about 60 species of herbs and shrubs making up the genus *Reseda* (family Resedaceae). They are native to Europe, North Africa, and parts of Asia but have been widely introduced elsewhere. Several species have become popular garden flowers.

Mignonette (*Reseda odorata*)

Bernard Alfieri

Mignonettes are annual or perennial plants that reach heights of 30 to 75 cm (1 to 2 feet) and are found in field margins and open grasslands. Their leaves are typically simple in shape and pinnately lobed. Mignonettes bear long spikes—technically racemes—of small white or yellowish green flowers that have orange anthers (pollen sacs). The popular garden mignonette (*R. odorata*) assumes the form of a low dense mass of soft green foliage studded freely with the racemes of flowers. This species is widely grown for its flowers' delicate, musky fragrance and for an essential oil that is used in perfumery. Other species include wild mignonette (*R. lutea*) and white mignonette (*R. alba*).

migraine, a condition marked by painful recurring headaches, sometimes with nausea and vomiting. *See* headache.

migrant labour, casual and unskilled workers who move about systematically from one region to another offering their services on a temporary, usually seasonal, basis. In North America, migrant labour is usually employed in agriculture; it generally involves harvesting activities and is manual, repetitive, easily learned, and demanding of almost no skill. The demand for migrant labour in agriculture stems from the seasonal nature of its worker requirements. In Europe and the Middle East, migrant labour has usually been recruited for urban rather than agricultural employment and involves longer periods of residence. Migrant labour in various forms is found in South Africa, the Middle East, western Europe, the United States, and India.

The economic conditions that favour the demand for migrant labour include those where rapid increases in agricultural production have taken place or where there has been a rapid decrease in the number of farm labourers owing to high urban wages. The supply of migrant labour, on the other hand, is influenced by unfavourable economic and social conditions existing in the home base of such labourers.

The labour market for migrant workers in agriculture is notably disorderly, partly because such workers' employment relationships are so ephemeral. Most migrant labourers have no reemployment rights, are usually not organized in unions, and have little systematic access to job seeking. Middlemen, job brokers, labour contractors, and crew leaders arise out of this fundamental disorganization of this labour market. Labour contractors, in addition to bringing the workers together, transporting them, supervising them, and dispensing their pay, also search out the employers and negotiate wages and working conditions.

The wages, working conditions, and standard of life of migrant workers tend to be lower than those of other groups of workers. Migrants often must work long hours under exacting requirements. In some countries, particularly India, child labour is widespread among migrant labourers, and even in the United States those children who do not work often do not go to school, because in most localities the schools are open only to local residents. Migrant labourers' housing often amounts to little more than a roof over one's head. Literacy levels, social cohesion, and rates of political participation are exceptionally low among migrant workers.

Contributing to these ills is the fact that the migrants, whether national or foreign-born, are fundamentally alien to the community in which they work. The local population, if eager to see them come, is even more eager to see them go. Migrant workers have difficulty gaining access to local health and social services, are often deprived of their rights, do not enjoy easy recourse to the courts, and are abused by exploitative employers.

The fact that the migrant worker is "here today and gone tomorrow" makes the regulation of his working and living conditions difficult. Union- and government-established labour standards available to regular industrial and agricultural workers generally do not exist for migrant labour. Government authorities on all levels generally acknowledge the existence of serious social problems associated with migrant labour, yet claim that they are unable to deal with them effectively. Where social legislation has been passed and improvements have been achieved in the lives of migrants, the major effect has been to force employers to provide more housing and sanitary facilities and to regularize the activities of the labour contractors.

In the Northern Hemisphere migrant labour moves seasonally from south to north following the harvest (in the Southern Hemisphere the pattern is reversed). Within this broad direction most migrant workers move in well-established patterns. In the United States, for example, workers may winter in Florida to help pick citrus crops and then, joined by others from Texas and Puerto Rico, move northward into New England as far as Maine, harvesting tomatoes, potatoes, apples, and other farm produce. Another large stream of workers from Texas sets out in the spring for the north-central, mountain, and Pacific states, harvesting fruits, vegetables, sugar beets, and cotton. A third stream of migrants works on harvesting vegetables, moving from southern California northward through the Pacific Coast states.

In the United States, owing chiefly to the increased use of mechanization in farming, less than 500,000 persons are still occupied in migrant labour; in the 1940s there were more than 1,000,000, and in the 1920s there were twice that number. Some of the migrant workers employed are American citizens of Mexican descent, while many others are illegal immigrants from south of the border. Most are younger than 30, males predominate, and a majority of these have less than eight years of schooling. In common with those of other countries, many migrant workers in the United States suffer from underemployment, inadequate housing, and exclusion from normal community life. They usually work for low wages and have average annual incomes that amount to only a fraction of those of most American workers. The lot of migrant workers in the United States has nevertheless improved since the 1960s, when labour unions began to try to organize the migrants, and some states and localities established special committees to implement and expand social legislation benefiting them.

Patterns of migrant labour on other continents have differed substantially from those in North America, with urban (rather than agricultural) employment accounting for a much greater share of such work. Migrant labour was used on a massive scale in South Africa, where black workers were drawn from rural areas to work in cities in which they lacked residence rights. This racially determined migrancy was a cornerstone of the apartheid system in the second half of the 20th century and forced millions of black workers to shuttle between their impoverished black "homelands" and the cities, where they enjoyed only the minimal rights common to most migrant workers.

More benign forms of migrancy flourished in Europe and the Middle East in the second half of the 20th century. In West Germany, for instance, where rapid industrial growth in the decades after World War II produced a severe labour shortage, several million workers were drawn from Turkey, Greece, Italy, and Yugoslavia to jobs there. The same phenomenon drew many workers to France from North Africa, Spain, and Italy, while Britain took workers from its former colonies in South Asia, Africa, and the West Indies. After western Europe's economic growth tapered off in the 1970s, the presence of so many foreign workers became a source of social tension in some of their host countries. An even more dramatic example of migratory employment occurred in the oil-rich countries of the Persian Gulf in the 1970s and '80s; millions of workers from Egypt, Yemen, Jordan, Pakistan, and other Muslim countries migrated to work in the rapidly expanding economies of Saudia Arabia, United Arab Emirates, Libya, Iraq, and Kuwait.

India still probably has more migrant workers in agriculture than any other Asian country; these are involved mainly in the harvesting of tea, cotton, and rice. In Australia and the southernmost nations of Latin America, migrants work on ranches more often than on farms and are engaged in wool shearing and meat processing.

migration, in ethology, the regular, usually seasonal, movement of all or part of an animal population to and from a given area. Familiar migrants include many birds; hoofed animals, especially in East Africa and in the Arctic tundra; bats; whales and porpoises; seals; and fishes, such as the salmon.

A brief treatment of migration follows. For full treatment, *see* MACROPAEDIA: Behaviour, Animal.

Most migration is horizontal, but the patterns of migration vary widely among animal groups. Marine invertebrates such as plankton are simply carried by ocean currents; certain species travel only during certain seasons, while others combine the two modes. Crustaceans, including those that normally live on land, migrate to reproduce in seawater. Insects migrate to breed, feed, or hibernate. Migratory fish may be classified according to whether they live and migrate entirely in the sea (*e.g.,* herring), live in the sea and migrate to freshwater to spawn (salmon), or live in freshwater and breed in the sea (certain eels). Most reptiles and amphibians are unable to travel great distances and thus do not migrate; many species of frogs and toads, however, make annual migration-like movements to breeding ponds and lakes, and sea turtles make prodigious migrations to reach their breeding grounds.

Migration is most highly developed among birds, many species of which migrate annually between their breeding grounds in higher latitudes and wintering grounds in lower latitudes. Northern Hemisphere birds tend to go south for the winter, and tropical birds migrate according to the cycle of wet and dry seasons. Pelagic, or open-sea, birds travel much greater distances than coastal birds, which stick close to land though they may change altitude. During migration, even the most individualistic birds become gregarious; some, like ducks and cranes that fly in the well-known V-shape pattern, are extremely cohesive.

It is not fully understood how migrating animals find their way over long and complex routes. A compass sense has been demonstrated in birds, which navigate by the position of the Sun, stars, and the Earth's magnetic field, similar mechanisms are used by some insects, crustaceans, and fish. Migrating land animals, on the other hand, may depend on scented trails and landmarks over short distances. Migration is part of the life cycle of an animal. It is controlled by the pituitary gland in a cyclical pattern related to seasonal changes in daylight, but it may be modified by environmental conditions, such as sudden cold weather, which will stimulate early departure. Migration has great ecological significance; it results in the optimal use of food surpluses and enables fast-moving animals to live for a time in otherwise unsuitable regions.

migration, human: *see* human migration.

Miguel (Portuguese personal name): *see under* Michael.

Mihai (Romanian personal name): *see under* Michael.

Mihailo, also spelled MIHAJLO (Serbo-Croatian personal name): *see under* Michael.

Mihailovgrad, also spelled MIHAJLOVGRAD (Bulgaria): *see* Montana.

Mihailović, Dragoljub, Mihailović also spelled MIHAJLOVIĆ, byname DRAŽA (b. March 27, 1893, Ivanjica, Serbia—d. July 17, 1946, Belgrade, Yugos.), army officer and head of the royalist Yugoslav underground army, known as the Chetniks (*q.v.*), during World War II.

Having fought in the Balkan Wars (1912–13) and World War I, Mihailović, a colonel at the time of Germany's invasion of Yugoslavia (April 1941), refused to acquiesce in the capitulation of the Yugoslav army. He organized the royalist Chetniks, who operated mainly in Serbia. He was appointed general in 1941 and minister of war that same year by King Peter's Yugoslavian government-in-exile.

Both the Chetniks under Mihailović and the communist-dominated Partisans, who were led by Josip Broz Tito, resisted the occupying German forces, but political differences led to distrust and eventual armed conflict between them. Reports of Chetnik resistance in the early stages of occupation buoyed the Allies and made of Mihailović a heroic figure. Fearful, however, of brutal reprisals against Serbians, Mihailović came to favour a restrained policy of resistance until the Allies could provide more assistance; the Partisans supported a more aggressive policy against the Germans. Favouring the latter policy and confronted with reports of Chetnik collaboration (particularly in Italian-held areas) directed against the Partisans, the Allies switched their support from Mihailović to Tito in 1944. After the war Mihailović went into hiding. He was captured by the Partisans on March 13, 1946, and charged by the Yugoslav government with treason and collaboration with the Germans. Although a U.S. commission of inquiry cleared Mihailović and those under his immediate command of the charge of collaboration, the issue is still disputed by some historians. Mihailović was sentenced to death and was executed in Belgrade in 1946.

Mihalache, Ion (b. March 3, 1882, Topoloveni, Rom.—d. 1953?, Galați), Romanian statesman and popular political leader and founder of the Peasant Party.

In 1918 Mihalache formed the Peasant Party of the old Regat (Moldavia-Walachia, within the territories acquired from Austria-Hungary, Russia, and Turkey); the party had much success in the elections of November 1919. While he was minister of agriculture in the Peasant-Transylvanian National coalition government (1919–20), his proposed land reforms disquieted King Ferdinand and the conservative interests and led to the so-called royal coup d'état of March 1920, in which the rightist general Alexandru Averescu was installed as premier. In October 1926 Mihalache became vice president of the National Peasant Party, formed by the fusion of his Peasant Party with the Transylvanian Nationals. In 1928–30, in the first cabinet of Iuliu Maniu, he served again as minister of agriculture, and between 1930 and 1933 he served as interior minister under three governments. He refused to participate in the corporatist dictatorship of King Carol II and during World War II joined the underground liberation movement against General Ion Antonescu's military dictatorship.

After the installation of a communist regime in 1945, he planned with Maniu a Romanian government-in-exile but was arrested and imprisoned in November 1947. He died in Sighet prison, probably in 1953.

Mihara, city, Hiroshima *ken* (prefecture), Honshu, Japan. It is located on the mouth of the Nuta River, at the Bingo Channel of the Inland Sea. The city grew around Mihara Castle (1582), and in the 17th century large tracts of land in the locality were brought under cultivation. Mihara has long been an important Inland Sea port; the construction of a wharf at Itozakichō (1864) and a major railway (1894) contributed to its prosperity. By the early 20th century, numerous factories were established, producing fibres, cement, and rolling stock. Chemical factories began operation in the early 1970s. Pop. (1990) 85,518.

Mihira: *see* Varāhamihira.

miḥnah, any of the Islāmic courts of inquiry established about AD 833 by the ʿAbbāsid caliph al-Maʾmūn (reigned 813–833) to impose the Muʿtazilite doctrine of a created Qurʾān (Islāmic sacred scripture) on his subjects.

The Muʿtazilites, a Muslim theological sect influenced by the rationalist methods of Hellenistic philosophy, taught that God was an absolute unity admitting of no parts. This rationale was brought to bear on the problem of God's Word, the Qurʾān: because the Word is God and not a part of Him, the Qurʾān, as a verbal expression and thus a material thing removed from God, had to be created by God in order to be accessible to man. In contrast, the traditionalist view held that the Qurʾān was uncreated and external, essentially, that it had existed along with God since the beginning of time.

Al-Maʾmūn adopted the Muʿtazilite view and demanded that all judges and legal scholars in the empire submit to questioning to determine the soundness of their positions. Most acquiesced, utilizing the principle of taqiya (concealment of one's beliefs under duress) to avoid imprisonment. When al-Maʾmūn died, the new caliph, al-Muʿtaṣim (reigned 833–842), continued the policies of his brother. The caliph al-Wāthiq (reigned 842–847) also vigorously enforced the *miḥnah,* in one case trying himself to execute a man he considered a heretic. The inquisition continued until about 848, when al-Mutawakkil (reigned 847–861) made the profession of the Muʿtazilite view of a created Qurʾān punishable by death. *See also* Muʿtazilah.

mihrab, Arabic MIḤRĀB, prayer niche in the qibla wall (that facing Mecca) of a mosque; mihrabs vary in size but are usually ornately decorated. The mihrab originated in the reign of the Umayyad prince al-Walīd I (705–715), during which time the famous mosques at Medina, Jerusalem, and Damascus were built. The structure was adapted from the prayer niches common to the oratories of Coptic Christian monks. *See also* mosque.

Mijikenda (people): *see* Nyika.

Mikael SEHUL (b. *c.* 1692—d. 1784, Adowa, Eth.), nobleman who ruled Ethiopia for a period of 25 years as regent of a series of weak emperors. He brought to an end the ancient Solomonid dynasty of Ethiopia, which had ruled for 27 centuries, and began a long period of political unrest.

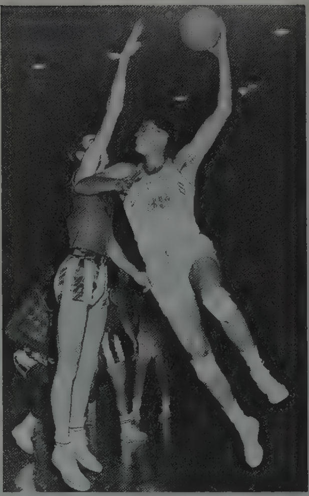
In the reign of Iyoas (1755–69), son of the last Solomonid emperor, Mikael was called to aid the emperor in resisting a takeover of power by the Oromo (Galla) peoples of the south, who were traditionally Islāmic and enemies of the Christian north. Mikael took this opportunity to occupy the capital with his own troops and had himself proclaimed regent. When Iyoas attempted to have Mikael assassinated, Mikael had Iyoas tried and hanged (1769) and selected the next three emperors, Yohannes II, Tekle Haimanot II, and Tekle Giorgis, whom he controlled until his fall. In 1784 a coalition, initiated by Oromo nobles, defeated him in battle. He was allowed to return to his native Tigray province as governor, where he died.

Mīkāl, also spelled MĪKĀʾĪL, in Islām, the archangel who was so shocked at the sight of hell when it was created that he never laughed again. In biblical literature Michael is the counterpart of Mīkāl. In Muslim legend, Mīkāl and Jibrīl were the first angels to obey God's order to worship Adam. The two are further credited with purifying Muḥammad's heart before his night journey (*isrāʾ*) from Mecca to Jerusalem and subsequent ascension (*miʿrāj*) to heaven. He also is remembered as aiding the Muslims to their first significant military victory in Arabia in 624.

The single allusion to Mīkāl in the Qurʾān (2:98) states: "Whoever is an enemy of God or his angels or his apostles or Jibrīl or Mīkāl, verily God is an enemy of the unbelievers." This has generated several explanatory legends that revolve around the Jews, who hold Michael in particular esteem as "the lord of Israel." In one story Muḥammad is questioned by Jews about his prophetic mission and answers them quite satisfactorily. But when he says that Jibrīl is the bearer of his revelations, the Jews attack the archangel as the spirit of destruction and the foe of Michael, the angel of fertility. On another occasion the caliph ʿUmar is reported to have asked the Jews of the synagogue of Medina how Mīkāl and Jibrīl were regarded by God. The Jews replied that Michael sat at God's left and Gabriel at his right but that the two were enemies. Whereupon ʿUmar revealed the falseness of their position and said that an enemy of either angel was immediately an enemy of God.

Mikan, George, in full GEORGE LAWRENCE MIKAN (b. June 18, 1924, Joliet, Ill., U.S.), American professional basketball player and executive who was selected in an Associated Press poll in 1950 as the greatest basketball player of the first half of the 20th century. Standing about 6 feet, 10 inches, he was the first of the outstanding big men in the post-World War II professional game.

Mikan received his undergraduate and legal education at De Paul University, Chicago. After a brief period with the Chicago American Gears of the professional National Basketball League (NBL), he joined the Minneapolis Lakers, a team that was successively in the NBL, the Basketball Association of America (BAA), and, from 1949, the National Basketball Association (NBA). In nine seasons he scored 11,764 points in 520 regular games for an average of 22.6 points a game, and 2,141 points in 91 championship games for a 23.5-point average. With Mikan at centre, the Lakers won six championships from 1947–48 through 1953–54 (1950–51 season excepted). Having retired as a player in 1956, he coached the Lakers for part of the 1957–58 season.



Mikan (with ball), 1949
AP/Wide World Photos

When the professional American Basketball Association (ABA) was founded on Feb. 2, 1967, Mikan was named its commissioner (chief executive). He resigned on July 14, 1969, because the ABA office was to be moved to New York City from Minneapolis, where he was a successful lawyer and businessman.

Mikawachi porcelain, Japanese porcelain of the Tokugawa period (1603–1867) from the kilns at Mikawachi on the island of Hirado, Hizen province, now in Nagasaki prefecture. Although the kilns were established by Korean potters in the 17th century, it was not until 1751, when they came under the patronage of the prince of Hirado, that they began to make the all-white and the blue-and-white wares for which they are famous. The body of Mikawachi ware is of fine-grained, extremely white porcelain that is usually decorated with miniature-style paintings of landscapes, trees and flowers, or figures in a delicate underglaze blue. The figure paintings are the most characteristic, especially those of Chinese boys at play (*karo-ko*). Relief decoration and colour glazes, particularly dark brown, were also used. Water droppers, small incense burners, brush sets, ink palettes, and modeled animal figures were among the many objects produced. The period of patronage lasted until 1843, at which time the quality of Mikawachi porcelain declined.

Mike Fink (folklore hero): *see* Fink, Mike.

Mikhail (Russian personal name): *see under* Michael.

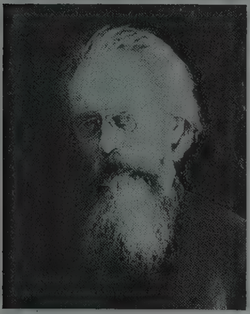
Mikhailovka (Russia): *see* Mikhaylovka.

Mikhailovskii, Nikolai Konstantinovich: *see* Mikhaylovsky, Nikolay Konstantinovich.

Mikhaylovgrad (Bulgaria): *see* Montana.

Mikhaylovka, also spelled MICHAJLOVKA, or MIKHAILOVKA, city, Volgograd *oblast* (province), western Russia, on the Medveditsa River and the main highway between Voronezh and Volgograd. Its main industries are flour milling, canning, and meatpacking. Limestone quarries located near the city are the basis for a number of cement factories. Pop. (1991 est.) 58,700.

Mikhaylovsky, Nikolay Konstantinovich, Mikhaylovsky also spelled MIKHAILOVSKII (b. Nov. 27 [Nov. 15, Old Style], 1842, Meshchovsk, Russia [now in Russian S.F.S.R.]—d. Feb. 10 [Jan. 28], 1904, St. Petersburg), Russian literary critic and publicist whose views provided much of the theoretical basis for the Populist (Narodnik) movement.



Mikhaylovsky, detail of a portrait by N.A. Yaroshenko, 1893; in the State Literature Museum, Moscow

Novosti Press Agency

Born into a noble family and trained as a mining engineer, Mikhaylovsky began writing for the press in 1860. From 1868 to 1884 he was associated with the widely read St. Petersburg literary journal *Otechestvennye Zapiski* ("Native Notes"). Building upon the critical traditions established by N.G. Chernyshevsky and N.A. Dobrolyubov, he viewed the writer as the moral judge of society and viewed literature as an expression of conscience, in which the writer analyzed reality from the standpoint of a particular subjective ideal. His most celebrated pieces were "The Left and Right Hand of Count Leo Tolstoy" (1873), which accurately predicted Tolstoy's later social doctrines, and "A Cruel Talent" (1882), a criticism of Fyodor Dostoyevsky's *The Possessed.*

Although he took no personal part in revolutionary or illegal activities, his provocative pieces and well-known sympathies were highly influential. Opposed to the social implications of evolutionary theory, Mikhaylovsky held that history followed no predetermined pattern; his faith in individualism and rationalism gave a liberal cast to the Populist (Narodnik) ideology of his followers. Mikhaylovsky championed the obligations of the nobility toward the people; he also set himself at variance with Marxism in his call for the Russian intelligentsia to draw upon the strength, values, and institutions of the peasantry in the struggle for progress and social change.

Mikhaylovsky was temporarily banished from St. Petersburg (1882 and 1891) for his ties to revolutionary organizations, but in 1892 he became the editor of the liberal populist journal *Russkoye bogatstvo* ("Russian Wealth"), a post he held until his death.

Miki, city, Hyōgo *ken* (prefecture), western Honshu, Japan. The town developed around a castle built by Bessho Naganori in 1468 and captured by the Hideyoshi clan in 1580. Subsequently, the economy centred on hardware manufacture, and, during the Meiji period (1868–1912), the city was a major supplier of hardware in Japan. After World War II the industry declined, and Miki was restructured as a satellite city of metropolitan Kōbe. Pop. (1990) 76,509.

Miki Kiyoshi (b. Jan. 5, 1897, Hyōgo prefecture, Japan—d. Sept. 26, 1945, Tokyo), Marxist philosopher who helped establish the theoretical basis for the noncommunist democratic-socialist movement popular among workers and intellectuals in Japan after World War II.

After graduating from Kyōto Imperial University, Miki studied in Germany and then returned to Japan, where in 1927 he became a professor of philosophy at Hosei University in Tokyo. In 1928 he launched the influential review *Shinkō kagaku no hata no moto ni* ("Under the Flag of the Rising Science") to promote Marxist socialism, and over the next several years he wrote a series of books, all designed to show Marxism as the inevitably prevailing philosophy. He also began to gain a tremendous following.

Miki's liberal attempts at synthesizing democracy and socialism, however, brought his expulsion (1930) from the communist circle of the Proletariat Science Institute. Ironically, the same year, he was arrested by the government as a communist supporter and held for six months. Returning to the university, he opposed the increasing power of the military, but in 1942 he was drafted by the army press to work in the Philippines for a year. By the end of his tour of duty, his opposition to the government had grown more muted; nevertheless, this did not prevent his being arrested again in 1945 for having sheltered a communist. He died in Toyotama Prison 40 days after the war ended.

Miki Takeo (b. March 17, 1907, Donari, Japan—d. Nov. 13, 1988, Tokyo), politician, prime minister of Japan from December 1974 to December 1976.

The son of a Shikoku landowner, Miki attended Meiji University in Tokyo, as well as American universities, earned a law degree in 1937, and was elected to the Diet a few months later. He publicly opposed the war against the United States, and thus his political career, unlike those of many others, was not interrupted or destroyed by the postwar American occupation. At various times of his life he occupied 10 Cabinet posts, including the Ministry of International Trade and Industry and the Foreign Ministry (1966–68).

In the general election of July 1974 the Liberal-Democratic Party (LDP), which had governed Japan since 1955, suffered a severe setback, losing many seats in the Diet (though retaining their majority). Miki, then deputy prime minister, resigned from the Cabinet in protest at the heavily financed electoral campaign directed by Prime Minister Tanaka Kakuei and at rumours about Tanaka's alleged financial irregularities. In retrospect this was seen as the first of a chain of events that led to the resignation of Tanaka in the following December. The Liberal-Democrats, ridden by financial scandal and deeply divided, elected the irreproachable Miki as a compromise candidate to succeed Tanaka in the LDP presidency and the prime ministry.

As prime minister Miki planned to reform the LDP, and he pushed the government inquiry into the developing scandal over Tanaka's acceptance of large bribes paid to him by high executives of the Lockheed Aircraft Corporation. But despite these efforts, Tanaka's indictment in August 1976 deeply hurt the LDP at the polls; in the general election of December 1976, the Liberal-Democrats won only 249 of the 511 seats in the Diet. Miki, accepting responsibility for the decline in the party's power, resigned.

Mikimoto Kōkichi (b. January 1858, Mie prefecture, Japan—d. Sept. 21, 1954, near Nagoya), Japanese pearl farmer and merchant who introduced the commercial production of cultured pearls.

In 1892, by inserting semiglobular mother-of-pearl beads into pearl oysters, he succeeded in inducing the oysters to form half pearls around the irritating foreign substance. Tokichi Nishikawa, his son-in-law, perfected the technique of producing wholly spherical cultured pearls. Mikimoto strictly maintained the high quality of his pearls, exhibited them at international expositions, and established sales offices abroad. Although his monopoly in the cultured pearl business was gradually broken, until his death he continued research to improve the quality of Mikimoto pearls.

Mikkeli, Swedish SANKT MICHEL, *lääni* (province), southeastern Finland, encompassing the major part of the Savo forest region. It has a land area of 6,310 square miles (16,342 square km); approximately one-third of the province is occupied by the Saimaa and Päijänne lake systems. Principal towns are Mikkeli, the administrative capital; Savonlinna, a lake port, rail junction, and tourist centre; and Heinola, a rail terminus and resort centre. Local industry includes forestry and the manufacture of wood products; metalworking, food processing, and the quarrying of limestone, granite, and graphite are also important. Pop. (1991 est.) 208,345.

Mikkeli, Swedish SANKT MICHEL, town, capital of Mikkeli *lääni* (province), southeastern Finland, northeast of Helsinki. Mikkeli received its town charter in 1838 and became the administrative capital of the province in 1843. It was the site of the Battle of the Porrassalmi Canal (1789), in which the Finns defeated a much larger Russian force. The town is the seat of a Lutheran bishopric and has a regional museum. Local industry includes plywood milling and granite quarrying. Tourist activities centre on skiing. Pop. (1991 est.) mun., 31,904.

Mikkelsen, Ejnar (b. Dec. 23, 1880, Vester-Brønderslev, Den.—d. May 3, 1971, Copenhagen), Danish polar explorer and author.

Mikkelsen went to sea at the age of 14. He was inspired by dreams of polar exploration, and at age 16 he walked the 320 miles (515 km) from Stockholm to Göteborg in an unsuccessful attempt to persuade S.A. Andrée to take him on the latter's Arctic balloon flight. In 1900, however, G.C. Amdrup took him on the Danish expedition to east Greenland. In 1901–02 Mikkelsen was a member of the Baldwin-Ziegler expedition to Franz Josef Land. He served as chief officer of the international hydrographic expedition to the North Atlantic in 1903–04. He then led the Anglo-American polar expedition (1906–08); his sledge journey of several hundred miles over the ice of the Beaufort Sea established that, contrary to previous reports, there was no land north of Alaska. He described this expedition in *Conquering the Arctic Ice* (1909).

Mikkelsen's most notable exploit belongs to the expedition that he led to northeast Greenland in 1909–12 to look for the maps and diaries left there by the explorer Ludwig Mylius-Erichsen in 1907. Mikkelsen found these, but, when he and his only companion, I.P. Iversen, returned to their base on the coast, they found their ship crushed by ice and no sign of the remaining members of the expedition, who had in fact returned home on a sealing vessel. The two men survived a further two winters in Greenland, suffering great hardships, and were rescued by a Norwegian sealer after nearly all hope for them had been abandoned. Mikkelsen recounted this adventure in *Lost in the Arctic* (1913).

After further years at sea and after practicing as a journalist, Mikkelsen led an expedition in 1924 to establish an Eskimo settlement at Scoresby Sound in east Greenland, and in 1932 he led a scientific expedition to southeast Greenland. He later served as inspector general for east Greenland (1934–50). He took an active role in the resettlement of Eskimos along Greenland's east coast. Among his other books were *Frozen Justice* (1922) and *Two Against the Ice* (1957).

Miklas, Wilhelm (b. Oct. 15, 1872, Krems, Austria—d. March 20, 1956, Vienna), statesman who served as president of the first Austrian republic (1928–38).

A member of the Christian Social Party, Miklas sat in the Reichsrat (parliament) during the late years of empire (1907–14), and, after 1919, in the Nationalrat (lower house) of the new Austrian republic. He was president of the Nationalrat when he was elected to the federal presidency. Despite the increased powers granted the president by the constitutional revision of 1929, he remained little more than a figurehead, drifting unprotestingly with the rightward, anti-constitutional current of Austrian politics after 1930. When Austria was united with Nazi Germany, in 1938, he was forced to resign from office, and thereafter he retired from public life.

Mikołajczyk, Stanisław (b. July 18, 1901, Holsterhausen, near Gelsenkirchen, Ger.—d. Dec. 13, 1966, Washington, D.C.), Polish statesman, who tried to establish a democratic, non-Soviet regime in Poland after World War II.

Coorganizer and leader of the Peasant Party (1931–39) and a member of the Sejm (Diet), Mikołajczyk fled to London after the German invasion of Poland in 1939. He served as minister of the interior of the Polish government in exile and then became prime minister (1943–44).

On June 27, 1945, Mikołajczyk returned to Poland and joined the Communist-dominated provisional government as second deputy premier and minister of agriculture and land reform. At the Potsdam Conference, he tried to press the interests of a free Poland, a condition that was agreed upon but ignored. Mikołajczyk's Peasant Party members, as the only organized non-Communist opposition, suffered from repeated intimidation and arrests. When the manipulated election of 1947 foreshadowed a Stalinist takeover, Mikołajczyk fled to England and then to the United States. He was the author of *The Pattern of Soviet Domination* (1948).

Mikon (Greek painter): *see* Micon.

Míkonos, also spelled MYKONOS (Greek: White Island), island, one of the smaller of the eastern Cyclades (*q.v.*) group of Greek islands in the Aegean Sea. According to legend it is the piece of rock thrown by Heracles to destroy the Giants. It is a rugged granite mass, about 33 sq mi (85 sq km) in area, lying next to Dhílos (Delos) and between Tínos to the northwest and Naxos and Páros to the south. Míkonos has several beaches and on the north coast the Gulf of Pánormos forms a deep indentation. The Ionians, who worshipped Dionysus, were the first to settle on the island; in 426 BC the Athenians transferred the remains of the dead buried at the shrine on Delos to Rheneía, near Míkonos. During the Frankish period around AD 1253 the island passed to the dukes of Naxos, and later it was attached to Venice. During the Greek War of Independence at the beginning of the 19th century, the people of the island, led by Manto Maroghenious, repulsed a Turkish attack. The Rococo church of Paraportiani, near the seashore, is the main church on the island. It consists of four chapels with curved vaults and coloured cupolas. There are also about 360 churches built by sailors and their families, honouring vows made during Aegean storms. Architectural attractions of the island include the Tria Pighadia (Square of the Three Wells); Venetia, a line of old houses with wooden balconies; and the hill of windmills. Míkonos has poor soil and is ill-supplied with water; it thus has little agriculture, the major crops being barley, grapes, and figs. Manganese is mined, but tourism is the chief economic activity. The island is the point of departure for the shrines of the sacred island of Delos, and so has air service from Athens, as well as boat connections to other islands of the Cyclades. Local specialties known throughout Greece include almond cookies called *amygdalato*, and colourful hand-woven garments, napkins, and rugs. A branch of the school of Fine Arts at Athens is located at Míkonos and enrolls students from around the world. The folkloric emblem of Míkonos is the pelican, nicknamed Petros. Pop. (1981) 5,503.

Mikoyan, Anastas Ivanovich (b. Nov. 25 [Nov. 13, old style], 1895, Sanain, Armenia—d. Oct. 21, 1978, Moscow), Old Bolshevik and highly influential Soviet statesman who dominated the supervision of foreign and domestic trade during the administrations of Joseph Stalin and Nikita S. Khrushchev.

Mikoyan abandoned the priesthood to join the Bolshevik Party in 1915 and to become one of the chiefs of the revolutionary movement in the Caucasus. In 1918 he was arrested by British troops that had intervened in the Russian Civil War. After his release, he went to work in the Communist Party organization.

Mikoyan, 1962
Keystone

Mikoyan's support of Stalin in the power struggle of the early 1920s earned him a post in the Central Committee of the party in 1923. He was appointed people's commissar for external and internal trade in 1926, and thereafter consistently held posts relating to that field. In 1935 he was elected a member of the Politburo, serving as its specialist on trade matters. Appointed to the State Defense Committee (February 1942), which ruled the Soviet Union during World War II, Mikoyan supervised the procurement and transport of supplies to the armed forces. In 1946 he became deputy premier (*i.e.,* vice chairman of the Council of Ministers), with responsibility for directing the country's trade.

Although Mikoyan was apparently in danger of losing Stalin's favour, Stalin died (March 1953) before he could purge him, and Mikoyan was able to become minister of trade and deputy premier in the post-Stalin government and to retain his membership in the party's Presidium (formerly the Politburo). He subsequently supported Khrushchev in his rise to power, and ultimately became Khrushchev's close adviser and a first deputy premier of the Soviet Union.

After Khrushchev was removed, Mikoyan held the largely ceremonial position of chairman of the Presidium of the Supreme Soviet from 1964 to December 1965. Although he was excluded from the party's Presidium in April 1966, he remained a member of the Central Committee and continued to be honoured as a high official at public ceremonies. After his death in 1978, Mikoyan was not accorded interment in the Kremlin wall, the traditional resting place for the most honoured Soviet leaders: he was buried in the Novodevichy Cemetery, Moscow, site of the graves of second-rank public figures, including that of Khrushchev.

Miksa (Hungarian personal name): *see under* Maximilian.

Mikszáth, Kálmán (b. Jan. 16, 1847, Szklabonya, Hung.—d. May 28, 1910, Budapest), novelist, regarded by contemporaries and succeeding generations alike as the outstanding Hungarian writer at the turn of the century. He studied law but soon took up journalism. In 1887, already famous, he was elected to the National Assembly.

Mikszáth scored his first success with two volumes of short stories entitled *A tót atyafiak* (1881; "The Slovak Kinsfolk"), and *A jó palócok* (1882; "The Good Palócs"). In 1894 he published his first novel, *Beszterce ostroma* ("The Siege of Beszterce"), the story of an eccentric Hungarian aristocrat. Mikszáth's early art is romantic. Toward the end of the century he became more realistic as the writer of everyday life, which he described with understanding and sympathy, though he did not hesitate to pillory the shortcomings of society with sharp-witted satire.

Only toward the end of his life did Mikszáth succeed in creating such full-sized novels as his two principal works *Különös házasság* (1900; "A Strange Marriage") and *A Noszty fiu esete Tóth Marival* (1908; "The Noszty Boy and Mary Tóth"). The first of these works is set in early 19th-century Hungary and deals with the fight of two lovers against the oppressive forces of society. The second tells the story of a frivolous young noble who tries to make a fortune by seducing a rich middle-class girl. Mikszáth's last work, *A fekete város* (1910; "The Black City"), is the finest of his historical novels.

Mikulicz-Radecki, Johannes von (b. May 16, 1850, Czernowitz, Rom.—d. June 4, 1905, Breslau, Ger.), Polish surgeon whose innovations in operative technique for a wide variety of diseases helped develop modern surgery. At the University of Vienna (M.D., 1875) he assisted the German founder of abdominal surgery, Theodor Billroth (1875–82), and did much to popularize Joseph Lister's antiseptic methods.

Professor of surgery at the universities of Kraków (1882–87), Königsberg (1887–90), and Breslau (1890–1905), Mikulicz contributed prodigiously to cancer surgery, especially on organs of the digestive system. He was first to suture a perforated gastric ulcer (1885), surgically restore part of the esophagus (1886), remove a malignant portion of the colon (1903), and describe what is now known as Mikulicz' disease, a symmetrical swelling of the lacrimal (tear) and salivary glands caused by an overgrowth of lymph tissue. He also developed (1881) improved models of the esophagoscope and gastroscope, instruments introduced into the alimentary canal to view the esophagus and stomach, respectively.

mikvah, also spelled MIKVEH, or MIQWE ("collection [of water]"), in Judaism, a pool of natural water in which one bathes for the restoration of ritual purity. The Mishna (Jewish code of law) describes in elaborate detail the requirements for ritually proper water and for the quantity of water required for ritual cleansing. In former times, a *mikvah* was so essential to each community of Jews that, if necessary, a synagogue could be sold to finance its construction.

With the destruction of the Second Temple of Jerusalem in AD 70, many laws of ritual purity lost their relevance. Consequently, ritual bathing in modern times is much restricted. Traditionally observant Jews, however, still use the *mikvah*, and converts are required by Halakha (legal tradition) to undergo a ritual bath. Males bathe each Friday and before major festivals, while women use the *mikvah* (as the law prescribes) before their wedding, after childbirth, and following menstruation.

mīlād (Islām): *see* mawlid.

Milan, Italian MILANO, city, capital of Milan province and of Lombardy region (Lombardia), northern Italy. Milan is the leading financial centre of Italy and its most prosperous manufacturing and commercial city. Milanese assert that it is the ideological, if not the actual, capital of Italy. Settled by the Gauls in about 600 BC, the site has had a long and often turbulent history.

A brief treatment of Milan follows. For full treatment, *see* MACROPAEDIA: Milan.

Milan is situated north of the Po River in the heart of the Po Basin, halfway across the plain spreading between the Ticino and the Adda rivers. To the north lies the great sweep of the southern flank of the Alps. Milan's winters are chilly and damp and its summers hot and humid.

Milan owes its economic supremacy largely to its geographical position at the centre of the transportation routes of the Val Padana (Po Valley). Italy's principal commercial and financial centre, Milan has the country's largest stock market. It also is an internationally renowned centre of fashion and design. Major industries include the manufacture of vehicles, electric appliances, textiles and clothing, and chemicals and related items. Papermaking and publishing, food processing, production of rubber goods, telecommunications, and tourism are also important.

The course of walled fortifications can still be traced in contemporary streets. The 15th-century Castello Sforzesco and the 14th-century Duomo (cathedral), the great Piazza del Duomo (1489), and the commercial Piazza Cordusio dominate the modern city centre. Most industrial growth has been concentrated in peripheral areas; entire industrial districts have developed, mainly in the north and northeast and in the south and southwest. Many old streets and buildings have been demolished to make way for massive new city blocks and high rises. Though central Milan's transportation is encumbered by narrow streets, the newer suburban areas are linked to the core of the city by major arterial highways.

Milan's most striking architectural achievement is the medieval Duomo, the third largest church of Europe. The most notable of the city's many palaces is the Palazzo di Brera, the construction of which began in 1651. The Pinacoteca di Brera contains an excellent collection of northern Italian painting as well as the Biblioteca Nazionale Braidense. San Simpliciano, located on the Corso Garibaldi, is an ancient church that was founded in the first centuries of the Christian Era; the fresco "Coronation of the Virgin" ornaments its apse. Leonardo da Vinci's "Last Supper," one of the most famous paintings of the Renaissance, is in the former refectory of the convent of Sta. Maria delle Grazie.

Milan is rich in galleries, museums, libraries, and theatres; La Scala (1776–78) is one of the great opera houses of the world. Milan is the seat of three universities. Other institutes of higher education include the Polytechnic Institute of Milan and the Giuseppe Verdi Conservatory of Music.

An extensive network of roads and rail lines spreading toward outlying areas, and particularly toward the north, gives Milan an economic advantage over other Italian cities. Trans-Alpine tunnels and other connections link the city with all parts of Europe. Milan is the starting point of the famous scenic route known as the Autostrada del Sole, which stretches down the spine of the Italian peninsula. Two international airports serve Milan, the Aeroporto di Linate, which is 6 mi (10 km) east of the city, and the Aeroporto della Malpensa, 29 mi to the northwest. Area city, 70 sq mi (182 sq km). Pop. (1998 est.) 1,302,808.

Milan, village, Erie and Huron counties, northern Ohio, U.S., on the Huron River, just southeast of Sandusky. In 1804 Moravian missionaries established an Indian village called Pequotting on the site. Settlers from Connecticut arrived a few years later, and the village was laid out in 1816 by Ebenezer Merry and named for Milan, Italy. A canal was dug (1832–39) to Lake Huron, 3 mi (5 km) away, and the community became a busy wheat-shipping centre. The village's refusal, however, to allow the Lake Shore and Michigan Railroad a right-of-way marked its decline as a commercial centre. Milan, now a quiet, rustic community, is the birthplace of the inventor Thomas Alva Edison (1847); the red-brick house on Edison Drive, where he spent the first seven years of his life, is preserved as a museum. The home of Lehman Galpin, the Edison family doctor, is now a local historical museum. Pop. (2000) 1,445.

Milan III (or I), in full MILAN OBRENOVIĆ (b. Oct. 21, 1819, Kragujevac, Serbia—d. July 8, 1839, Belgrade), prince of Serbia in 1839.

On June 13, 1839, at age 19, Milan succeeded to the Serbian throne on the abdication of his father, Prince Miloš. Severely ill with tuberculosis, he took no part in government, which was managed by a three-man regency. After Milan died 25 days later, the regency continued to administer the country for nine months until his brother and successor, Michael III, arrived in Belgrade in March 1840.

Milan IV (or II), in full MILAN OBRENOVIĆ (b. Aug. 22 [Aug. 10, Old Style], 1854, Mărăşeşti, Moldavia—d. Feb. 11 [Jan. 29], 1901, Vienna), prince (1868–82) and then king (1882–89) of Serbia.

Succeeding his cousin Prince Michael III of Serbia on July 2, 1868, Milan was dominated during the first years of his reign by a regency that adopted a seemingly liberal constitution in 1869, tried to develop close relations with Austria, and made Milan generally unpopular. When Milan assumed personal control of the government (August 1872), however, he further alienated public opinion by his frivolous extravagance; by his unfaithfulness to his wife, the Russian-born Natalie Petrovna Keshko, whom he married in 1875; and by his refusal to accommodate the pan-Slavist sentiments of his subjects or support the rebels of Bosnia-Hercegovina, who rose against their Ottoman Turkish rulers in 1875. Only when threatened with a revolution did he abandon his policy of neutrality and declare war on the Turks (June 30, 1876). Although the Serbs were quickly defeated, their situation was saved by the subsequent Russian victory over the Turks (Russo-Turkish War of 1877–78). Ultimately, the Treaty of Berlin not only enlarged Serbia's territory but also recognized it as a completely independent state (1878).

In order to acquire such concessions at the peace conference, Milan's representatives had been obliged to rely on Austria, which demanded in return that Serbia link its railroads, as well as its economy, with Austria's. Although many Serb political figures preferred to develop close relations with Russia rather than with Austria, Milan favoured the pro-Austrian policy: he appointed pro-Austrian ministers, concluded trade and tariff agreements that made Serbia's economy dependent on Austria's, and secretly pledged to conclude no treaties with other governments without Austria's approval (1881).

Subsequently, Austria supported Milan when he proclaimed himself king and declared the principality of Serbia a kingdom (1882). In 1883, with his army, he quelled a large peasant uprising led by radicals in eastern Serbia.

After Milan declared war on Bulgaria in 1885 and suffered another major military defeat, Austria extended diplomatic aid and arranged for peace to be concluded on the basis of status quo ante bellum. Milan's dependence upon Austria aggravated domestic discontent, which he tried to assuage by granting a more liberal constitution in January 1889. In March, however, Milan was compelled to abdicate in favour of his son Alexander.

Having divorced Natalie in October 1888, Milan renounced his Serb nationality in 1892 and settled in Paris as the Count of Takovo. In 1897 he returned to Serbia to serve as his son's commander in chief. Although he instituted beneficial reforms in the army, he remained unpopular; and when Alexander married against the advice of his father and his chief ministers, Milan went permanently into exile (1900).

Milan, Edict of, a proclamation that permanently established religious toleration for Christianity within the Roman Empire. It was the outcome of a political agreement concluded in Milan between the Roman emperors Constantine I and Licinius in February 313. The proclamation, made for the East by Licinius in June 313, granted all persons freedom to worship whatever deity they pleased, assured Christians of legal rights (including the right to organize churches), and directed the prompt return to Christians of confiscated property. Previous edicts of toleration had been as short-lived as the regimes that sanctioned them, but this time the edict effectively established religious toleration.

Milán, Luis (b. *c.* 1500, Valencia, Aragon—d. after 1561, Valencia, Spain), composer, courtier, and player of the vihuela, the Spanish variety of the lute. In Valencia he lived at the brilliant and cultivated court of the vicereine Germaine de Foix, which he described in a manual of courtly behaviour (1561). His most noted work is *El Maestro* ("The Teacher"), a collection of vihuela pieces and solo songs with vihuela accompaniment. This was the first of a series of vihuela books that became one of Spain's most distinguished contributions to 16th-century music. The pieces in Milán's book are arranged in order of difficulty. The songs—Spanish and Portuguese villancicos and romances and Italian sonnets—are often of great beauty, and the instrumental writing is varied and resourceful.

Milan, University of, Italian UNIVERSITÀ DEGLI STUDI DI MILANO, coeducational state institution of higher learning in Milan founded in 1924 by Luigi Mangiagalli as the Royal University of Milan. Two existing scientific institutions, the Royal Scientific and Literary Academy (founded under the Casati Law of 1859) and the Clinical Institutes (1906), formed the foundation of the new university. By 1934, 60 different scientific institutes, clinics, and schools of advanced study had been established within the university, including a school whose graduates were sent to practice in rural districts. Brought under state control by the Fascists, the university remains under government jurisdiction but enjoys administrative autonomy. In the decade following 1969, when admission requirements to Italian universities were relaxed, student enrollment at Milan rose from about 11,000 to more than 60,000. A *laurea,* or degree, is offered in 19 disciplines requiring four to six years of study.

Milan faience, tin-glazed earthenware (usually called maiolica in Italy) produced by several factories in Milan during the 18th century. The earliest known specimens are from the factory of Felice Clerici, opened *c.* 1745. The wares were copies of, or inspired by, porcelain models from China and Japan. The Japanese prototype, Imari ware, was characterized by profuse decoration and a nonnaturalistic use of colours. In 1759 the factory of Pasquale Rubati began to produce maiolica decorated in an imitation of porcelain.

Milanese lace, lace made at Milan in the 17th and 18th centuries. It is a bobbin-made lace, with a design consisting of bold, conventionalized leaf, scroll, and ribbon ornament interspersed with arms, human and animal figures, and the like. The design is formed of continuous tape or braid, worked on a pillow (a padded oval or round board), the background (thread bars or net) being worked around it afterward.

Milano (Italy): *see* Milan.

Milazzo, Latin MYLAE, town, Messina province, northern Sicily, Italy, on the low isthmus of a peninsula 3 miles (5 km) long, on the west side of the Golfo (gulf) di Milazzo, west of Messina. The town was founded in 716 BC by colonists from Zankle (Messina). It was taken by the Athenians in 426 BC and by the Syracusan tyrant Agathocles in 315 BC. The consul Gaius Duilius won the first Roman naval victory over the Carthaginians in the bay in 260 BC, and in 1860 the Italian nationalist Giuseppe Garibaldi defeated the Bourbon forces of the Kingdom of the Two Sicilies outside Milazzo. The town suffered from Allied bombing in World War II. The old town on a hill above is partly surrounded by Spanish walls from the 16th century and contains a 13th-century Norman castle.

The transit port for the Eolie Islands, Milazzo is a tourist centre and exports early fruit, wine, and olive oil. It has a growing chemical industry and an oil refinery. Pop. (1984 est.) mun., 31,497.

Milbank, city, seat of Grant county, northeastern South Dakota, U.S., in the Whetstone Valley, 28 miles (45 km) northeast of Watertown. Settlers arrived after 1880, when it was made a railroad division point. It was named for Jeremiah Milbank, director of the Chicago, Milwaukee, and St. Paul Railroad. The city is the birthplace of American Legion Junior League Baseball (1925). Milbank's economy depends on agriculture, granite quarrying, and food processing. Inc. town, 1881; city, 1894. Pop. (1990) 3,879.

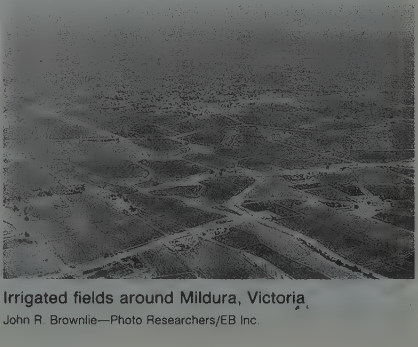
Mildenhall, parish, Forest Heath district, county of Suffolk, England, on the River Lark. The town retains its hexagonal market, cross dating from the reign of Henry V and now scheduled as an ancient monument. The Church of St. Mary is of the 13th to the 15th century with a tower 112 feet (34 m) high. It is distinguished for the open-timber hammer-beam roof of the nave. Mildenhall lies amid a farming area for which it acts as the main service centre.

The so-called Mildenhall Treasure is a hoard of Roman silver tableware acquired by the British Museum in 1946, having apparently been discovered four years before in the plowing of a field at West Row, 2 miles (3.2 km) northwest of Mildenhall, near remains of a 4th-century Roman building. The majority of the pieces, 34 in all, seem to be of 4th-century workmanship, and some are products of Mediterranean factories. Possibly the owners buried their family plate in the troubled days of the Anglo-Saxon invasions. Pop. (1981) 11,971.

mildew, a conspicuous mass of threadlike hyphae and fruiting structures produced by various fungi (division Mycota). It is associated with cloth, fibres, leather goods, and plant diseases (downy mildew and powdery mildew [*qq.v.*]). The fungi use these substances as sources of food for growth and reproduction.

Mildner glass, late 18th-century glassware decorated by Johann Josef Mildner (1763–1808) in the *Zwischengoldgläser* (*q.v.*) technique of bonding gold-leaf engravings or etchings between two layers of glass, one of which fits precisely into the other. Mildner, who worked at the Gutenbrunn glasshouse in Austria, is best known for his gift tumblers featuring a medallion etched in gold or silver leaf, usually against a red ground. His motifs consisted of portraits, monograms, or coats of arms and, less often, of allegories or representations of saints. Occasionally, he scratched a poem onto the back of the medallion. Works signed between 1787 and 1808 are extant.

Mildura, city, Victoria, Australia, on the Murray River near its junction with the Darling. In the 1840s sheep runs were established in the district, which became known as Mildura, a name derived from an Aboriginal term for "red earth." Settlement began with irrigated agriculture, introduced there in 1886 by George and William Chaffey, Canadians from California who received a 250,000-acre (100,000-hectare) grant from the colonial government to develop the semiarid countryside, called the Mallee (*q.v.*). After initial setbacks in the 1890s, irrigation succeeded and the settlement grew. Proclaimed a borough (1920) and a town (1922), Mildura became a city in 1934. The area, also known as Sunraysia, produces most of the state's dried fruits and supplies fresh fruits and vegetables to Melbourne, 290 miles (467 km) to the southeast by rail and highway. Industries include fruit processing and packing, flour milling, wine making, and brick, plaster, and pipe works. Pop. (1985 est.) 17,840.



Irrigated fields around Mildura, Victoria

John R. Brownlie—Photo Researchers/EB Inc.

mile, any of various units of distance, such as the statute mile of 5,280 feet. It originated from the Roman *mille passus,* or "thousand paces," which measured 5,000 Roman feet, or 4,840 English feet.

About the year 1500 the "old London" mile was defined as eight furlongs. At the time, the furlong, measured by a larger northern (German) foot, was 625 feet, and thus the mile equaled 5,000 feet. During the reign of Queen Elizabeth I, the mile gained an additional 280 feet—to 5,280—under a statute of 1593 that confirmed the use of a shorter foot that made the length of the furlong 660 feet.

Elsewhere in the British Isles, longer miles were used, including the Irish mile of 6,721 feet and a Scottish mile of 5,951 feet.

A nautical mile is the length on the Earth's surface of one minute of arc, or, by international definition, 1,852 m (6,076.12 feet; 1.1508 statute miles). The measure remains in universal use in both marine and air transportation. The knot is one nautical mile per hour.

Miles City, city, seat of Custer county, eastern Montana, U.S., at the junction of the Yellowstone and Tongue rivers. It was founded in 1877 and was named for a U.S. army officer who had campaigned in the area, General Nelson A. Miles. After the arrival of the Northern Pacific Railway (1881), it became a market for cattle, sheep, wool, and farm crops. Saddles are made, and roundups and rodeos are annual events. The city is the seat of Miles Community College (1939) and of the State Industrial School for Boys. The Range Riders Museum, a bird refuge, and fish hatchery are nearby. Inc. 1887. Pop. (1990) 8,461.

Miles Gloriosus, also called BRAGGART WARRIOR, stock figure in theatrical comedies from Roman times to the present whose name derives from a comedy written *c.* 205 BC by the Roman playwright Plautus. Plautus' play, based on one or more Greek plays of unknown authorship, is a complicated farce in which a vain, lustful, and stupid soldier, Pyrgopolynices, is duped by his clever slave and a courtesan. The work was highly popular, and Pyrgopolynices became the prototype for many swaggering cowards of later comedy. One of the most popular stock figures of the commedia dell'arte of mid-16th-century Italy was the strutting Capitano. Created from the same pattern are Shakespeare's Falstaff and Pistol and the characters of many other Elizabethan playwrights, including Ben Jonson and Beaumont and Fletcher. The influence of Plautus' *Miles Gloriosus* can be seen in the works of many other dramatists, from Corneille to George Bernard Shaw and Bertolt Brecht.

Milescu, Nicolae (b. 1636, Vaslui, Moldavia [now in Romania]—d. 1708, Moscow), Moldavian writer, scholar, and traveler.

After studies at the Greek patriarchate college in Constantinople, he returned in 1653 to Iaşi (Jassy), Moldavia, and was appointed secretary to Prince Gheorghe Ştefan. Hoping to be appointed prince of Moldavia, he intrigued against Prince Ilias Alexandru, who in 1668 punished him by cutting his nose. So disgraced, Milescu left his native country, never to return. He revisited Constantinople, where his friend Dositheos, patriarch of Jerusalem, gave him a letter to Tsar Alexis (Aleksey Mikhaylovich). He traveled to Moscow, where he arrived in 1671 and was appointed translator to the *posolski prikaz* (foreign office) as Nikolay Gavrilovich Spafari. He gained the confidence of two boyars (aristocrats) who had great influence with the tsar and in 1675 was sent as ambassador to Peking, returning in January 1678. In the meantime, Alexis had been succeeded by his son Fedor III, and Spafari-Milescu lost his official position.

A highly educated man who could write in Greek, Latin, Romanian, and Russian, Milescu left many manuscripts. He translated the Bible from Greek into Romanian; and the Bible printed in 1688 by the Walachian prince Şerban Cantacuzino was based on his translation. Among his writings the most valuable is the *Puteshestviye cherez Sibir . . . do Kitaya* ("Journey Across Siberia . . . to China"). It was printed in 1882 (Eng. trans. in J. Baddeley's *Russia, Mongolia, China,* vol. 2, 1919).

Milesian tale, Latin MILESIA FABULA, in the literature of ancient Greece and Rome, a brief erotic or picaresque tale of romantic adventure. This type of tale was first written or collected by Aristides of Miletus (*c.* 2nd century BC). In the 1st century BC, Aristides' collection was translated into Latin by Lucius Cornelius Sisenna as *Milesiae fabulae;* this volume served as a model for episodes in Petronius' *Satyricon* (1st century AD), a narrative dealing with the escapades of a trio of disreputable heroes, and for *The Golden Ass* (2nd century AD) by Lucius Apuleius, an account of the ribald adventures of a hero who is changed into an ass. The Greek and Latin Milesian tales provided prototypes for many tales included in Boccaccio's *Decameron* (1348–53) and the *Heptaméron* (1558–59) of Margaret of Angoulême.

Miletus, Byzantine PALATION, Turkish BALAT, ancient Greek city of western Anatolia, some 20 miles (30 km) south of the present city of Söke, Turkey. It lies near the mouth of the Büyükmenderes (Menderes) River.

Before 500 BC, Miletus was the greatest Greek city in the east. It was the natural outlet for products from the interior of Anatolia and had a considerable wool trade with Sybaris, in southern Italy. Miletus was important in the founding of the Greek colony of Naukratis in Egypt and founded more than 60 colonies on the shores of the Black Sea, including Abydos, Cyzicus, Sinope (now Sinop), Olbia, and Panticapaeum. In addition to its commerce and colonization, the city was distinguished for its literary and scientific-philosophical figures, among them Thales, Anaximander, Anaximenes, and Hecataeus. Together with the people of the other two Ionian cities of Caria, Myus and Priene, the Milesians spoke a distinctive Ionian dialect. Little is known about Milesian government before 500 BC. At the beginning and end of the 6th century BC, however, the city was ruled by the tyrants Thrasybulus and Histiaeus, respectively.

In the 7th century BC Miletus came into conflict with the neighbouring state of Lydia, and it probably acknowledged Lydian overlordship in the mid-6th century. In the latter part of the 6th century, it came under Persian rule, along with the other Greek cities of Anatolia. About 499 BC the Milesians led the Ionian revolt that marked the beginning of the Greco-Persian Wars (*q.v.*). The city was stormed and sacked by the Persians in 494. After the Persian defeat by the Greeks (479), Miletus joined the Athenian-dominated Delian League. By the mid-5th century the city had been weakened and impoverished by internal divisions, and in 442 it was defeated in war by neighbouring Samos.

Its fortunes soon revived, however, and the Milesians set about rebuilding their city on a new grid plan of the type invented in this period by Hippodamus of Miletus. In 412 the city sided with Sparta against Athens; before 350 Mausolus of Caria ruled it, and it fell to Alexander in 334 after a siege. Hellenistic rulers who competed for influence at Miletus included the Seleucid Antiochus IV Epiphanes and Eumenes II of Pergamum, both about 170 BC. Miletus retained its commercial importance and received special attention from the Roman emperors Augustus and Trajan. By the 6th century AD, however, its two harbours had silted up, and it was eventually abandoned.

The ruins occupy the former peninsula crowned by the hill of Kalabak Tepe. The total area of the archaic city is unknown, but Hellenistic town walls and foundations have been uncovered. There also are extensive remains of the classical city from the 5th century BC to Roman imperial times. The Greco-Roman theatre and its adjoining Byzantine castle are the most visible of the site's ruins.

Milford, city, coextensive with the town (township) of Milford, New Haven county, southwestern Connecticut, U.S. It lies on Long Island Sound, near the mouth of the Housatonic River. Settled in 1639 on land bought from the Paugusset Indians, it was probably named (1640) for Milford Haven, Wales, or for Milford, Eng. In 1643 it became a part of New Haven Colony, which in turn united with Connecticut Colony in 1664. During the Revolution, Milford militia drove off a small British landing force. Oysters and clams have always been important commercially, and they provide the basis of the economy along with agriculture, some light industry, and summer tourism. Simon Lake invented his even-keel submarine torpedo boat there in 1894. Milford was chartered as a city in 1959, the year of town-city consolidation. Pop. (1994 est.) 49,092.

Milford Haven, Welsh ABERDAUGLEDDYF, port, Preseli Pembrokeshire district, Dyfed county, Wales, on the north shore of a deep natural harbour. The inlet, also named Milford Haven, for many centuries was used as a landing and embarkation point on the route from southwestern Wales to Ireland, but the town was founded only in 1793.

Milford Haven has had a checkered maritime history, suffering a rapid decline of its whaling industry and losing to other ports on the Haven its naval dockyard and Irish packet service, all before 1860. It had gained importance as a fishing port by 1900, though, and since 1960 it has become one of Europe's leading oil ports, one of the few places in western Europe able to accommodate the largest tankers. Major refineries have been built, and both oil and petroleum products arrive at the port via pipeline. An oil-fired power station has been built nearby. Pop. (1991) 13,398.

Milford Haven, Louis Alexander Mountbatten, 1st marquess of, also called (until 1917) LOUIS ALEXANDER, PRINCE OF BATTENBERG (b. May 24, 1854, Graz, Austria—d. Sept. 11, 1921, London, Eng.), British admiral of the fleet and first sea lord, who was responsible, with Winston Churchill, for the total mobilization of the fleet prior to World War I.

The eldest son of Prince Alexander of Hesse, he was naturalized as a British subject in 1868, when he entered the Royal Navy. He took part in the British invasion of Egypt in 1882, including the bombardment of Alexandria (July 11). After serving as director of naval intelligence, he was promoted to the rank of rear admiral in 1904 and vice admiral in 1908. He commanded the Atlantic Fleet from 1908 to 1910 and became first sea lord in 1912. As such he was charged with readying the fleet for war. After a test mobilization in July 1914, he ordered (with instructions from Churchill, first lord of the Admiralty) the reserve ships to remain in full commission; thus, the fleet was wholly mobilized on Aug. 3, 1914, the day before Great Britain entered World War I.

Despite this and other services, he was forced to resign as first sea lord (Oct. 29, 1914) because of his German birth. In 1917, at the request of King George V, he relinquished his German titles, assumed the surname of Mountbatten, and on July 17 of that year was created marquess of Milford Haven.

In 1884 he had married Princess Victoria of Hesse-Darmstadt, a granddaughter of Queen Victoria. They had two daughters and two sons, George (1892–1938), 2nd marquess, and Louis, afterward Earl Mountbatten of Burma. A grandson (through his daughter Princess Alice) is Prince Philip, duke of Edinburgh, husband of Queen Elizabeth II.

Milford Sound, inlet of the Tasman Sea, southwestern South Island, New Zealand. The sound is a fjord, created when the sea flooded a glacial valley. About 2 miles (3 km) wide, it extends inland for 12 miles (19 km). From the heights of Mitre Peak (5,560 feet [1,695 m]) and Pembroke Peak (6,710 feet), the valley walls plunge steeply beneath the water, reaching a depth of 1,680 feet (512 m) near the fjord's head. The sound is entered by the Arthur and Cleddau rivers from the main valley and by the Bowen, Sinbad, Harrison, and Stirling rivers from side valleys.

Named by a whaler in the 1820s because of its resemblance to Milford Haven in Wales, the sound was surveyed by Captain John Lort Stokes of the Royal Navy in 1851. The sound is the northernmost fjord in Fiordland National Park and the terminus of the Milford walking track. It is also the site of a town, Milford Sound, one of the region's few permanently inhabited places.

Milhaud, Darius (b. Sept. 4, 1892, Aix-en-Provence, France—d. June 22, 1974, Geneva, Switz.), a principal French composer of the 20th century known especially for his development of polytonality (simultaneous use of different keys).

Born of a Provençal Jewish family, Milhaud studied under Paul Dukas and Vincent d'Indy at the Paris Conservatory. He was grouped by the critic Henri Collet with the young composers whom Collet called "Les Six" (*see* Six, Les). In 1940 he became professor at Mills College, Oakland, Calif. After 1947 he taught at the Paris Conservatory. In his later years he suffered from crippling arthritis, but he continued to compose and conduct.

Milhaud's bold, individual, dissonant style is especially exemplified in the ballets *L'Homme et son désir* (1918; *Man and His Desire;* scenario, Paul Claudel), *Le Boeuf sur le toit* (1919; *The Nothing-Doing Bar;* scenario, Jean Cocteau), and *La Création du monde* (1923; *The Creation of the World;* scenario, Blaise Cendrars). He composed the incidental music for Claudel's *Protée* (1920) and for Claudel's translations of the Aeschylean tragedies *Agamemnon* (1913), *Choéphores* (1915), and *Les Euménides* (1917–22). Whips and hammers are introduced into the orchestration of this trilogy, a work of great dramatic force, in which the chorus is required to groan, whistle, and shriek. His other operas include *Christophe Colomb* (1930; text by Claudel); *Le Pauvre Matelot* (1926; *The Poor Sailor;* text by Cocteau), *David* (1954), and *Médée* (1939).

From about 1913, Milhaud's music is characterized by his use of bitonality and polychords. He was the first to analyze (though not the first to use) polytonality and to develop that technique consistently. An example of his use of polytonality is the "Saudades do Brasil" (1921). His style became simplified in later years, but its harmonic basis remained mostly polytonal. The effect of his polytonality is that of simultaneous movement of different planes of sound. Although dissonant, his music retains a lyrical quality.

A prolific composer, Milhaud wrote more than 400 works, including radio and motion-picture scores, a setting of the Jewish *Sabbath Morning Service,* symphonies (eight for large orchestra, five for small orchestra), choral works, and the two-piano suite "Scaramouche" (1936; later arranged for saxophone or clarinet and orchestra). His chamber music includes a suite for violin, clarinet, and piano, and 18 string quartets. Among his songs are settings of poems by Claudel, Christina Rossetti, and Stéphane Mallarmé.

miliaria, an inflammatory disorder of human skin, characterized by multiple small lesions at the site of sweat pores, brought about by the blockage of sweat ducts and the resulting escape of sweat into various levels of the skin. Most cases of miliaria occur in extremely hot weather; the lesions tend to disappear with cooler weather and the resultant decrease in sweating. There are four varieties of miliaria.

In miliaria crystallina, the sweat escapes into the superficial region of the epidermis, the outermost horny layer of the skin, where it collects in tiny, clear, noninflammatory, dewdrop vesicles (blisters); these are most commonly seen in patients with fever or after a sunburn.

Miliaria rubra, or prickly heat, the most common form of sweat retention, results from the escape of sweat into the epidermis, where it produces discrete, densely packed, pinhead vesicles or red papules (solid, usually conical elevations); these lesions occur chiefly on the trunk and extremities, where they cause itching and burning. The incidence of prickly heat is highest in tropical climates, where it most commonly affects infants.

In miliaria pustulosa, there are pustules, or small elevations of the skin filled with pus, at the site of sweat retention.

Miliaria profunda is a deep type of sweat retention, the sweat escaping into the dermis, the vascular layer of the skin located below the epidermis. The lesions, in this form of miliaria, are firm papules.

Milíč (of Kroměříž), John, Czech JAN MILÍČ Z KROMĚŘÍŽE (b. *c.* 1305, Kroměříž, Bohemia [now in Czech Republic]—d. June 29, 1374, Avignon, France), theologian, orator, and reformer, considered to be the founder of the national Bohemian religious-reform movement.

Milíč was educated at Prague and ordained about 1350, entering the imperial chancery of Charles IV in 1358. Later, he received a clerical benefice from Pope Innocent VI and was made a minor prelate and treasurer of St. Vitus' Cathedral in Prague. Inspired by the spirit of reform and repelled by clerical corruption, Milíč resigned his office in 1363 and went into seclusion.

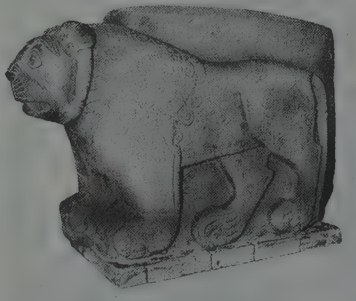
When he emerged, he devoted himself to preaching the tenets of church reform, asceticism, and ecclesiastic and secular poverty. He attacked the secularization of the Roman Catholic church and emphasized the Scriptures as a rule for life, preaching in Czech and German rather than the traditional Latin. His use of the vernacular and his reforming zeal soon gained him wide popularity among the laity.

Convinced that the degenerate state of the church and society portended an imminent end of the world and the coming of the Antichrist, Milíč traveled to Rome in the spring of 1367 and preached penance and moral conversion before the papal court. For his efforts, he was imprisoned by the Inquisition on suspicion of heresy but was released by Pope Urban V when the latter returned from Avignon in October. Late in 1367 he presented Urban with his pamphlet *Libellus de Antichristo* ("Booklet on Antichrist"), in which he urged the pope to convene a general council to reform the church.

Milíč then returned to Prague, where he began preaching daily sermons at the cathedral, in Latin for the clergy and in Czech for the people. His sermons were widely distributed throughout central Europe and spurred demands for Christian reform. At several centres he established at Prague, Milíč introduced the *devotio moderna,* a reform of prayer developed in Holland that emphasized a method of devotion centred on Christ (Christocentric) and intended to involve the emotions—as opposed to the academic and abstract forms of medieval scholastic theology.

When new charges of heresy were drawn up against him, Milíč, supported by the Holy Roman emperor and by Archbishop John of Jenstein, submitted his case to Pope Gregory XI at Avignon in 1373. Absolved of all charges, he was invited by the pope to preach to the College of Cardinals. He became ill and died the following year before he could return to Prague. Although Milíč remained within the Roman Catholic church, he is considered the forerunner of the Bohemian Reformation because of his attempted clerical reforms, his support for a vernacular Bible and vernacular preaching, and his doctrinal influence on Jan Hus.

Milid, modern ARSLANTEPE (Turkish: "Lion Mound"), ancient city near the upper Euphrates River in east-central Turkey, 4 miles (6.5 km) northeast of the town of Malatya. The site was first inhabited in the 4th millennium BC and later became an important city of the Hittites until the dissolution of their empire early in the 12th century BC. It survived as an independent city-state, sometimes linked with the "neo-Hittite" federation (a postimperial Syrian-Hittite culture) and sometimes subject to Assyria. Removed to a new site in Roman times, it became the capital of Lesser Armenia. Later, it was successively occupied by Sāsānid Persians and Arabs and finally became an important centre of the Christian Jacobite sect. In the 12th century AD it fell to the Seljuq sultanate of Rūm.



Lion from Milid, Neo-Hittite period (10th or 8th century BC); in the Archaeological Museum, Ankara

By courtesy of the Archaeological Museum, Ankara

Milid was excavated from 1932 onward by French archaeologists, and the bas-reliefs found there are among the best surviving examples of Hittite art.

Milinda-pañha (Pāli: "Questions of Milinda"), lively dialogue on Buddhist doctrine with questions and dilemmas posed by King Milinda—*i.e.,* Menander, Greek ruler of a large Indo-Greek empire in the late 2nd century BC—and answered by Nāgasena, a senior monk. Composed in northern India in perhaps the 1st or 2nd century AD (and possibly originally in Sanskrit) by an unknown author, the *Milinda-pañha* is the one noncanonical work whose authority was accepted implicitly by such commentators as Buddhaghosa, who quoted it frequently. It is also one of the few postcanonical works of the Theravāda school that was not produced in Ceylon, though its authority there remains unquestioned.

The problems discussed are common themes in the Pāli canon, beginning with the nonexistence of a soul, and the doctrine is orthodox Theravāda. Of the seven books into which the work is divided, the second and third and sections of the first are masterpieces of ancient Indian prose. They deal with basic questions of interest to laypersons and make excellent use of parables. The remainder is a later addition of a more scholastic nature.

military, naval, and air academies, schools for the education and training of officers for the armed forces. Their origins date from the late 17th century, when European countries began developing permanent national armies and navies and needed trained officers for them—though the founding of academies themselves did not begin until the mid-18th century and later. Until the 20th century, training emphasized the handling of weapons, the drilling and management of men, tactics and strategy, and ceremonial; for naval cadets, navigation was included. In the 20th century, separate air force academies were founded in some countries. To accommodate the increasing part played by science, technology, and organization in modern warfare, the content of the instruction has broadened to include more scientific, technical, and general subjects. At the same time, cadets began to be drawn from much wider social strata than hitherto.

Perhaps the first country to develop a comprehensive and modernly efficient scheme of military education was Prussia, which had such early brilliant reformers as Gerhard von Scharnhorst, August von Gneisenau, and Carl von Clausewitz and whose complex of military institutions in the 19th century would elicit the respect (and often the imitation) of other military powers. At the base of the officer-training system were eventually 8 cadet schools, more or less for the upper class or elite, and 10 war schools for the less select—both training men for commissions. At the apex of the system was the venerable War Academy, or Kriegs Akademie, at Berlin, founded in 1810 and offering the highest advanced education for commissioned officers. A great complex of technical and auxiliary schools, such as for cavalry and engineering, filled in the system. After World War I the entire complex was disrupted, though the military tradition persisted.

Among the countries that closely imitated the Prussian system were Austria-Hungary, tsarist Russia, and Japan. The first real military academies in Russia were established in the mid-19th century. Immediately after the Bolshevik Revolution in October 1917, a new centralized Soviet military academy was founded in Moscow, followed by the founding of naval, air, engineering, and military political academies. In Japan, the principal schools for the training of officers were the Army Academy (founded 1868) and the Naval Academy (founded 1869), both of which were disbanded after World War II. Perhaps the most famous military academy in East Asia, however, was the Whampoa Academy, an army academy set up by the Chinese Kuomintang (Nationalist) leader Sun Yat-sen near Canton in 1924 with Chiang Kai-shek as its first commandant.

In France the system developed in simpler form, with two traditional channels for men seeking commissions. Military engineers, artillerymen, and other technical officers were trained at the École Polytechnique (*q.v.*), an engineering school that was founded in 1794. Staff and other officers for the infantry and cavalry were trained at the École Spéciale Militaire de Saint-Cyr, founded by Napoleon in 1803. (*See* Saint-Cyr.) Advanced training for selected colonels is also offered at the École Supérieure de Guerre. The École Navale at Brest trains officers for the navy, and the École de l'Air at Salon-de-Provence is the air force academy.

Until 1939 potential officers for the British army were trained at either the Royal Military Academy at Woolwich (founded 1741), offering training in artillery, engineering, and communications, or the Royal Military College at Sandhurst (founded 1802), offering cavalry and infantry training. From 1940 the functions of these schools were combined at Sandhurst (*q.v.*), which in 1947 was officially designated the Royal Military Academy, Sandhurst. British naval cadets are enrolled at the Royal Naval College, Dartmouth; and air force cadets train at the Royal Air Force College, Cranwell (founded 1920). Selected commissioned officers are educated in higher strategy and policy at the Imperial Defence College.

The United States has four major academies: the United States Military Academy (*q.v.*) at West Point, N.Y. (founded 1802); the United States Naval Academy (*q.v.*) at Annapolis, Md. (founded 1845); the United States Air Force Academy (*q.v.*) at Colorado Springs, Colo. (founded 1954); and the United States Coast Guard Academy (*q.v.*) at New London, Conn. (founded 1876). There is also the United States Merchant Marine Academy (*q.v.*) at Kings Point, N.Y. (founded 1943), whose graduates may apply for commissions in the naval reserve. At the apex of the system, for training commissioned officers of the three basic services in higher strategy and policy, are the National War College and the Industrial College of the Armed Forces, the latter for study of economic aspects of mobilization. Advanced training is also offered at the several academies and at nonmilitary universities.

military and naval affairs, issues having to do with the organization, training, equipment, and employment of the armed forces of a nation.

Military and naval affairs are treated in a number of articles in the MACROPAEDIA. For discussion of military sciences such as strategy and tactics, as well as related disciplines such as the law of war, *see* War, Theory and Conduct of. For weapons and weapons systems, *see* War, Technology of. For related topics, *see* Cryptology; Intelligence and Counterintelligence; Mapping and Surveying; Navigation. For histories of major wars and campaigns, *see* Crusades; World Wars. Other wars and campaigns are covered in the history sections of articles on various nations, empires, and continents.

For a description of the place of military and naval affairs in the circle of learning and for a list of both MACROPAEDIA and MICROPAEDIA articles on the subject, *see* PROPAEDIA: Part Five, Division IV; Part Seven, Division III.

Military Appeals, United States Court of: *see* United States Court of Military Appeals.

military bridge, temporary bridge that must usually be constructed in haste by military engineers, from available materials, frequently under fire. The earliest types historically were pontoon bridges—*i.e.,* floating bridges that rest on stationary boats. Pontoon bridges were constructed in ancient times by Persians, Greeks, Romans, and Mongols, the most famous being Xerxes' 2-mile (3-kilometre) span over the Hellespont (Dardanelles). The Romans, however, frequently built more durable military bridges, notably Julius Caesar's timber crossing of the Rhine River and Trajan's timber-arch span of the Danube. By the 17th century, bridging equipment was part of the train of European and Turkish armies, with pontoons fashioned not only of timber but also of leather, copper, and tin. Pneumatic pontoons with steel roadways made their appearance during World War II.

Military trestles were built in considerable numbers in the wars of the 19th century, notably the American Civil War. Abraham Lincoln, inspecting a 400-foot (120-metre) railroad bridge over Potomac Creek, built in nine days, expressed his astonishment: "Loaded trains are running every hour, and upon my word it consists of nothing but beanpoles and cornstalks."

Military pontoon bridges are usually built either by successively extending outward from the shore or by constructing whole sections as rafts and floating them into position. Truss bridges, for use where riverbanks are steep or navigation must be kept open, are made up in panels readily bolted together. Military truss bridges were pioneered in World War II by the highly successful British-invented Bailey bridge, which played an especially important role in the Allied campaign in Italy. Also during World War II, the scissors assault bridge was introduced; a folding bridge, consisting of a pair of solid-girder-supported deck sections, hinged at their juncture, was carried to the riverbank by a tank; opening out in an inverted V, it flattened into a level crossing. Modern refinements of basic types of military bridges have included increased use of aluminum, more efficient and stronger scissors types, and greatly increased use of mechanical erecting equipment. *See also* pontoon bridge.

military engineering, the art and practice of designing and building military works and of building and maintaining lines of military transport and communications. Military engineering is the oldest of the engineering skills and was the precursor of the profession of civil engineering.

Modern military engineering can be divided into three main tasks: (1) combat engineering, or tactical engineer support on the battlefield, (2) strategic support by the execution of works and services needed in the communications zones, such as the construction of airfields and depots, the improvement of ports and road and rail communications, and the storage and distribution of fuels, and (3) ancillary support, such as the provision and distribution of maps and the disposal of unexploded bombs, mines, and other warheads. Construction, fortification, camouflage, demolition, surveying, and mapping are the province of military engineers. They build bases, airfields, depots, roads, bridges, port facilities, and hospitals. In peacetime military engineers also carry out a wide variety of civil-works programs.

Classical and medieval eras. Evidence of the work of the earliest military engineers can be found in the hill forts constructed in Europe during the late Iron Age, and later in the massive fortresses built by the Persians. One epic feat of ancient military engineering was the pontoon bridge built by the engineers of the Persian king Xerxes across the Hellespont (modern Dardanelles), which, according to Herodotus, was accomplished by a mile-long chain of boats, 676 in all, arranged in two parallel rows. The greatest ancient defensive work ever built is the Great Wall of China, which was begun in the 3rd century BC to defend China's northern frontier from its barbarian neighbours. Counting its tributary branches, the Great Wall is about 6,400 km (4,000 miles) long and dwarfs any other set of fortifications ever built.

The Romans were the preeminent military engineers of the ancient Western world, and examples of their works can still be seen throughout Europe and the Middle East. The Romans' *castra,* or military garrison towns, were protected by ramparts and ditches and interconnected by straight military roads along which their legions could speedily march. Like the Chinese, the Romans also built walls to protect their empire, the most famous of these being Hadrian's Wall in Britain, which is 73 miles (117 km) long and was built to protect the northern frontier from Picts and Scots. The troops and engineers of the legions built many of the greatest works of the Roman Empire, including its extensive network of roads; the watchtowers, forts, and garrison towns manned by its troops; the aqueducts that brought water to cities and towns; and various bridges, harbours, naval bases, and lighthouses. The Romans were also masters of siegecraft who used such devices as battering rams, catapults, and ballistae (giant crossbows) to take enemy fortifications.

The Byzantine Empire, India, and China continued to fortify their cities with walls and towers, while in Europe urban civilization collapsed with the fall of the Roman Empire and the ensuing Middle Ages. One sign of its revival was the motte-and-bailey forts that sprang up on the continent in the 10th and 11th centuries AD. These basically consisted of a high mound of earth (motte) encircled by wooden palisades, ditches and embankments (the bailey), with a wooden tower occupying the central mound. They were replaced from the 11th century by stone-built castles that served as both military strongholds and centres of administration. (*See* castle.) Medieval engineers became proficient at mining operations, by which tunnels were driven under the walls of castles and their timbering set afire, causing the masonry overhead to collapse.

The Renaissance and after. The development of powerful cannons in the 15th century brought about a reappraisal of fortification design and siege warfare in Europe and parts of Asia. In China and India the response to the new siege guns was basically to build fortifications with thicker walls. Sixteenth-century Europe's response was the sunken profile, which protected walls from artillery bombardment, and the bastioned trace, a series of projections from the main fortress wall to allow both direct and flanking fields of fire against attackers. This system was brought to a peak of sophistication in the 17th century by Sébastien Le Prestre de Vauban of France, whose fortifications and siege-warfare techniques were copied by succeeding generations of military engineers. The system perfected by him did not change until the second half of the 19th century, when breech-loading artillery and the use of high-explosive shells called for drastic alterations in the design and construction of defenses.

The 19th century. Technological advances changed the nature of military engineering in the century following the Napoleonic Wars. British and French military engineers first used the electric telegraph in the Crimean War (1853–56). With the spread of railways, military engineers became responsible in theatres of war for the construction and maintenance of railway systems and the control of the rail movement of troops and military matériel. Military engineering schools offered the finest technical training in Europe well into the 19th century, and their graduates were among the technical elite of industrialized nations. As European countries colonized vast portions of Africa, Asia, and Australia, military engineers were often given responsibility for the exploration and mapping of these regions and for the construction of public buildings and utilities, roads, bridges, railways, telegraph networks, irrigation projects, harbours, and maritime defenses. In the United States, the Army Corps of Engineers led the way in developing the West; they explored, surveyed, and mapped the land, built forts and roads, and later assisted in building the transcontinental railway. The corps later specialized in improving harbours and inland waterways and constructing dams and levees.

The 20th century. The protracted trench warfare of World War I called upon all of the traditional siegecraft skills of the military engineers. Trench tramways and light railways were built for the maintenance of forward troops. Large camouflage projects were carried out to screen gun positions, storage dumps, and troop movements from enemy observation. Mining and countermining were carried out on a scale never before attempted. The greatest achievement was the firing in June 1917 by British sappers of more than 1,000,000 pounds (450,000 kg) of explosive, placed in 16 chambers 100 feet (30 m) deep, which completely obliterated Messines Ridge in Belgium and inflicted 20,000 German casualties.

The scope of military signaling increased enormously and reached such a size and complexity that, when World War I ended, military telecommunication engineers became a separate corps in all armies. New techniques were developed for fixing enemy gun positions. Mapmaking by the use of aerial photographs (photogrammetry) developed. Field printing presses were set up to provide vast quantities of maps of the fighting areas, and a grid system was introduced for maps covering the whole theatre of operations.

In the 1930s French military engineers designed and constructed the Maginot Line, a supposedly impregnable defensive system protecting France's common frontier with Germany and Luxembourg. The military engineers of World War II faced and solved problems on a scale and of a character not previously experienced. Because of the importance of air power, hundreds of airfields and airstrips had to be built, often in great haste and while under fire. Amphibious operations, involving the landing of troops on a hostile shore, involved a host of engineering problems, from the underwater demolition of obstacles to the rapid construction of open-beach dock facilities, such as the prefabricated Mulberry Harbour used to maintain the Normandy landings in 1944. Special equipment, including armoured engineering vehicles that had to be capable of wading ashore from landing craft, was developed for the Allies' amphibious operations. Inland, new and stronger types of temporary bridges were developed to support the passage of tanks and other heavy armoured vehicles.

Minelaying is a subspecialty of military engineering that acquired increased importance in the 20th century. Floating submarine mines were first used to destroy ships in the 19th century and came into wide use in World War I during the Battle of the Atlantic. Antitank mines came into wide use in World War II and became the principal obstacle to the movement of armoured forces. Special techniques and equipment were developed for minelaying, mine location, and the breaching and clearing of minefields.

One of the most extraordinary feats of military engineering during the war was the building in 1944 by Allied forces of a supply road from Ledo, India, to the Burma Road at a point where the road was still in Chinese hands. This Stilwell (originally Ledo) Road opened in January 1945, was 478 miles (770 km) long, and twisted through mountains, swamps, and jungles. The most important fortifications of the war were those built by Germany along the coast of northern France in 1942–44 to resist an Allied invasion across the English Channel. The largest task carried out by military engineers in World War II, however, was the Manhattan Project, which produced the atomic bombs dropped on Hiroshima and Nagasaki. Civilian scientists as well as engineers were recruited in large numbers for this mammoth project, whose success made it a model for later large-scale government efforts involving many scientists and engineers from different disciplines.

In the latter part of the 20th century military engineers were responsible for the construction of command and control facilities such as the granite-delved complex at Cheyenne Mountain, Colorado Springs, Col., U.S., which houses the operations centre for the North American Aerospace Defense Command (better known as NORAD) and other aerospace units.

military government, administration of occupied territory by an occupying power, including the exercise of executive, legislative, and judicial authority. In international law, territory is considered occupied when it is actually under the authority of hostile armed forces. The necessity for military government arises from the failure or inability of the legitimate government to exercise its functions. It is immaterial whether or not the government over an enemy's territory consists of a military or civil or mixed administration.

Because it is in connection with belligerent occupation that the general concept of military government evolved, the definition does not cover cases in which military forces have been stationed in neutral or friendly territory and share with local civil authorities the responsibilities of administration. Also, military government must be distinguished from military law and martial law. Military law is the code that regulates the conduct of members of the armed forces but does not apply to civilians. Martial law is the temporary government of the civil population through the military forces without the authority of written law, as necessity may require; it is invoked only in domestic territory.

military law, the body of law concerned with the maintenance of discipline in the armed forces. Military law in no way relieves military personnel of their obligations to their country's civil code or to the codes of international law, as recognized in various conventions.

A brief treatment of military law follows. For full treatment, *see* MACROPAEDIA: War, The Theory and Conduct of.

In any armed force a disciplinary code is necessary to ensure that the will of the commander is obeyed. In Rome, military law was formalized in the 5th century AD in the Digest and Codex of the emperor Justinian. Until then, Roman military law varied according to the individual commander. In the European Middle Ages, military law was defined by ordinances or articles of war issued by the sovereign or by a commander designated by him at the outset of each new campaign. The articles of war of Maurice of Nassau, prince of Orange, and Gustav II Adolf formed the basis of military law throughout Europe, which, revised, reformed, and amended, continues to this day.

The jurisdiction of military law extends, in different countries and in different degrees, to any offense committed by a member of the armed forces. It also extends to any offense injurious to military discipline, whether committed by a soldier or by a civilian. Soldiers who fail to respond to military conscription in some countries are subject to military law for such offenses as desertion or self-mutilation. Reservists in some countries are subject to military law for such offenses as treason, revelation of state secrets, or communication with foreign countries. Ordinary civilians in some countries may be prosecuted in military courts on charges of treason, rebellion, fraud, or impeding military operations. In other countries, civilians may not be prosecuted in military courts unless accused of crimes committed in a war zone or during a state of siege. Some countries recognize no military offenses by civilians.

Prisoners of war fall under military jurisdiction as well, and their rights have been established by the Geneva Prisoner of War Convention of 1949.

Mutiny, insubordination, desertion, and misconduct in action constitute violations of military law, but military law usually extends further to all actions committed by soldiers in foreign territory that would constitute offenses against the civil code of their home countries. A soldier may be prosecuted in a civil court for severe crimes against his civil code.

Continental European countries tend to distinguish between military crimes subject to judicial punishment and breaches of discipline subject to administrative action. Members of the Commonwealth and those countries whose military law derives from the Anglo-Saxon model do not make such a distinction, instead regarding all military offenses as subject to judicial punishment.

In most countries, summary penalties such as loss of privileges, cancellation of liberty, and fines can be imposed by officers not lower than the rank of captain; the commanding officer of the unit is the principal source of discipline. A soldier may appeal against summary punishment, either to a higher military authority or to a tribunal. In most countries, offenses beyond a commanding officer's jurisdiction are tried in a service court, or court-martial. Prior to trial by court-martial, a military magistrate conducts a formal investigation of the charges. A court-martial is generally tried by between three and seven judges selected from the officer corps.

In times of war, military offenders are almost always tried in military courts, regardless of whether the country has civilian jurisdiction over military personnel.

The degree to which a soldier is responsible for unlawful conduct committed on orders from a superior officer is a question that is widely debated by the architects of modern military law and by scholars of war crime.

military police, disciplinary force, composed of soldiers, that exercises police and related functions in armies. Generally, their principal duty is to maintain law and order, prevent and investigate crime within the army, and operate confinement facilities. They also engage in combat as infantry when required.

In the United States, military police constitute a separate branch of the army known as the Military Police Corps. Although it had a long, irregular history dating back to 1776, the corps as a unified, centrally directed organization developed only with the rapid expansion of the army during and after World War II. Its responsibilities extend wherever U.S. troops are stationed. The head of the corps, the provost marshal general, is the chief law-enforcement authority on the staff of the Department of the Army.

In the United Kingdom the military police are organized as a combat corps in the army and have been known since 1946 as the Corps of the Royal Military Police. At the head of the corps is the provost marshal, one of the most ancient appointments in the army. In addition to the usual functions performed by all military police, the corps' duties include the preservation of discipline outside unit bases, road patrols and traffic control, and escorts and antivice duties. In war, in addition to controlling prisoners of war and stragglers, the corps manned information posts, cared for refugees, and prevented looting.

Most other countries of the world, except those of continental Europe, have formed their military police on the United States and British models.

military unit, also called UNIT, a group having a prescribed size and a specific combat or support role within a larger military organization. The chief military units in the ancient classical world were the phalanx (*q.v.*) of the Greeks and the legion (*q.v.*) of the Romans. The units used in modern armies have their origins in the 16th–18th centuries, when professional armies reemerged in Europe after the end of the Middle Ages. The basic units of the company, battalion, brigade, and division have been retained since then.

Armies, navies, and air forces are organized hierarchically into progressively smaller units commanded by officers of progressively lower rank. The prototypical units are those of the army. The smallest unit in an army is the squad, which contains 7 to 14 soldiers and is led by a sergeant. (A slightly larger unit is a section, which consists of 10 to 40 soldiers but is usually used only within headquarters or support organizations.) Three or four squads make up a platoon (*q.v.*), which has 20 to 50 soldiers and is commanded by a lieutenant. Two or more platoons make up a company (*q.v.*), which has 100 to 250 soldiers and is commanded by a captain or a major. The function of administration is introduced at this level, in the form of a headquarters platoon administered by a sergeant and containing supply, maintenance, or other sections.

Two or more companies make up a battalion (*q.v.*), which has 400 to 1,200 troops and is commanded by a lieutenant colonel. The battalion is the smallest unit to have a staff of officers (in charge of personnel, operations, intelligence, and logistics) to assist the commander. Several battalions form a brigade, which has 2,000 to 8,000 troops and is commanded by a brigadier general or a colonel. (The term regiment [*q.v.*] can signify either a battalion or a brigade in different countries' armies.) A brigade is the smallest unit to integrate different types of combat and support units into a functional organization. A combat brigade, for example, usually has infantry, armour, artillery, and reconnaissance units.

Two or more brigades, along with various specialized battalions, make up a division (*q.v.*), which has 7,000 to 22,000 troops and is commanded by a major general. A division contains all the arms and services needed for the independent conduct of military operations. Two to seven divisions and various support units make up an army corps, or a corps, which has 50,000 to 300,000 troops and is commanded by a lieutenant general. The army corps is the largest regular army formation, though in wartime two or more corps may be combined to form a field army (commanded by a general), and field armies in turn may be combined to form an army group.

militia, military organization of citizens with limited military training, which is available for emergency service, usually for local defense. In many countries the militia are of ancient origin; Macedonia under Philip II (d. 336 BC), for example, had a militia of clansmen in border regions who could be called to arms to repel invaders. Among the Anglo-Saxon peoples of early medieval Europe, the militia was institutionalized in the fyrd, in which every able-bodied free male was required to give military service. Similar arrangements evolved in other countries. In general, however, the emergence in the Middle Ages of a quasi-professional military aristocracy, which performed military service in return for the right to control land and servile labour, tended to cause the militia to decay, particularly as political power became increasingly centralized and life became more secure. The institution persisted nevertheless and, with the rise of national monarchies, served in some measure to provide a manpower pool for the expanding standing armies. In France in the 18th century, one-eighteenth of the militia was required to enter the regular army each year.

In colonial America the militia, based on the tradition of the fyrd, was the only defense against hostile Indians during the long periods when regular British forces were not available. During the American Revolution, the militia, called minutemen, provided the bulk of the American forces as well as a pool for recruiting or drafting of regulars. The militia played a similar role in the War of 1812 and the American Civil War. After that conflict, however, the militia fell into disuse. State-controlled volunteer units of well-to-do men (those who could afford to buy their own uniforms) were formed in most states and came to serve a quasi-social function; many of these volunteers were veterans of the Civil War. In the 1870s and '80s such units, which came to be referred to as the National Guard, were called upon by state governors to break strikes. At that time these state units constituted the nation's only trained reserve. In the 20th century, despite the parallel growth of designated reserve forces, the National Guard was called into federal service in both world wars and continued to be used in emergencies by both the state and the federal government.

In Great Britain the Territorial Force, a militia-like reserve organization for home defense, was created in 1908. It became the Territorial Army in 1921, and overseas service was required. During World War II the militia principle was followed in the establishment of the Home Guard. Militia forces—conscripts who undergo periodic military training until retired to an inactive reserve in middle age—constitute today the bulk of the armed forces available for emergency service in Switzerland, Israel, Sweden, and several other countries. China and various other countries that maintain large standing forces and conscript reserves also support huge militia forces as territorial reserves for local defense.

Miliukov, Pavel Nikolayevich (Russian statesman): *see* Milyukov, Pavel Nikolayevich.

milk, liquid secreted by the mammary glands of female mammals to nourish their young for a period beginning immediately after birth. The milk of domesticated animals is also an important food source for humans, either as a fresh fluid or processed into a number of dairy products such as butter and cheese.

A brief treatment of milk follows. For full treatment, *see* MACROPAEDIA: Food Processing.

Almost all the milk now consumed in Western countries is from the cow, and milk and milk products have become important articles of commerce. Other important sources of milk are the sheep and goat, which are especially important in southern Europe and the Mediterranean area; the water buffalo, which is widely domesticated in Asia; and the camel, which is important in the Middle East and North Africa.

Milk is essentially an emulsion of fat and protein in water, along with dissolved sugar (carbohydrate), minerals, and vitamins. These constituents are present in the milk of all mammals, though their proportions differ from one species to another and within species. (*See* Table.) The milk of each species seems to be a complete food for its own young for a considerable time after birth. In the stomachs of the young, milk is converted to a soft curd that encloses globules of fat, enabling digestion to proceed smoothly without the disturbance often caused by fatty food. Lactose, or milk sugar, is broken down into simpler digestible sugars by the enzyme lactase, which is produced in the intestine of infants. Infants who do not produce lactase develop lactose intolerance, a condition in which a variety of gastrointestinal problems arise. Lactose intolerance also commonly develops after weaning or with advancing age, when many individuals cease producing lactase.

Milk protein is of high nutritional value because it contains all the essential amino acids—*i.e.,* those which infants cannot synthesize in the necessary quantities. Milk's mineral content includes calcium and phosphorus in quantities sufficient for normal skeletal development, but little iron. Milk contains B vitamins as well as small amounts of vitamins C and D. Commercial cow's milk is commonly enriched with vitamins D and A before sale.

Microorganisms contained in raw (unheated) milk or picked up from the environment will quickly sour and curdle the milk. Cooling to slightly above its freezing point keeps milk palatable for a longer time by reducing the multiplication of spoilage bacteria and the chemical changes that they induce.

Many countries have laws requiring that milk be pasteurized as a protection against pathogenic (disease-causing) organisms. Pasteurization is a partial sterilization accomplished by raising the milk to a temperature high enough to destroy pathogenic bacteria and a large proportion of those causing spoilage. Pasteurized milk that is kept refrigerated in closed containers will remain consumable for approximately 14 days.

Milk fat, being less dense than other milk components, can be efficiently removed in a cream separator by centrifugation, yielding low-fat milk and skim milk. Low-fat milk contains 1–2 percent fat, while skim milk contains less than 0.5 percent fat.

Much of the milk sold as a beverage has undergone homogenization, a process in which the milk is forced under high pressure through small openings to distribute the fat evenly throughout the milk.

milk fever, also called PARTURIENT PARESIS, in cattle, a disorder characterized by abnormally low levels of calcium in the blood (hypocalcemia). It occurs in cows most commonly within three days after they have calved, at a time when the cow's production of milk has put a severe strain on its calcium stores. The early symptoms include loss of appetite and depression or restlessness, followed by muscle weakness and spasms of the hindlegs. In acute cases the hindlegs become paralyzed and the cow collapses into coma, followed by death. The death rate in untreated animals may run as high as 90 percent. Fever is not a symptom in this disorder. The most effective treatment is the intravenous injection of calcium gluconate, upon which the animal makes a speedy recovery. There is no effective means of preventing milk fever, but modern treatment methods have made deaths from it a rarity in the developed nations.

milk glass, opaque white glass (as opposed to white, or clear, glass) that was originally made in Venice before 1500 and in Florence between 1575 and 1587, where it was intended to simulate porcelain. In northern Europe it was made only to a very limited extent, with rare 17th-century examples coming from

Nutrient composition of the whole milk of humans and select domesticated animals (per 100 g)

source	energy (kcal)	fat (g)	cholesterol (mg)	protein (g)	calcium (mg)	phosphorus (mg)	carbohydrate (g)
human	70	4.38	14	1.03	32	14	6.89

milk leg, also called ILIOFEMORAL THROMBOPHLEBITIS, or PHLEGMASIA ALBA DOLENS, inflammation of the femoral vein, the principal vein of the thigh, with formation of a clot that blocks the channel of the vein. The condition may occur shortly after childbirth, or it may result from the use of oral contraceptives. Other predisposing factors are aging, malignancy, and chronic infection. The leg becomes swollen and is pale and painful (hence the name phlegmasia alba dolens—"white, painful inflammation"). If the blockage persists, ulcers may develop. The affected person is kept in bed, with the swollen leg elevated and motionless; anticoagulants are used to prevent further clotting while the body's plasmin (also called fibrinolysin) dissolves the blockage, and antibiotics are used to combat any infection. The leg is bandaged to prevent collection of fluid in the tissues (edema). Severe occlusion may require surgical treatment. If the clot detaches there is danger of pulmonary artery blockage.

Milk River, river rising in two headstreams in the Blackfeet Indian Reservation in the Rocky Mountain foothills, northwestern Montana, U.S. Both streams flow northeastward into Alberta, Can., where they unite as the Milk River, which, after flowing east for about 100 miles (160 km), bends southeastward to reenter Montana. The river then flows in an easterly direction across the state to enter the Missouri River below Nashua, a few miles northeast of the Fort Peck Dam and Reservoir (1940), after a course of 625 miles (1,006 km). Near Havre, Mont., much of the river's water, stored in a lake created by Fresno Dam (1939), is used for irrigation.

Milken, Michael R. (b. July 4, 1946, Encino, Calif., U.S.), American financier whose junk-bond operations fueled many of the corporate takeovers of the 1980s.

Milken studied business at the University of California, Berkeley, graduating in 1968. In 1969, while studying at the University of Pennsylvania's Wharton School of Finance, he began working at the Drexel Firestone banking firm, which soon afterward merged with Burnham & Company to form what became Drexel Burnham Lambert Inc., a major investment banking company. In 1971 Milken became head of Drexel Burnham's bond-trading department. He saw great potential in the neglected area of "junk bonds"—*i.e.*, non-investment-grade bonds that were typically issued by smaller, newer companies or by established firms whose fortunes had soured. Though junk bonds earned substantially higher rates of return than did investment-grade bonds, they were also regarded as more liable to default and hence were considered too risky by the large institutional investors—savings and loan associations, pension funds, insurance companies, and mutual funds—that provided American corporations with much of their investment capital. Milken's studies showed that junk bonds had acceptable default rates for their higher yield, and he began persuading a growing number of institutions to buy them.

By 1984 Drexel Burnham was able to raise large amounts of capital by floating new issues of junk bonds, which Milken used to provide financing for a new class of entrepreneurs and "corporate raiders" to expand their businesses or acquire other companies. Milken's vast and increasingly powerful junk-bond network fostered the "merger mania" of the 1980s, in which his clients, partners, and allies, among others, engaged in a wave of corporate mergers, acquisitions, hostile takeovers, and leveraged buyouts. By the end of the 1980s, the junk-bond market had grown to $150 billion in size, and Drexel Burnham had become one of the leading financial firms in the United States. Milken's own operations accounted for at least half of the firm's profits, and his own salary jumped from $25,000 in 1970 to $550 million in 1987—the highest annual compensation to that time.

In 1986, however, one of Drexel's clients, Ivan Boesky, was convicted of insider trading, and he implicated Milken and Drexel Burnham Lambert in his illegal financial dealings. In 1988 both Milken and Drexel Burnham were charged with securities fraud. Drexel reached a settlement with the government later that year, agreeing to pay $650 million in fines, and Milken left the firm in 1989. Without Milken's controlling hand, his network of junk-bond issuers and buyers fell apart, and soon afterward the junk-bond market collapsed, leading to Drexel Burnham's bankruptcy in 1990. Milken pled guilty to six counts of securities fraud that same year; he was sentenced to 10 years in prison, ordered to pay fines totaling $600 million, and permanently barred from engaging in the securities business.

milkfat: *see* butterfat.

milkfish, also called BANDENG, or BANGOS (*Chanos chanos*), silvery marine food fish that is the only living member of the family Chanidae (order Gonorhynchiformes). The milkfish is often collected when young and raised for food in brackish or freshwater tropical ponds. It is a toothless herbivore 1 to 1.5 m (3 to 5 feet) or more in length with a deeply forked tail. It is found throughout warmer regions of the Pacific and Indian oceans and can withstand very shallow, warm (88° F [31° C]) lagoon water. From March to May, it lays up to several million eggs in shallow, brackish water.

milkweed, any of several species of flowering plants belonging to the family Asclepiadaceae (*q.v.*).

milkweed butterfly, any of a group of butterflies considered by some authorities as the family Danaidae (order Lepidoptera) and by others as the subfamily Danainae of the brush-footed butterfly (*q.v.*) family Nymphalidae. The best known are species such as the monarch butterfly (*q.v.*) and queen butterfly. Although the majority of species are found in the tropics of both the Old World and the New, some well-known members live in temperate regions. The large, colourful adults have long, usually brownish wings marked by black-and-white patterns. The first pair of legs is small and not used for walking. They fly slowly and deliberately, and some, such as the monarch butterfly, migrate great distances.

The larvae are often brightly banded or striped, with two to four pairs of fleshy projections protruding from the body. They feed chiefly on milkweed and sometimes on nightshade; these plants contain acrid, milky juices that probably make the larva and its subsequent stages distasteful to predators. This, combined with a conspicuous coloration, protects them. Many other butterflies benefit from this protection through mimicry.

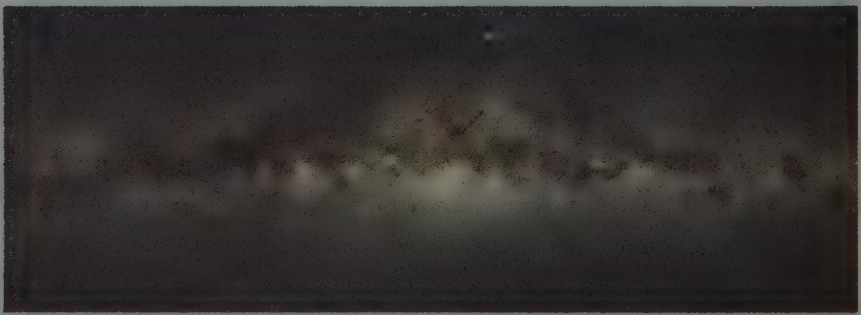
milkweed floss, seed fibre of *Asclepias syriaca,* or common milkweed, and *A. incarnata,* or butterfly weed, both of which are plants of the Asclepiadaceae family and grow in North America. The soft, buoyant, lustrous floss is yellowish white in colour and is made up of individual fibres that are about 1 to 3 cm (0.375 to 1.12 inches) in length and 20 to 50 microns (0.0008 to 0.002 inch) in diameter. The seedpods containing the floss are mechanically processed, or ginned, separating the seeds from their attached fibres. The fibres contain oily material and lignin, a woody plant substance, which makes them too brittle for spinning.

Milkweed floss is used in such water-safety equipment as life jackets and belts and will float in water while supporting as much as 30 times its own weight. It is also used as upholstery padding and insulation material. Like similar seed flosses, it is sometimes known as vegetable silk.

Milky Way Galaxy, large disk-shaped system of stars and interstellar matter of which the Sun is a component. It includes the multitude of stars whose light produces the Milky Way, the highly irregular luminous band that encircles the sky. This band of starlight lies roughly in the plane of the galactic disk.

A brief treatment of the Milky Way Galaxy follows. For full treatment, *see* MACROPAEDIA: Galaxies.

The Milky Way system is one of billions of galaxies that make up the universe. It contains several billion stars and large amounts of interstellar gas and dust. The system is a typical example of a class of galaxies known as barred spirals. It has a nucleus surrounded by a large central bulge with spiral arms coiled around



Milky Way Galaxy as seen from Earth

Dirk Hoppe

it. These curving arms, which resemble those of a huge pinwheel, are embedded in the galactic disk, which constitutes the main part of the system and measures roughly 70,000 light-years in diameter.

The galactic nucleus is obscured by interstellar dust particles, which absorb both the visible and the ultraviolet light radiated by its components. Investigators, however, have been able to record and study emissions from the region at radio, infrared, X-ray, and gamma-ray wavelengths. The strong emissions of infrared radiation and X rays in particular seem to indicate the presence of rapidly moving clouds of ionized gas. These gas clouds are thought to be circling a supermassive object, in all likelihood a black hole with a mass approximately 4,000,000 times that of the Sun. Investigators have determined that the central bulge contains mostly Population II objects (*i.e.,* old stars and star clusters) such as RR Lyrae variable stars and globular clusters. The components of the spiral arms are quite different. The arms are occupied by objects belonging to the extreme Population I variety (*i.e.,* very young, bright stars and open clusters). In addition, this region of the Galaxy contains the highest concentrations of interstellar gas and dust particles and therefore constitutes the most favourable site for new star formation. The Sun is located near the inner edge of one of these arms—the Orion arm—about two-thirds of the way from the centre of the Galaxy. The galactic nucleus lies in the direction of the constellation Sagittarius at a distance of about 27,000 light-years from the Sun.

Above and below the galactic disk is a spherical region (referred to as simply the spherical component) that is occupied by globular clusters and other very old Population II objects—*e.g.,* dwarf stars deficient in the heavy elements. Exterior to the whole visible portion of the Galaxy is the giant massive halo. Its constituents, shape, and extent are still not known.

The entire Milky Way system rotates around the galactic centre, but the various constituent objects do not rotate at the same velocity. Stars distant from the centre travel at lower speeds than do those closer to it. The Sun, which is located relatively far from the nucleus, moves at an estimated speed of about 225 km per second (140 miles per second) in a nearly circular orbit. Because of its relatively low velocity, the Sun's period of revolution about the galactic centre is approximately 200,000,000 years.

Mill (board game): *see* Nine Men's Morris.

Mill, James (b. April 6, 1773, Northwater Bridge, Forfarshire, Scot.—d. June 23, 1836, London, Eng.), Scottish philosopher, historian, and economist. He was prominent as a representative of philosophical radicalism, a school of thought also known as Utilitarianism, which emphasized the need for a scientific basis for philosophy as well as a humanist approach to politics and economics. His eldest son was the celebrated Utilitarian thinker John Stuart Mill.

After distinguishing himself as a Greek scholar at the University of Edinburgh, James Mill was licensed a Presbyterian preacher in 1798. He soon turned to teaching, however, and embarked on historical and philosophical studies. In 1802 he went to London to devote himself to a career in journalism. In 1804 he wrote a pamphlet on the corn trade, arguing against a bounty on the exportation of grain, and in 1806 he began his *History of British India,* 3 vol. (1817).

Mill became acquainted with Jeremy Bentham, who founded Utilitarianism, in 1808. As Bentham's chief companion and ally for many years, he adopted Bentham's principles in their entirety and did more to propagate them and to oppose the beginnings of Romanticism than anyone else. He was a regular contributor (1806–18) to the *Anti-Jacobin Review,* the *British Review,* the *Eclectic Review,* and the *Edinburgh Review* (1808–13). In 1811 he helped edit the periodical *Philanthropist* with the English writer William Allen, contributing his opinions on education, freedom of the press, and prison discipline. He also participated in the discussions that led to the founding of London University in 1825. In 1814 Mill undertook to write various articles on politics, law, and education for the six-volume Supplement to the 4th, 5th, and 6th editions of the *Encyclopædia Britannica.* As reprints they enjoyed a wide circulation in his time. One of the articles, "Government," had considerable influence on public opinion in the 1820s. In it, Mill concluded that a representative democracy based on wide suffrage is a necessary element of good government. "Government," which was possibly the most succinct statement of the political theory of the philosophical radicals, helped prepare the ground for passage of the first Reform Bill by Parliament in 1832.

James Mill

In 1819, two years after Mill's *History of British India* appeared, he was appointed an official in India House, despite his drastic criticisms in the *History* of British rule in India. He rose gradually through the ranks until he was appointed head of the examiner's office in 1830. The *History,* his major literary achievement, was the first full historical treatment of the British conquest of India. Mill harshly criticized the British administration of India, and during his 17 years with the India House he helped completely reform the system of government in the colony. However, the *History*'s severe Utilitarian analysis of Indian civilization also popularized among European readers an image of the subcontinent as perpetually backward and undeveloped. Mill never actually visited India.

Mill was also influential in English politics. His writings and his personal connections with radical politicians helped determine the change of view from theories of the rights of man and the absolute equality of men, as promulgated by the French Revolution, to the claiming of securities for good government through wide extension of the franchise. His *Elements of Political Economy* (1821), an especially precise and lucid work, summarizes the views of the philosophical radicals, based primarily on the work of the economist David Ricardo. In this work Mill maintained: (1) that the chief problem of political reformers is to limit the increase of population, on the assumption that capital does not naturally increase at the same rate as population; (2) that the value of a thing depends entirely on the quantity of labour put into it; and (3) that what is now known as the "unearned increment" of land is a proper object for taxation. The enunciation of the second of these propositions is important in view of the use made of it by Karl Marx. Mill developed Bentham's doctrines by his explanation of the association of ideas. This theory, presented in Mill's *Analysis of the Phenomena of the Human Mind,* 2 vol. (1829), centres on the interrelatedness of mental concepts.

BIBLIOGRAPHY. Leslie Stephen, *The English Utilitarians,* vol. 2, *James Mill* (1900, reissued 1991), is an influential early biographical essay. Bruce Mazlish, *James and John Stuart Mill* (1975, reprinted 1988), is a dual biography of Mill and his son.

Mill, John Stuart (b. May 20, 1806, London, Eng.—d. May 8, 1873, Avignon, France), English philosopher, economist, and exponent of Utilitarianism, which he tended to humanize and infuse with an element of Idealism.

A brief treatment of John Stuart Mill follows. For full treatment, *see* MACROPAEDIA: Mill, John Stuart.

Mill was educated under his father's rigorous discipline both at home and in France. He joined the examiner's office of India House in 1823, becoming its chief in 1856. After writing essays for various periodicals, he was asked to edit *The London Review* in 1835. His early writings, later published in the first two volumes of *Dissertations and Discussions* (1859), added a new dimension to English radicalism. Mill's major publications, however, were *A System of Logic* (1843) and *Principles of Political Economy* (1848). He showed interest in woman suffrage (*Subjection of Women* [1869]) and wrote on ethics and politics (*On Liberty* [1859]; *Considerations on Representative Government* [1861]).

Mill's successive friendships with John Sterling, Thomas Carlyle, and Mrs. Taylor (Harriet Hardy), whom he married in 1851, influenced his thinking over the years and sustained his interest and enthusiasm. He had a brief parliamentary career and was also elected rector of St. Andrews University in 1867, but he retired in the following year and moved to France. His *Autobiography* (1873) and *Three Essays on Religion* (1874) were published posthumously.

Millais, Sir John Everett, 1ST BARONET (b. June 8, 1829, Southampton, Hampshire,

"The Blind Girl," oil painting by Sir John Everett Millais, 1856; in the Birmingham City Museum and Art Gallery, Birmingham, Eng.

By courtesy of the Birmingham Museums and Art Gallery

Eng.—d. Aug. 13, 1896, London), English painter and illustrator, and a founding member of the artistic movement known as the Pre-Raphaelite Brotherhood.

In 1838 Millais went to London and at the age of 11 entered the Royal Academy schools. Extremely precocious, he won all the academy prizes. In 1848 Millais joined with two other artists, William Holman Hunt and Dante Gabriel Rossetti, to form the Pre-Raphaelite Brotherhood. The Brotherhood was founded in opposition to contemporary academic painting, which the group believed was the result of the example set by Raphael and which had dominated the schools and academies since his time. At the next year's academy, the novelist Charles Dickens led a violent attack on Millais's "Christ in the House of His Parents" (1850; Tate Gallery, London), which many considered blasphemous because of its lack of idealization and seeming irreverence in the use of the mundane.

Millais's period of greatest artistic achievement came in the 1850s. "The Return of the Dove to the Ark" (1851; Ashmolean Museum, Oxford) was admired by both the English essayist and critic John Ruskin and the French author Théophile Gautier; and "The Order of Release" (1853; Tate Gallery), which included a portrait of his future wife Effie Gray (then unhappily married to Ruskin, whose portrait Millais also painted), was praised by Eugène Delacroix in 1855 and earned for its artist his associateship to the Royal Academy in 1853. In 1856 Millais painted one of his greatest public successes, "The Blind Girl" (Birmingham City Museum and Art Gallery)—a tour de force of Victorian sentiment and technical facility.

In 1863 Millais became full academician, and by this time his style had broadened and his content altered toward a more deliberately popular, less didactic approach. He executed illustrations for George Dalziel's *Parables* (1864) and E. Moxon's edition of Tennyson's poems and contributed to *Once a Week*, *Good Words* and other periodicals. Millais's later work is undoubtedly of poorer overall quality—a deterioration of which he was fully aware. In 1870 appeared the first of his pure landscapes, "Chill October." Many of these landscapes are of Perthshire, where Millais shot and fished in the autumn. Many portraits belong to this late period, including those of William Gladstone, of Alfred, Lord Tennyson, and of Cardinal Newman. Millais was created a baronet in 1885 and was elected president of the Royal Academy in 1896.

Millardet, Pierre-Marie-Alexis (b. Dec. 13, 1838, Monmerey-la-Ville, France—d. Dec. 15, 1902, Bordeaux), French botanist who developed the Bordeaux mixture, the first successful fungicide. He also saved the vineyards of France from destruction by *Phylloxera,* a genus of plant lice.

Millardet studied at the universities of Heidelberg and Freiburg in Germany, then returned to France to take doctorates in both medicine and science. He became assistant professor of botany at the University of Strasbourg in 1869, moved to Nancy three years later, and in 1876 became professor of botany at the University of Bordeaux, remaining there until his retirement in 1899.

Between 1858 and 1863 the greenish yellow grape phylloxera, an aphidlike plant pest, was introduced into Europe on vines imported from the United States for grafting. The insect spread swiftly, causing extensive destruction. Millardet brought this plague under control by introducing resistant American vines as stocks for grafting with European varieties.

Along with phylloxera came *Plasmopara viticola,* a downy mildew fungus that damaged fruits and vegetables, particularly grapes. Farmers for centuries in the Médoc area of France had sprinkled their vines with a thick mixture of copper sulfate, lime, and water, whose unappetizing appearance discouraged thieves from stealing the grapes. In October 1882 Millardet noticed that this mixture also controlled the downy mildew, suggested its application as a fungicide, and, after three years of experimentation and testing, published his favourable results in the *Journal d'Agriculture Pratique.* This combination of chemicals, which became known as the Bordeaux mixture, was the first fungicide to receive large-scale use the world over and can be said to have started a new era in the technology of agriculture.

Millau, town, Aveyron *département,* Midi-Pyrénées *région,* southern France. It lies in the Grands-Causses plateau region, at the confluence of the Tarn and Dourbie rivers, southeast of Rodez on the northwestern edge of the Causses du Larzac. In pre-Roman times it was Condatomag, a Celtic community. The Romans renamed it Aemilianum and developed it as a pottery centre. Chartered in 1183, it was ruled by the Aragonese and the English in the Middle Ages. During the Reformation, it became a Huguenot stronghold and rebelled against Louis XIII in 1620. Millau is noted for gloves and Roquefort cheese. Pop. (1990) 22,458.

Millau, Fr., on the Grands-Causses Plateau
Club Iris

Millay, Edna St. Vincent (b. Feb. 22, 1892, Rockland, Maine, U.S.—d. Oct. 19, 1950, Austerlitz, N.Y.), American poet and dramatist who came to personify romantic rebellion and bravado in the 1920s.

Millay's earliest poems were published in the children's magazine *St. Nicholas*. Until she left home for college, she lived with her mother and sisters in Camden, Maine, and her work is filled with the imagery of coast and countryside.

Her first acclaim came when "Renascence" was included in *The Lyric Year* in 1912; the poem brought Millay to the attention of a benefactor who made it possible for her to attend Vassar College. She graduated in 1917. For a time she supported herself in New York City by writing short stories under the pseudonym Nancy Boyd and as an actress and playwright with the Provincetown Players. In 1923 she married the businessman Eugen Boissevain and lived thereafter on a farm in the Berkshires.

"Renascence" gave its title in 1917 to her first book, *Renascence and Other Poems*, which was full of the romantic and independent temper of youth. The line "My candle burns at both ends," from a poem in *A Few Figs from Thistles* (1920) was taken up as the watchword of the "flaming youth" of that era and brought her a renown that she came to despise. *Second April* (1921) marked a return to the earlier mood and craftsmanship. In 1921 she also published three verse plays: *Two Slatterns and a King*, *The Lamp and the Bell*, and *Aria da Capo*. "The Harp Weaver," a work thought to have been inspired by her devotion to her mother, was published in 1923 in *The Harp Weaver and Other Poems*. She was commissioned to write the libretto for Deems Taylor's opera *The King's Henchman*, first presented at the Metropolitan Opera in New York City in 1927 and a greater success than any previous American opera. Her major later works include: *The Buck in the Snow* (1928), introducing a more sombre tone to her poetry; *Fatal Interview* (1931), a highly acclaimed sonnet sequence; and *Wine from These Grapes* (1934). Her letters were edited by A.R. Macdougall in 1952.

Millburn, urban township, Essex county, northeastern New Jersey, U.S., just west of Newark on the Rahway and Passaic rivers. It is primarily a residential community that abuts the fashionable Short Hills district. About 1664, colonists from New York purchased land from the Lenni Lenape Indians and founded Elizabethtown, which was divided in 1793 when the Township of Springfield was formed. In 1857 the northern part of Springfield seceded and was incorporated as the Township of Millburn, the name originating from Samuel Campbell's first "mill-on-the-burn," built about 1790. This so-called Diamond Paper Mill has been transformed into the Paper Mill Playhouse (the State Theatre of New Jersey). Earlier, the township had many names, including Rum Brook, Riverhead, Vauxhall, Milltown, and Millville. During the Revolutionary War, the Battle of Springfield (June 23, 1780) took place in the vicinity, with fighting around the present town hall. Pop. (1993 est.) 18,934.

Mille, Cecil B. de: *see* DeMille, Cecil B.

Mille Miglia (Italian: "Thousand Miles"), the most famous of the Italian road races for automobiles. Although the course was changed 13 times in the 23 years the race was run, it often started and ended in Rome, winding through the mountains and smaller towns of Italy. The first Mille Miglia was run March 26–27, 1927, starting in Brescia, with the winner returning just over 20 hours later and averaging 48 mph for the race. The race was banned by Mussolini in 1939 after several spectators were killed in a crash in the 1938 race. It was reinstated in 1947 but was discontinued after the 1957 race when a crash killed 2 drivers and 11 spectators.

Milledgeville, city, seat (1809) of Baldwin county, central Georgia, U.S., on the Oconee River (dammed immediately north of the city to form Lake Sinclair). It was founded in 1803 and named for John Milledge, then governor of Georgia. It was the capital of Georgia from 1807 to 1867. Relatively little damage was done to it during the Civil War by Gen.

William Tecumseh Sherman on his march to Savannah, and many fine antebellum homes remain. The old statehouse is now part of Georgia Military College (founded 1879). The Old Governor's Mansion (1838) is on the campus of Georgia College (1889). Inc. town, 1806; city, 1835. Pop. (1999 est.) 18,034.

millefiori glass (Italian: "thousand flowers"), type of mosaic glassware characterized by a flowerlike pattern. It is produced by first heating a bundle of thin glass rods of different colours until the rods fuse together. The bundle is pulled thin, cooled, and sliced cross-sectionally to produce small disks with flowerlike designs. These disks are applied to hot blown glassware such as a vase or bowl, which is then reheated and blown a second time. The resulting glassware is brilliantly coloured with an intricate, fade-resistant design. The technique of millefiori glassmaking was developed by the Romans in the 1st century BC and revived and refined by Venetian glassmakers in the 15th century. Since the mid-19th century, the technique has been used to make paperweights and gaming marbles.

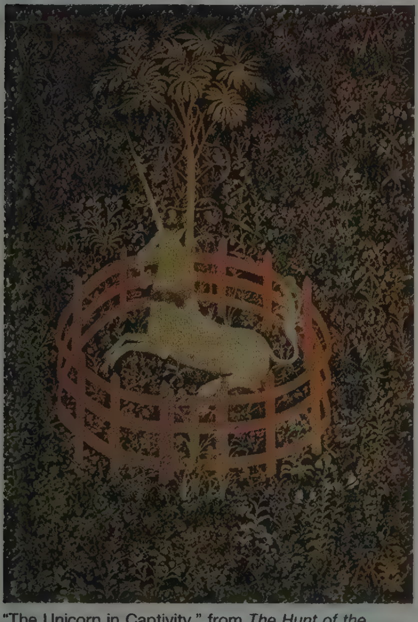
millefleur tapestry (French: "thousand flowers"), also called MENUES VERDURES, kind of tapestry characterized by its background motif of many small flowers. Millefleur tapestries, which often show secular scenes or allegories, are thought to have originated in the Loire district in France in the mid-15th century. They became popular and were produced in many parts of France and the Low Countries until the end of the 16th century.



"The Unicorn in Captivity," from *The Hunt of the Unicorn*, French or Flemish millefleur tapestry, late 15th–early 16th century, from the Château de Verteuil; in the Cloisters, the Metropolitan Museum of Art, New York City

By courtesy of the Metropolitan Museum of Art, New York City, the Cloisters Collection, gift of John D. Rockefeller, Jr., 1937

Millenary Petition, request for changes within the Church of England, presented to King James I of England in April 1603 by Puritan ministers. Its authors claimed that it had been signed by 1,000 (Latin *millenarius*, "of a thousand") ministers. Some practices objected to included the priest's making the sign of the cross during Baptism, use of the ring for marriage, and ministers' wearing of surplices. In response the king called the Hampton Court Conference (*q.v.*), where most of the requests were rejected.

millennium, a period of 1,000 years. The Gregorian calendar (*q.v.*), put forth in 1582 and subsequently adopted by most countries, did not include a year 0 in the transition from BC (years before Christ) to AD (those since his birth). Thus, the 1st millennium is defined as spanning years 1–1000 and the 2nd 1001–2000. Although numerous popular celebrations marked the start of the year 2000, the 21st century and 3rd millennium AD began on Jan. 1, 2001.

millennium, in Christian theology, the 1,000-year period when Jesus Christ will return and establish his kingdom on Earth. Among early Christians the idea of millennialism, or millenarianism, derived chiefly from Jewish eschatological expectations and usually implied the nearness of the triumph of Christians over the world.

A brief treatment follows. For a full treatment, *see* MACROPAEDIA: Doctrines and Dogmas, Religious.

The doctrine of the millennium is clearly present in the New Testament only in Rev. 20. According to that account, Satan was bound and thrown into a pit for 1,000 years. Martyrs were resurrected and reigned with Christ for the millennium. At the end of the period, Satan was loosed to deceive the nations, but he was soon defeated. All the dead were then gathered for the final judgment.

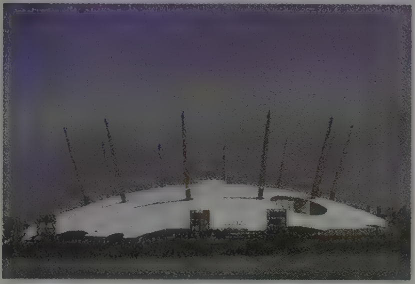
Many different interpretations of the millennium have been given. Those Christians who believe that the Second Coming of Christ will begin the 1,000-year period of righteousness in the world have been called premillennialists. Others, known as postmillennialists, believe that eventually Christianity will be accepted throughout the world, and a 1,000-year period of Christian righteousness will be climaxed by the return of Christ, the resurrection of the dead, and the final judgment.

The more general use of the term to include expectations of material benefits to be enjoyed on earth in the near future means that a number of early Christian writers, especially those close to Jewish Christianity, can be called millenarians. Many Christians first became aware of the dangers of this kind of doctrine only with the rise of the movement known as Montanism. The Montanists believed that the heavenly Jerusalem would soon be manifested in Phrygia. At the same time, more orthodox teachers continued to share a similar hope; Hippolytus tells of bishops in Syria and Pontus who led their flocks out into the desert to await Christ's coming.

By the time of the triumph of the church in the reign of Constantine such hopes were on the wane. The great Western theologian Augustine was a millenarian early in his career, but he later changed his views. At the Council of Ephesus (431) millenarian views were not condemned; but they were mentioned only to be ignored. In later times they were used sporadically against the authority of the church; thus they flourished among spiritual enthusiasts during the Middle Ages and particularly at the time of the Reformation, especially among the various groups loosely denominated Anabaptist. The more conservative Reformers shared the Catholic view of the coming of Christ as primarily past rather than future, thus at least partly identifying the Kingdom of God on earth with the church.

Throughout later Western history, the appeal of millennialism has tended to resurge in times of great social change or crisis. Sects arising out of the industrialization of the West include the Seventh-day Adventists, Jehovah's Witnesses, and the Latter-day Saints (Mormons).

Millennium Dome, complex in Greenwich, London, England. Its central structure is the largest dome in the world, with nearly twice the area of the former record holder, the Georgia Dome (in Atlanta, Ga., U.S.).



The Millennium Dome under construction, July 1999

© Reuters New Media Inc./Corbis

The dome's foundation, main supports, and Teflon-coated roof, which were completed in mid-1998, create an interior floor area of more than 861,000 square feet (80,000 square m). The roof measures 1,050 feet (320 m) in diameter and reaches a height of some 165 feet (50 m). The roof assembly is supported by a web of 2,600 cables suspended from a circle of 12 steel masts that rise nearly 330 feet (100 m). The unusual design of the dome resembles a partly flattened mushroom punctured by a circle of 12 pins.

The dome's creation stirred controversy owing to its enormous cost and uncertainties regarding the value and popularity of its exhibits. The Millennium Dome exhibition took place from Dec. 31, 1999, until Dec. 31, 2000; however, visitor receipts failed to cover expenses.

millepore, also called STINGING CORAL, or PEPPER CORAL (Millepora), any of a genus of invertebrate marine animals comprising the order Milleporina (phylum Cnidaria). Millepores are common in shallow tropical seas to depths of 30 metres (about 100 feet). Unlike the true corals, which belong to the class Anthozoa, millepores are closely related to the hydras (*q.v.*). Both hydras and the millepores belong to the class Hydrozoa. Some species form branching treelike growths up to 50 cen-

timetres (about 20 inches) high. Others form massive and shapeless or leaflike growths. Most are whitish, yellowish, or beige in colour. They bear powerful stinging structures called nematocysts.

miller (moth): *see* owlet moth.

Miller, Arthur (b. Oct. 17, 1915, New York City), U.S. playwright who combined social awareness with a searching concern for his characters' inner lives. He is best known for *Death of a Salesman* (1949).

Miller was shaped by the Depression, which spelled financial ruin for his father, a small manufacturer, and demonstrated to the young Miller the insecurity of modern existence. After graduation from high school he worked in a warehouse. With the money he earned he attended the University of Michigan, where he began to write plays. His first public success was with *Focus* (1945), a novel about anti-Semitism. *All My Sons* (1947), a drama about a manufacturer of faulty war materials that strongly reflects the influence of Ibsen, was his first important play. *Death of a Salesman* became one of the most famous American plays of its period. It is the tragedy of a small man destroyed by false values that are in large part the values of his society.

Magnum

The Crucible (1953) was based on the witchcraft trials in Salem, Mass., in 1692, a period Miller considered relevant to the 1950s, when investigation of subversive activities was widespread. In 1956, when Miller was called before the House Un-American Activities Committee, he refused to name people he had seen 10 years earlier at an alleged Communist writers' meeting. He was convicted of contempt but appealed and won.

A Memory of Two Mondays and another short play, *A View from the Bridge* (a story of an Italian-American longshoreman whose passion for his niece destroys him), were staged on the same bill in 1955. *After the Fall* (1964) is concerned with failure in human relationships and its consequences. *The Price* (1968) continued Miller's exploration of the theme of guilt and responsibility to oneself and to others by examining the strained relationship between two brothers. He directed the London production of the play in 1969.

The Archbishop's Ceiling, produced in Washington, D.C., in 1977, dealt with the Soviet treatment of dissident writers. *The American Clock,* a series of dramatic vignettes based on Studs Terkel's *Hard Times* (about the Great Depression), was produced at the 1980 American Spoleto Festival in Charleston, S.C.

Miller also wrote a screenplay, *The Misfits* (1961), for his second wife, the actress Marilyn Monroe (1926–62). *I Don't Need You Any More,* a collection of his short stories, appeared in 1967, and a collection of theatre essays in 1977.

Miller, Cincinnatus Hiner: *see* Miller, Joaquin.

Miller, David Hunter (b. Jan. 2, 1875, New York City—d. July 21, 1961, Washington, D.C.), U.S. lawyer and an expert on treaties who participated in the drafting of the covenant of the League of Nations.

He practiced law in New York City from 1911 to 1929, served on the Inquiry, a body of experts that collected data for the Paris Peace Conference (1917–19), and was legal adviser to the American commission to the conference.

As an officer of the U.S. Department of State (1929–44), Miller headed the U.S. delegation to the 1930 Hague Conference for the codification of international law. His published works include *My Diary at the Conference of Paris, with Documents* (21 vol., 1924–26) and *Treaties and Other International Acts of the United States of America* (8 vol., 1931–48).

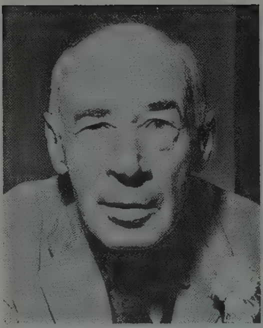
Miller, (Alton) Glenn (b. March 1, 1904, Clarinda, Iowa, U.S.—d. Dec. 16, 1944, at sea en route from London to Paris), U.S. composer and trombonist, one of the most remarkable of all popular music figures because of the intensity of his posthumous reputation.

Miller was educated at the University of Colorado, Boulder, and in 1926 became a professional trombonist with Ben Pollack's band. By 1930 he was a much sought-after New York City free-lance musician. Later he became an organizer of other men's bands, particularly those of the Dorsey brothers (1934) and Ray Noble (1935). After an abortive attempt to form his own orchestra (1937), he tried again a year later and by 1939 had achieved world fame as a big-band leader. He became captain and then major as leader of the U.S. Air Force band in Europe. While flying to Paris from England, he disappeared; neither bodies nor wreckage were ever sighted or recovered.

Miller's triumphs in the ballrooms were based on sweet orchestrations meticulously executed. The Miller saxophone sound, instantly recognizable and much copied, was based on quite simple musical precepts, as were all his big successes, including his own composition, "Moonlight Serenade," which grew out of an exercise he had written while studying with Joseph Schillinger. His two Hollywood films, *Sun Valley Serenade* (1941) and *Orchestra Wives* (1942), contributed to his reputation; but by far the biggest factor in the persistence of his memory was the release in 1953 of the somewhat sweetened movie biography, *The Glenn Miller Story.* Some critics hold that the jazz content of his orchestra was negligible, but others regard its sound as the definitive popular music of its time. Because of its great popularity, the orchestra was held together for a time under saxophonist Tex Beneke, and an organization known as the Glenn Miller Orchestra, which purveyed its original leader's sound, performed into the 1980s.

Miller, Henry (Valentine) (b. Dec. 26, 1891, New York City—d. June 7, 1980, Pacific Palisades, Calif., U.S.), U.S. writer and perennial Bohemian whose autobiographical novels achieve a candour—particularly about sex—that made them a liberating influence in mid-20th-century literature. He is also notable for a free and easy American style and a gift for comedy that springs from his willingness to admit to feelings others conceal and an almost eager acceptance of the bad along with the good. Because of their sexual frankness, his major works were banned in Britain and the United States until the 1960s, but they were widely known earlier from copies smuggled in from France.

Miller was brought up in Brooklyn, and he wrote about his childhood experiences there in *Black Spring* (1936). In 1924 he left his job with Western Union in New York to devote himself to writing. In 1930 he went to France. *Tropic of Cancer* (published in France in 1934, in the United States in 1961) is based on his hand-to-mouth existence in Depression-ridden Paris. *Tropic of Capricorn* (France, 1939; U.S., 1961) draws on the earlier New York phase.



Henry Miller

Camera Press

Miller's visit to Greece in 1939 inspired *The Colossus of Maroussi* (1941), a meditation on the significance of that country. In 1940–41 he toured the United States extensively and wrote a sharply critical account of it, *The Air-Conditioned Nightmare* (1945), which dwelt on the cost in human terms of mechanization and commercialization.

After settling in Big Sur on the California coast, Miller became the centre of a colony of admirers. Many of them were writers of the Beat generation who saw parallels to their own beliefs in Miller's whole-hearted acceptance of the degrading along with the sublime. At Big Sur, Miller produced his *Rosy Crucifixion* trilogy, made up of *Sexus, Plexus,* and *Nexus* (U.S. edition published as a whole in 1965). It covers much the same period of Miller's life as *Tropic of Capricorn* and, together with that book, traces the stages by which the hero-narrator becomes a writer. The publication of the "Tropics" in the United States provoked a series of obscenity trials that culminated in 1964 in a Supreme Court decision rejecting state court findings that the book was obscene.

Other important books by Miller are the collections of essays *The Cosmological Eye* (1939) and *The Wisdom of the Heart* (1941). He was also a watercolourist; he exhibited internationally and wrote about art in *To Paint Is To Love Again* (1960). Various volumes of his correspondence have been published: with Lawrence Durrell (1963), to Anaïs Nin (1965), and with Wallace Fowlie (1975).

Miller, Hugh (b. Oct. 10, 1802, Cromarty, Cromartyshire, Scot.—d. Dec. 24, 1856, Edinburgh), Scottish geologist and lay theologian who was considered one of the finest geological writers of the 19th century and whose writings were widely successful in arousing public interest in geologic history.

Hugh Miller, detail of an engraving by Francis Croll

The Mansell Collection

After early literary ventures and a six-year period as a bank accountant in Cromarty, Miller went to Edinburgh in 1840 as editor of the newly founded newspaper *The Witness.* The newspaper, which opposed patronage in the Church of Scotland, gained a wide reputation through Miller's leading articles. He also wrote a brilliant geological series for it, part of which was published in book form as *The Old Red Sandstone* (1841). In this work he described his discoveries, in Cromarty, of fossils found in formations of the Devonian strata (408 to 360 million years ago).

Of his remaining works on geology, *Footprints of the Creator* (1849) was the most nearly original. The book recorded Miller's reconstruction of the extinct fishes he had discovered in the Old Red Sandstone and contended, on theological grounds, that their perfection of development disproved the theory of evolution. He also discovered the fish species subsequently known as *Pterichthyodes milleri.* It was largely from Miller's writings that the Devonian Period became known as the Age of Fishes.

Miller, Joaquin, pseudonym of CINCINNATUS HINER MILLER, Hiner also spelled HEINE (b. Sept. 8, 1837, near Liberty, Ind., U.S.—d. Feb. 17, 1913, Oakland, Calif.), American poet and journalist whose best work conveys a sense of the majesty and excitement of the Old West. His best-known poem is "Columbus" with its refrain, "On, sail on!"—once familiar to millions of American schoolchildren.

Joaquin Miller
By courtesy of the Library of Congress, Washington, D.C.

Miller went west with his family and led a picaresque early life in California among miners, gamblers, and Indians. He attended Columbia College (Eugene, Ore.) briefly in 1858–59 and was admitted to the Oregon bar in 1860. Between 1862 and 1866 he owned a pony express and a newspaper (the *Eugene Democratic Register*) and was a county judge in Canyon City, Ore. For the *Register* he wrote an article defending the Mexican brigand Joaquin Murietta, whose given name he later used as a pseudonym. His first books of poems, *Specimens* (1868) and *Joaquin et al.* (1869), attracted little attention.

In 1870 he traveled to England, where his exotic manners and flamboyant western costume made him a great favourite with the literati. *Pacific Poems* (1871) was privately printed there. *Songs of the Sierras* (1871), upon which his reputation mainly rests, was loudly acclaimed in England, while generally derided in the United States for its excessive romanticism. His other books of poetry included *Songs of the Sunlands* (1873), *The Ship in the Desert* (1875), *The Baroness of New York* (1877), *Songs of Italy* (1878), *Memorie and Rime* (1884), and the *Complete Poetical Works* (1897).

Whitmanesque in temper, his work is frequently bombastic and artificial. Because of his fondness for Byronic posturings, his autobiographical writings (*e.g., Life Among the Modocs,* 1873) are usually considered untrustworthy.

BIBLIOGRAPHY. O.W. Frost, *Joaquin Miller* (1967); Benjamin S. Lawson, *Joaquin Miller* (1980).

Miller, Sir Jonathan, in full SIR JONATHAN WOLFE MILLER (b. July 21, 1934, London, Eng.), actor, director, producer, medical doctor, and man of letters noted for his wide-ranging abilities.

Miller was the son of a psychiatrist and a novelist. He graduated from St. John's College, Cambridge, in 1956 and studied medicine at the University College School of Medicine of London University, from which he took a degree in medicine in 1959. Miller made his professional stage debut at the Edinburgh Festival in 1961 as actor and coauthor in the satirical review *Beyond the Fringe*. He left the show in 1963 to write television scripts and to direct live theatre. His sometimes controversial interpretations of classic works from William Shakespeare and Richard Sheridan to *Alice in Wonderland* gained him notoriety, and his appointment (1973) as associate director of the National Theatre—not noted for its innovative spirit—served only to frustrate him; he resigned in 1975. He then became involved with the world of opera and directed, most notably, P.I. Tchaikovsky's *Eugene Onegin*. In 1978 he wrote *The Body in Question,* a 13-part series on the history of medicine and of attitudes toward the human body, for the British Broadcasting Company; it also became a best-selling book. He continued his association with opera and theatre, not neglecting his interest in medicine. In 1988 he became artistic director of Old Vic in London. His directorial work took him to Germany, Italy, and the United States as well as throughout the United Kingdom. He was knighted in 2002.

Miller, Marilyn, pseudonym of MARY ELLEN REYNOLDS (b. Sept. 1, 1898, Evansville, Ind., U.S.—d. April 7, 1936, New York, N.Y.), one of the most popular American musical comedy actresses of the 1920s.

Miller made her stage debut at the age of four with her mother and stepfather as "The Three Columbians," a vaudeville trio, in Dayton, Ohio. She toured at home and abroad for the next 10 years until Lee Shubert discovered her at the Lotus Club in London and invited her to perform at the Winter Garden in New York City. She debuted there in *The Passing Show of 1914,* which was followed by appearances in later editions of *The Passing Show,* then the *Ziegfeld Follies of 1918,* and subsequently her starring role in *Sally,* which ran for 570 performances. In 1924 Miller played Peter Pan in J.M. Barrie's play, followed by other great successes, including *Sunny* (1925), *Rosalie* (1928), and Florenz Ziegfeld's *Smiles* (1930).

Miller went to Hollywood in 1930 and made successful film versions of both *Sunny* and *Sally* in that year and then in 1931 filmed *Her Majesty, Love* with W.C. Fields. She returned to Broadway to star in *As Thousands Cheer* (1933) but died of a sinus infection three years later while still at the height of her career.

Miller, Merton H., in full MERTON HOWARD MILLER (b. May 16, 1923, Boston, Mass., U.S.—d. June 3, 2000, Chicago, Ill.), American economist who, with Harry M. Markowitz and William F. Sharpe (*qq.v.*), won the Nobel Memorial Prize in Economic Science for 1990. His contribution (and that of his colleague Franco Modigliani, who received the Nobel Prize in Economic Science in 1985), known as the Modigliani-Miller theorem, was pioneering work in the field of finance theory.

Miller attended Harvard University (B.A., 1944), worked at the U.S. Treasury Department, and then graduated from Johns Hopkins University, Baltimore, Md. (Ph.D., 1952). He taught at the Carnegie Institute of Technology (now Carnegie Mellon University), Pittsburgh, Pa., until 1961, when he became professor of finance at the University of Chicago's Graduate School of Business Administration.

Miller's work was based on the work of Markowitz (whose "portfolio theory" established that wealth can best be invested in assets that vary in terms of risk and expected return) and Sharpe (who developed the "capital asset pricing model," a model to explain how securities prices reflect risks and potential returns). The Modigliani-Miller theorem explains the relationship between a company's capital asset structure and dividend policy and its market value and cost of capital; the theorem demonstrated that how a manufacturing company funds its activities is less important than the profitability of those activities. Miller was recognized as one of the most important developers of theoretical and empirical analysis in the field of corporate finance. In addition to his position as the business school's R. McCormick distinguished service professor, Miller served as a director of the Chicago Mercantile Exchange.

Miller, Neal E., in full NEAL ELGAR MILLER (b. Aug. 3, 1909, Milwaukee, Wis., U.S.—d. April 4, 2002, Hamden, Conn.), American psychologist who, with John Dollard, developed a theory of motivation based on the satisfaction of psychosocial drives, combining elements of a number of earlier reinforcement theories of behaviour and learning.

Miller attended the University of Washington (Seattle) and Stanford University (Palo Alto, Calif.) before receiving his Ph.D. in psychology from Yale University in 1935. He remained at Yale's Institute of Human Relations to continue his experiments on learning. In *Social Learning and Imitation* (1941) and *Personality and Psychotherapy* (1950), he and Dollard presented their results, which suggested that behaviour patterns were produced through the modification of biologically or socially derived drives by conditioning and reinforcement. Miller was appointed professor of psychology at Yale in 1950, resigning the position in 1966 to accept a professorship at Rockefeller University (emeritus from 1981).

Miller, Oskar von (b. May 7, 1855, Munich [Germany]—d. April 9, 1934, Munich), electrical engineer who fostered the electric-power industry in Germany and founded the Deutsches Museum of science and technology in Munich.

Miller studied at the Munich Technical Institute and organized the Munich Electrical Exposition of 1882, the first ever held in Germany. There he demonstrated the transmission of electrical energy over a wire 35 miles (57 km) long. In 1883 he founded the German Edison Company with Emil Rathenau; this company, which in 1887 was renamed Allgemeine Elektricitäts Gesellschaft (AEG), was largely responsible for installing Germany's first electrical system. Miller himself designed Berlin's first central power station. In 1891, while technical director of the Frankfurt Electrical Exposition, he captured world attention by building a cable that transmitted alternating current at 25,000 volts over a distance of 112 miles (180 km). His interest in the conversion of water power to electrical energy led to the development of hydroelectric stations in Bavaria.

In 1903 Miller proposed the construction of a museum that would not only preserve technological artifacts but also teach visitors scientific principles through the use of operating devices and dioramas. The resulting teaching museum, the first of its kind, became the model for science museums throughout the world.

Miller, Samuel Freeman (b. April 5, 1816, Richmond, Ky., U.S.—d. Oct. 13, 1890, Washington, D.C.), associate justice of the U.S. Supreme Court (1862–90), a leading opponent of efforts to use the Fourteenth Amendment of the Constitution to protect business against government regulation. He was spokesman for the court in its first attempt to construe the amendment, passed after the American Civil War largely to assure the rights of the newly freed slaves. He was in the majority then, but his view that the amendment did not bar legislative restraints on industry ceased to prevail by the 1890s and did not again predominate until the late 1930s.

Samuel Miller

By courtesy of the Library of Congress, Washington, D.C.

A practicing physician for 12 years, Miller also read law and was admitted to the bar in 1847. His opposition to slavery caused him to move in 1850 from the slave state of Kentucky to the free state of Iowa, where he became a prominent lawyer and a Republican Party leader. Appointed to the Supreme Court by President Abraham Lincoln on July 16, 1862, Miller was the first justice from any state west of the Mississippi River.

During the Civil War, Miller supported military trials of dissident civilians and the Union blockade of the Confederacy. Dissenting from the court, he also approved the federal and state loyalty oaths required of lawyers, teachers, and clergymen immediately after the war. His dissenting opinion in favour of "greenbacks" as war-emergency legal tender (*Hepburn* v. *Griswold*, 1870) became the majority's stand when the court reversed itself the next year and led to the permanent legitimation of paper money in the United States.

The court's first opportunity to construe the Fourteenth Amendment was given by the Slaughter-House cases (1873), in which a group of livestock butchers challenged a state law that granted a monopoly of their trade to a single entrepreneur. The amendment, which was supposed to confer civil rights on black Americans, was invoked by the challengers to support the proposition that the right to run a business without state-government interference was one of the protected "privileges and immunities" of citizenship. Concluding that there was no such federal right, Miller strictly limited the amendment's guarantees of "due process of law" and "equal protection of the laws," as well as "privileges and immunities of citizens." While Miller's view prevailed, business corporations were unable to shield themselves from legislative regulation by claiming to be among the "persons" or "citizens" whose rights the framers of the Fourteenth Amendment intended to safeguard. (In the 1890s, however, the court came to accept Justice Stephen J. Field's contrary conception of the amendment as an aid to big business.)

By declaring most civil rights to be aspects of state rather than of federal citizenship, Miller unwittingly deprived the federal government of jurisdiction over many problems of the political and social equality of blacks. In *Ex parte Yarbrough* (1884), however, he upheld federal protection, against repression by private persons, of blacks' right to vote in congressional elections. Another libertarian opinion by Miller, *Kilbourn* v. *Thompson* (1881), checked irresponsible investigation by congressional committees.

Miller, William (b. Feb. 15, 1782, Pittsfield, Mass., U.S.—d. Dec. 20, 1849, Low Hampton, N.Y.), American religious enthusiast, leader of a movement called Millerism that sought to revive belief that the bodily arrival ("advent") of Christ was imminent.

Miller was a farmer, but he also held such offices as deputy sheriff and justice of the peace. In the War of 1812 he served as a captain of the 30th Infantry. After years of Bible study he began to preach in 1831 that the present world would end "about the year 1843." He based this belief primarily on a passage in the Book of Daniel (8:13–14). He published a pamphlet in 1833 and a book of lectures in 1836, the first of many publications. Principal organs of the Millerite movement were the *Signs of the Times* (Boston) and the *Midnight Cry* (New York). Miller estimated that between 50,000 and 100,000 believed in his views. When 1843 passed, some of his associates set Oct. 22, 1844, as the date of the Second Coming. This date brought the movement to a sharp climax. There is no historical foundation for stories that the Millerites engaged in such fanatical excesses as ascending hills, housetops, and trees in ascension robes. The last general conference met at Albany, N.Y., April 1845. Belief in the imminence of the advent was restated, but no date was set and no church organization created.

There are two principal Adventist bodies today—the Advent Christian Church, organized in 1861, and the much larger body of Seventh-day Adventists, organized in 1863—and several small Adventist bodies.

Miller indices, group of three numbers that indicates the orientation of a plane or set of parallel planes of atoms in a crystal. If each atom in the crystal is represented by a point and these points are connected by lines, the resulting lattice may be divided into a number of identical blocks, or unit cells; the intersecting edges of one of the unit cells defines a set of crystallographic axes, and the Miller indices are determined by the intersection of the plane with these axes. The reciprocals of these intercepts are computed, and fractions are cleared to give the three Miller indices (*hkl*). For example, a plane parallel to two axes but cutting the third axis at a length equal to one edge of a unit cell has Miller indices of (100), (010), or (001), depending upon the axis cut; and a plane cutting all three axes at lengths equal to the edges of a unit cell has Miller indices of (111). This scheme, devised by British mineralogist and crystallographer William Hallowes Miller, in 1839, has the advantage of eliminating all fractions from the notation for a plane. In the hexagonal system, which has four crystallographic axes, a similar scheme of four Bravais-Miller indices is used.

Millerand, Alexandre (b. Feb. 10, 1859, Paris, Fr.—d. April 7, 1943, Versailles), French lawyer and statesman who, as president of the Republic (1920–1924), was noted for his desire to strengthen the power of the president by constitutional revision.

Educated for the bar, Millerand was elected to the Chamber of Deputies as a socialist in 1885. He soon became the leader of the socialist left and until 1896 edited their organ, *La Petite République.* In 1899 he joined René Waldeck-Rousseau's Cabinet of "republican defense" as minister of commerce and applied himself to bettering labour conditions, to upgrading the mercantile marine, and to developing trade, educational resources, and the postal system.

In 1909 Millerand became minister of public works in Aristide Briand's first Cabinet, his principal achievement being the reorganization of the state railways. With Briand he assumed responsibility for using troops to suppress the railway strike of October 1910. Appointed minister of war under Raymond Poincaré in 1912, he reorganized the higher command and for the first time gave a definite status to military aeronautics. He retained the same post in René Viviani's Cabinet until he resigned in October 1915. In 1918 he was elected a member of the Académie des Sciences Morales et Politiques.

On the resignation of Georges Clemenceau in January 1920, Millerand formed a Cabinet and became premier and minister for foreign affairs. Mainly concerned with the application of the Treaty of Versailles, in May 1920 he frustrated attempts to organize revolutionary strikes; he also did much to supply war materiel to Poland during the Polish-Soviet war.

In September 1920 Paul Deschanel, president of the Republic, was forced by ill health to resign. Millerand, at this time leader of the Bloc National (a right-centre moderate coalition), was elected Deschanel's successor. During his candidature Millerand made no secret of his wish to strengthen the power of the president by a revision of the constitution. His concept of the presidency brought him into collision with the radical and socialist majority, which, under the name of the Cartel des Gauches, was successful in the elections of May 1924. Violently attacked by the left majority for ignoring the traditional presidential neutrality by openly favouring conservatives, he was unable to form an acceptable Cabinet and had to resign.

From 1927 to 1940 Millerand played a secondary role in the Senate. Among his published works are *Le Socialisme réformiste* (1903) and *Pour la défense nationale* (1913).

millerite, a nickel sulfide mineral (NiS) found in carbonate veins, as at Keokuk, Iowa, or as an alteration product of other nickel minerals, as at Andreas-Berg, Ger. Other occurrences are in meteorites and as a sublimation product on Vesuvius. Millerite forms pale brass-yellow crystals that belong to the hexagonal system. For detailed physical properties, *see* sulfide mineral (table).

miller's-thumb, fish that is a species of sculpin (*q.v.*).

Milles, Carl, original name WILHELM CARL EMIL ANDERSSON, (b. June 23, 1875, Uppsala, Swed.—d. Sept. 19, 1955, Lidingö), one of Sweden's greatest sculptors, whose expressive rhythmical works drew inspiration from European archaic sculpture and greatly influenced the course of German Expressionist and American sculpture during the first half of the 20th century.

In 1902, during student years in Paris, Milles won recognition through the competition for the Sten Sture monument at Uppsala (completed 1925). His style, at first impressionistic under the influence of the late 19th-century French sculptor Auguste Rodin, became more abrupt and formal under the successive influences of medieval and early Greek art as interpreted by the German sculptor-theorist Adolf von Hildebrand. Later, Milles' work showed more fluent patterns within the individual figures of his elaborate compositions.

Milles worked in clay (for casting into bronze) and in stone and wood. His first major fountain, Europa, in Halmstad, Swed. (1926), has the elements of spacious design, subtle water effects, and inventive figure types (such as the fusion of classical triton or faun with Nordic goblin or troll)—also characteristic of his Orpheus Fountain in Stockholm (1936) and the Meeting of the Waters in St. Louis, Mo. (1940).

In 1931 he became head of the department of sculpture at Cranbrook Academy of Art, Bloomfield Hills, Mich., and he became a U.S. citizen in 1945. Milles' works were collected at Cranbrook, his home for 20 years, and at the Milles villa, now a museum, in Lidingö, near Stockholm. His Aganippe Fountain was set up in the Metropolitan Museum of Art, New York City, shortly after his death in 1955.

millet, any of various grasses, members of the Gramineae (Poaceae) family, producing small edible seeds used as forage crops and as food cereals. Millets, probably first cultivated in Asia or Africa more than 4,000 years ago, range in height from 1 to 4 feet (0.3 to 1.3 m), with the exception of pearl millet, which has stalks 5 to 10 feet (1.5 to 3 m) tall and about 1 inch (2.54 cm) thick. The heads may be spikes or racemes, in which the flowers are borne on stalks of about equal length along an elongated axis, or panicles, clusters of small florets. With the exception of pearl millet, seeds remain enclosed in hulls after threshing. Hulled seeds are usually creamy white.

Millets are an important food staple in much of Asia, Russia, and western Africa. In the United States and western Europe they are used chiefly for pasture or to produce hay, although they were major grains in Europe during the Middle Ages. Pearl millet, or cattail millet, called bajra in India (species *Pennisetum americanum*), is suited to soils of low fertility and limited moisture and is a popular food crop in India and Africa. Proso—the common, or broomcorn, millet (*Panicum miliaceum*)—ripening within 60–80 days after sowing, is used in birdseed and chick-feed mixtures and as livestock feed in the United States and as a food in Asia and eastern Europe. Foxtail varieties (*Setaria* [*Chaetochloa*] *italica*) having small pointed seeds are grown for hay in North America and western Europe but are important as foods in China and other Asian countries. Finger millet, or koracan millet, also called raggee (*Eleusine coracana*), is an important food grain in southern Asia and parts of Africa. Japanese millet (*Echinochloa crus-galli* variety *frumentacea*) is grown chiefly in Japan and the United States as a hay crop. Little millet (*Panicum miliare*) is chiefly a food crop of India. Browntop (*Panicum ramosum*) is grown in the southeastern United States for hay, pasture, and game-bird feed.

The millets are high in carbohydrates, with protein content varying from 6 to 11 percent and fat varying from 1.5 to 5 percent. They are somewhat strong in taste and cannot be made into leavened bread. Instead, they are mainly consumed in flatbreads and porridges or prepared and eaten much like rice. About 30,000,000 metric tons of millet are produced annually, chiefly in India, China, Nigeria, and Russia.

Pearl millet (*Pennisetum americanum*)

J.C. Allen and Son

Millet, Jean-François, byname FRANCISQUE (baptized April 27, 1642, Antwerp [Belgium]—buried June 3, 1679, Paris, Fr.), French painter whose serene landscapes made him one of the most influential followers of Nicolas Poussin in 17th-century France.

Millet is generally classed among the painters of Flanders because of the location of his birth, but his father was a Frenchman who, while on service with the prince of Condé in Antwerp, apprenticed his son to a painter there. Francisque left with the painter for Paris, where he settled in 1660 after marrying his master's daughter. He was received as a member of the Royal Academy of Painting and Sculpture at Paris in 1673.

Francisque's paintings of Italian and Arcadian scenery, though derivative, were graceful and effective. Twelve of his most important landscapes in the Tuileries were destroyed by fire; and, though many of his pieces may still be found cataloged, a great number remain unknown and unacknowledged.

Millet, Jean-François (b. Oct. 4, 1814, Gruchy, near Gréville, Fr.—d. Jan. 20, 1875, Barbizon), French painter renowned for his peasant subjects.

"Self-portrait," charcoal sketch by Jean-François Millet, 1847; in the Louvre, Paris

By courtesy of the Cabinet des Dessins, Musee du Louvre; photograph, Cliche Musees Nationaux, Paris

Millet spent his youth working on the land, but by the age of 19 he was studying art in Cherbourg. In 1837 he arrived in Paris and eventually enrolled in the studio of Paul Delaroche, where he seems to have remained until 1839.

After the rejection of one of his entries for the Salon of 1840, Millet returned to Cherbourg, where he remained during most of 1841, painting portraits. He achieved his first success in 1844 with "The Milkmaid" and a large pastel, "The Riding Lesson," that has a sensual character typical of a large part of his production during the 1840s.

The peasant subjects, which from the early 1850s were to be Millet's principal concern, made their first important appearance at the Salon of 1848 with "The Winnower," later destroyed by fire. In 1849, after a period of great hardship, Millet left Paris to settle in Barbizon, a small hamlet in the forest of Fontainebleau. He continued to exhibit paintings of peasants, and, as a result, periodically faced the charge of being a socialist. Letters of the period defending Millet's position underline the fundamentally classical nature of his approach to painting.

By the mid-1860s, Millet's work was beginning to be in demand; official recognition came in 1868, after nine major paintings had been shown at the exposition of 1867. Important collections of Millet's pictures are to be found in the Museum of Fine Arts, Boston, and in the Louvre.

millibar, unit of air pressure in the metric system, commonly used in meteorology, equal to 1,000 dynes per square cm (about 0.0145 pounds per square inch), or slightly less than one-thousandth of a standard atmosphere. It is defined as 0.001 bar, a little-used standard equal to 1,000,000 dynes per square cm.

Millicent, market and industrial town, southeastern South Australia, 250 miles (402 km) by rail southeast of Adelaide. Founded in 1871, it was named for the wife of an early settler. The locality, which has much drained swampland, supports sheep, cattle, and grains. Limestone is quarried, and pine forests, based at Snuggery and Mount Barr, supply paper, timber, and cellulose mills. Crayfish, caught off the coast (10 miles [16 km] west), are processed at Millicent, which is the terminus for a rail line from the city of Mount Gambier. At nearby Wyrie Swamp Site the world's oldest known barbed spears have been discovered, as have the oldest boomerangs yet found in Australia. Pop. (1986) 5,075.

Milligan, Ex Parte (1866), case in which the U.S. Supreme Court ruled that the federal government could not establish military courts to try civilians except where civil courts were no longer functioning in an actual theatre of war.

Lambdin P. Milligan had been arrested in 1864, charged with aiding the Confederacy, conspiring to free Confederate prisoners, and inciting insurrection. Arrested in his Indiana home by the Union general in command of the state, Milligan had been active in a secret society friendly to the Confederate cause. He was tried by a military court established in Indiana under the authority of President Abraham Lincoln, found guilty, and sentenced to hang.

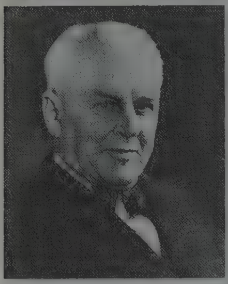
Milligan's lawyers sought a writ of habeas corpus, contesting the constitutionality of the military trial. The case eventually reached the Supreme Court, which unanimously declared that the president had no power to set up military tribunals in secure areas where civil courts were functioning. A majority of the Court also declared that Congress, too, lacked such authority. Milligan, as a consequence, had been deprived of his constitutional right to trial by jury and was freed after 18 months in jail.

Radical Republicans denounced the decision and feared the impact it might have on their plans for military rule in the South throughout Reconstruction.

Millikan, Robert Andrews (b. March 22, 1868, Morrison, Ill., U.S.—d. Dec. 19, 1953, San Marino, Calif.), American physicist honoured with the Nobel Prize for Physics in 1923 for his study of the elementary electronic charge and the photoelectric effect.

After studying at the universities of Berlin and Göttingen, Millikan joined the faculty of the University of Chicago, where in 1909 he performed his famous oil-drop experiment to determine the value of the electronic charge. He also verified Einstein's photoelectric equation and obtained a precise value for the Planck constant.

In 1921 he became director of the Norman Bridge Laboratory of Physics at the California Institute of Technology, Pasadena. There he made some initial studies of cosmic rays. He held the post of chairman of the executive council of the institute until his retirement in 1945.



Millikan

Millikan oil-drop experiment, first direct and compelling measurement of the electric charge of a single electron. It was performed originally in 1909 by the American physicist Robert A. Millikan, who devised a straightforward method of measuring the minute electric charge that is present on many of the droplets in an oil mist. The force on any electric charge in an electric field is equal to the product of the charge and the electric field. Millikan was able to measure both the amount of electric force and magnitude of electric field on the tiny charge of an isolated oil droplet and from the data determine the magnitude of the charge itself.

Millikan's original experiment or any modified version, such as the following, is called the oil-drop experiment. A few oil droplets are directed through a small hole in the top of a closed box having a metal top and bottom and transparent sides. From an observation by microscope of the speed of a specific droplet falling slowly under the influence of gravity and air resistance, the weight of the droplet, or the force of gravity on it, can be determined. If the droplet has any net charge on it, it can be brought to a stop by properly adjusting the potential difference, or voltage, between the metal top and bottom. In effect, the amount of upward electric force on the charged droplet can be adjusted until it just equals the known downward gravitational force. The values of the electric charge on individual oil drops determined by repeated application of this method are not distributed continuously but fall into distinct groups that are whole-number multiples of a lowest value, the elementary electric charge itself. From the time of Millikan's original experiment, this method offered convincing proof that electric charge exists in basic natural units. All subsequent distinct methods of measuring the basic unit of electric charge point to the same fundamental value of electric charge.

millimetre, also spelled MILLIMETER, metric unit of length equal to 0.001 metre (*q.v.*).

Millin, Sarah Gertrude, *née* LIEBSON (b. March 19, 1889, Kimberley, Cape Province, S.Af.—d. July 6, 1968, Johannesburg), South African writer whose novels deal with the problems of South African life.

Of Jewish parentage, Millin spent her childhood near the diamond fields at Kimberley and the river diggings at Barkly West, whose white, Coloured, and black communities provided the background for much of her writing. Her first novel, *The Dark River* (1920), was set around Barkly West. Others followed, but it was *God's Step-Children* (1924; new ed. 1951)—dealing with the problems of four generations of a half-black, half-white ("Coloured") family in South Africa—that established her reputation. With *Mary Glenn* (1925), a study of a mother's reaction to her child's disappearance, she became one of the most popular South African novelists in English, identified by a nervous, sharp, vivid, often almost staccato style. She also wrote biographies of Cecil Rhodes (1933; new ed. 1952) and General Jan C. Smuts (1936). In a few of her many novels she referred to actual events in South African history—*e.g.*, *The Coming of the Lord* (1928), about a black "prophet" in the eastern Cape, and *King of the Bastards* (1949), on the life of the white chieftain Coenraad Buys. *Men on a Voyage* (1930) is a collection of essays; she also wrote a series of war diaries (1944–48) and two autobiographical books, *The Night Is Long* (1941) and *The Measure of My Days* (1955). Her last novels were *The Wizard Bird* (1962) and *Goodbye, Dear England* (1965). She is regarded less well in the late 20th century than she was in her lifetime.

milling machine, device that rotates a circular tool that has a number of cutting edges symmetrically arranged about its axis; the workpiece is commonly held in a vise or similar device clamped to a table that can move in three perpendicular directions. Disk- or barrel-shaped cutters are clamped through holes in their centres to arbors (shafts) attached to the machine spindle; they have teeth on their peripheries only or on both peripheries and faces. An end mill is a cutter shaped like a pencil with a tapered shank that fits into the machine spindle; it has cutting teeth on its face and spiral blades on the lateral surface.

In the milling operation the workpiece is carried on a table that is driven either manually or by power against the rotating cutter. Milling machines usually produce flat surfaces, but any shape that can be ground on the cutter will be reproduced on the work. To mill the teeth of a spur gear, a disk-type cutter with its cutting edges in the shape of the space (groove) between the teeth of the gear is used, milling the gear blank one space at a time.

millipede, any member of the arthropod class Diplopoda, distributed worldwide and commonly grouped with several other classes as myriapods. The approximately 10,000 species live in and eat decaying plant matter; some injure living plants, and a few are predators and scavengers. The characteristic feature of the group is the presence of diplosomites, double trunk segments formed from the fusion of two segments. They have as many as 200 pairs of legs—two pairs on each diplosomite except for the first (head) segment, which is legless, and the next three segments, which each contain one pair of legs. In addition, each diplosomite (except for the first four) contains two pairs of internal organs (*i.e.*, two pairs of ganglia and two pairs of heart arteries). The head contains antennae, simple eyes (ocelli), and only a single maxilla. The length ranges from 2 to 280 mm (0.08 inch to 11 inches). The number of segments also varies, ranging from 11 to more than 100 in some species. All but one order of millipedes are armoured with calcareous dorsal plates. In defense, they do not bite; most tuck head first into a tight coil with the exoskeleton exposed, and many secrete a pungent, toxic liquid or gas from lateral glands.

Julid millipede

E.S. Ross

The class includes myriapods common to many gardens, such as *Julus* (sometimes spelled *Iulus*) *terrestris*, a 25-millimetre (1-inch) species native to Europe and introduced into North America, and smooth-bodied forms often called wireworms. Some millipedes lack eyes and are brightly coloured; an example is the 25-millimetre (1-inch) greenhouse millipede (*Oxidus gracilis*). One of the most common and conspicuous forms is the 100-millimetre (4-inch) black and red *Narceus americanus* of southeastern U.S. forests.

Mills, Bertram (Wagstaff) (b. Aug. 11, 1873, London, Eng.—d. April 16, 1938, Chalfont St. Giles, Buckinghamshire), English circus entrepreneur who for 18 years (1920–37) staged a circus at London's Olympia Theatre at Christmas and also toured through the British Isles.

A coachmaker's son, Mills worked in his father's business until World War I broke out, when he joined the Royal Army Medical Corps. After the war, a friend who directed the Olympia challenged him on his boast that he could produce a better show than the one he saw at the Olympia on Christmas Day 1919. He thereupon formed his own company from available performers, and his impromptu circus was an immediate success. In 1929 he inaugurated the Bertram Mills Tenting Circus, which toured the provinces from April to October and required up to four trains and 75 trucks and tractors to transport performers, animals, and equipment.

He was president of the Showman's Guild from 1934 until his death. After his death, the circus was carried on by his sons, Cyril Bertram Mills and Bernard Notley Mills.

Mills, Caleb (b. July 29, 1806, Dunbarton, N.H., U.S.—d. Oct. 17, 1879, Crawfordsville, Ind.), American educator known as the father of Indiana's public schools.

Mills, the son of a farmer, was educated at local schools and at the Pembroke Academy before entering Dartmouth College in Hanover, N.H. He graduated in 1828 and then pursued theological studies at Andover Theological Seminary in Andover, Mass., completing his work there in 1833 and being ordained a Presbyterian minister in 1835.

In 1833 Mills moved to Indiana and settled in Crawfordsville, where he established a school that later became Wabash College. At first he was the sole instructor as well as principal, but by 1835 Wabash College had a faculty and Mills was professor of languages. He later served variously as principal of the preparatory department and of the normal school, professor of Greek language and literature, and college librarian.

Appalled at the low level of literacy then prevailing in Indiana, Mills began a one-man crusade to bring about the creation of a state public-school system. Starting in 1846 he wrote anonymous messages (signed "One of the People") to each Indiana state legislator. He continued writing until, in 1852, the legislature passed an act setting up a system of common schools. Owing to legislative imperfections the act was later invalidated by state courts, but a subsequent act in 1865 finally established the system.

In the interim, Mills served as state superintendent of public instruction (1854–57). During his administration, he helped found the Indiana State Teachers Association, and he awakened the people of the state to the need for normal schools to produce better-trained teachers.

Mills, Charles Wright (b. Aug. 28, 1916, Waco, Texas, U.S.—d. March 20, 1962, Nyack, N.Y.), American sociologist associated with Marxism, with the theories of Max Weber, and with issues regarding the role of intellectuals in modern life.

Mills received his A.B. and A.M. from the University of Texas in 1939 and his Ph.D. from the University of Wisconsin in 1941. As professor of sociology at Columbia University (from 1946), Mills sought to establish that social scientists should not be merely disinterested observers, engaged in what he called "abstracted empiricism," but also activists asserting their social responsibility. He was concerned about the ethics of his sociological peers, feeling that free intellectuals often failed to affirm moral leadership, thus surrendering social responsibility and allowing the less qualified to assume positions of leadership.

Mills's works focused on explaining and advancing the Marx-Weber tradition of economic determinism, and he qualified the idea of class by adding the category of status. All of his books were concerned with problems of social change, primarily in the United States. His analysis of the major echelons of American society appeared in *The New Men of Power, America's Labor Leaders* (1948), *White Collar* (1951), and *The Power Elite* (1956). Among his other works are *The Sociological Imagination* (1959), *Listen, Yankee* (1960), and *The Marxists* (1962). In his best-known book, *The Power Elite,* Mills explored the concept of an elite, or ruling class, based primarily on administrative and bureaucratic power rather than on the ownership of property. He viewed the power elite of the United States as the ruling group of the military-industrial complex, exercising arbitrary power in its own interests. A collection of Mills's essays appeared as *Power, Politics and People* (1963).

Mills, Martin: *see* Boyd, Martin (à Beckett).

Mills, Robert (b. Aug. 12, 1781, Charleston, S.C., U.S.—d. March 3, 1855, Washington, D.C.), one of the first American-born professional architects. He was associated with Thomas Jefferson, James Hoban, and Benjamin Latrobe.

A Neoclassical architect, Mills generally followed the principle, enunciated by Jefferson, that antique classical architectural forms best befitted a reincarnation of ancient republics—*i.e.,* the new United States. He used classical forms with originality. Mills's more than 50 major works included colleges, prisons, hospitals, houses, canals, bridges, and breakwaters. His best-known structures are the Treasury (built 1836–42) and the Old Patent Office (built 1836–40; later modified; now part of the Smithsonian Institution) in Washington, D.C.; the wings of Independence Hall in Philadelphia (1807); and the monuments to George Washington in Baltimore, Md. (designed 1814, erected 1815–29), and Washington, D.C. (designed 1836, completed 1884).

millstone, one of a pair of flat, round stones used for grinding grain. One millstone is stationary; the other rotates above it in a horizontal plane. Grain is poured through a hole in the centre of the rotating millstone, flowing into shallow grooves, called channels, which radiate from the centre of the stationary millstone. The channels lead the grain onto the flat grinding section, called the land, and to the edge, where it emerges as flour. Sharpening a millstone consists of recarving worn channels and checking and smoothing the land.

The best millstones are made from French buhrstone, quarried near Paris. In the United States, where there is no buhrstone, quartz conglomerate, quartzite, sandstone, or granite is substituted.

Millville, city, Cumberland county, southwestern New Jersey, U.S. It lies at the head of navigation on the Maurice River, 45 miles (72 km) south of Philadelphia. Union Lake, formed by a dam (1806), is northwest. The earliest white settlers were woodcutters who built cabins along the riverbank in the 1700s. Once a part of Maurice River and Fairfield townships, and known successively as Shingle Landing, Maurice River Bridge, and The Bridge, the town was laid out by Joseph Buck, who named it for the local mills. Millville is an industrial centre that uses the vast silica deposits found in the locality for glassmaking. The city's Wheaton Village includes the restored glass factory of Dr. T.C. Wheaton (1880s) and a glassware museum. The city's other manufactures include aircraft parts and textiles. Inc. town, 1801; city, 1866. Pop. (1994 est.) city, 26,528; (1995 est.) Vineland-Millville-Bridgeton PMSA, 138,058.

Milne, A.A., in full ALAN ALEXANDER MILNE (b. Jan. 18, 1882, London, Eng.—d. Jan. 31, 1956, Hartfield, Sussex), English humorist, the originator of the immensely popular stories of Christopher Robin and his toy bear, Winnie-the-Pooh.

Milne attended Westminster School, London, and Trinity College, Cambridge. In 1906 he joined the staff of *Punch,* writing humorous verse and whimsical essays in a style that quickly dated. He achieved considerable success with a series of light comedies such as *Mr. Pim Passes By* (1921) and *Michael and Mary* (1930). Milne also wrote one memorable detective novel, *The Red House Mystery* (1922); and a children's play, *Make-Believe* (1918), before stumbling upon his true literary métier with some verses written for his son Christopher Robin. These grew into the collections *When We Were Very Young* (1924) and *Now We Are Six* (1927). These remain classics of light verse for children.

A.A. Milne, pen and ink drawing by P. Evans, c. 1930; in the National Portrait Gallery, London
By courtesy of the National Portrait Gallery, London

His most popular works were the two sets of stories about the adventures of Christopher Robin and his toy animals—Pooh, Piglet, Tigger, Kanga, Roo, Rabbit, Owl, and Eeyore—as told in *Winnie-the-Pooh* (1926) and *The House at Pooh Corner* (1928). Ernest Shepard's illustrations added to the books' charm. In 1929 Milne adapted another children's classic, *The Wind in the Willows,* by Kenneth Grahame, for the stage as *Toad of Toad Hall.* A decade later he wrote his autobiography, *It's Too Late Now.*

Milne, Edward Arthur (b. Feb. 14, 1896, Hull, Yorkshire, Eng.—d. Sept. 21, 1950, Dublin), English astrophysicist and cosmologist best known for his development of kinematic relativity.

Milne was educated at the University of Cambridge and served as assistant director of the Solar Physics Observatory at Cambridge from 1920 to 1924. He then became a professor of applied mathematics at the University of Manchester, and from 1929 until his death he was a professor of mathematics at the University of Oxford.

Collaborating with Sir Ralph H. Fowler, Milne became known in the 1920s for their formulation of a reliable surface-temperature scale for stars of any spectral type. His theoretical studies of the balance between gravitational forces and radiation pressure in stellar atmospheres led him to study the escape velocities of molecules from stars, and he demonstrated that the Sun can eject atoms at speeds up to 1,600 km per second (1,000 miles per second). In 1929 he turned his attention to the structure and internal conditions of stars. His work eventually led to the theory explaining the highly dense white dwarf stars.

About 1932 Milne shifted his focus to cosmology, and he developed the theory of kinematic relativity. Like cosmologies based on Einstein's general theory of relativity, kinematic relativity featured an expanding universe, but it was nonrelativistic and used Euclidean space. Milne's theory met with opposition from his contemporaries on both scientific and philosophical grounds, but his work helped to sharpen mainstream ideas about space-time and also inspired the steady-state theorists. Milne's works include *Thermodynamics of the Stars* (1930), *The White Dwarf Stars* (1932), *Relativity, Gravitation and World-Structure* (1935), and *Kinematic Relativity* (1948).

Milne, John (b. Dec. 30, 1850, Liverpool, Eng.—d. July 30, 1913, Shide, Isle of Wight), English seismologist and geologist who invented the seismograph and promoted the establishment of seismological stations.

Milne worked as a mining engineer in Labrador and Newfoundland and in 1874 served as geologist on the expedition led by Charles T. Beke, the noted British explorer and biblical scholar, to Egypt and northwestern Arabia. In 1875 Milne accepted the position of professor of geology and mining at the Imperial College of Engineering, Tokyo. He invented the seismograph in 1880 and traveled widely in Japan to set up 968 seismological stations for a survey of Japan's widespread earthquakes. After many years of seismic studies, Milne returned to England in 1894 and established a private seismological station near Newport, Isle of Wight. His attempt in 1906 to determine the velocity of shock waves through the Earth was largely unsuccessful. He served as secretary of the Seismological Committee of the British Association and organized a worldwide network of observation stations. Many of his findings were published in his books *Earthquakes* (1883) and *Seismology* (1898).

Milne Bay, bay of Papua New Guinea, southwestern Pacific. Milne Bay is the easternmost inlet on the coast of New Guinea island and measures 30 miles (50 km) by 6–8 miles (10–13 km). The bay, which receives the Gummi River, has fertile south and west shores that support plantations. The north shore is steep and rugged. The Spanish explorer Luis Váez de Torres charted the bay in 1606. In 1873 the British navigator Captain John Moresby named it for Admiral Alexander Milne. European interest in the area increased during the gold-rush years of 1889–99. Samarai, an island in the China Strait, became a boom town from which prospectors spread through the islands of Milne Bay and to the mainland. A base of Japanese operations early in World War II, the bay was the scene of Japan's first major setback of the war in a battle fought in August 1942 and was an Allied base for the duration of the war.

Milner (of Saint James's and Cape Town), Alfred Milner, Viscount, also called (1901–02) BARON MILNER, or (1895–1901) SIR ALFRED MILNER (b. March 23, 1854, Giessen, Hesse-Darmstadt [Germany]—d. May 13, 1925, Sturry Court, near Canterbury, Kent, Eng.), able but inflexible British administrator, whose attitude while he was high commissioner and governor in southern Africa helped to bring about the South African War (1899–1902).

Milner, detail of an oil painting by Hugh de Twenebrokes Glazebrook, 1901; in the National Portrait Gallery, London
By courtesy of the National Portrait Gallery, London

Of German and English ancestry, Milner was a brilliant student; he won numerous scholarships at Oxford and became a fellow of New College (1872). In 1881 he began to practice law but turned to journalism, working on the *Pall Mall Gazette.* Defeated as a Liberal candidate for Parliament (1885), he became the private secretary of the chancellor of the Exchequer, George Goschen. As an administrator, he served with distinction in Egypt (1889–92) and as chairman of the Board of Inland Revenue (1892–97), for which he was knighted in 1895. In 1892 he wrote *England and Egypt*.

An ardent imperialist, Milner in 1897 became high commissioner in southern Africa and governor of the Cape Colony. With Britain and the Transvaal close to conflict, his was the most critical post in the empire. The Transvaal's president, Paul Kruger, had become deeply mistrustful after the abortive Jameson Raid (Dec. 29, 1895) into Boer territory. Thus, when Kruger was reelected in February 1898, Milner concluded that "there is no way out of the political troubles of South Africa except for reform in the Transvaal, or war." Milner's idea of reform was to secure justice for the Uitlanders (British residents in the Transvaal) by demanding full citizenship rights for them after five years' residence. During the futile negotiations at the Bloemfontein Conference (May–June 1899), Kruger was prepared to bargain, but Milner was not. The Transvaal government made further concessions, but by this time Milner had determined that British supremacy in southern Africa should be asserted by force, hence he remained intransigent. After delivering an ultimatum, the two Boer republics, the Orange Free State and the Transvaal, declared war on Britain on Oct. 11, 1899.

When Britain annexed the Orange Free State and the Transvaal in 1901 during the war, Milner left his post as governor of the Cape and took over as administrator of those two Boer territories. Retaining the office of high commissioner, he and the military commander, Lord Kitchener, negotiated the Peace of Vereeniging (May 31, 1902) that ended both the war and the independence of the two Boer republics. For his services in South Africa, Milner was made a baron (1901) and a viscount (1902).

Milner was largely in charge of the postwar settlement, and his administration undertook the task of resettling the Boers on their farms. Meanwhile, by encouraging economic growth, particularly in the gold-mining industry, Milner hoped to attract British immigrants to create a permanent majority, and he introduced a vigorous education program with all the instruction in English.

Milner's schemes proved a failure. Though the Boers were successfully resettled, they reacted strongly against his insistence upon the use of English in the schools. During the long postwar depression, many British residents left the land, and few immigrants came. Milner persuaded the colonial secretary to permit the importation of Chinese labour for the shorthanded gold-mining industry; public opinion in Britain was outraged, and the Conservatives were defeated in the British election of January 1906. The new Liberal government, moreover, rejected his plans for a constitution that would give the Transvaal a representative government rather than responsible self-rule.

Milner had already resigned his South African posts and returned to England (1905), where he intended to retire from public life, and he began work on *The Nation and the Empire* (1913). He became an active member of the House of Lords, however, and was a member of David Lloyd George's World War I Cabinet from 1916 to 1921. In March 1918 he played a decisive part in setting up a unified Allied command under Marshal Foch of France. Appointed colonial secretary at the end of the war, Milner attended the peace conference. When the Cabinet rejected his proposal that Egypt be given a modified form of independence, Milner resigned in 1921. In 1923 he published *Questions of the Hour*. Milner's viscountcy became extinct upon his death without an heir. *The Milner Papers* (1931–33) were edited by C. Headlam.

BIBLIOGRAPHY. Biographies include Vladimir Halperin, *Lord Milner and the Empire* (1952); John Marlowe, *Milner* (1976); and Terence H. O'Brien, *Milner* (1979).

Milnes, Richard Monckton: *see* Houghton (of Great Houghton), Richard Monckton Milnes, 1st Baron.

Milo, Titus Annius (d. 48 BC, near Thurii, Bruttium [Italy]), Roman politician, a supporter of the Optimates and bitter rival of Publius Clodius.

Milo supported Pompey and thus became pitted against Clodius, a reckless and disruptive politician who had allied himself with Julius Caesar. Milo organized gangs of mercenaries and gladiators and led them in clashes against the partisans of Clodius in Rome from 57 to 52 BC. As tribune of the plebs in 57, Milo actively promoted the recall of Cicero, whom Clodius had managed to have exiled. Milo tried unsuccessfully to prosecute Clodius and prevent his election to the aedileship, and Clodius, in turn, failed in an attempt to press charges against Milo. After serving as praetor in 55, Milo in 53 was a candidate for the consulship, while Clodius was seeking the praetorship. A confrontation between the two leaders at Bovillae ended with the murder of Clodius (January 52). Milo's guilt in the murder was clear. He was impeached and prosecuted, his enemies using a variety of means to intimidate the judges and his supporters. Cicero was afraid to speak at the trial; his extant oration *Pro Milone* is an expanded form of the unspoken defense. Milo retired into exile at Massilia (Marseille) and was the only man barred from Julius Caesar's general amnesty. Joining Marcus Caelius Rufus in 48 in an uprising against Caesar, Milo was killed near Thurii.

Milon OF CROTON, Milon also spelled MILO (fl. late 6th century BC), Greek athlete who was the most renowned wrestler in antiquity. His name is still proverbial for extraordinary strength.

A greatly honoured native of Croton (modern Crotone, Calabria), an Achaean Greek colony in southern Italy, Milon led the Crotoniate army to victory over the Sybarites (Greeks from Sybaris, also in southern Italy) in about 510 BC. In six Olympic Games and in six Pythian Games (both events held quadrennially), Milon won the wrestling championship; in these and other Greek national games, he won 32 wrestling competitions. He is said to have carried an ox on his shoulders through the stadium at Olympia. According to the traditional account of his death, the aging Milon tried to tear apart with his hands a tree that had been split with a wedge; the wedge fell out and the tree closed on one hand, holding him captive until he was attacked and devoured by wolves.

Miloš, English MILOSH, Serbo-Croatian in full MILOŠ OBRENOVIĆ, original name MILOŠ TEODOROVIĆ (b. March 18 [March 7, Old Style], 1780, Srednja Dobrinja, Serbia—d. Sept. 26 [Sept. 14], 1860, Topčider, near Belgrade), Serbian peasant revolutionary who became prince of Serbia (1815–39 and 1858–60) and who founded the Obrenović dynasty.

Miloš Teodorović, originally a herdsman, worked for his half brother Milan Obrenović, then joined Karageorge, who was leading the Serbs in a rebellion against their Ottoman Turkish rulers (1804–13). In 1805 Miloš was appointed a commander in the rebel forces, but after his half brother was killed (1810), possibly by Karageorge, he took the surname Obrenović and assumed an enmity toward Karageorge. When Karageorge fled into Hungary following the collapse of his revolt (1813), Miloš remained in Serbia. The Turks appointed him *knez* (prince) of three central Serb districts, and he cooperated with them in pacifying the country, even helping in the suppression of a new revolt (1814). But when the Turks began large-scale massacres, Miloš gathered his followers at Takovo, Serbia, and on Palm Sunday (April 1815) began his own revolt, quickly winning a series of military victories. Because the Turks feared that Russia might intervene on the Serbs' behalf, a peace settlement was soon arranged (December 1815). The Turks recognized Miloš as prince of Serbia, which was granted a large degree of autonomy but remained a part of the Ottoman Empire; they also allowed the Serbs to retain their weapons and to hold their own national assembly, or Skupština.

Miloš, who shortly thereafter ordered that Karageorge be murdered, consolidated his position and in November 1817 was named the hereditary prince of Serbia by the Skupština. Demonstrating himself to be a patient yet determined diplomat, Miloš then conducted prolonged negotiations with the Turks, who finally recognized Miloš' position as hereditary and granted full autonomy to the Serb principality (Aug. 28, 1830). Three years later Miloš also acquired possession of the eastern Serb lands that the Turks had originally excluded from his jurisdiction (May 25, 1833).

Despite his diplomatic successes, his achievements in promoting trade, reorganizing the army, and building roads and his agricultural and land-distribution policies favouring peasants with small landholdings, Miloš' autocratic methods aroused strong opposition. In 1835 he was compelled to grant a constitution; and when Russia and Turkey forced him to repeal it (regarding it as too liberal), the Turkish sultan promulgated another constitution for Serbia in December 1838. In accordance with it, Miloš appointed a council of 17 senators, who immediately demanded his abdication. Naming his son Milan as his successor (June 13, 1839), Miloš Obrenović retired to his estates in Walachia.

Twenty years later the Skupština called on Miloš to return to the throne to replace Alexander Karageorgević (reigned 1842–58), whom it had deposed in December 1858. Resuming his autocratic methods, Miloš then adopted policies that defied Austria, which had gained a great deal of influence over Serbia during the preceding reign. He also demanded that the Turks again recognize his position as hereditary and reduce their military strength inside Serbia. Before he could accomplish his aims, however, he died.

Mílos (Greece): *see* Melos.

Milošević, Slobodan (b. Aug. 29, 1941, Požarevac, Yugos.), politician and administrator who, as leader of Serbia's main political party and as president (1989–97), pursued Serb nationalist policies that led to the breakup of Yugoslavia. He subsequently embroiled Serbia in a series of conflicts with the successor Balkan states. From 1997 to 2000 he was president of the Federal Republic of Yugoslavia.

Milošević was born of Montenegrin parents living in Serbia and joined the Communist Party when he was 18. After graduating from the University of Belgrade with a law degree in 1964, he began a career in business administration, eventually becoming head of the state-owned gas company and president of a major Belgrade bank. Milošević entered politics full-time in 1984 as a protégé of Ivan Stambolić, who was head of the League of Communists of Serbia (LCS). Milošević became head of the party organization in Belgrade that year.

Milošević soon introduced a new populist style to Serbia, appealing directly to Serbs over the heads of party officials. He used his rising popularity to oust his former mentor Stambolić and replace him as leader of the LCS in 1987. As Serbia's spokesman, Milošević demanded that the federal government restore to Serbia full control over the autonomous provinces of Vojvodina and Kosovo. He also opposed efforts to introduce free-market reforms, instead defending the socialist tradition of state economic intervention.

In 1989 the Serbian assembly ousted Stambolić from the republic's presidency in favour of Milošević. In 1990 Milošević pushed through changes to the Serbian constitution that curtailed the provinces' autonomy. But Milošević's policies created an anti-Serb backlash in the other republics, and Serbia's resistance to reform accelerated the breakup of both the Yugoslav federation and the Communist Party. Both Croatia and Slovenia elected noncommunist governments in 1990. Milošević renamed the LCS as the Socialist Party of Serbia, and in 1990 he was returned to office by a huge majority.

The popularly elected leaders of Croatia and Slovenia continued to press for the transformation of Yugoslavia into a confederation. A negotiated settlement proved impossible, and in 1991 first Slovenia and Croatia and then Macedonia declared their independence. In 1992 the Muslims and Croats of Bosnia and Herzegovina also voted to secede. Milošević sent Serb militias to wrest control of the culturally Serbian portions of Bosnia and Croatia and unite them with Serbia. After three years of full-scale warfare in Bosnia, however, Serb militias failed to defeat the Muslim forces, and in 1995 the Croatian army swept almost the entire Serb population out of their historic enclave in Croatia. By this time Serbia's economy, which had never recovered from the political crises of the late 1980s, was further crippled by UN trade sanctions imposed in 1992. In order to lift the sanctions, Milošević agreed to sign a peace agreement on behalf of the Bosnian Serbs in November 1995, thus ending the war in Bosnia.

Barred from a third term as president of Serbia, Milošević had the federal parliament elect him to the presidency of Yugoslavia, which then consisted of Serbia plus Montenegro, in 1997. The next year relations between Serbs and ethnic Albanians in Kosovo deteriorated into armed conflict, and early in the spring of 1999 the Yugoslav army moved in. Alarmed by reports of "ethnic cleansing," NATO retaliated with a bombing campaign that led to a peace accord in June.

As details of Serb atrocities became known, prosecutors for the World Court at The Hague, Neth., indicted Milošević for war crimes as commander of the Yugoslav armed forces. Defeated in his bid for reelection in 2000, Milošević was arrested by the Yugoslav government in 2001 and eventually turned over to the International Court of Justice in The Hague for trial.

Miloslavskaya, Mariya Ilinichna (b. 1625—d. 1669), first wife of Tsar Alexis of Russia. Of her 13 children, two sons survived to maturity and became tsars: Fyodor III (reigned 1676–82) and Ivan V (reigned 1682–96, jointly with Peter I the Great [*q.v.*]).

After Mariya Miloslavskaya's death her relatives formed a political faction that dominated the reign of Mariya's son Fyodor III and the regency of her daughter Sophia (served 1682–89). Sophia was able to promote the claim of her brother Ivan V to rule as co-tsar with Peter I. This arrangement continued under Sophia's regentship until she and her brother were deprived of power in 1689 by the partisans of Peter I.

After the death of Peter II (Peter I's grandson) the Russian throne reverted to Mariya Miloslavskaya's descendants: her granddaughter Anna (reigned 1730–40) and her great-great-grandson Ivan VI (reigned 1740–41 under the regentship of his mother). The latter was overthrown and imprisoned by promoters of Peter I's daughter Elizabeth, who, on becoming empress in 1741, effectively ended the political career of the Miloslavsky family.

Miłosz, Czesław (b. June 30, 1911, Šateiniai, Lithuania, Russian Empire [now in Lithuania]), Polish American author, translator, and critic who received the Nobel Prize for Literature in 1980.

The son of a civil engineer, Miłosz completed his university studies in Wilno, Pol. (now Vilnius, Lithuania). His first book of verse, *Poemat o czasie zastygłym* (1933; "Poem of Frozen Time"), expressed catastrophic fears of impending war and worldwide disaster. During the Nazi occupation he moved to Warsaw, where he was active in the Resistance and edited *Pieśń niepodległa* (1942; "Independent Song: Polish Wartime Poetry"), a clandestine anthology of well-known contemporary poems.

Miłosz's collection *Ocalenie* (1945; "Rescue") contained his prewar poems and those written during the occupation. In the same year, he joined the Polish diplomatic service and, after briefly working during 1946 in the Polish embassy in New York City, was sent to Washington, D.C., as cultural attaché, and then to Paris, as first secretary for cultural affairs in Paris. There he asked for political asylum in 1951. Nine years later he immigrated to the United States, where he joined the faculty of the University of California at Berkeley and taught Slavic languages and literature until his retirement in 1980. Miłosz became a naturalized citizen of the United States in 1970.

Miłosz's poetic works are noted for their classical style and their preoccupation with philosophical and political issues. An important example is *Traktat poetycki* (1957; "The Poetic Treatise"), which combines a defense of poetry with a history of Poland from 1918 to the 1950s. There are several volumes of his poetry in English translation, notably *The Collected Poems 1931–1987* (1988) and *Provinces* (1991). His many prose works include his autobiography, *Rodzinna Europa* (1959; *Native Realm*); *Prywatne obowiązki* (1972; "Private Obligations"), the novel *Dolina Issy* (1955; *The Issa Valley*); *The History of Polish Literature* (1969); and the diaries in *Rok myśliwego* (1990; *A Year of the Hunter*).

Though Miłosz was primarily a poet, his best-known work became his collection of essays *Zniewolony umysł* (1953; *The Captive Mind*), which condemned the accommodation of many Polish intellectuals to communism. This theme is also present in his novel *Zdobycie władzy* (1955; *The Seizure of Power*).

BIBLIOGRAPHY. Leonard Nathan and Arthur Quinn, *The Poet's Work: An Introduction to Czeslaw Milosz* (1991), discusses his life and work. Aleksander Fiut, *The Eternal Moment: The Poetry of Czeslaw Milosz* (1990; originally published in Polish, 1987), presents analyses for advanced study. *World Literature Today* devoted two issues (Summer 1978 and Autumn 1999) to Miłosz.

Milstein, César (b. Oct. 8, 1927, Bahía Blanca, Arg.—d. March 24, 2002, Cambridge, Eng.), Argentine immunologist who in 1984, with Georges Köhler and Niels K. Jerne, received the Nobel Prize for Physiology or Medicine for his work in the development of monoclonal antibodies.

Milstein attended the universities of Buenos Aires and Cambridge (Ph.D., 1960) and was on the staff of the National Institute of Microbiology in Buenos Aires (1957–63). Thereafter he was a member of the Medical Research Council Laboratory of Molecular Biology, Cambridge, Eng., and held dual Argentine and British citizenship.

Milstein and Köhler, who was at Cambridge on a fellowship, made their discovery of the technique for producing monoclonal antibodies in 1975. It involved the fusion of short-lived, highly specific lymphocytes (antibody-producing cells) with the cells of a myeloma, a type of tumour that can be made to reproduce indefinitely. The resulting hybrid cells retained the two desired properties: like the lymphocytes, they secreted a single species of antibody molecules, and, like myeloma cells, they perpetuated themselves, providing potentially unlimited amounts of any desired antibody. This technique enabled the production of large quantities of pure, uniform antibodies that are able to recognize single antigenic determinants (*i.e.*, a single characteristic of a particular microbial invader in the body).

Milstein received the Royal Medal from the Royal Society of London in 1982, and in 1994 he was made a Companion of Honour.

Milstein, Nathan (b. Dec. 31, 1903, Odessa, Ukraine, Russian Empire—d. Dec. 21, 1992, London, Eng.), one of the leading violinists of the 20th century, especially acclaimed for his interpretations of J.S. Bach's unaccompanied violin sonatas as well as for works from the Romantic repertoire.

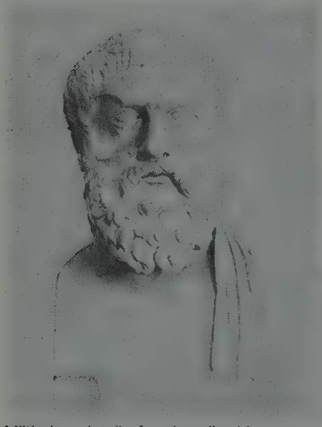
Among Milstein's teachers were two celebrated violinists, Leopold Auer in St. Petersburg and Eugène Ysaÿe in Brussels. Milstein gave concerts throughout the Soviet Union, frequently in joint recital with the pianist Vladimir Horowitz. In 1925 he moved to Paris. He toured Europe annually from 1927 until World War II, resuming in 1947.

In 1928 he went to the United States, later becoming a U.S. citizen. From his U.S. debut in 1929 as soloist with the Philadelphia Orchestra, he made extensive tours of the United States and Canada and recorded widely. He also published a number of transcriptions for the violin. In 1968 he was honoured by France by being made an officer of the Legion of Honour.

Miltiades, Saint, also spelled MELCHIADES (b. Africa?—d. Jan. 10, 314, Rome [Italy]; feast day December 10), pope from 311 to 314.

Miltiades became the first pope after the edicts of toleration by the Roman emperors Galerius (ending the persecution of Christians), Maxentius (restoring church property to Miltiades), and Constantine I the Great (favouring Christianity). Concurrently, however, dissension within the church was caused by the Donatists, North African schismatics who contested the election of Caecilian as bishop of Carthage. At the Lateran Council of 313, Miltiades supported Caecilian and condemned the Donatists, who refused to submit. Constantine then ordered the Council of Arles (Arelate), the first representative meeting of Christian bishops in the Western Roman Empire, but Miltiades died before the council convened. Miltiades is considered a martyr because of earlier sufferings under the Roman emperor Maximian.

Miltiades the Younger (b. *c.* 554 BC, Athens [Greece]—d. probably 489 BC, Athens), Athenian general who led Athenian forces to victory over the Persians at the Battle of Marathon in 490.



Miltiades, detail of an inscribed herm, *c.* 450 BC; in the National Museum of Ravenna

Fotofast S.A.S. Galleria Cavour, Bologna, Italy

Early years. Miltiades' family must have been extraordinarily wealthy; his father, Cimon, three times won the chariot races at the Olympic Games, while his uncle, after whom he was named, was the founder of an Athenian semi-independent principality in the Thracian Chersonese (now the Gallipoli Peninsula). Miltiades the Elder died childless and arranged for his stepbrother's sons to inherit the dominions he had conquered. About 516 BC, Miltiades left for the Chersonese, where he strengthened his authority by arresting his potential rivals and by surrounding himself, as tyrants were wont to do, with a heavily armed bodyguard of 500 men. He also married Hegesipyle, the daughter of a Thracian prince. Soon after, nonetheless, his authority was severely limited when Darius I of Persia expanded his power into Europe and reduced Miltiades to the rank of a Persian vassal. He led a contingent in the Scythian expedition of Darius (*c.* 513), and, according to Herodotus, he advised the destruction of the Danube bridge, which would have cut off Darius' retreat. Since Miltiades was not at once expelled by the Persians, the story is doubtful. It is a fact, on the other hand, that when the Ionian revolt against the Persians broke out in 499 BC, Miltiades decided to join the insurgents and to enter into friendly relations with the newly established Athenian democracy. Probably during the revolt Miltiades seized the isles of Lemnos and Imbros, which he eventually ceded to Athens. But the revolt collapsed by 494, and the year after, when Darius' fleet appeared off the Chersonese, Miltiades loaded five boats with his treasures and made for Athens. One of the boats, captained by Miltiades' eldest son, Metiochos, was captured. Metiochos was taken as a lifelong prisoner to Persia, but Darius treated him honourably, married him to a Persian princess, and regarded their children as members of the Persian nobility.

Because of his fabulous wealth, his foreign wife Hegesipyle (who bore him a son, Cimon the younger, about 510), and his past as a "tyrant," Miltiades was bound to raise animosities in Athens. He was prosecuted for his tyrannical role in the Chersonese, probably at the instigation of the rival clan of the pro-Persian Alcmaeonids, but he was triumphantly acquitted as the champion of resistance to Persian encroachments upon Greek freedom.

Battle of Marathon. The Persians were threatening Athens, which had supported the Ionian revolt with a punitive expedition, and Miltiades, who had first-hand experience of the Persians, was chosen, from 493 onward, as one of the 10 generals of the Athenian land forces. (Unlike Themistocles, he was still thinking in terms of land warfare and of an agreement with Sparta, which was favoured by the Athenian landowners, the peasantry, and the rural middle class.) In the summer of 490 BC the Persians landed at Marathon. The Athenians were faced with the choice of marching out and confronting them there or waiting for them at Athens; the decision was to be made by the Assembly. Miltiades was well aware of the power of the Persian cavalry, which, once out on the open plain, would wreak havoc. He was also anxious for a quick decision, because there were factions within Athens which would have welcomed a Persian victory in order to advance their own political ambitions. His arguments persuaded the Assembly, and the Athenian forces set out. A runner was sent to Sparta, to seek the support of the Spartan army, but the Spartans replied that they would participate only at the conclusion of a religious festival six days later. A conflict then arose among the 10 Athenian generals over whether to wait or to attack the Persians immediately. The deciding vote was cast by the *polemarchos* (supreme military commander) Callimachus, whom Miltiades was able to persuade to immediate action. The operational command of the army was to be held for one day in turn by each of the 10, but the four who had supported Miltiades surrendered their right to command to him.

Occupying the foothills surrounding the bay, Miltiades waited for a favourable moment to attack. He chose a time when the Persian cavalry was nonoperational, either because it reembarked for a possible direct attack on Athens or because of some other circumstance; the reason for its absence is uncertain. Charging a mile across the Marathon plain, Miltiades' forces engaged the Persian infantry, killing some 6,400 men (and capturing 7 ships) at a cost of 192 Athenian dead. The rest of the Persian force quickly embarked and put out to sea.

Following the defeat of the Persians at Marathon, Miltiades set out in the spring of 489 BC with a fleet of 70 ships on an expedition to conquer those islands that had supposedly sided with Persia. His mission was not a success, and on his return to Athens there was an outcry of indignation, ably exploited by his rivals, the Alcmaeonids. Miltiades, dying of gangrene from a leg wound suffered in a mishap, was fined 50 talents, although the death penalty had been demanded. He probably died soon after in prison.

The tragic outcome of his life, however, did not cloud the judgment of Miltiades' historical role. His fellow citizens never forgot that it was to his initiative and leadership that they owed their victory over the Persians. (P.T.)

BIBLIOGRAPHY. The best writings on Miltiades in English are in H.T. Wade-Gery, *Essays in Greek History* (1958); E.S. Gruen, "Stesimbrotus on Miltiades and Themistocles," *California Studies in Classical Antiquity,* 3:91–98 (1970); the general works by C. Hignett, *Xerxes' Invasion of Greece* (1963); and A.R. Burn, *Persia and the Greeks* (1962). The only recent, though highly tendentious, biography of Miltiades is by H. Berve, *Miltiades: Studien zur Geschichte des Mannes und seiner Zeit* (1937), who eventually qualified and severely modified his theory.

Milton, urban town (township), Norfolk county, eastern Massachusetts, U.S. It lies along the Neponset River, just south of Boston. Settled in 1636 as a part of Dorchester, it was early known as Uncataquisset, an Indian word meaning "head of tidewater," and was separately incorporated in 1662. At Vose House in Milton, delegates met on Sept. 9, 1774, and adopted the Suffolk Resolves (protesting the Intolerable Acts of Britain), which were then carried by Paul Revere to the Continental Congress at Philadelphia.

Utilization of the Neponset River's waterpower led to Milton's growth as a mill town, and in the 18th century it was a small but busy industrial centre. Manufacturing declined during the 19th century with the exception of stonecutting. Stone for the Bunker Hill Monument was quarried in Quincy, cut in Milton, and transported by the horse-drawn Granite Railway, the first railroad chartered (1826) in the United States. In the late 19th century, Milton became a wealthy suburb of Boston; its large estates were gradually broken up after 1930, and it became a residential community. The Milton Academy was founded there in 1807, Curry College in 1879, and Aquinas College in 1956. The Blue Hills Reservation, a 6,500-acre (2,600-hectare) year-round sports and recreation area, is immediately south of the town. Pop. (1994 est.) 25,788.

Milton, John (b. Dec. 9, 1608, London, Eng.—d. Nov. 8, 1674, Chalfont St. Giles, Buckinghamshire), one of the greatest poets of the English language, best known for his epic poem *Paradise Lost* (1667). He was also a noted historian, scholar, pamphleteer, and civil servant for the Parliamentarians and the Puritan Commonwealth.

A brief treatment of John Milton follows. For full treatment, *see* MACROPAEDIA: Milton.

Milton exhibited scholarly achievement and a devotion to Latin verse at an early age. He was educated at Christ's College, Cambridge (1625–32), where he wrote poetry in Latin, Italian, and English. From 1632 to 1638 Milton retired to his father's home and engaged in private study—producing the masque *Comus,* his first dramatization of the conflict of good and evil, and the poem "Lycidas"—and then toured Italy for a year.

Concerned with the Puritan cause in England, Milton spent much of the years 1641–60 pamphleteering for civil and religious liberty and serving as the secretary for foreign languages in Oliver Cromwell's government, producing *Of Education* and *Areopagitica* in 1644. He lost his sight (1651–52) but continued in his work, completing *The Second Defence of the People of England* in 1654. After the Restoration of Charles II in 1660, Milton was arrested as a noted defender of the Commonwealth but was soon released. The epics *Paradise Regained* and *Samson Agonistes* were published in 1671. His late, long poems were dictated to relatives, friends, disciples, and paid amanuenses.

Milton Keynes, new town and unitary authority, geographic and historic county of Buckinghamshire, England. There is no single urban centre within the unitary authority, but the whole area, which contains several preexisting towns, has been developed as a new town since 1967. The southern part is mainly urban, while the north remains largely rural.

Milton Keynes has attracted people, offices, and industry to become an area of striking growth. Earlier, the towns of Bletchley, Wolverton, and Newport Pagnell all had built-up industries, the first two largely because of their position on, and connection with, the main railway from London to the Midlands and the north. Its access to excellent rail service to London and to the M1 motorway has increased its attractiveness to commerce and industry. Among the most important institutions is the Open University, whose students receive instruction by correspondence. Area unitary authority, 120 square miles (310 square km). Pop. (1991) new town, 156,148; (1998 est.) unitary authority, 203,200.

Milwaukee, city, seat (1835) of Milwaukee county, southeastern Wisconsin, U.S., and port of entry on Lake Michigan, where the Milwaukee, Menomonee, and Kinnickinnic rivers join and flow into Milwaukee Bay. French missionary Jacques Marquette camped there in 1674, and fur traders soon followed. In 1835 three settlers bought land around Milwaukee: Solomon Juneau founded Juneautown, Byron Kilbourn founded Kilbourntown, and George Walker founded Walker's Point (not developed until 1850). Juneau and Kilbourn clashed over the building of streets and bridges, each purposely constructing them so they would not line up with those of the other. The situation climaxed in 1845 when three bridges were burned; the following year an agreement made Milwaukee a single community. It grew as an industrial and distribution centre in the 19th century, though Milwaukee's importance as a shipping point declined in the late 1800s.

German settlers played an important part in the city's early development, becoming the largest ethnic group. The Irish formed the second largest group in the mid-19th century. There were large influxes of Poles and Italians toward the end of the century. After the American Civil War the city found itself involved with labour unions, disputes, and strikes until the turn of the century. A Progressive-era reform movement brought Milwaukee a reputation for clean and efficient government. The city had three socialist mayors: Emil Seidel (1910–12), Daniel Webster Hoan (1916–40), and Frank P. Zeidler (1948–60). Milwaukee remained a leading manufacturing city until the 1980s. Although it was once a centre of beer production, by 2000 only one major brewery remained.

The port of Milwaukee is open all year and accessible to the largest ships using the St. Lawrence Seaway. The city has an international airport and extensive rail and highway connections. The modern economy is diversified, with services and high-technology industries as major factors. Manufacturing (including medical equipment, mining machinery, electronics, and motorcycle parts) and shipping are still important; printing, food processing, and tourism also contribute.

Milwaukee has an extensive park system. The Milwaukee County Zoo is on the western edge of the city, and the Mitchell Park Horticultural Conservatory (the Domes) displays tropical and desert plants and a changing flower show. Milwaukee has a symphony orchestra, ballet, and opera, as well as other theatre and music organizations. There are several museums, including those devoted to art and natural history. The city is known for its many annual summer festivals along the lakefront, including Summerfest (a music festival) and ethnic festivals celebrating a dozen different cultures. The Great Circus Parade (July) re-creates an early 20th-century circus parade. Professional sports teams include the Brewers (baseball) and Bucks (basketball).

Among Milwaukee's many educational institutions are Marquette University (1881), Milwaukee School of Engineering (1903), Milwaukee Area Technical College (1912), and the University of Wisconsin–Milwaukee (1885). Inc. 1846. Pop. (2000) city, 596,974; Milwaukee-Waukesha PMSA, 1,500,741; Milwaukee-Racine CMSA, 1,689,572.

Milwaukee County Zoological Gardens, zoo located on the outskirts of Milwaukee, Wis., U.S. The zoo, founded in 1892, was originally situated closer to the centre of the city but was relocated to its present 200-acre (80-hectare) site in 1958. It receives financial support from a local zoological society. The zoo has some 2,500 specimens representing about 300 species. Many of the animals are exhibited in barless, moated enclosures, which are positioned so that natural predators and their prey (*e.g.,* lions and zebras, tigers and deer) seem to be housed together. Many of the displays are arranged according to the animals' geographic area of origin. The zoo has an aviary and special features such as a sea lion show.

Milwaukee Depth, deepest point in the Atlantic Ocean, lying at a depth of 27,493 feet (8,380 m) about 100 miles (160 km) northwest of the island of Puerto Rico. It lies within a submarine depression called the Puerto Rico Trench, located at the southern edge of the North American Basin, between the Puerto Rico Ridge (north) and the North Antillean Arc (south); it is about 7,000 feet (2,100 m) deeper than the adjoining basin floors. The Milwaukee Depth is named after the first ship that sounded it.

Milwaukee Journal Sentinel, daily newspaper published in Milwaukee, Wisconsin's leading newspaper and generally accounted one of the great regional dailies of the United States.

It was founded in 1882 by Lucius W. Nieman as the *Daily Journal,* an independent, community-oriented paper. The *Journal* has been noted for its coverage of Milwaukee and state affairs. It has tended to support progressive or liberal candidates for political office and has maintained an international point of view. It is also distinguished for its editorial stance, which exposed the Nazi underpinning of the German-American Bund in the 1930s and attacked Wisconsin's U.S. senator Joseph R. McCarthy for his unfounded accusations of communist sympathy in the 1950s.

Nieman died in 1935 and his wife in 1936; part of their fortune went to establish the Nieman Fellowships for working journalists at Harvard University. Harry J. Grant had become editor of *The Milwaukee Journal* in 1919, and after the Niemans' deaths he organized a plan whereby employees could buy stock in the company; it is now 90 percent employee-owned. In 1962 it purchased the *Milwaukee Sentinel* from the Hearst Corp. The papers were combined as the *Milwaukee Journal Sentinel* in 1995.

Milyukov, Pavel Nikolayevich, Milyukov also spelled MILIUKOV (b. Jan. 27 [Jan. 15, Old Style], 1859, Moscow, Russian Empire—d. March 3, 1943, Aix-les-Bains, Fr.), Russian statesman and historian, who played an important role in the events leading to the Russian Revolution of 1917 and served as foreign minister in Prince Lvov's Provisional government (March–November 1917). He is one of the greatest of Russia's liberal historians.

Early career. Milyukov entered Moscow University in 1877 and attained academic distinction as a Russian history specialist. His three-volume *Ocherk po istorii russkoy kultury* (1896–1903; *Outlines of Russian Culture*) brought him nationwide renown. He became even better known as a spokesman for imperial Russia's nascent liberal movement.

Milyukov's concern with political issues led in 1895 to the loss of his teaching post, whereupon he began traveling widely and developing a deep admiration for the political values of more advanced democratic countries. In 1903 and 1904–05, he visited the United States, where he lectured on Russian history and politics. As a convinced "Westernizer," Milyukov saw tsarist absolutism as the main obstacle to Russia's progress. He strove to make Russian liberalism a more broadly based movement committed to a radical transformation of the empire's political and social structure. In particular, he stood for the rule of law, parliamentary government, universal suffrage, a broad range of civil freedoms, the expansion of popular education, and land reform. He was perhaps a better judge of abstract ideas than of human nature and was too inflexible to succeed in practical politics.

Milyukov

EB Inc.

Political journalism. As a contributor to a clandestinely circulated journal, *Osvobozhdeniye* ("Liberation"), founded in 1902, Milyukov did much to swing the moderate members of the *zemstva* (local government bodies) to the left. During the revolutionary year 1905, he was active in forming the Union of Unions, a broad alliance of professional associations, and subsequently the Constitutional Democratic, or Kadet, Party. As editor of the Kadet daily newspaper, *Rech* ("Speech"), and a member of the party's Central Committee, he directed its tactics in Russia's first nationwide election, which brought the Kadets success at the polls. The gulf between the newly created Duma, or national assembly, and the government could not be bridged, however, and in July 1906 the assembly was prematurely dissolved. Milyukov helped to draft the Vyborg Manifesto, appealing for a campaign of passive resistance to the government; this, technically speaking, was an illegal act. Many moderates thought that his tactics, which involved a measure of cooperation with the revolutionary Socialists, were too radical.

Subsequently Milyukov moved to the right. In the third and fourth Dumas (1907–17), he led the Kadets' depleted parliamentary faction in condemning bureaucratic abuses and championing progressive causes. After the outbreak of World War I, Milyukov adopted a patriotic "defensist" policy, which in 1915 led him to criticize the imperial regime for its inefficiency in organizing Russia's resources for the war effort. He helped to form a Progressive Bloc of moderate Duma leaders, who sought by gentle pressure from public opinion to secure a ministry enjoying the nation's confidence. When these overcautious tactics proved unavailing, Milyukov swung sharply to the left and, on Nov. 14, 1916, delivered a powerful speech in the chamber implying that the government was guilty of treason. His charges had no real substance, but they greatly stimulated revolutionary sentiment, which soon exceeded the bounds that Milyukov had expected or desired.

Foreign minister. When Tsar Nicholas II abdicated under this pressure on March 15, 1917, Milyukov wanted to preserve the monarchy as a stabilizing force but found little support. The revolutionary tide was now running strongly against him. In the liberal Provisional Government under Prince Georgy Lvov, which Milyukov helped to constitute, he towered intellectually over his colleagues but was soon outmaneuvered by the Socialist leader Aleksandr Kerensky, who favoured a policy of concessions to popular demands, notably on the question of taking immediate steps toward a negotiated peace. As foreign minister, Milyukov clung to Russia's wartime alliances. He resisted heavy pressure from inside and outside the government to send a note to the Allies redefining his country's war aims, and when, on May 1, he yielded, the note was phrased ambiguously. Disturbances broke out in the streets of Petrograd (St. Petersburg), and Milyukov was obliged to resign (May 15).

Last years. Thereafter he endeavoured to counter the new coalition government's leftward swing by rallying the moderates, but with little success. The Bolshevik seizure of power in November 1917 forced him to leave Petrograd for southern Russia, where he became political counselor to the leaders of the White Volunteer Army. Subsequently he emigrated to Paris. Milyukov held fast to his liberal principles and remained active in politics and scholarship until his death. (J.L.H.K./Ed.)

BIBLIOGRAPHY. Thomas Riha, *A Russian European: Paul Miliukov in Russian Politics* (1969), is a thorough study that emphasizes the period 1905–17.

Milyutin, Dmitry Alekseyevich, Count (Graf) (b. June 28 [July 10, New Style], 1816, Moscow, Russia—d. Jan. 25 [Feb. 7], 1912, Simeiz, near Yalta, Crimea, Russian Empire), Russian military officer and statesman who, as minister of war (1861–81), was responsible for the introduction of important military reforms in Russia.

Graduated from the Nicholas Military Academy in 1836, Milyutin served in the Caucasus (1838–45) and then became a professor at the academy. In 1856 Milyutin returned to active duty. In 1860 he entered the Ministry of War as deputy minister and became minister of war the following year. Milyutin reorganized the system of military education for both officers and regular troops; among other innovations, he made elementary education available to all draftees. In 1874 he introduced universal compulsory military service into Russia, compelling all Russian males at 20 years of age, except those who qualified for specific exemptions, to serve in the army; he also reduced the term of active service from 25 years to 6. In addition, Milyutin introduced the reserve system.

Despite the success of his reforms, which was demonstrated by Russia's victory over the Ottoman Empire in the Russo-Turkish War of 1877–78, Milyutin acquired many powerful enemies, especially among those who resented his reduction of the nobles' privileges within the military establishment. He chose to retire (May 1881) soon after Alexander III ascended the Russian throne.

Milyutin, Nikolay Alekseyevich (b. June 6 [June 18, New Style], 1818, Moscow, Russia—d. Jan. 26 [Feb. 7], 1872, Moscow), Russian statesman who played a prominent role in the emancipation of the serfs in Russia.

Educated at Moscow University, Milyutin entered the Ministry of the Interior at the age of 17 and advanced rapidly in the service. In the early 1840s he was responsible for the reform of the municipal governments of St. Petersburg, Moscow, and Odessa. Appointed assistant minister of the interior in 1859, Milyutin took a leading part in the framing of the Emancipation Manifesto of March 3, 1861, from which he and his progressive associates succeeded in eliminating some of the more objectionable features advocated by the ultraconservative groups. He was forced to retire in April 1861, but, after the Polish insurrection of 1863, he was appointed secretary of state for the Russian part of Poland, where in 1864 he carried out the emancipation of the peasantry at the expense of the Polish landowners, whom he considered to be the core of Polish nationalism. Milyutin also removed all Roman Catholic priests and monks from Poland's schools with a similar intent. He suffered a stroke in 1866 and lived in retirement thereafter.

Mimamsa, Sanskrit MĪMĀṂSĀ ("Reflection," or "Critical Investigation"), one of the six orthodox systems (darshans) of Indian philosophy. Probably the earliest of the six, Mimamsa is fundamental to Vedānta and has deeply influenced the formulation of Hindu law.

The aim of Mimamsa is to give rules for the interpretation of the Vedas and to provide a philosophical justification for the observance of Vedic ritual. Because Mimamsa is concerned with the earlier parts of the Vedas (called the Karmakāṇḍa), it is also referred to as Pūrva-Mīmāṃsā ("Prior Study"), or Karma-Mīmāṃsā ("Study of the Acts"). Vedānta, which deals with the later portion, the Upaniṣads, is called Uttara-Mīmāṃsā ("Posterior Study"), or Jñāna-Mīmāṃsā ("Study of Knowledge").

The earliest work of the system is the *Mīmāṃsā-sūtra* of Jaimini (*c.* 4th century BC). A major commentary was written by Śabarasvāmin (1st century BC?), who was followed by a long line of interpreters and teachers, most notably Kumārila Bhaṭṭa and Prabhākara (7th/8th century AD).

The goal of Mimamsa is to provide enlightenment on dharma, which in this school is understood as the set of ritual obligations and prerogatives that, if properly performed, maintains the harmony of the world and furthers the personal goals of the performer. Since dharma cannot be known through either perception or reasoning, one must depend on revelation in the Veda, which is considered eternal, authorless, and absolutely infallible.

To find out what one's dharma is on specific occasions, examples of direct or implicit command in the Vedic text must be relied upon. If the command is implicit, one must judge from parallels; if a text fails to detail how a priest proceeds with an action, this detail must be provided from other texts. This concern with precise statement necessitates meticulous examination of the structure of a sentence conveying a command.

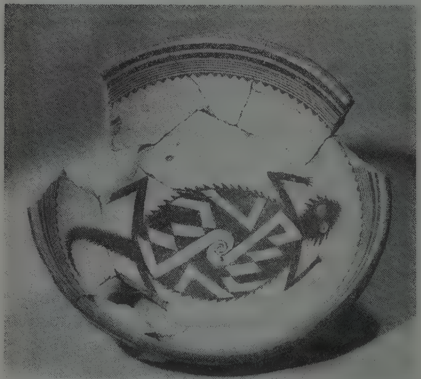
Although it was purely practical in origin, Mimamsa became a powerful intellectual force. Mimamsa, in the person of Kumārila, is traditionally credited with the defeat of Buddhism in India. It has also contributed to the direction, method, and content of Hindu erudition.

Mimana (Korean confederation): *see* Kaya.

Mimas, smallest and innermost of the eight large, regular satellites of Saturn. It has a diameter of 392 km (243 miles) and orbits the planet in a prograde, near-circular orbit at a mean distance of nearly 185,520 km (115,022 miles). The orbital period of 23 hours is half that of the Saturnian satellite Tethys, and therefore Mimas and Tethys are involved in an orbital resonance, always reaching conjunction on the same side of Saturn. The origin of this resonance is not fully understood. Mimas rotates synchronously with its orbital motion, always keeping the same hemisphere toward Saturn.

The mean density of Mimas is only 1.2 times that of water, and its surface shows characteristics of water frost. For these reasons, Mimas is believed to be composed principally of ice. Its surface is bright and heavily marked with deep, bowl-shaped craters. The depth of the craters appears to be a consequence of the low surface gravity. In spite of Mimas' small size, there is some evidence of resurfacing, possibly resulting from a partial melting of the icy crust. The most noteworthy feature on Mimas is a 130-kilometre- (80-mile-) diameter crater named Herschel, which is near the centre of the leading hemisphere. The crater walls are 5 km (3 miles) high, its floor 10 km (6 miles) deep, and the central peak 6 km (4 miles) high. This is the largest impact structure, relative to the size of the body, so far discovered in the solar system.

Mimbres, a prehistoric North American people who formed a branch of the classic Mogollon culture and who lived principally along the Mimbres River in the rugged Gila Mountains of what is present-day southwestern New Mexico, U.S. They also lived along nearby stretches of the Gila River and the Rio Grande. At the height of their culture, between AD 1000 and 1150 (known as the Classic Mimbres Period), the Mimbres lived in compact pueblolike villages of adobe and masonry, each village containing perhaps 200 people. Because of sparse rainfall in the area, they relied on irrigation to grow corn (maize), beans, and squash; they also hunted small game. The Mimbres are perhaps most famous for their pottery, which was decorated with imaginative black-on-white designs of insects, animals, and birds or of geometric lines.



Mimbres bowl with black-on-white horned toad design, *c.* 1050–1150; in the Museum of New Mexico, Santa Fe

By courtesy of the Museum of New Mexico, Santa Fe; photograph, Arthur Taylor (Neg. No. 99666)

The Mimbres, numbering perhaps 5,000 at their height, were eventually absorbed by the closely related Pueblo peoples to the north. Some may have migrated to Mexico.

mime and pantomime, Latin MIMUS and PANTOMIMUS, Greek MIMOS and PANTOMIMOS, in the strict sense, a Greek and Roman dramatic entertainment representing scenes from life, often in a ridiculous manner. By extension, the mime and pantomime has come to be in modern times the art of portraying a character or a story solely by means of body movement (as by realistic and symbolic gestures). Analogous forms of traditional non-Western theatre are sometimes also characterized as mime or pantomime.

Early Western forms. The Greco-Roman mime was a farce that stressed mimetic action but which included song and spoken dialogue. The preliterary form can only be guessed at, and even the surviving fragments of the playlets of Epicharmus, a 5th-century-BC writer of comedies, yield only the scanty information that his mimes were concerned with scenes of daily life or with mythological travesty. Other Greek writers of mimes were Sophron (fl. *c.* 430 BC) and Herodas (3rd century BC).

Drawing of an ancient Roman pantomimus wearing a mask and tunic

Historical Pictures Service, Chicago

The existence of a native Italian form of mime may safely be postulated. The first to give literary form to the Roman mime was the knight Decimus Laberius (*c.* 105–43 BC), who was eclipsed by the former slave Publilius Syrus. The presentation of mimes was a traditional feature of the annual Floralia festival, which, being licentious in spirit, opened the popular stage to naked mime actresses.

Though only fragments exist, it is clear that the usual mime plot, while free to indulge in biting topical allusion, centred principally on scenes of adultery and other vice. Evidence exists that acts of adultery were actually performed on the mime stage during the Roman Empire. Execution scenes with convicted criminals in place of actors are on record. When condemning the Roman theatre, the early Christian writers attacked primarily the mimes in this state of degeneracy. Stock characters and situations of the classical mime found their way into the comic drama of Plautus and reappeared greatly modified in the commedia dell'arte, a Renaissance extempore entertainment with roots in the Roman theatrical tradition.

The Roman pantomime differed from mime in two ways: its themes were usually loftier, and, unlike the mime actor, the pantomimus wore various masks, which identified his characters but deprived him of speech and of the use of facial expressions. Thus his art was primarily one of posture and gesture, in which hand movements were particularly expressive and important.

The pantomimus, dressed like a tragic actor in a cloak and long tunic, usually performed solo, accompanied by an orchestra that included cymbals and other rhythm instruments, flutes, pipes, and trumpets. The libretto of the piece was sung or recited by a chorus and was usually adapted from a well-known tragedy. Both the music and the librettos of the pantomimes were considered to be of little artistic value. The talent and skill of the pantomimus himself were of supreme importance, and the greatest performers enjoyed the favour of wealthy patricians and even emperors, such as Nero and Domitian.

Oriental dance-dramas. In Asia the art of mimetic drama was developed long before it achieved definite form in the Western world. In India the union of music, song, and dance with character portrayals took place several centuries BC. Out of such native drama, with added dialogue, grew the bharata natya (*bhārata-nāṭya*). One of the classical Hindu dance-dramas, it is meticulously described in the *Nāṭya-śāstra,* the great treatise of Sanskrit dramaturgy composed before the 3rd century AD. The two-hour performances feature a solo dancer backed by musicians and a singer; the dancer neither leaves the stage nor changes costumes. Sections of dance alternate with sections of conventionalized gesturing. Mimetic scenes derived from the mythology of Vishnu are still sometimes enacted by the Bengali *jātrās*, folk pageants combining words and conventionalized mime, and the rasas, folk dance-dramas. In the 20th century, authentic classical dancing of India was introduced to the West by Uday Shankar to the accompaniment of Indian music played on native instruments.

In the theatre of China and Japan, mime acquired a role unknown in the West, becoming an integral part of the major dramatic genres. In Chinese drama the conventions of gesture and movement, as well as the symbolism of the stage properties, are immense in scope and mystifying to those unfamiliar with the traditional forms.

English pantomime. The English pantomime originated in the popular harlequinade afterpieces of early 18th-century dramatic productions. Similar to the French Arlequin comic dances, these spectacles, employing commedia dell'arte characters accompanied by music and dance, initially were performed without words, although some added speech later.

Under the Victorians the subjects of pantomime shifted to fairy tales, with interludes of juggling and acrobatics, providing more wholesome entertainment for children. After the mid-19th century, performances of pantomime became limited to an extended Christmas season. It became traditional for a young actress to take the part of the hero, or principal boy, and a comic actor to portray an old woman, or dame, for comic relief. Popular pantomimes in the 20th century include *Cinderella, The Babes in the Wood, Aladdin, Robinson Crusoe, Mother Goose, Blue Beard,* and *Goody Two-Shoes.*

Marcel Marceau, French mime, as Bip, a character of his own invention, playing the violin

Ronald A. Wilford Associates, Inc.

Modern mime. Modern Western mime developed into a purely silent art whereby meanings are conveyed solely through gesture, movement, and expression. Its influence was felt strongly in ballet, where the formal posturing of classic style modulated into the descriptive silence of modern dramatic dance movement. In the United States, silent film mimes such as Charlie Chaplin and Ben Turpin, television entertainers such as Sid Caesar, and circus clowns such as Emmett Kelly were masters in the ancient tradition. The high art of modern mime, however, was reached in France, where its practice was ennobled philosophically by Étienne Decroux, Jean-Louis Barrault, and Marcel Marceau. Marceau defined mime as "the art of expressing feelings by attitudes and not a means of expressing words through gestures."

mimeograph, also called STENCIL DUPLICATOR, duplicating machine that uses a stencil consisting of a coated fibre sheet through which ink is pressed. Employing a typewriter with the ribbon shifted out of the way so that the keys do not strike it, the information to be duplicated is typed on the stencil. The keys cut the coating on the stencil and expose the fibre base, making it possible for ink to pass through it. Corrections can be made by a sealing fluid that permits retyping over the patched-error position. Signature or drawings are added on the stencil with a hand stylus.

Either of two machines is used to produce copies from stencils. In one, the stencil is fastened to the ink-saturated surface of a hollow, rotating cylinder. As the cylinder rotates, ink flows through the cuts in the stencil to the sheets of paper fed under the cylinder. The other machine has two cylinders around which a silk-screen belt rotates. The stencil is attached to the screen, and the ink is distributed to the surface of the rotating cylinders by two rollers. The ink is thus pressed through the small openings in the screen and through the stencil openings, or image areas. Paper is fed between the stencil and an impression roller to create the copy. Up to 5,000 copies can be made in either process from a single stencil. Stencils may be stored for considerable periods of time for reuse.

The mimeograph became largely obsolete with the development of xerography and other photocopiers.

mimesis, basic theoretical principle in the creation of art. The word is Greek and means "imitation" (though in the sense of "re-presentation" rather than of "copying"). Plato and Aristotle spoke of mimesis as the re-presentation of nature. According to Plato, all artistic creation is a form of imitation: that which really exists (in the "world of ideas") is a type created by God; the concrete things man perceives in his existence are shadowy representations of this ideal type. Therefore, the painter, the tragedian, and the musician are imitators of an imitation, twice removed from the truth. Aristotle, speaking of tragedy, stressed the point that it was an "imitation of an action"—that of a man falling from a higher to a lower estate. Shakespeare, in Hamlet's speech to the actors, referred to the purpose of playing as being "... to hold, as 'twere, the mirror up to nature." Thus, an artist, by skillfully selecting and presenting his material, may purposefully seek to "imitate" the action of life.

mimetite, arsenate mineral, lead chloride arsenate [$Pb_5(AsO_4)_3Cl$], in the pyromorphite series of the apatite group of phosphates. Its colour ranges from brown to olive green, yellow, or orange. It greatly resembles pyromorphite (*q.v.*), in which phosphorus replaces arsenic in the crystal structure; mimetite is similar in physical characteristics and mode of occurrence (barrel-shaped crystals or rounded masses) but is less common. Mimetite also forms a continuous solid-solution series with vanadinite in which vanadium replaces mimetite's arsenic in the crystal structure. Campylite is any member of the pyromorphite-mimetite series distinguished by distorted crystals with curved faces. For detailed physical properties, *see* arsenate mineral (table).

mimicry, in biology, form of resemblance between two or more organisms that has evolved through the survival advantage conferred upon one or more of the organisms by means of some "information flow" between these organisms and an animate agent of selection.

A brief treatment of mimicry follows. For full treatment, *see* MACROPAEDIA: Mimicry.

In 1862 the English naturalist H.W. Bates developed the theory of mimicry to explain the similar appearances of two unrelated species of butterflies. Bates observed that one species, marked by a distinctive coloration, was noxious and inedible by birds and thus served as the model for another species that was edible. The palatable species mimicked the markings of the inedible one, sending a deceptive signal to birds. The principle of Batesian mimicry is that one organism, lacking defenses against a predator, engages in mimicry to take advantage of the defenses of the model.

Bates also observed, however, that a group of butterfly species, all of which were inedible, were similar in appearance. He could not explain why such should be the case, since each of the species in question had an adequate defense to back up its warning coloration. In 1878 Fritz Müller, a German zoologist, offered an explanation for this apparent paradox. According to his line of reasoning, the resemblance between the distasteful or formidable species themselves was an adaptation that economizes life; *i.e.,* if two inedible species are alike, they will share between them the lives collectively lost before the predators have learned to associate the warning characteristics with their special means of defense. If they are dissimilar in appearance, the lives must be contributed by each species independently. Resemblances of this type—a form of common or combined warning—are termed Müllerian mimicry.

Batesian and Müllerian mimicry are essentially defensive responses made by species against their predators. There also are cases in which a predator engages in mimicry to overcome its prey. An example of aggressive mimicry occurs with the sabre-toothed blenny (*Aspidontus taeniatus*), a fish that occurs with the cleaner wrasse (*Labroides dimidiatus*). The wrasse is marked with black and white stripes and executes a characteristic swimming movement, features that identify it to other fish, who then allow it to approach and eat parasites attached to their skin. The blenny resembles the cleaner fish both in markings and behaviour, permitting it to approach other fish, on which it then feeds.

Another type of aggressive mimicry involves parasites who mimic their hosts. The European cuckoo (*Cuculus canorus*), for example, lays its eggs in the nests of other species that then raise the young. To prevent the host birds from rejecting her eggs, a cuckoo lays only in nests of species whose eggs resemble her own. Different species of cuckoos lay differently coloured eggs; thus each must learn which species it can successfully parasitize. It is thought that a female cuckoo learns to recognize the species by which she was raised and then seeks out nests of the same species for her own eggs.

Mimicry of animal colour patterns and scents also occurs in some plants, usually for the purpose of pollination and dispersal.

Mimidae, songbird family, order Passeriformes, consisting of the mockingbirds, catbirds, and thrashers. The family contains 31 species of medium-sized birds and is notable for its excellent songsters and mimics found in the Western Hemisphere.

Members range in size from 20 to 30 cm (8 to 12 inches) long. They have slender, strong bills that are often curved downward; strong feet; short, rounded wings; and long tails. They are closely related to the wrens (family Troglodytidae), which they resemble in behaviour and colour, being active, aggressive birds of gray to brownish colouring. They forage for insects and fruit in woodland litter. The family includes the common, or northern, mockingbird (*Mimus polyglottos*) and the catbird (*Dumetella carolinensis*), both of which are fine singers and mimics of other birdsong. The brown thrasher (*Toxostoma rufum*) is a good singer but does not mimic as frequently as the mockingbird. The Mimidae belongs to the songbird suborder (Passeres).

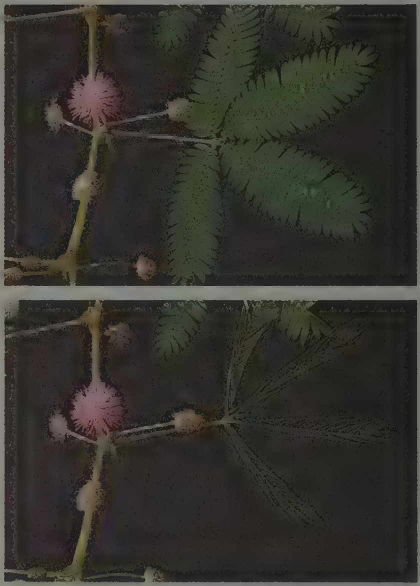
Mimir, Old Norse MÍMIR, in Norse mythology, the wisest of the gods of the tribe Aesir; he was also believed to be a water spirit. Mimir was sent by the Aesir as a hostage to the rival gods (the Vanir), but he was decapitated and his head was returned to the Aesir. The god Odin preserved the head in herbs and gained knowledge from it. According to another story, Mimir resided by a well that stood beneath one of the roots of Yggdrasill, the world tree. That well, sometimes called Mímisbrunnr, contained one of Odin's eyes, which Odin had pledged in order to drink from the waters and receive wisdom. In another myth, Mimir was a smith who taught the hero Siegfried his craft.

Mimnermus (fl. *c.* 630 BC), early Greek elegiac poet of Colophon in Asia Minor. One of his extant fragments refers to the struggle of the Ionians against Lydia. His most important poems were a set of elegies addressed to a flute girl named Nanno. Quotations in later writers indicate that mythological narratives figured largely in these poems; but it is possible that the erotic element was more important than the mythological. He took a gloomy view of the onset of old age and prayed for death at 60, for which the more optimistic Solon sternly reproved him.

mimosa, any member of a genus (*Mimosa*) of more than 450 plants in the mimosa family (Mimosaceae), native to tropical and subtropical areas throughout both hemispheres. They are so named from the movements of the leaves in certain species that "mimic" animal sensibility.

Most *Mimosa* species are herbs or undershrubs; some are woody climbers; and a few are trees. They are often prickly. The leaves of most are bipinnate (*i.e.,* the leaflets of the feather-formed leaves, in turn, bear leaflets). The roots of some species are poisonous; others contain substances irritating to the skin. Mimosas give their name to the family Mimosaceae (order Fabales), whose members are characterized by small regular flowers with valvate corolla.

Mimosas are widely cultivated partly for the beauty of their bipinnate foliage and partly for their interesting response to light and mechanical stimuli. A few species have leaves that are sensitive to light and touch; they droop in response to darkness and close up their leaflets when touched. When shaken in any way, the leaves close and droop simultaneously. The well-known sensitive plant (*q.v.*), or humble plant (*M. pudica*), native to Central America, and similar species such as *M. sensitiva* are commonly grown in greenhouses.



(Top) Unstimulated and (bottom) stimulated sensitive plant (*Mimosa pudica*)

E.R. Degginger

Many species of the related genus *Acacia* are commonly but erroneously called mimosas.

Mimpō: *see* Japanese Civil Code.

Min, in ancient Egyptian religion, a god of fertility and harvest, embodiment of the masculine principle; he was also worshiped as the Lord of the Eastern Desert. His cult originated in predynastic times (4th millennium BC). Min was represented with phallus erect, a flail in his raised right hand. His cult was strongest in Coptos and Akhmim (Panopolis), where in his honour great festivals were held celebrating his "coming forth" with a public procession and presentation of offerings. The lettuce was his sacred plant.

Min, wearing a crown with two feathers and holding a ceremonial flail, bronze statuette, *c.* 600 BC; in the Oriental Institute, the University of Chicago

Min-chia (people): *see* Pai.

Min Chiang, also spelled MIN JIANG (China): *see* Min River.

Min languages, Chinese spoken in Fukien *sheng* (province) and in parts of Kwangtung and Taiwan. The Min languages are divided into Northern Min, with its centre at Foochow, and Southern Min, with its centre at Amoy. Min speakers use a pronunciation (called T'ang Min) for the literary language that differs from the one used in other Chinese languages. The T'ang Min pronunciation of the standard language preserves the final consonants of Ancient Chinese, but nonliterary spoken Min languages do not. Other differences between Min languages and other Chinese languages include differences in vocabulary and the preservation of archaic dental consonants (formed by contact of the tongue and teeth). Northern Min preserves the nasal sounds of an earlier stage of Chinese at the ends of words, but Southern Min has lost them.

Min Mountains, Wade–Giles romanization and Pinyin MIN SHAN, range in southwestern Kansu and northwest Szechwan *sheng* (provinces), China. The Min Mountains are a branch of the Kunlun Mountains and have a roughly northwest to southeast axis. The range is made up of extremely rugged limestone, with an average elevation of 8,200 feet (2,500 m) above sea level; individual peaks reach much higher elevations. In the western section of the range, several peaks reach nearly 13,000 feet (4,000 m) and occasionally even higher. The structure of the system is complex, consisting of several chains, which mingle with the northern part of the north to south Ta-hsüeh Mountains of western Szechwan.

The area is mostly very arid, and much of it consists of grassland and mountain meadow. The vegetation cover, however, varies greatly according to altitude and position. In the west, the very highest peaks have snow cover. The area is drained to the south by the Min River and its tributaries, which empty into the Yangtze River. The northern slopes are drained in the west by the headwaters of the Huang Ho (Yellow River) and in the east by the tributaries of the Chia-ling River. The region is inhabited by Tibetan herdsmen, with some Mongols living in the far west. The Chinese are confined to the market towns and to scattered cultivated areas.

The name Min is a very ancient one; in early times it was the name of one or other of the major peaks of this range, rather than of the range as a whole. Other names are applied to various parts of the Min Mountains. The far western ranges are called the Amne Machin (Chi-shih Mountains), and the northern section is called the Hsi-ch'ing Mountains. The section of the central range lying west of the Min River, which has an axis running almost north to south, is known as the Chiung-lai Mountains. The easternmost section, which joins the Ta-pa Mountains, is known as the Mo-t'ien Mountains.

Min-ning (Chinese emperor): *see* Tao-kuang.

Min River, Wade–Giles romanization MIN CHIANG, Pinyin MIN JIANG, river in Fukien *sheng* (province), China. The Min River and its various tributaries rise in the mountains of the Fukien–Kiangsi border area and flow to the sea across the grain of the southwest to northeast mountain ranges that cross the province; this flowage results in a trellislike drainage pattern, with lateral tributaries following the direction of the valleys. The name Min, though commonly applied to the whole system, properly applies only to the lower course of the river below Nan-p'ing, where it cuts through the coastal ranges. Above this are the headwaters—the Fu-t'un and Chin rivers, which flow from the western mountain ranges—and two tributaries that drain the major interior valley basin of the province, the Sha River (flowing from the southwest through Yung-an and San-ming) and the Chien River system (flowing from the northern mountains on the Kiangsi–Chekiang border). The river's total length is 358 miles (577 km), and the area of its drainage basin is 21,600 square miles (56,000 square km).

The Min River was formerly of little use for navigation, though its upper tributaries above Nan-p'ing carried considerable junk traffic. In the 1950s the lower course of the river entering the East China Sea below Fu-chou was cleared for navigation of small ships up to 80 tons. Since 1957, however, a railway system has provided a link between the central valley and the coastal ports of Amoy and Fu-chou; Nan-p'ing and San-ming have therefore become transshipment points at which riverborne goods are loaded onto the railway.

Mina, also called MEO, or MEWATI, tribe and caste inhabiting Rājasthān and Punjab states in northern India, and Punjab province, Pakistan, who speak Hindi and claim descent from the Rājputs. The Mina are possibly of inner Asiatic origin, and tradition suggests that they migrated to India in the 7th century with the Rājputs, but no other link between the two has been substantiated. In the 11th century, the Meo branch of the Mina tribe converted from Hinduism to Islām, but they retained Hindu dress. Although the Mina and Meo are regarded as variants, some Meo claim that their ancestral home is Jaipur.

Originally a nomadic, warlike people practicing animal breeding and known for lawlessness, today most Mina and Meo are farmers with respected social positions. In the late 20th century the Mina in India numbered more than 1,100,000, and the Meo, concentrated in northeastern Punjab, Pakistan, numbered more than 300,000. Both are divided into 12 exogamous clans, led by a headman (*muqaddam*) and a council (*panch*) of tribe members. They trace descent patrilineally and divide themselves into three classes: landlords, farmers, and watchmen. Both the Mina and Meo permit widow divorce and remarriage, and the Meo allow a man to exchange a sister or close female relative for his bride. Following Hindu tradition, the Mina cremate their dead while the Meo observe burial rites.

mina, the earliest of all known units of weight, created by the Babylonians and used by the Hittites, Phoenicians, Assyrians, Egyptians, Hebrews, and Greeks. Its weight and relationship to its major subdivisions varied at different times and places in the ancient world. In one surviving form, from the Babylonian period, the mina weighs about 640 grams, while in another it weighs 978 grams.

The mina, or minah, was a basic standard of weight among the ancient Hebrews. In the sacred system of weights, the sacred mina was equal to 60 shekels, and 50 sacred minas equaled one sacred talent. In the Talmudist system, one Talmudist mina equaled 25 shekels, and 60 Talmudist minas equaled one Talmudist talent. The Hebrew sacred mina has been estimated at 499 grams. The Greek, or Attic, mina, equal to 100 drachmas, has been estimated at 431 grams.

Mina, Casa da (Portuguese trading house): *see* Guiné, Casa da.

Mina Hassan Tani (Morocco): *see* Kenitra.

Minahasa, northeasternmost portion of the longest of the four peninsulas that project from the curiously shaped, mountainous island of Celebes (Sulawesi), Indonesia. The peninsula protrudes northeast between the Celebes and Molucca seas. The name is derived from the Minahasan, a local Malayan tribe that was converted to Christianity in the 19th century. *See* Celebes.

Minahasan, people inhabiting the northernmost extension of the island of Celebes, Indonesia, in and around the port town of Manado. Of Proto-Malay stock, the Minahasan, formerly headed by chiefs, are now organized patrilineally under headmen, and land is owned communally by each village. Extended families are bound to undivided estates that are apportioned according to the needs of each household. Class distinctions are no longer significant in community definition; members of a geographical area compose the basic political unit. Internally, the Minahasan are divided into societies, *malpus,* that provide reciprocal agricultural assistance. The Minahasan cultivate wet and dry rice, corn (maize), sago palms, coffee, tobacco, and cocoa. As a result of the influx of Portuguese Roman Catholic missionaries around 1850, the Minahasan are almost entirely Christian and most are well-educated. Some of the Minahasan hold low-level administrative posts on Java; a few are prosperous owners of coconut plantations. Their population was estimated at more than 1,000,000 in the late 20th century.

minai ware, in Islāmic ceramics, bowls, beakers, tankards, and bottles with enamel painting and gilding on a white ground, often with rich figure compositions in bands. Similar vessels in animal and human form were also produced. In the 13th and 14th centuries Sultanabad (now Solṭānābād, Iran) and Varāmīn turned out *minai* ware.

Minamata, city, Kumamoto *ken* (prefecture), southeastern Kyushu, Japan, on Yatsushiro Bay. A company town of the Nippon Chisso Hiryo Company, its main products are chemical fertilizer, carbide, and vinyl chloride. Minamata was traditionally a fishing port and has regular sea-route connections to Amakusa-shimo Island, the main island of the Amakusa Archipelago. Hot springs are found in the vicinity. After 1956 a sometimes-fatal disease known as "the Minamata disease" was recognized among local fishermen and their families. The cause was determined to be an organo-mercury compound in wastes discharged by local chemical factories into the sea, polluting fish and shellfish consumed by the local inhabitants. The first disease whose cause was recognized as industrial pollution of seawater, Minamata disease aroused worldwide concern and did much to stimulate the development of the environmental protection movement. Pop. (1995 prelim.) 32,842.

Minami-tori Island, Japanese MINAMI-TORI-SHIMA, also called MARCUS ISLAND, coral atoll rising to 204 feet (62 m), in the central Pacific Ocean, 700 miles (1,125 km) southeast of Japan. Prior to World War II it was administered as part of the Tokyo *fu* (urban prefecture). Occupied by U.S. troops late in the war, it was returned to Japan in 1968. It now shares a common administration with the Bonin Islands and the Volcano Islands. Minami-tori Island, with an area of 740 acres (300 hectares) was discovered by the Japanese navigator Shinroku Mizutani (1868) and was annexed by Japan (1898). The atoll was the site of a meteorological station for studying typhoons. Marine products harvested include swordfish, seaweed, and squid.

Minamoto Shitagō (b. 911, Japan—d. 983, Japan), Japanese poet of the middle Heian period (794–1185).

Although he was a descendant of the emperor Saga and was a member of the powerful Minamoto clan, Shitagō was barred from high political position because he did not belong to the Fujiwara family, which controlled the government. Instead he devoted himself to scholarly and literary pursuits and became recognized as one of the outstanding poets of ancient Japan. He helped compile the *Gosenshū* and, as one of the Nashitsubo no Go'nin

("Five Men of the Pear Garden"), also engaged in the interpretation of the *Man'yō-shū*. *Minamoto no Shitagō shū*, a collection of his works, revealed his discontent and frustration over his lack of success in official life. He frequently participated in poetry contests. During the Shōhei era (931–938) he compiled the *Wamyō ruijūshō*, a dictionary of Japanese and Chinese words by categories, which was the first dictionary in Japan. He is also thought to be the author of many other works, including *Utsubo monogatari* ("The Tale of the Hollow Tree"), written between 956 and 983.

Minamoto Tameyoshi (b. 1096, Japan—d. Aug. 17, 1156, Japan), warrior whose defeat by his own son resulted in the temporary eclipse in Japanese affairs of the Minamoto clan and the ascendancy of the Taira clan.

The scion of a noted warrior family, Tameyoshi distinguished himself at the age of 19 by suppressing a riot against the court by soldier-priests of a monastery near the capital. Following this event, Tameyoshi eliminated his rivals and became head of the Seiwa Genji, the powerful branch of the Minamoto clan in control of the strategic Kantō region in northern Japan.

Failing to receive from the court the recognition that he felt befitted his position, Tameyoshi in 1156 supported the former emperor Sutoku, a son of the former emperor Toba, in an attempted coup d'etat against Sutoku's brother, the emperor Go-Shirakawa. Tameyoshi's son and heir, Yoshitomo, however, joined the Tairas in support of Go-Shirakawa. In this conflict, known as the Hōgen Disturbance, Tameyoshi was defeated, and Yoshitomo was ordered to kill his father. He refused, but another Minamoto, saying that it would be a disgrace to allow Tameyoshi to be killed by a Taira, executed the defeated warrior.

Minamoto Yorinobu (b. 968, Japan—d. June 1, 1048, Japan), warrior whose service to the powerful Fujiwara family, which dominated Japan between 857 and 1160, helped raise the Seiwa branch of the Minamoto clan (also known as the Seiwa Genji) to a position of preeminence.

In 1028 the Fujiwaras, no longer willing to fight their own battles, hired Yorinobu to quell a rebellion that had broken out in eastern Japan. His success in crushing the rebellion three years later established his clan's influence in the east and strengthened his own position at court. Thereafter the Minamotos were known as the "claws and teeth" of the Fujiwaras, and their influence grew until, by the 12th century, they dominated all Japan.

Minamoto Yoritomo (b. 1147, Japan—d. Feb. 9, 1199, Kamakura), founder of the *bakufu*, or shogunate, a system whereby feudal lords ruled Japan for 700 years.

Defying the emperor, Yoritomo established *shugo* (constables) and *jitō* (district stewards) throughout the Japanese provinces, thus undermining the central government's local administrative power, and in 1192 he acquired the title of supreme commander (*shōgun*) over the *shugo* and *jitō*.

Aristocratic and military background. He was of noble and, as a descendant of the emperor Seiwa (reigned AD 858–876), even royal lineage. His family name, Minamoto, is Genji in Chinese (Gen being the Chinese reading of the symbol for Minamoto), and it is immortalized as the embodiment of ancient courtly ways in *The Tale of Genji* (*Genji monogatari*), one of the world's earliest and greatest novels. But the family's immediate past was military as well as aristocratic, and Yoritomo was impatient with the court's cultured and precious subtleties. He wanted power and was jealous, suspicious, and cold-hearted, even in his own circle. He went as far, in fact, as to liquidate several near relations. But once in power, he proved an excellent administrator.

Early life. Yoritomo was the third son of Minamoto Yoshitomo, who, in 1159, attempted to destroy Taira Kiyomori (scion of another dominant military family, the Taira clan) in the Heiji Disturbance, in Kyōto province. He was defeated, however, and his son Yoritomo was captured and banished to Izu province (a peninsula southwest of Tokyo), where for 20 years he lived under Taira surveillance.

Yoritomo enlivened his rustication by seducing the daughter of his jailer, Itō Sukechika. The latter's rage forced Yoritomo's flight to the protection of Itō's superior and neighbour, Hōjō Tokimasa, a Taira vassal whose hostile attitude to the Taira clan typified the contemporary split between court and country. Hōjō's daughter also succumbed to Yorimoto's blandishment but had to postpone marriage until 1180, when her official fiancé, the pro-Taira acting governor, had been eliminated. The essential feature, however—an understanding between Tokimasa and Yoritomo—was swiftly completed; and Yoritomo's political pretensions now enjoyed support.

Meanwhile Taira Kiyomori, the head of the Taira clan, exercised his power over the Imperial court, thus alienating Go-Shirakawa, the retired emperor. (At this period of Japanese history the emperor often lived in "retirement" away from court so he could rule without the hindrance of the highly detailed court ceremonials. This practice was known as *insei*.) Most of the aristocracy and the heads of the great temples and shrines were also resentful of the Taira clan's hold over the emperor.

Rise to power. In 1180 Minamoto Yorimasa, another member of the Minamoto clan, joined in a rebellion with an Imperial prince, Mochihito-ō, who summoned the Minamoto clan to arms in various provinces. Yoritomo now used this princely mandate as a justification for his own uprising. Despite Mochihito-ō's death, which occurred shortly before Yoritomo's men were led into battle, he succeeded in gaining much support from the feudal lords in the eastern provinces. Many members of the Taira family also enrolled under Yoritomo's banner, for they were disappointed with their meagre rewards from cousins at court. Yoritomo immediately advanced to Kamakura (about 10 miles [16 km] south of modern Tokyo) and established his headquarters there. As well as consolidating a hold over his own vassals in the Kantō area (west of Tokyo), Yoritomo tried to organize the Minamoto followers under his direct control. He was loath to relinquish control to any of his various relatives, and to this end he established the Samurai-dokoro ("Board of Retainers").

Minamoto Yoritomo, colour on silk cloth attributed to Fujiwara Takanobu; in the collection of Jingō Temple, Kyōto

Collection of Jingō Temple, Kyōto; photograph from the Tokyo National Museum

In 1183 Minamoto Yoshinaka, a cousin of Yoritomo, occupied the Hokuriku district and invaded Kyōto, the seat of the court. Shirakawa-Go, who always hoped to play off supporters, as well as enemies, against each other to regain some of the substance of Imperial power, invited Yoritomo to put an end to Yoshinaka's dangerously successful career; and Yoritomo accordingly crushed Yoshinaka at Kyōto. Yoritomo now established the Kumonjo ("Board of Public Papers") and Monchūjo ("Board of Questioning"), setting up not only a military but also an independent political government in the east, yet one that was recognized by the central Imperial court in Kyōto. In 1184 Yoritomo's considerable armies, commanded by his two younger half-brothers Noriyori and Yoshitsune, the latter a brilliant commander of whom Yoritomo was jealous, were ranged against the Taira forces for what was hoped would be a climactic campaign, but decisive victory was not gained until the following year. After Minamoto's next victory, the emperor supported Yoshitsune in efforts to restrain Yoritomo's power. But Yoritomo immediately expelled Yoshitsune and imposed on the emperor the establishment of *shugo* and *jitō* throughout Japan, avowedly to capture Yoshitsune, though such arrangements were instrumental in making Yoritomo's ascendancy nationwide. Soon after, Yoritomo succeeded in having Yoshitsune put to death.

The Kamakura shogunate. Yoritomo gave his *shugo*, each placed in a province, the function of administering and policing the Minamoto vassals locally. The *shugo* also administered the judicial proceedings in cases of rebellion and murder, and they thus acquired something of a military hold over each province. To supervise individual estates, the more pacific office of *jitō* was created, which levied taxes and undertook the management of the estates. And, not surprisingly, both the *shugo* and the *jitō* became feudal lords. Through these institutions, Yoritomo was thus able to undermine the central government's local administrative power, and subsequently he even made efforts to rule remote districts, such as Kyushu, Japan's southernmost island.

In 1185 he destroyed Fujiwara Yasuhira, an independent noble of the Tohoku area, demonstrating his ambition to create a power structure independent of the capital, at Kyōto. In 1192, a few months after his old rival Go-Shirakawa's death, Yoritomo, now with no one to hinder his ultimate ambition, titled himself *sei-i tai shōgun* ("barbarian-quelling generalissimo"), becoming the supreme commander over the feudal lords. The Kamakura shogunate was now formally complete.

After 1192 Yoritomo's policies were designed to relieve the strain between the military lords and the court aristocrats, and the powerful temples and shrines. Thanks to the institutions of the *shugo* and *jitō*, relations between the court of Kyōto and Yoritomo's government at Kamakura were fairly stable. Yoritomo died in 1199.

Yoritomo is often charged with cruelty, particularly in the killing of his cousin and brothers, but political circumstances of his time were difficult. He had above all to prevent discord among his vassals and the whole military class if his work was to attain the permanence that it did. *See also* Fujiwara family; Hōjō family; Taira family. (K.N.)

Minamoto Yoriyoshi (b. 988, Japan—d. Aug. 27, 1075, Japan), warrior who established the Minamoto clan in the strategic Honshu region of northern Japan.

After aiding the central government in quelling several uprisings by Ainu tribesmen, Yoriyoshi was sent to crush a rebellion led by Abe Yoritoki of the powerful Abe warrior clan of northern Japan (1051). The fighting was characterized by repeated pauses, defeats on both sides, and many barbarous incidents, but Yoriyoshi was finally victorious in 1062. These battles are known as the Earlier Nine Years' War, nine years being the actual time of the fighting, not counting the pauses between battles. In the course of the war, Yoriyoshi gained many loyal retainers who eventually served the Minamoto clan well in its struggle for dominance in Japan.

Minamoto Yoshiie (b. 1039, Kawachi, Japan—d. August 1106, Japan), warrior who shaped the Minamoto clan into an awesome fighting force that was feared and respected throughout Japan. Later generations of Minamotos worshipped Yoshiie as an almost divine ancestor.

The son of Minamoto Yoriyoshi, Yoshiie aided his father in the battles known as the Earlier Nine Years' War (1051–62), which ultimately resulted in the defeat of the Abe clan and the ascendancy of the Minamotos in northern Japan. Yoshiie's military prowess so awed his enemies that they called him Hachiman-Tarō, "the firstborn of the God of War."

Twenty years after this war, the Kiyowara family, which had aided the Minamoto family in the Earlier Nine Years' War, began to challenge Minamoto rule in northern Japan. In a series of battles lasting from 1083 to 1087, Yoshiie's reputation for ferocity in battle was not diminished. He eliminated the Kiyowaras and established the absolute sovereignty of the Minamotos in the north. Unlike the Earlier Nine Years' War, however, this conflict was fought without any commission from the court and was evidence of the Minamotos' growing independence. These later battles are collectively known as the Later Three Years' War, three years being the time of the actual fighting, not counting the pauses.

Minamoto Yoshitomo (b. 1123, Japan—d. Feb. 12, 1160, Owari Province, Japan), Japanese warrior whose support of Taira Kiyomori, the leader of the Taira clan, in the Hōgen Disturbance (1156) was decisive in a Taira victory over the Minamoto clan, headed by Yoshitomo's own father, Minamoto Tameyoshi. After Kiyomori's victory, Yoshitomo was ordered to kill his father. He refused, but another Minamoto officer, saying it would be a disgrace to allow a Taira to execute Tameyoshi, performed the deed.

Dissatisfied with his share of the spoils, Yoshitomo in 1159 took advantage of Taira Kiyomori's absence from the capital to attempt a coup d'etat. In the resulting Heiji Disturbance (1159), one of the most colourful episodes in Japanese history, Kiyomori rallied his forces and defeated Yoshitomo. Yoshitomo escaped, only to be killed while seeking refuge in eastern Japan. Two of his sons survived, however, and one, Yoritomo, later defeated Kiyomori and established Minamoto dominance over all of Japan.

Minamoto Yoshitsune (b. 1159, Japan—d. June 15, 1189, Fort Koromogawa, Mutsu Province, Japan), warrior who engineered many of the military victories that helped his half brother Yoritomo gain control of Japan. He is probably the most popular Japanese historical figure of the period, and his romantic exploits have captured the imagination of the Japanese people, who have perpetuated numerous legends, stories, and kabuki plays celebrating the adventures of Yoshitsune and his faithful follower Benkei. Many Western-style novels and films have also been based on his life.

Yoshitsune was the son of Minamoto Yoshihomo (1123–60), who was killed while seeking refuge after his defeat by Taira Kiyomori in the Heiji Disturbance (1159). Kiyomori spared the infant Yoshitsune, who was placed in a monastery near the capital at Kyōto, where he trained to become a Buddhist priest. According to legend, on a bridge near the monastery, Yoshitsune encountered Benkei, who challenged him to a sword match. Easily defeated by Yoshitsune, Benkei became a trusted retainer.

At 15 Yoshitsune ran away from the monastery to join his older brother, Yoritomo, in the Honshu region of northern Japan. Despite his youth, Yoshitsune proved to be a military genius in the revolt Yoritomo had raised against Kiyomori. Provided with an army by Yoritomo, he was ordered to advance against the forces of his cousin Minamoto Yoshinaka, who threatened Yoritomo's plans for domination of Japan. Victorious over Yoshinaka, Yoshitsune occupied Kyōto. He then attacked the remaining Taira forces along the Inland Sea, annihilating them in a famous naval battle during the spring of 1184.

While in Kyōto, Yoshitsune became a favourite of the Emperor and his court, arousing Yoritomo's jealousy. Yoshitsune's attempt to visit his brother in the northern city of Kamakura was rebuffed with a letter charging the younger man with having taken arbitrary actions during his campaigns. Yoshitsune then attempted to raise a rebellion against him with the aid of his uncle Minamoto Yukiie, but, failing, he was forced to flee.

Hunted by his brother's soldiers, Yoshitsune wandered Japan for several years, often in the guise of a monk, before taking refuge with Fujiwara Hidehira, a powerful independent lord in northern Japan. When Hidehira died in 1187, after exacting a promise from his son to protect Yoshitsune, the son, fearful of Yoritomo, sent soldiers to surround Yoshitsune and force his suicide. His head was then sent to Yoritomo preserved in sake, but Yoritomo, who was seeking to consolidate and complete his conquests, destroyed the Fujiwara quarters, bringing all Japan under his control.

Mīnanātha (Indian guru): *see* Matsyendranātha.

Minangkabau, Malay URANG PADANG (People of Padang), largest ethnic group on the island of Sumatra, Indonesia, whose traditional homeland is the west central highlands. Their numbers have been variously estimated at between 2,000,000 and 5,000,000. Although Muslim, the Minangkabau are matrilineal—*i.e.,* they trace descent and inheritance through the female line. Traditionally, the wife remained with her maternal relatives after marriage, and the husband, having no home of his own, resided in his mother's house and only visited his wife.

The domestic unit was traditionally the community house, in which a head woman, her sisters, their daughters, and their children lived. Several of these houses made up the clan, within which no marriage was allowed. Several clans made up the *negari,* the largest unit of government, roughly equivalent in size to a village. Each house was represented in the clan council by a male member, or uncle.

The family house was a large rectangular structure, raised high above the ground, with a saddle-shaped roof. A main room occupied much of the structure. Adjoining it were the living compartments, each occupied by a woman, her children, and her husband when present.

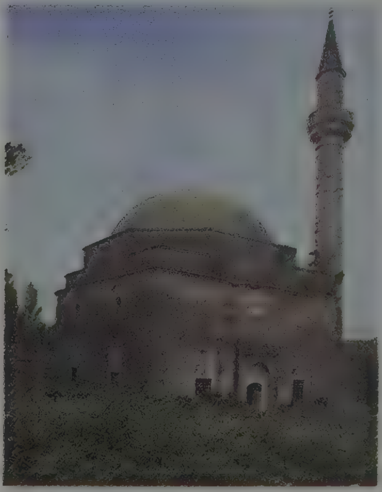
The Minangkabau have extensive terraced fields and garden plots in which they raise irrigated rice, tobacco, and cinnamon, as well as fruits and vegetables. Their crafts include wood carving, metalworking, and weaving.

Since World War II the traditional kinship structure has declined in importance, and many men have left the village to establish their own households with wives and children. Some of the kin-group land has become the personal property of these households.

Their language, closely resembling Malay, belongs to the Austronesian (Malayo-Polynesian) language family.

Some Minangkabau migrated to Malaya in the late 19th century and formed a confederation of small states that came to be known as Negri Sembilan (Nine States). Minangkabau tribesmen, closely resembling peninsular Malay physically and linguistically, left Sumatra to seek greater economic opportunity across the Strait of Malacca. Rapid expansion of Malayan tin mining after 1850 lured increasing numbers of Minangkabau as miners or as petty merchants. The immigrants secured transit to Malaya by selling property or receiving assisted passage in return for contract mine labour. By the beginning of the 20th century, however, capital-intensive mining displaced Minangkabau miners, who then shifted to agricultural pursuits in interior river valleys. Land was plentiful, and the Minangkabau frequently settled by squatting (*i.e.,* gaining title by clearing, planting, and living on the land). Malay sultans raised no objections to these racially Malay immigrants, who partially offset the influx of Chinese labourers. Minangkabau immigrants became successful smallholder farmers and in the 20th century came to control most retail trade in Malaya.

minaret (Arabic: "beacon"), in Islāmic religious architecture, the tower from which the faithful are called to prayer five times each day by a muezzin, or crier. Such a tower is always connected with a mosque and has one or more balconies or open galleries. At the time of the Prophet Muḥammad, the call to prayer was made from the highest roof in the vicinity of the mosque. The earliest minarets were former Greek watchtowers and the towers of Christian churches. The oldest minaret in North Africa is at al-Qayrawān, Tunisia. It was built between 724 and 727 and has a massive square form.



Small mosque with minaret near Edirne, Tur.

Villota—Photo Researchers

Minarets are constructed in a wide variety of forms ranging from thick, squat spiral ramps, as at Samarra, Iraq (built 848–852), to soaring, delicate, pencil-thin spires. Often the minaret is square at the base, where it is attached to the mosque. Above this square base it may rise in a series of circular, hexagonal, or octagonal stages, each marked by a projecting balcony. At the top is a bulbous dome, an open pavilion, or a metal-covered cone. The upper parts of the minaret are usually richly decorated with carving. The steps may be internal or external. The number of minarets per mosque also varies, from one to as many as six. These towers were built to be "landmarks of Islām"—to be visible from afar and to stamp a site with Islāmic character.

Minas, capital, Lavalleja department, southeastern Uruguay. Founded in 1783, the city was named for the surrounding mines. In the second half of the 20th century Minas has become increasingly attractive to tourists, since it is only 75 mi (120 km) northeast of Montevideo and offers hills and forests, both unusual in Uruguay. Its bottled mineral waters long have been distributed throughout the nation. Neighbouring mines and quarries (yielding granite, iron ore, and marble), administration, trade, and some industry provide the city's principal occupations. There is a television station in Minas. It is connected to Montevideo by the Pan-American Highway, a national railroad, and air services. Pop. (1996) 35,090.

Minas Basin, eastern inlet of the Bay of Fundy, protruding into central Nova Scotia, Canada. Up to 25 mi (40 km) in width and more than 50 mi in length (including its eastern extension, Cobequid Bay), the basin has some of the highest tides in the world; fluctuations exceeding 50 ft (15 m) have been recorded. It is connected to the Bay of Fundy by Minas Channel and receives the drainage of the Avon, Cornwallis, Salmon, and Shebenacadie rivers. Minas Basin, corrupted from the French Le Bassin des Mines, was so named in 1604 by Samuel de Champlain because of the mineral deposits (specifically at Cap d'Or) found along its shores. Walton, on the southeast coast, is the province's principal centre for mining metallic minerals (zinc, copper, silver, and lead).

Minas Gerais, inland *estado* (state) of Brazil. It is the storehouse of the mineral riches of that country, as is indicated by its name, which means "general mines." The state is bounded on the north by the states of Goiás and Bahia; on the east by Bahia, Espírito Santo, and Rio de Janeiro; on the south by Rio de Janeiro and São Paulo; and on the west by São Paulo, Mato Grosso do Sul, and Goiás. Its area is 226,708 sq mi (587,172 sq km). Its population is exceeded among Brazilian states only by that of São Paulo. The state capital and largest city is Belo Horizonte.

Minas Gerais was first explored by Fernão Dias Pais Leme between 1664 and 1677, though he was not the first European to enter the area. The discovery of gold in 1692–95 by bands of adventurers from the São Paulo settlements led to a mad rush for the new mines. Minas Gerais at first formed part of the captaincy of São Paulo, but in 1720 it was established as a separate captaincy general and was brought more directly under the Portuguese crown. Minas Gerais has traditionally played an important role in Brazilian politics, in part because of its central position but also because of the dense population in its southeast. In 1822 it became a province in the Brazilian Empire, and in 1891 a state in the federal republic. In 1897 the old colonial capital of Ouro Prêto, deprived of its administrative function, became a national monument in 1933. The new capital was placed at Belo Horizonte, where a new city, laid out on previously almost unoccupied land, was planned and built.

Minas Gerais lies almost wholly within the geologically ancient, mineral-rich uplands known as the Brazilian Highlands, a much dissected hilly upland reaching an elevation of about 2,600 ft (790 m) above sea level. Only small sections of the southern and eastern parts are within the zone of the Great Escarpment which forms the eastern margin of the highlands. In the southwest, along the border of São Paulo, is the commanding range of mountains known as the Serra da Mantiqueira, whose highest summit, Pico das Agulhas Negras (also known as Pico do Itatiaia), reaches 9,144 ft. The other principal mountain range is the Serra do Espinhaço, which begins a little south of Belo Horizonte and extends northward into Bahia. It forms the divide between the rivers draining to the São Francisco River and those draining eastward directly to the Atlantic (the Doce, Mucuri, Jequitinhonha). In the southwest Minas Gerais is drained by the Rio Grande, one of the major headwaters of the Paraná River. The whole northwestern part of the state is drained by the São Francisco, which flows northward through a rift valley to the west of the Serra do Espinhaço.

At Belo Horizonte, 2,800 ft above sea level, the average temperature of the warmest month (February) is 72° F (22° C), and the average of the coldest month (July) is 62° F (about 17° C). The rainfall throughout most parts of the state averages between 40 and 60 in. (1,000 and 1,500 mm).

The southern and eastern part of the state was originally covered with a dense tropical forest including a few species of trees that shed their leaves in the dry season. On the upper slopes of the Serra da Mantiqueira and of the Serra do Espinhaço, the forest gives way to upland meadows or to a scrubby growth of deciduous woodland. All of southwestern and western Minas Gerais is covered by a woodland savanna.

The population of Minas Gerais is chiefly of Portuguese origin, with a considerable admixture from other European countries. Persons of African and mixed (African and European or European and Indian) ancestry constitute other important elements. Outside of the cities, there is a dense rural population in the south and east, but the whole northern and western part of the state is still very thinly occupied. The language is Portuguese, and the predominant religion is Roman Catholicism.

Living conditions in general are higher in the urban areas, and health services are more accessible in the cities. Minas Gerais has been one of the leading states in providing for education. The Universidade Federal de Minas Gerais, one of the country's official universities, was founded in 1927, and the Universidade Católica de Minas Gerais was established in 1958; both are in Belo Horizonte. The Escola Nacional de Minas e Metalurgia (founded 1876) is at Ouro Prêto.

The largest source of wealth in Minas Gerais is mining, but the largest source of employment is agriculture, and the greater part of the area is used for pasture of cattle. Minas Gerais has long been known for its wealth of minerals and its mining activities, supplying more than half the mineral production of Brazil. Gold was discovered in 1698 and in 1729 diamonds were discovered. These precious commodities created great wealth in the 18th century, and Ouro Prêto, the former administrative centre of Minas Gerais, became a city of great splendour, with numerous beautifully decorated churches. By 1800, however, the richest gold sources had been used up. Minas Gerais is also widely known for its semiprecious gems, such as aquamarine, amethyst, tourmaline, and topaz, and it is an important source of industrial diamonds and large quartz crystals.

Of greater importance in modern times, however, are the vast deposits of high-grade iron ore and manganese. In the southern part of the Serra do Espinhaço there is a large reserve of iron-ore, containing few impurities and so located that it can be mined with mechanical shovels. By the late 20th century there were three large-scale steel plants using this ore. Brazil now exports about two-thirds of its iron ore, with the majority of the exported ore produced in Minas Gerais. Minas Gerais also supplies bauxite, zirconium, iron pyrite, rutile, graphite, chromite, molybdenum, nickel, tungsten, titanium, beryl, and mica.

Manufacturing and processing industries have developed in and around the cities, especially around Belo Horizonte. In addition to iron and steel, principal industries include food processing, textiles, chemicals, and furniture and other consumer and capital goods.

Slash-and-burn agriculture produces corn (maize), rice, beans, and cassava rotated with pasture grass, chiefly for cattle grazing. This area is the chief source of beef for Rio de Janeiro, São Paulo, and other cities. Dairy farming is important in southern Minas Gerais. In only a few spots is the land used for sugarcane or coffee. The state is a leading producer of rice, beans, corn, and cheese.

In the Serra da Mantiqueira and in the southwestern uplands of the state, to the north of these mountains, are a number of resort towns, most of them possessing various hot and curative baths. The mineral waters are bottled and widely dispensed in Brazil.

Minas Gerais is served by railroads, all-weather highways, airports, and by river steamers that descend the São Francisco from Pirapora to Juàzeiro in Bahia. The main railroad, Estrada de Ferro Central do Brasil, runs from Rio de Janeiro to Belo Horizonte. Since World War II all-weather motor highways provide easy access to Rio de Janeiro, São Paulo, and the capital, Brasília.

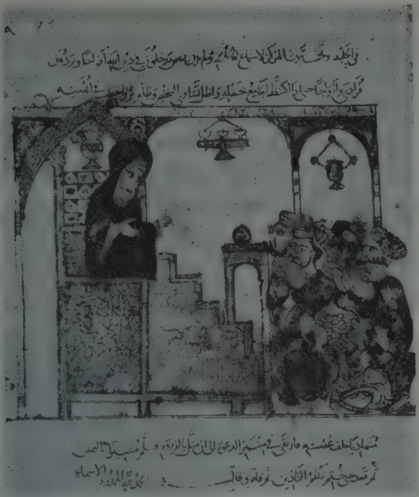
As is to be expected, the cultural life of the state is concentrated in its cities and especially in the capital, Belo Horizonte, and in Ouro Prêto, the old colonial capital. Pop. (2000 prelim.) 17,835,488.

Minatitlán, city and river port, southeastern Veracruz state, south central Mexico. It is on the Isthmus of Tehuantepec on the Río Coatzacoalcos, 20 mi (32 km) from its mouth on the Gulf of Mexico and 210 ft (64 m) above sea level. When founded in 1822 as Paso de la Fabrica, the settlement's inhabitants included North Americans, French, and Germans. The colony did not prosper until oil was discovered in the vicinity in the 1940s. Now a prosperous petrochemical centre, Minatitlán refines and distributes oil found on the isthmus. Mexico's first refinery was built in Minatitlán, and there is a network of gas and oil pipelines, the most important of which crosses the isthmus to the port of Salina Cruz, on the Gulf of Tehuantepec. Lumbering and agriculture are additional sources of income. Minatitlán is accessible by highway, railroad, river, and air. Pop. (2000 prelim.) 150,000.

minbar, in Islām, the pulpit from which the sermon (*khuṭbah*) is delivered. In its simplest form the *minbar* is a platform with three steps; often it is constructed as a domed box at the top of a staircase and is reached through a doorway that can be closed.

Muḥammad originally delivered his *khuṭbahs* while leaning against a palm-trunk pillar in the mosque at Medina. *Ḥadīth* (accounts of Muḥammad's life and sayings) report that Muḥammad later used a seat with two steps for receiving delegations in the mosque and also that he preached from this portable *minbar,* which was fashioned from tamarisk wood by a Greek or Abyssinian carpenter. His successors, the caliphs, used his *minbar* as a symbol of their authority.

During the first century of Islām, provincial governors also came to use the *minbar,* from which they made speeches and heard petitions, primarily in their capacity as rulers. When the *khuṭbah* lost its informative, political, and discursive character and became a



Sermon being preached from a *minbar*, miniature from the *Maqāmāt* of al-Ḥarīrī, 1223 (Paris, Bibliothèque Nationale, MS. Arabe 6094, fol. 93)

By courtesy of the Bibliotheque Nationale, Paris

purely religious sermon during the reign of the ʿAbbāsid caliphs, the *minbar* also became a religious object. It became more permanent in nature, the number of steps increased, and it was commonly executed in stone or brick. It was even covered with a cloth, the *qaṭīfah.*

A list of the abbreviations used in the MICROPAEDIA *will be found at the end of this volume*

Minbu, town, west-central Myanmar (Burma), on the Irrawaddy River opposite Magwe (Magway) town. The river there is about 3 miles (5 km) wide but contains many islands and sandbanks, and in the dry season steamers can come no nearer than 4 miles (6.5 km) south of the town.

Although much of the surrounding land is semidesert scrub forming part of Myanmar's dry zone, large areas around Minbu are irrigated by the Mon, Maw, and Salin rivers. The area is the site of one of the three historic irrigation systems in Myanmar and has modern irrigation works. Sesame, millet, gram, peanuts (groundnuts), and other crops are grown in the nonirrigated lowland. Fishing is an important economic activity. There is oil in mud volcanoes, and small oilfields have been developed in the line of hills running through Minbu, which is the site of a diesel electric plant. Pop. (1983) 135,862.

Minch, The, also called NORTH MINCH, Atlantic sea channel between the Outer Hebrides island group on the west and the mainland of Scotland on the east. The channel varies in width between 25 and 45 miles (40 and 70 km) and has both great depth and a rapid current. The Little Minch, its southerly extension, lies between the island groups of the Outer and Inner Hebrides, separating the islands of Harris and North Uist in the west from the island of Skye in the east.

mincha, also spelled MINCHAH (Judaism): *see* minhah.

Minchō: *see* Kichizan.

Mincio, Giovanni, Latin JOHANNES MINCIUS (pope): *see* Benedict (X).

mind, in the Western tradition, the complex of faculties involved in perceiving, remembering, considering, evaluating, and deciding. Mind is in some sense reflected in such occurrences as sensations, perceptions, emotions, memory, desires, various types of reasoning, motives, choices, traits of personality, and the unconscious.

A brief treatment of mind follows. The subject of mind is treated in a number of articles in the MACROPAEDIA. For a philosophical treatment of Western conceptions, *see* Mind, Philosophy of. For scientific treatment of the so-called mental faculties, *see* Intelligence, Theories and Distribution of; Learning, Animal; Learning and Cognition, Human; Memory; Perception, Human; Thought and Thought Processes. For treatment of Eastern conceptions, in the context of the respective philosophical traditions, *see* Buddhism, Buddha and; Hinduism; etc.

To the extent that mind is manifested in observable phenomena, it has frequently been regarded as a peculiarly human possession. Some theories, however, posit the existence of mind in other animals besides human beings. One theory regards mind as a universal property of matter. According to another view, there may be superhuman minds or intelligences, or a single absolute mind, a transcendent intelligence.

Several assumptions are indispensible to any discussion of the concept of mind. First is the assumption of thought or thinking. If there were no evidence of thought in the world, mind would have little or no meaning. The recognition of this fact throughout history accounts for the development of diverse theories of mind. It may be supposed that such words as "thought" or "thinking" cannot, because of their own ambiguity, help to define the sphere of mind. But whatever the relation of thinking to sensing, thinking seems to involve more—for almost all observers—than a mere reception of impressions from without. This seems to be the opinion of those who make thinking a consequence of sensing, as well as of those who regard thought as independent of sense. For both, thinking goes beyond sensing, either as an elaboration of the materials of sense or as an apprehension of objects that are totally beyond the reach of the senses.

The second assumption that seems to be a root common to all conceptions of mind is that of knowledge or knowing. This may be questioned on the ground that, if there were sensation without any form of thought, judgment, or reasoning, there would be at least a rudimentary form of knowledge—some degree of consciousness or awareness by one thing or another. If one grants the point of this objection, it nevertheless seems true that the distinction between truth and falsity and the difference between knowledge, error, and ignorance or between knowledge, belief, and opinion do not apply to sensations in the total absence of thought. Any understanding of knowledge that involves these distinctions seems to imply mind for the same reason that it implies thought. There is a further implication of mind in the fact of self-knowledge. Sensing may be awareness of an object, and to this extent it may be a kind of knowing, but it has never been observed that the senses can sense or be aware of themselves.

Thought seems to be not only reflective but reflexive, that is, able to consider itself, to define the nature of thinking, and to develop theories of mind. This fact about thought—its reflexivity—also seems to be a common element in all the meanings of "mind." It is sometimes referred to as "the reflexivity of the intellect," as "the reflexive power of the understanding," as "the ability of the understanding to reflect upon its own acts," or as "self-consciousness." Whatever the phrasing, a world without self-consciousness or self-knowledge would be a world in which the traditional conception of mind would probably not have arisen.

The third assumption is that of purpose or intention, of planning a course of action with foreknowledge of its goal or of working in any other way toward a desired and foreseen objective. As in the case of sensitivity, the phenomena of desire do not, without further qualification, indicate the realm of mind. According to the theory of natural desire, for example, the natural tendencies of even inanimate and insensitive things are expressions of desire. But it is not in that sense of desire that the assumption of purpose or intention is here taken as evidence of mind.

It is rather on the level of the behaviour of living things that purpose seems to require a factor over and above the senses, limited as they are to present appearances. It cannot be found in the passions, which have the same limitation as the senses, for unless they are checked they tend toward immediate emotional discharge. That factor, called for by the direction of conduct to future ends, is either an element common to all meanings of "mind" or is at least an element associated with mind. It is sometimes called the faculty of will—rational desire or the intellectual appetite. Sometimes it is treated as the act of willing, which, along with thinking, is one of the two major activities of mind or understanding; and sometimes purposiveness is regarded as the very essence of mentality.

These assumptions—thought, knowledge or self-knowledge, and purpose—seem to be common to all theories of mind. More than that, they seem to be assumptions that require the development of the conception. The conflict of theories concerning what the human mind is, what structure it has, what parts belong to it, and what whole it belongs to does not comprise the entire range of controversy on the subject. Yet enough is common to all theories of mind to permit certain other questions to be formulated: How does the mind operate? How does it do whatever is its work, and with what intrinsic excellences or defects? What is the relation of mind to matter, to bodily organs, to material conditions, or of one mind to another (*see* mind–body dualism)? Is mind a common possession of men and animals, or is whatever might be called mind in animals distinctly different from the human mind? Are there minds or a mind in existence apart from man and the whole world of corporeal life? What are the limits of so-called artificial intelligence, the capacity of machines to perform functions generally associated with mind?

The intelligibility of the positions taken in the disputes of these issues depends to some degree on the divergent conceptions of the human mind from which they stem. The conclusions achieved in such fields as theory of knowledge (*see* epistemology), metaphysics, logic, ethics, and the philosophy of religion are all relevant to the philosophy of mind; and its conclusions, in turn, have important implications for those fields. Moreover, this reciprocity applies as well to its relations to such empirical disciplines as neurology, psychology, sociology, and history.

mind–body dualism, in philosophy, any theory that mind and body are distinct kinds of substances or natures. This position implies that mind and body not only differ in meaning but refer to different kinds of entities. Thus, a dualist would oppose any theory that identifies mind with the brain, conceived as a physical mechanism.

The modern problem of the relationship of mind to body stems from the thought of René Descartes, a 17th-century French philosopher and mathematician, who gave dualism its classical formulation. Beginning from his famous *Cogito, ergo sum* (Latin: "I think, therefore I am"), Descartes developed a theory of mind as an immaterial, nonextended substance that engages in various activities such as rational thought, imagining, feeling, and willing. Matter, or extended substance, conforms to the laws of physics in mechanistic fashion, with the important exception of the human body, which Descartes believed is causally affected by the human mind and which causally produces certain mental events. For example, willing the arm to be raised causes it to be raised, whereas being hit by a hammer on the finger causes the mind to feel pain. This part of Descartes's dualistic theory, known as interactionism, raises one of the chief problems faced by Descartes: the question how this causal interaction is possible.

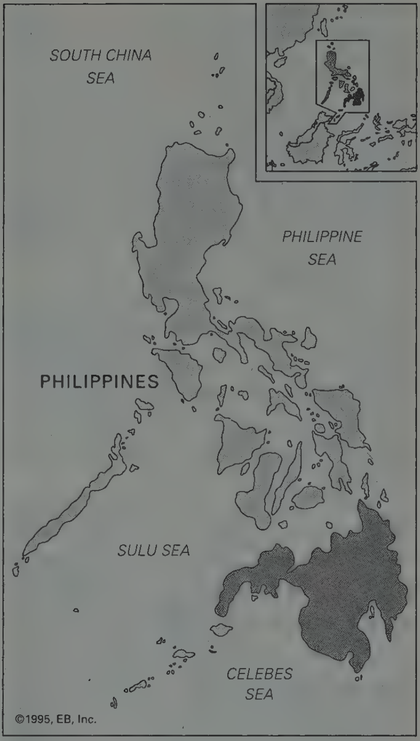
This problem gave rise to other varieties of dualism, such as occasionalism and some forms of parallelism that do not require direct causal interaction. Occasionalism maintains that apparent links between mental and physical events are the result of God's constant causal action. Parallelism also rejects causal interaction but without constant divine intervention. Gottfried Wilhelm Leibniz, a 17th-century German rationalist and mathematician, saw mind and body as two perfectly correlated series, synchronized like two clocks at their origin by God in a preestablished harmony.

Another dualistic theory is epiphenomenalism, which agrees with other theories in holding that mental events and physical events are different. The epiphenomenalist holds, however, that the only true causes are physical events, with mind as a by-product. Mental events seem causally efficacious because certain mental events occur just before certain physical events and because humans are ignorant of the events in the brain that truly cause them.

Among the difficulties of dualism is the inherent obscurity in conceiving of what sort of thing a mental substance—an immaterial, thinking "stuff"—might be. Such criticisms have led some thinkers to abandon dualism in favour of various monistic theories.

mind reading, a magician's trick involving various silent or verbal signals that cue a conjurer to answer a question as though with second sight. Philip Breslaw, the first magician of note to feature mind reading, played in 1781 at the Haymarket Theatre in London to appreciative audiences. In 1784 the Pinettis, a husband-and-wife team, advertised Mrs. Pinetti as able to guess the thoughts of the audience. In the 19th century, Jean-Eugène Robert-Houdin, Robert Heller, Compars Herrmann, and Henri Robin also used mind reading as part of their repertoire. In the 20th century there were Harry Houdini, Joseph Dunninger, and the Amazing Kreskin.

Drawing on carefully devised alphabetical and numerical arrangements and on certain methods of conveying signals, the conjurer would guess personal names and numbers. Another arrangement of objects into sets, verbal cues, and numerical signals allowed the magician to guess objects in the hands of audience members. With the aid of electricity, Robert Heller was able to answer questions correctly by using a silent signal.



Mindanao

Mindanao, island, the second largest (after Luzon) in the Philippines, in the southern part of the archipelago, surrounded by the Bohol, Philippine, Celebes, and Sulu seas. Irregularly shaped, it has an area of 36,537 square miles (94,630 square km) and measures 293 miles (471 km) north to south and 324 miles (521 km) east to west. The island is marked by peninsulas and is heavily indented by the Davao and Moro gulfs in the south and by Iligan Bay in the north. The long, semicircular Zamboanga Peninsula (west) extends southwesterly toward the Sulu Archipelago and Borneo, and the Cotabato and Surigao peninsulas extend south and north, respectively.

Rugged, faulted mountains and volcanoes occur in many areas. Mount Apo, at 9,691 feet (2,954 m), is an active volcano in the southern part of the central highlands; it is the highest peak in the Philippines. The island has narrow coastal plains, and broad, fertile basins and extensive swamps are formed by the Mindanao and Agusan river systems. Lake Sultan Alonto (formerly called Lake Lanao), created by a lava dam, has an area of 134 square miles (347 square km). The island has a marsh-game refuge and bird sanctuary. The rare monkey-eating eagle is unique to Mindanao.

Mindanao is a Muslim outpost in the predominantly Roman Catholic Philippines. Although Muslims are no longer a majority, Islāmic culture is evident; there are many mosques, and distinctive brassware, including the kris, or dagger, is manufactured. The autonomous region of Muslim Mindanao—consisting of territory in western and southwestern Mindanao along with a number of nearby islands, including Tawitawi and Jolo—was established in 1990.

Mindanao also has the largest concentration of ethnic minorities in the Philippines. They include the Magindanaw, Maranaw, Ilanum, and Sangil; all are Muslim groups known collectively as the Moro. Groups usually found in the uplands include the Tagabili, Subanon, Bukidon, Bagobo, Mandaya, and Manobo. Another important group is the Tiruay, whose religion is a mixture of Christian, Muslim, and animist beliefs.

Houses along the southern coast of Mindanao, Philippines

Paul Almasy

Because of its large expanses of undeveloped fertile land, Mindanao has been considered the nation's "pioneer frontier." It did not experience substantial population increase until migration was promoted after 1939. The chief crops are corn (maize), rice, abaca, bananas, pineapples, mangoes, and coconuts. Cotton, ramie (a fibre plant), coffee, and cacao are also grown. The timber industry is important, and there are gold, nickel, iron, and coal deposits. Chartered cities include Zamboanga City, Cotabato City, Davao City, Cagayan de Oro, and Butuan (*qq.v.*). Pop. (1990 prelim.) 13,232,000.

Mindanao Deep, also called MINDANAO TRENCH (Pacific Ocean): *see* Philippine Trench.

Mindanao River, also called RÍO GRANDE DE MINDANAO, or COTABATO RIVER, main river of the Cotabato lowland, central Mindanao, Philippines. It rises in the central highlands of northeastern Mindanao (island) as the Pulangi and then flows south to where it joins the Kabacan to form the Mindanao. It meanders northwest through the Libungan Marsh and Liguasan Swamp, which is the habitat of crocodiles. At Datu Piang the river turns to enter Illana Bay of the Moro Gulf in two tributaries—the Cotabato and Tamentaka—after a 200-mile (320-kilometre) course. With its many tributaries—Pulangi and Maridagao (north), Alah (south), Malabul, Dalapuan, and Alip (east)—the river system forms a wide fertile basin. It is a major inland-transportation artery, the banks of which are lined with trading centres that include Cotabato City, Datu Piang, and Pagalungan.

Mindanao Sea: *see* Bohol Sea.

Mindaugas (Lithuanian), Polish MENDOG, or MINDOWE, Russian MENDOVG (d. 1263), ruler of Lithuania, considered the founder of the Lithuanian state. He was also the first Lithuanian ruler to become a Christian.

Mindaugas successfully asserted himself over other leading Lithuanian nobles and tribal chiefs, including his brother and his nephews, in 1236. The state thus formed under his leadership included Lithuania proper, Samogitia, and much of Belorussia. In 1250 or 1251 Mindaugas accepted baptism from the Livonian Knights, thus easing western pressure against his state from the Teutonic and Livonian Knights and from Daniel of Halich-Volynia. In 1253 he received a royal crown from Pope Innocent IV.

With the west for a time stabilized, Mindaugas continued his eastern expansion into Russian lands, which he had begun in the 1230s. His efforts led to the incorporation of much Russian territory into Lithuania at the expense of Russia's Mongol subjugators. Indeed, Mindaugas' campaigns in the east checked a Mongol drive toward the Baltic.

Mindaugas turned his attention to the west again in the late 1250s, when the Livonian Knights encroached on Samogitia, causing a local revolt. Mindaugas unofficially supported the Samogitians and reverted to paganism. In 1263 he and two of his sons were murdered by a group of Samogitian rivals.

Mindel Glacial Stage, major division of Pleistocene time and deposits in Alpine Europe (the Pleistocene epoch began about 1,600,000 years ago and ended about 10,000 years ago). The Mindel Glacial Stage is part of the early geologic scheme (*c.* 1900) that first recognized the importance of multiple episodes of Pleistocene glaciation. The Mindel Glacial Stage, representing a period of relatively severe climatic conditions and glacial advance, preceded the Mindel-Riss Interglacial and followed the Günz-Mindel Interglacial, both periods of relatively moderate climatic conditions. The Mindel Glacial Stage lasted from about 750,000 to 675,000 years ago. At least two periods of glacial advance, separated by a moderate period, are recognized in the Mindel.

Mindelo, Portuguese PORTO GRANDE, city and main port of Cape Verde, in the Atlantic Ocean. It lies on the northwest shore of São Vicente Island, about 560 miles (900 km) off the west African coast. The city's deepwater harbour on Porto Grande Bay is an important refueling point for transatlantic freighters. Mindelo port has been a submarine cable station since 1875. A new shipyard, financed by a loan from the European Investment Bank, was completed in the early 1980s. Pop. (1990 prelim.) 47,080.

Mindelo, chief city of São Vicente Island
Walter Imber

Minden, city, North Rhine–Westphalia *Land* (state), northwestern Germany. It lies along the Weser River, near a narrow defile known as the Porta Westfalica where the river quits the mountains and enters the North German Plain. The emperor Charlemagne organized a military bishopric there in 800. The town struggled for independence from the bishopric, joined the Hanseatic League in the 13th century, and thrived as a trading centre. The bishopric was secularized in 1648, when it passed with the town to Brandenburg. Minden was fortified by Frederick II the Great of Prussia in the mid-18th century. Although it was held briefly by the French in the Seven Years' War, it reverted to Prussia after the victory of the British and Hanoverians at the Battle of Minden in 1759. It passed to Westphalia in 1807 but became Prussian again in 1814. Historic buildings in the centre of the city, including the 11th–13th-century Gothic single-naved cathedral and the early Gothic town hall, were severely damaged in World War II. Both have been rebuilt. The medieval churches of St. Martin and St. Mary and a number of "Weser Renaissance" houses survived.

An important road and rail traffic centre, Minden is the junction of waterways where the remarkable Mittelland Canal aqueduct bridges the Weser. Textiles, furniture, chemicals, glass, ceramics, and heavy metals are important in the city's economy. Other significant economic activities are based on farming and cattle breeding in the surrounding area. Pop. (1992 est.) 78,909.

Mindon (b. 1814, Amarapura, Myanmar [Burma]—d. Oct. 1, 1878, Mandalay), king of Myanmar from 1853 to 1878. His reign was notable both for its reforms and as a period of cultural flowering in the period before the imposition of complete colonial rule.

Mindon was a brother of Pagan (reigned 1846–53), who had ruled during the Second Anglo-Burmese War in 1852. As soon as he became king, Mindon sued for peace and began negotiations with the British on the status of Pegu (in southern Myanmar), which the British had occupied during the war. Frustrated in his attempts to persuade them to return Pegu, the king was obliged to accept a much-reduced dominion, cut off from the sea and deprived of some of the richest teak forests and rice-growing regions. To avoid further trouble, he signed a commercial treaty in 1867 that gave the British generous economic concessions in the unoccupied parts of Myanmar. In 1872 he sent his chief minister, the Kinwun Mingyi U Gaung, on a diplomatic mission to London, Paris, and Rome to secure international recognition of Myanmar's status as an independent country and to appeal for restoration of its lost territory.

Mindon's reign is sometimes considered to have been a golden age of Myanmar culture and religious life. In 1857 he built a new capital, Mandalay, with palaces and monasteries that are masterpieces of traditional Myanmar architecture. The king also sought to make Mandalay a centre of Buddhist learning, convening the Fifth Buddhist Council there in 1871 in an effort to revise and purify the Pāli scriptures.

Despite conservative opposition, Mindon promoted numerous reforms. The most important were the *thathameda,* the assessed land tax, and fixed salaries for government officials. He standardized the country's weights and measures, built roads and a telegraph system, and was the first Myanmar king to issue coinage. Mindon's reign compares favourably with that of Mongkut of Siam (Thailand), even though Siam enjoyed the privileged position of a buffer state between British and French possessions, while the continued existence of an independent Myanmar kingdom was a hindrance to British interests.

Mindon was succeeded by his son, Thibaw (reigned 1878–85), who was to be the last king of Myanmar.

Mindoro, island, west-central Philippines. It lies across the Verde Island Passage from Luzon (northeast) and between the Mindoro (southwest) and Tablas (southeast) straits. Unlike the majority of its sister islands, Mindoro has no deep coastal embayments or fringing islets. Oval-shaped, it has an area of 3,759 square miles (9,735 square km).

A mountainous core extending for 100 miles (160 km) along the island's entire length is surrounded by a broken coastal plain, widest along the eastern shore. Lake Naujan and Mount Halcon (8,481 feet [2,585 m]), the island's highest point, are in the northeast. Steep-sided valleys are formed by rivers, including the Pandan, Ibod, and Bongabong. The *tamaraw* (tamarau), a small water buffalo, is unique to Mindoro.

Historically, Mindoro's population growth was kept in check through raids by Muslim (Moro) seafarers from the southern islands and by the prevalence of malaria. Since 1948 the island has been one of the nation's resettlement areas, which has lent a frontier aspect to its life. The inhabitants of the rugged interior are non-Christian, seminomadic peoples who practice slash-and-burn (*kaingin*) farming; they include Negritos and Hanunóo. Coastal areas, especially in the west, are more densely populated and commercialized and are settled primarily by Christian Tagalogs, particularly from the Batangas Peninsula of Luzon. Hiligaynon peoples have migrated to the southern areas.

The University of the Philippines maintains a marine biological station at Puerto Galera on the northern coast. There are substantial deposits of coal in the south.

The island's main population centres are Calapan and Mamburao. Pop. (1990 prelim.) including adjacent islands, 833,000.

Mindowe (Lithuanian ruler): *see* Mindaugas.

Mindszenty, József, original name JÓZSEF PEHM (b. March 29, 1892, Csehimindszent, near Szombathely, Austria-Hungary [now in Hungary]—d. May 6, 1975, Vienna, Austria), Roman Catholic clergyman who personified uncompromising opposition to fascism and communism in Hungary for more than five decades of the 20th century.

Politically active from the time of his ordination as a priest in 1915, Mindszenty was arrested as an enemy of totalitarian governments twice in 1919 and again in 1944, the year in which he was consecrated bishop of Veszprém. In 1945 he was appointed primate of Hungary and archbishop of Esztergom, and in 1946 he was made a cardinal.

His refusal to permit the Roman Catholic schools of Hungary to be secularized prompted the communist government to arrest him in 1948 and convict him in 1949 on charges of treason. Sentenced to life imprisonment, he was set free during the uprising of 1956 and, when the communist government regained control, he sought asylum in the U.S. embassy in Budapest. He spent 15 years in voluntary confinement there, rejected requests from the Vatican to leave Hungary, and relented only in 1971, at the entreaty of the U.S. president Richard M. Nixon. As the guest of the Vatican and, after 1971, in Vienna, he criticized the pope's attempts to deal with Hungary's communist regime and in 1974 was retired from his posts as archbishop and primate. His *Memoirs* were published in 1974. Mindszenty was originally buried in Austria, but in 1991, after the fall of Hungary's communist government, he was reburied in the Basilica in Esztergom, Hungary.

mine, in military and naval operations, a usually stationary explosive device that is designed to destroy personnel, ships, or vehicles when the latter come in contact with it. Submarine mines have been in use since the mid-19th century; land mines did not become a significant factor in warfare until a hundred years later.

Submarine mine. A submarine mine is an underwater weapon consisting of an explosive charge fitted with a device that causes it to explode when a ship or submarine enters into close proximity. Usually emplaced by specialized vessels called minelayers or dropped by specialized aircraft, submarine mines are steel spheres or ovate shapes that contain enough air to enable the mine to float in the water. The mine is anchored in place, its depth beneath the surface depending on the length of the cable by which it is tethered. When touched or approached by the hull of a vessel, the mine explodes. Highly destructive yet relatively cheaply built, mines are effective naval weapons. They are used offensively by being placed where enemy vessels are expected to pass, especially in or just outside enemy harbours. Defensively, mines are placed in carefully and secretly charted locations adjacent to the defender's harbours and installations, and they are usually staggered at varying depths to protect against both submarines and surface vessels. Saboteurs or commandos sometimes covertly attach mines to vessels' hulls for later explosion by timer or remote control. The typical submarine mine contains about 225 kg (500 pounds) of explosives.

The most common type of detonator used in submarine mines is a contact device; rods or antennae protrude from the mine's surface and activate the firing mechanism when the hull of a passing ship strikes them. Other types of detonators used on submarine mines include magnetic, pressure, and acoustic ones. The magnetic mine is triggered by the approaching ship's magnetic field. The pressure mine employs the principle that beneath every ship in motion in shallow water there is an area of reduced pressure. The pressure mine contains a chamber divided by a diaphragm, with one side of the chamber open to the sea. Any sudden decrease in pressure on the seaward side deflects the diaphragm and closes a firing circuit in the other chamber to explode the mine. The pressure mine reacts only to a pressure change produced by a ship larger than a minesweeper (*q.v.*), thus making it difficult to clear. Acoustic mines once depended on hydrophones to pick up the sound made by a ship's propellers when the ship came within range. They had limited lifetimes owing to deterioration of their components, but techniques related to sonar and microelectronics technology have made acoustic mines more effective and less prone to breakdowns.

In World War I the mine was the most effective antisubmarine weapon. Mines were even more important during World War II; in that conflict, mines sank 1,316 Axis ships and damaged 540. Great Britain, the United States, and their allies lost 1,118 vessels to mines. The Axis and Allied nations laid a total of more than 550,000 submarine mines in World War II.

Land mine. A land mine is an encased explosive charge buried just below the surface of the ground. It may be fired by the weight of vehicles or troops on it or by the passage of time or by remote control. Though improvised land mines in the form of buried artillery shells were used in World War I, particularly by the Germans against French and British tanks, the land mine only became important in World War II. Easily manufactured and transported, the weapon in a variety of types was sown in extensive minefields in Russia, in North Africa, and on the Western Front. Most early mines had circular or square metal cases, but to prevent magnetic detection later models are sometimes made of plastic. Land mines are typically used to disrupt or prevent the massed attack of tanks and/or infantry.

There are two basic types: antitank mines designed to destroy or damage vehicles, especially tanks; and lighter antipersonnel mines. A standard antitank mine contains about 5 kg of explosives and weighs about 9 kg in all. Antipersonnnel mines, which can kill or wound soldiers upon exploding into many small fragments, usually contain less than 0.5 kg of explosives and can be detonated by a footstep on them. Land mines have been widely used since World War II, with increasing ingenuity going into both their design and their detection.

mine gas, any of various harmful vapours produced during mining operations. The gases are frequently called damps (German *Dampf*, "vapour"). Firedamp is a gas that occurs naturally in coal seams. The gas is nearly always methane (CH_4) and is highly inflammable and explosive when present in the air in a proportion of 5 to 14 percent. White damp, or carbon monoxide (CO), is a particularly toxic gas; as little as 0.1 percent can cause death within a few minutes. It is a product of the incomplete combustion of carbon and is formed in coal mines chiefly by the oxidation of coal, particularly in those mines where spontaneous combustion occurs. Black damp is an atmosphere in which a flame lamp will not burn, usually because of an excess of carbon dioxide (CO_2) and nitrogen in the air. Stinkdamp is the name given by miners to hydrogen sulfide (H_2S) because of its characteristic smell of rotten eggs. Afterdamp is the mixture of gases found in a mine after an explosion or fire.

Minedra (Indo-Greek king): *see* Menander.

Miner, Jack, byname of JOHN THOMAS MINER (b. April 10, 1865, Dover Centre, Ohio, U.S.—d. Nov. 3, 1944, Kingsville, Ont., Can.), Canadian naturalist, author, and lecturer who won a reputation as a leading bird conservationist and who conducted extensive research into migratory patterns.

Miner moved to Essex county, Ont., in 1878. In 1904, on his farm at Kingsville, he established a bird sanctuary that became widely known. Banding more than 50,000 ducks between 1910 and 1915, he made the first complete banding records of North American birds. His sanctuary eventually became the temporary home of more than 50,000 migrating Canada geese. In 1931 his friends established the Jack Miner Migratory Bird Foundation to ensure the continuation of his work. He received the Order of the British Empire in 1943 "for the greatest achievement in Conservation in the British Empire."

mineral, any naturally occurring homogeneous solid that has a definite chemical composition and a distinctive internal crystal structure. Minerals are usually formed by inorganic processes. While this definition is applicable in most cases, there are certain notable exceptions. The term mineral is also applied to certain organic substances, such as coal, graphite, oil, and natural gas, that are obtained from the Earth for commercial use. Synthetic equivalents of various minerals, such as emeralds and diamonds, can be produced in the laboratory for experimental or commercial purposes.

Although most minerals are chemical compounds, a small number (*e.g.*, sulfur, copper, gold) are elements. The composition of a mineral can be defined by its chemical formula, and the identity of its anionic group determines the group into which the mineral is classified. For example, the mineral halite (NaCl) is composed of two elements, sodium (Na) and chlorine (Cl), in a 1:1 ratio; its anionic group is chloride (Cl^-)—a halide—so halite is classified as a halide. Minerals can thus be classified into the following major groups: native elements, sulfides, sulfosalts, oxides and hydroxides, halides, carbonates, nitrates, borates, sulfates, phosphates, and silicates. Silicates are the most commonly occurring minerals because silica is the most abundant constituent of the Earth's crust (about 59 percent).

A mineral crystallizes in an orderly, three-dimensional geometric form, so that it is considered to be a crystalline material. Along with its chemical composition, the crystalline structure of a mineral helps determine such physical properties as hardness, colour, and cleavage.

Minerals combine with each other to form rocks. For example, granite consists of the minerals feldspar, quartz, mica, and amphibole in varying chemical ratios. Rocks are thus distinguished from minerals by their heterogeneous composition. A mere 100 of the several thousand known types of minerals constitute the main components of rocks.

Minerals are treated in a number of articles in the MACROPAEDIA. For the composition, physical properties, occurrence, and classification of important rock-forming minerals, *see* Minerals and Rocks. For the characteristics, origins, and distribution of the major mineral fuels, *see* Fuels, Fossil. For the methods of removing and refining or treating industrially important minerals, *see* Industries, Extraction and Processing. For minerals used primarily for personal adornment, *see* Dress and Adornment. For mineralogy, the scientific study of minerals, *see* Earth Sciences, The.

For a description of the place of minerals in the circle of learning and for a list of both MACROPAEDIA and MICROPAEDIA articles on the subject, *see* PROPAEDIA: Part Two, Division I; Part Seven, Division II.

mineral oil, a clear, colourless, oily liquid that is a by-product of the distillation of petroleum. Mineral oil is used in medicine as a laxative and as an emollient. Given orally, it coats the bowel and softens the stool mass, thus easing the latter's passage. Mineral oil is completely indigestible and is not absorbed by the intestine. Its prolonged use may cause vitamin deficiencies, however, because it carries fat-soluble vitamins out of the digestive system and thus prevents their absorption. The possibility of the accidental inhalation of mineral oil into the lungs, where it causes lipid pneumonia, further limits its usefulness as a laxative. Mineral oil applied to the skin makes the latter softer and more pliable by retaining moisture within the epidermis. Mineral oil also has a variety of minor industrial uses, including use in hair sprays and as a solvent, lubricator, and insulator.

mineral processing, also called ORE DRESSING, mechanical treatment of crude ores to separate out the valuable minerals. Mineral-processing techniques were at first applied only to ores of precious metals such as gold and silver, but they later came to be used to recover other metals and nonmetallic minerals. They are also used during coal preparation to enrich the value of raw coal.

A brief treatment of mineral processing follows. For full treatment, *see* MACROPAEDIA: Industries, Extraction and Processing.

The primary operations of mineral processing are comminution and concentration. Comminution involves the liberation of valuable minerals from physical combination with the waste minerals. It is customarily carried out by large jaw crushers and by smaller cylindrical grinding mills. Mills may be operated either wet or dry.

Concentration consists of separating the liberated minerals from the waste. The most common methods are gravity separation and flotation separation. Gravity methods utilize the difference in density between valuable minerals and waste materials. Separation can be accomplished by jigging, an operation in which ground ore is fed into a pulsating body of water so that the heavier mineral fractions settle to the bottom while the lighter wastes remain at the top. Gravity separation can also be conducted on inclined planes, the ground ore being washed down spirals or shaking tables in such a manner that mineral and waste fractions settle in different areas.

In flotation (*q.v.*), separation is accomplished by treating ground ore with chemical reagents that cause one fraction to sink to the bottom of a body of water and the other fraction to adhere to air bubbles and rise to the top. Other important mineral-processing operations are dewatering, in which the concentrated minerals are dried and readied for transport; and sampling and analysis, in which the composition and properties of the raw materials or processed minerals are periodically characterized.

mineral water, water that contains a large quantity of dissolved minerals or gases. Mineral water from natural springs commonly has a high content of calcium carbonate, magnesium sulfate, potassium, and sodium sulfate. It may also be impregnated with such gases as carbon dioxide or hydrogen sulfide. Mineral water is produced artificially by adding salts to distilled water or aerating it with carbon dioxide. The mineral content of both natural and artificial mineral water varies greatly, and in some cases it may be less than that of ordinary tap water.

Since ancient times people have bathed in water from mineral springs, especially hot springs, because of its supposed therapeutic value for rheumatism, arthritis, skin diseases, and various other ailments. Many such springs have become sites for health spas and resorts, some of the most famous of which are Bath, Avon, Eng.; Baden-Baden and Wiesbaden, Ger.; and Saratoga Springs, N.Y. The use of mineral water as a beverage has increased greatly since the mid-1970s. Large quantities of bottled water from mineral springs in France and other European countries are exported each year.

Mineralnye Vody, town, Stavropol *kray* (region), southwestern Russia. It lies along the Kuma River and the main rail line between Rostov-na-Donu and Baku (Azerbaijan). Mineralnye Vody is a spa (its name means "mineral waters") on the northern edge of the Caucasus Mountains. It has an airport serving other Caucasian spa-resorts, and railway freight yards and workshops reflect its junction position on main rail lines. The town's food-processing industries also are important. Pop. (1993 est.) 73,700.

mineralogy, scientific discipline that is concerned with all aspects of minerals, including their physical properties, chemical composition, internal crystal structure, and occurrence and distribution in nature and their origins in terms of the physicochemical conditions of formation.

A brief treatment of mineralogy follows. For full treatment, *see* MACROPAEDIA: Earth Sciences, The.

The goals of mineralogical studies may be quite diverse, ranging from the description and classification of a new or rare mineral, to an analysis of crystal structure involving determination of its internal atomic arrangement, or to the laboratory or industrial synthesis of mineral species at high temperatures and pressures. The methods employed in such studies are equally varied and include simple physical and chemical identification tests, determination of crystal symmetry, optical examination, X-ray diffraction, isotopic analysis, and other sophisticated procedures.

Although much mineralogical research centres on the chemical and physical properties of minerals, significant work is conducted on their origin as well. Investigators are frequently able to infer the way in which a mineral species forms on the basis of data obtained from laboratory experiments and on theoretical principles drawn from physical chemistry and thermodynamics.

miner's cat, carnivorous mammal, a species of cacomistle (*q.v.*).

Minerva, in Roman religion, the goddess of handicrafts, the professions, the arts, and, later, war; she was commonly identified with the Greek Athena. Some scholars believe that her cult was that of Athena introduced at Rome from Etruria. This is reinforced by the fact that she was one of the Capitoline triad, in association with Jupiter and Juno. Her shrine on the Aventine in Rome was a meeting place for guilds of craftsmen, including at one time dramatic poets and actors.

Her worship as a goddess of war encroached upon that of Mars. The erection of a temple to her by Pompey out of the spoils of his Eastern conquests shows that by then she had been identified with the Greek Athena Nike, bestower of victory. Under the emperor Domitian, who claimed her special protection, the worship of Minerva attained its greatest vogue in Rome.

Minerva as goddess of war, bronze statuette, early Etruscan; in the British Museum

minesweeper, naval vessel used to clear an area of mines (*see* mine). The earliest sweeping system, devised to clear anchored contact mines, consisted of two ships steaming across a minefield towing a wire rope between them; mine mooring lines were cut by sawlike projections on the sweep wire or by cutting jaws. When the released mine rose to the surface, it was destroyed by gunfire.

USS *Prime*, ocean minesweeper

By courtesy of the U.S. Navy

In naval warfare, minesweepers have two primary tactical functions: to clear mines from sea lanes in order to protect the minesweeping nation's warships and merchant shipping; and to clear a path through minefields so that other warships can engage in battle or launch an amphibious landing (such as those in the Pacific theatre during World War II). Minesweepers can be just as vitally needed after a war has ended; hundreds of minesweepers were used to clear the tens of thousands of mines left floating in the world's sea lanes after the end of World War II.

The wide use by Communist forces during the Korean War of magnetic mines (detonated by the magnetic field of steel ships) led to the development of wooden-hulled nonmagnetic sweepers to replace steel-hulled World War II types. These craft had plywood hulls, stainless-steel-alloy engines, and metal fittings of aluminum, brass, or magnesium. The typical ocean minesweeper is about 50 m (165 feet) long, has a displacement of 750 tons, and has a crew of about 60. Another addition to the U.S. minesweeping force was the minesweeping boat; this vessel was completely nonmagnetic, equipped to sweep contact, magnetic, or acoustic mines, and was operated by a crew of six enlisted men. Helicopter minesweepers were also developed; these aircraft hover safely over the sea while towing minesweeping gear that explodes magnetic or acoustic mines.

Ming ———: for rulers of the Ming dynasty, *see under* individual names.

Ming DYNASTY, Pinyin MING (1368–1644), Chinese dynasty that provided an interval of native rule between eras of Mongol and Manchu dominance. The Ming extended the Chinese empire into Korea, Mongolia, and Turkistan on the north and into Vietnam and Myanmar (Burma) on the south, exercising more far-reaching influence in East Asia than any other native rulers of China.

Founded by Chu Yüan-chang, a man of humble origins who later assumed the reign title of Hung-wu, the Ming became one of the most stable but also one of the most autocratic of all Chinese dynasties. The basic governmental structure established by the Ming was continued by the subsequent Ch'ing dynasty and lasted until the imperial institution was abolished in 1912. The civil service system was perfected; almost all the top Ming officials entered the bureaucracy by passing a government examination. The censorate, an office designed to investigate official misconduct and corruption, was made a separate organ of the government. Affairs in each province were handled by a commission of three officials, each of whom reported to separate bureaus in the capital. The position of prime minister was abolished; the emperor took over personal control of the government, ruling with the assistance of the especially appointed Nei-ko, or Grand Secretariat.

The Ming government was gradually weakened by factionalism among civil officials, interference by palace eunuchs, the burdens of a growing population, and a succession of weak and inattentive emperors. In 1644 a rebel leader, Li Tzu-ch'eng, captured the capital, and the local Ming military commander requested aid from the Manchu tribesmen who had been encroaching on China's northern borders. The Manchu drove out Li Tzu-ch'eng and then remained, establishing the Ch'ing dynasty.

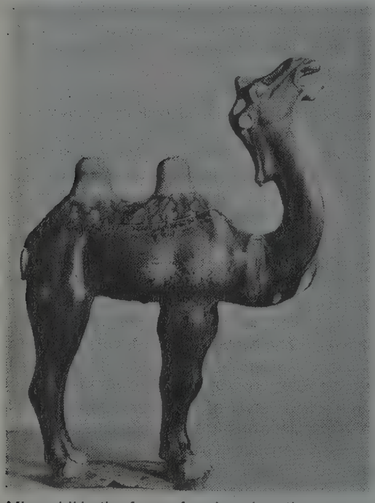
Despite the many foreign contacts made during the Ming period, cultural developments were characterized by a generally conservative and inward-looking attitude. Ming architecture is largely undistinguished, although the best of it may have been in regional applications. For all its visibility, the Forbidden City, a palace built in Peking in the 15th century by the Yung-lo emperor (and subsequently enlarged and rebuilt), unsurpassed as a symbol of imperial power, architecturally represents a decline from the adventurous planning of the Sung period. The best Ming sculpture is found not in large statues but in small ornamental carvings of jade, ivory, wood, and porcelain. Although a high level of workmanship is manifest in Ming decorative arts such as cloisonné, enamelware, bronzework, lacquerwork, and furniture, the major achievements in art were in painting and pottery.

While there were two main traditions in painting in the Ming period, that of "literati painting" (*wen-jen-hua*) of the Wu school and that of the "professional academics" associated with the Che school, artists generally stressed independent creation, impressing their work with strong marks of their personal styles.

Ceramics saw many new developments, along with the continuation of established traditions. There were three major types of decoration: monochromatic glazes, including celadon, red, green, and yellow; underglaze copper red and cobalt blue; and overglaze, or enamel painting, sometimes combined with underglaze blue. The latter, often called "blue and white," was imitated in Vietnam, Japan, and, from the 17th century, in Europe. Much of this porcelain was produced in the huge factory at Ching-te-chen in Kiangsi province. One of the period's most influential wares was the stoneware of I-hsing in Kiangsu province, which was exported in the 17th century to the West, where it was known as boccaro ware and imitated by such factories as Meissen.

The Ming regime restored the former literary examinations for public office, which pleased the literary world, dominated by Southerners. In their own writing the Ming sought a return to classical prose and poetry styles and, as a result, produced writings that were imitative and generally of little consequence. Writers of vernacular literature, however, made real contributions, especially in novels and drama. Chinese traditional drama originating in the Sung dynasty had been banned by the Mongols but survived underground in the South, and in the Ming era it was restored. This was *ch'uan ch'i,* a form of musical theatre with numerous scenes and contemporary plots. The regional music theatre that had been permitted by the Mongols was now for a time banned by the Ming so that it could be purged of Mongol influence. What emerged was *k'un chü,* less bombastic in song and accompaniment than other popular theatre. Under the Ming it enjoyed great popularity, indeed outlasting the dynasty by a century or more. It was adapted into a full-length opera form, which also survived until the development of Peking opera under the Ch'ing dynasty.

ming ch'i, Pinyin MING QI (Chinese: "spirit utensils"), funerary furniture or objects placed in Chinese tombs to provide the deceased with the same material environment enjoyed while living, thus assuring immortality. While *ming ch'i* were buried with the dead in virtually all historical periods, the custom was more popular in some periods than in others—for example, in the Han (206 BC–AD 220), T'ang (618–907), and Ming (1368–1644) dynasties.



Ming ch'i in the form of a glazed earthenware camel, T'ang dynasty (618–907); in the Metropolitan Museum of Art, New York City

By courtesy of The Metropolitan Museum of Art, New York, Rogers Fund, 1910

Ming ch'i are usually inexpensive, simply crafted clay models of that which is familiar in life—including guardians, servants, animals, and even architectural structures. A complete set of *ming ch'i* from a single tomb may amount to a model of an entire village, giving a comprehensive picture of the daily life of the period.

Ming Huang (Chinese emperor): *see* Hsüan Tsung.

Ming-ti, Pinyin MINGDI (posthumous name, or *shih*), personal name (*hsing-ming*) LIU CHUANG, temple name (TUNG HAN) HSIEN-TSUNG (b. AD 29, China—d. 75 or 76, China), second emperor of the Eastern Han dynasty (206 BC–AD 220), during whose reign (AD 57/58–75/76) Buddhism is thought to have been introduced into China.

Legend recounts that Ming-ti was visited in a dream by a golden image of the Buddha Śakyamuni, seeking to be worshiped in China. The emperor is said to have responded by recruiting two Buddhist monks from India and erecting a Buddhist temple at Lo-yang.

Ming-ti ("Enlightened Emperor") launched a military campaign to destroy the Hsiung-nu tribes plaguing China's northwest frontier. Through intrigue as well as military might, the Han armies under the general Pan Ch'ao succeeded in reestablishing Chinese influence in Inner Asia. Ming-ti was succeeded by his son Chang-ti.

Mingäçevir, Russian MINGECHAUR, also spelled MINGEČAUR, city in central Azerbaijan, on the Kura River; it is the site of the Mingäçevir Reservoir, which is used for flood control, hydroelectric power, and irrigation of the Kura lowland. There is a large cotton textile mill. Pop. (1991 est.) 90,900.

Consult the INDEX *first*

Minghetti, Marco (b. Nov. 8, 1818, Bologna, Papal States [Italy]—d. Dec. 10, 1886, Rome, Italy), statesman who was twice prime minister of united Italy (1863–64, 1873–76).

In his youth, while visiting an aunt in Paris, Minghetti came under the influence of exiled Italian patriots. Returning home he entered the University of Bologna, where he devoted himself to courses in science but was soon also attracted to the humanities and politics. He was drawn to Rome to assist in seeking reforms from the government of the Papal States under the liberal Pius IX, and he became a member of the revolutionary government of the Roman Republic (1847). He resigned in 1848 to join the Piedmont-Sardinian army fighting the Austrians, and he returned to Rome late in 1848. After the general failure of the revolutionary movement, he resumed a life of study and travel.

In 1859 Count Cavour, prime minister of Piedmont-Sardinia, appointed him secretary-general of the Piedmontese foreign office. After the successful French-Italian campaign against the Austrians, Minghetti served as president of the assembly of liberated Romagna until its annexation to Piedmont-Sardinia. He soon became minister of the interior of the expanding Piedmontese monarchy and premier of the newly united kingdom of Italy (1863). His role in shifting the capital from Turin to Florence in exchange for the withdrawal of French troops from Rome aroused popular antagonism because of the implied abandonment of Rome as united Italy's capital. He resigned eight days later (Sept. 23, 1864).

He returned to the government as minister of agriculture in 1869, and in July 1873 he again became prime minister. Taking the financial portfolio himself, he introduced reforms that led to the first balanced budgets since 1860, but his arbitrary measures against the political opposition eventually led to his losing office (March 1876). For the next few years Minghetti continued in a role of opposition to the left-leaning governments of Agostino Depretis and his successors.

Mingrelian language, also called MEGRELIAN, unwritten Kartvelian (South Caucasian) language spoken along the coast of the Black Sea in Georgia. Its speakers call it *margaluri nina;* in Georgian, it is called *megruli ena.*

Some scholars believe Mingrelian and the closely related Laz language to be dialects of a single language (called Zan) rather than independent languages, but Laz and Mingrelian are not inherently intelligible with each other. Speakers of Mingrelian use Georgian as their literary language. The Mingrelian, Laz, Georgian, and Svan languages together constitute the Kartvelian language family. *See also* Kartvelian languages.

Mingus, Charles, byname CHARLIE MINGUS (b. April 22, 1922, Nogales, Ariz., U.S.—d. Jan. 5, 1979, Cuernavaca, Mex.), American jazz composer, bassist, bandleader, and pianist whose work, integrating loosely composed passages with improvised solos, both shaped and transcended jazz trends of the 1950s, '60s, and '70s.

Mingus studied music as a child in Los Angeles and at 16 began playing bass. The foundation of his technique was laid in five years of study with a symphonic musician. After stints with Louis Armstrong and Kid Ory in the early 1940s, Mingus wrote and played for the Lionel Hampton big band from 1947 to 1948 and recorded with Red Norvo. In the early 1950s he formed his own record label and the Jazz Composer's Workshop, a musicians' cooperative, in an attempt to circumvent the commercialism of the music industry.

Mingus drew inspiration from Duke Ellington, Charlie Parker, Thelonious Monk, Negro gospel music, and Mexican folk music, as well as traditional jazz and 20th-century concert music. Though most of his best work represents close collaborations with improvising musicians such as trumpeter Thad Jones, drummer Dannie Richmond, alto saxophonist Jackie McLean, and woodwind-player Eric Dolphy, Mingus also wrote for larger instrumentations and composed several film scores.

As a bassist, Mingus was a powerhouse of technical command and invention; he was always more effective as a soloist than as an accompanist or sideman. The Mingus composition most frequently recorded by others is "Goodbye, Porkpie Hat," a tribute to Lester Young, and his most frequently cited extended work is "Pithecanthropus Erectus," a musical interpretation of human evolution. His volatile personality and opinions were captured in his autobiography, *Beneath the Underdog,* published in 1971.

Minh Mang, also spelled MINH MENH, original name NGUYEN PHUOC CHI DAM (b. May 24, 1792, Saigon [now Ho Chi Minh City], Vietnam—d. Jan. 11/21, 1841, Hue), emperor (1820–41) of central Vietnam who was known for his anti-Western policies, especially his persecution of Christian missionaries.

Prince Chi Dam was the fourth son of Emperor Gia Long (reigned 1802–20) and his favourite concubine and thus was not in line for the throne. He was chosen by Gia Long as his successor, however, because of his outspoken criticism of Europeans. Chi Dam took the reign name Minh Mang.

As a strict Confucian, Minh Mang believed that Christian doctrine undermined the basic principles of Vietnamese religious and political life, especially the worship of and obedience to the emperor as a divine emissary. In the early years of his reign he induced French missionaries to move from their posts to the capital at Hue, claiming that he needed interpreters. To persuade them to relinquish their proselytizing efforts, he conferred mandarin degrees upon them. As new priests arrived and refused to give up their missions, however, Minh Mang barred the entry of additional Christian missionaries (1825) and subsequently forbade the preaching of Christian doctrine; he also had the missionaries imprisoned. In response to pleas for moderation, Minh Mang consented to allow the priests to board a ship bound for Europe, but instead the freed missionaries returned secretly to their posts.

Because of his tenuous claim to the throne, Minh Mang felt the threat of pretenders who were soliciting help from the French for his overthrow. He also doubted the loyalty of his own people; though not indifferent to the plight of the peasants, he produced little land or social reform. Rebellion broke out in Saigon in 1833, and, when its leaders requested and received help from the Christian mission, Minh Mang was enraged and began active persecution of the Christians. He ordered the execution of the Reverend François Gagelin (Oct. 17, 1833); seven European missionaries were killed in the years to come, as were great numbers of native converts. Minh Mang's actions served as an excuse for France to invade Vietnam in 1858 so as to ensure the safety of French citizens.

minhag, Hebrew MINHAG ("custom," or "usage"), plural MINHAGIM, in Judaism, any religious custom that has acquired the legal binding force of Halakhah, the Jewish legal tradition. Because Halakhah itself can be considered to be based on custom, a minhag can come into force even though it presents an apparent contradiction to previous laws. The problem of minhagim has been a major subject for Judaic scholars.

There are two concepts closely related to that of minhag. A local minhag (*minhag ha-makom*) is a custom that is binding upon a specific Jewish community. A liturgical minhag is a Jewish religious rite that has developed in a particular locality. Thus, the acceptance by the Ashkenazi Jews of many elements of the Palestinian minhag and by the Sephardic Jews of many elements of the Babylonian minhag resulted in distinctive rites, which are also referred to as minhagim.

minhah, also spelled MINHA, MINCHA, or MINCHAH, Hebrew MINḤA ("offering"), in Judaism, the second of three periods of daily prayer. Minhah prayers are offered in the afternoon; to facilitate attendance at the synagogue, the afternoon service is often scheduled so that the evening prayers (maarib; Hebrew: *maʿariv*) can follow as soon as night has fallen. The morning period of daily prayer is known as shaharith (Hebrew: *shaḥarit*).

Minhah consists essentially of the statutory prayer called the Amidah (Hebrew: *ʿamida,* "standing"). On the Sabbath and on fast days (including Yom Kippur, the Day of Atonement), a portion of the Torah is read. The minhah service, the institution of which is traditionally ascribed to Isaac, is considered to be a substitute for the meal offering (Leviticus 2) made at dusk in the Temple of Jerusalem before its destruction in AD 70.

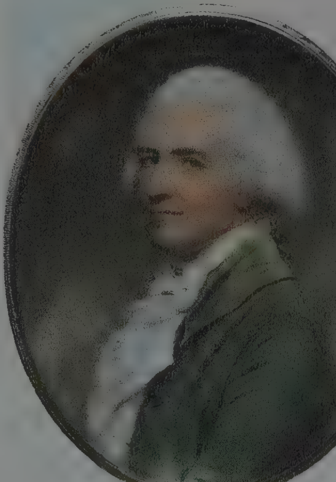
Minho, also called AQUEM-OS-MONTES, historical *provincia,* northwesternmost Portugal. Originally called Entre Douro e Minho, the region between the Minho and Douro rivers (now divided into Braga and Viana do Castelo districts) is the historical unit from which Portugal evolved. The area was occupied by both the Celts and the Romans, the former having left numerous ruins called *castra,* or hill forts. There is a narrow coastal plain stretching for about 30 miles (50 km) from north to south and extending between 2 and 10 miles (3 and 16 km) inland to the Santa Luzia Mountains. The rest of the region consists of undulating plateaus traversed by deep valleys of the Minho, Lima, Cávado, and Ave rivers.

Vineyards in the Minho area, Portugal

G. Mairani

High population densities have encouraged intensive cultivation. Corn (maize) and haricot beans are the most important crops, and the field borders are used for fruit trees and vines. The use of irrigation and of terraced fields on slopes characterize the landscape. Stock rearing is important on the higher lands, and the timber industry is significant. Fishing is of local importance at Esposende, Viana do Castelo, and Âncora-Gontinhaes. Braga, the capital of the historical *provincia,* and Guimarães are textiles centres. Many buildings are constructed out of local gray granite.

miniature painting, also called (16th–17th century) LIMNING, small, finely wrought portrait executed on vellum, prepared card, copper, or ivory. The name is derived from the minium, or red lead, used by the medieval illuminators. Arising from a fusion of the separate traditions of the illuminated manuscript and the medal, miniature painting flourished from the beginning of the 16th century down to the mid-19th century.



"Self-Portrait," by John Smart, ivory, 1797; in the Victoria and Albert Museum, London

Victoria and Albert Museum, London/Art Resource, New York City

The portrait miniature, as a separate portrait enclosed in either a locket or a covered "portrait box," is most plausibly traced to Flemish illuminators such as those of the Horenbout family. The earliest datable portrait miniatures, however, are not Flemish but French, and are all believed to have been painted by Jean Clouet at the court of Francis I. Under the patronage of King Henry VIII, Lukas Horenbout painted the first portrait miniatures recorded in England. He taught the technique to Hans Holbein the Younger, who was able to put into this small-scale work all the intensity of vision and fineness of touch apparent in his easel paintings and drawings, creating masterpieces of the then-new art form that remain unsurpassed.

Holbein inspired a long tradition of miniature painting in England. One of his pupils, Nicholas Hilliard, became the first native-born master of miniature painting in that country. He adopted the oval form, which had recently become fashionable on the continent of Europe in preference to the circular form and which remained the most popular shape until the early 19th century. Hilliard served as miniature painter to Queen Elizabeth I for more than 30 years. His chief pupil, Isaac Oliver, was a more technically sophisticated artist who became the chief miniaturist during the reign of King James I (1603–25). Oliver's pupil, Samuel Cooper, earned a preeminent reputation in Europe by his presentation of character and tight, effective brushwork.

Early miniaturists had painted in watercolour and gouache (opaque watercolour) on vellum or prepared paper. The technique of painting miniatures in enamel on a metal surface was introduced in France in the 17th century and perfected by Jean Petitot. About 1700 the Italian painter Rosalba Carriera introduced the use of ivory as a ground that could provide a luminous, glowing surface for transparent pigments and heighten their effect. This technical innovation stimulated a great revival of miniature painting in the second half of the 18th century. The chief European miniaturists of the period were Peter Adolf Hall and Niclas Lafrensen in France and Jeremiah Meyer, Richard Cosway, Ozias Humphrey, and John Smart in England.

In the early 19th century, French miniaturists such as J.B. Isabey were influenced by the easel portraits of Jacques-Louis David. Miniature portraits continued to be painted in the following decades, but they remained an expensive luxury. Inexpensive black-and-white portraits in the new medium of photography made painted miniatures obsolete in the second half of the century.

minicam, portable electronic video-camera unit. It consists of a lightweight hand-held camera, a backpack containing electronic circuitry and power supply, and a videotape cassette unit. Developed in the late 1960s, the minicam has become the main tool of television news reporting, largely supplanting the more cumbersome film-loaded motion-picture camera. The minicam enables television reporters to provide live coverage of news events, even from remote locations, since the signal can be relayed to the studio from a mobile van equipped with a microwave transmitter. The minicam also can transmit via coaxial cable (*e.g.,* telephone line). In other cases, the reporter may videotape an event or interview for later editing and use.

Minié, Claude-Étienne (b. Feb. 13, 1804, Paris, France—d. Dec. 14, 1879, Paris), French army officer who solved the problem of designing a bullet for the muzzle-loading rifle. The bullet became known as the Minié ball.

After serving in several African campaigns in the Chasseurs, Minié rose to the rank of captain. In 1849 he designed the Minié ball, a cylindrical bullet with a conical point. An iron cup was inserted in the hollow base so that when the ball was fired, the cup was forced forward, expanding the base to fit snugly against the rifling grooves.

The Minié ball produced lethally accurate fire at long ranges. It was almost universally adopted by the armies of Europe and the United States and was used throughout the American Civil War (1861–65). Minié was rewarded by the French government with 20,000 francs and an appointment to the staff of the military school at Vincennes. After retiring in 1858 with the rank of colonel, he served as a military instructor for the khedive of Egypt and as a manager at the Remington Arms Company in the United States.

Minikh, Burkhard Christoph, Count (Graf) von: *see* Münnich, Burkhard Christoph, Count von.

Minim, member of ORDER OF MINIM BROTHERS, an order of friars founded in 1435 by St. Francis of Paola in Calabria, Italy. Members consider humility the primary virtue and regard themselves as the least (*minimi*) of all the religious. To the traditional vows of poverty, chastity, and obedience they add a fourth vow binding them to abstain from meat, eggs, milk, cheese, fish, and their derivatives. The founder claimed to have received the motto "*Charitas*" in a vision from the Archangel Michael.

The rule's original order, based primarily on that of St. Francis of Assisi, was approved by

Pope Alexander VI in 1493. The rule was revised a number of times thereafter, becoming less dependent on St. Francis' rule. The order includes friars, nuns, and laypersons.

The order spread rapidly, especially in Italy and France, its greatest period of expansion occurring in the 16th century, when the Minims controlled more than 400 communities and numbered 9,000 members. Then, during the height of anticlericalism in the 19th century, the Minims fell on hard times and were drastically reduced in numbers and influence. Today the Minims have convents in Italy and Spain and a third order of laypersons in South America.

The Minims devote themselves to prayer, study, and scholarship. They have included several notable teachers, scholars, and pastors, among the best known being Blessed Gaspar de Bono and Father Bernard Boyl (Buil). Father Boyl accompanied Columbus on his second voyage to America and was the first apostolic delegate to America.

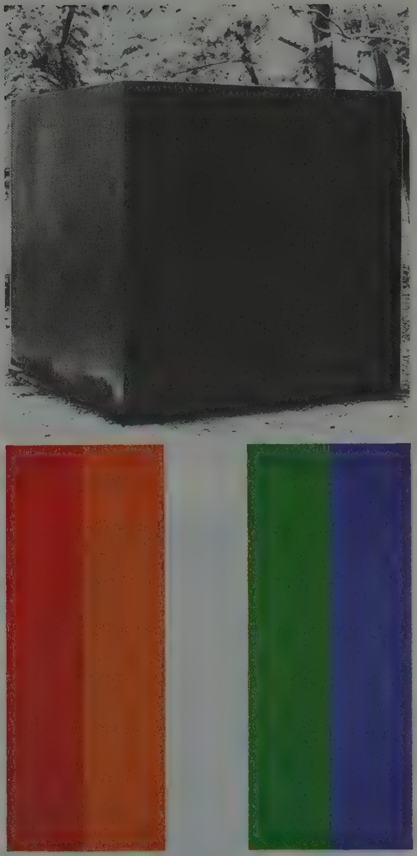
minimalism, chiefly American movement in the visual arts and music originating in New York City in the late 1960s and characterized by extreme simplicity of form and a literal, objective approach.

Minimal art, also called ABC art, is the culmination of reductionist tendencies in modern art that first surfaced in the 1913 composition by the Russian painter Kasimir Malevich of a black square on a white ground. The primary structures of the minimalist sculptors Donald Judd, Carl Andre, Dan Flavin, Tony Smith, Anthony Caro, Sol LeWitt, John McCracken, Craig Kaufman, Robert Duran, and Robert Morris and the hard-edge painting of Jack Youngerman, Ellsworth Kelly, Frank Stella, Kenneth Noland, Al Held, and Gene Davis grew out of these artists' dissatisfaction with Action painting, a branch of American Abstract Expressionism based on intuitive, spontaneous gesture that had dominated American avant-garde art through much of the 1950s. The minimalists, who believed that Action painting was too personal and insubstantial, adopted the point of view that a work of art should not refer to anything other than itself. For that reason they attempted to rid their works of any extra-visual association. Use of the hard edge, the simple form, and the linear rather than painterly approach was intended to emphasize two-dimensionality and to allow the viewer an immediate, purely visual response. They turned for inspiration to the impassive, quiet works of Barnett Newman and Ad Reinhardt, exponents of the colour-field branch of Abstract Expressionist painting.

Hard-edge painting is characterized by large, simplified, usually geometric forms on an overall flat surface; precise, razor-sharp contours; and broad areas of bright, unmodulated colour that have been stained into unprimed canvas. It differs from other types of geometric abstraction in that it rejects both lyrical and mathematical composition because, even in this simplified field, they are a means of personal expression for the artist. Minimal hard-edge painting is the anonymous construction of a simple object.

Minimal sculpture is composed of extremely simple, monumental geometric forms made of fibreglass, plastic, sheet metal, or aluminum, either left raw or solidly painted with bright industrial colours. Like the painters, minimalist sculptors attempted to make their works totally objective, unexpressive, and non-referential.

Minimal art, along with the music of Erik Satie and the aesthetics of John Cage, was a distinct influence on minimalist music. Reacting against the complex, intellectually sophisticated style of modern music, several composers began to compose in a simple, literal style, thereby creating an extremely simple and accessible music. La Monte Young, for example, composed a number of electronic "continuous frequency environments," in which he generated a few pitches and then electronically sustained them, sometimes for days or weeks. Young added very little to this texture and virtually eliminated variation as a developmental technique. Like Young, Morton Feldman tried to eliminate variation. His works explored innovative instrumental timbres through a slowly paced succession of unrelated, soft sounds. Another group of composers—Philip Glass, Steve Reich, Cornelius Cardew, and Frederic Rzewski—was influenced by the music of India, Bali, and West Africa. They used simple harmonic and melodic patterns in their highly repetitive music.



Minimal art: (top) "Die," six-foot steel cube by Tony Smith, 1962, in the Samuel Wagstaff, Jr. Collection, New York City: (bottom) "Red, Orange, White, Green, Blue," acrylic painting by Ellsworth Kelly, 1968, in the Pasadena Art Museum, California

By courtesy of (top) Fourcade-Droll Gallery, New York, (bottom) the Pasadena Art Museum, Purchase Fellows Acquisition Fund

In both music and the visual arts, minimalism was an attempt to explore the essential elements of an art form. In minimalist visual arts, the personal, gestural elements were stripped away in order to reveal the objective, purely visual elements of painting and sculpture. In minimalist music, the traditional treatment of form and development was rejected in favour of explorations of timbre and rhythm—musical elements largely unfamiliar to Western listeners.

minimum, in mathematics, point at which the value of a function is less than at any nearby point; *see* extremum.

minimum reserve system (banking): *see* fractional reserve system.

minimum wage, wage rate established by collective bargaining or by government regulation that specifies the lowest rate at which labour may be employed. The modern minimum wage, combined with compulsory arbitration of labour disputes, first appeared in Australia and New Zealand in the 1890s. In 1909 Great Britain established trade boards to set minimum wage rates in certain trades and industries. The first minimum wage in the United States (covering only women) was enacted by the state of Massachusetts in 1912. The intent of these laws was to shorten hours and raise pay in the covered industries.

Minimum-wage legislation or machinery for fixing minimum rates now exists in most of the nations of Latin America, Africa, and Asia, as well as in more industrialized countries.

Minin, Nikita (Russian patriarch): *see* Nikon.

mining, excavation of materials from the Earth's crust, including such minerals of organic origin as coal and petroleum.

A brief treatment of mining follows. For full treatment, *see* MACROPAEDIA: Industries, Extraction and Processing.

Mankind has found uses for minerals found in the Earth since prehistoric times. Materials like flint, for making fire, and pigment-bearing minerals like ochre and manganese ore were probably the first substances that people mined. The common names of archaeological periods like the Bronze Age and the Iron Age indicate significant use of those metals. Bronze (copper alloyed with tin) dates to roughly 3700 BC, and iron dates to as early as 2800 BC; both were first used in Mediterranean civilizations. Stone obtained from surface excavation, a process called quarrying, was responsible for the great Egyptian pyramids, some of which used as many as 2,300,000 blocks of limestone weighing 16 tons (14,500 kg) each.

An early method of mining, first recorded in Roman times, involved the use of log fires built at the base of rock faces. The intense heat caused expansion and cracking of the rock. The thorough treatise on mining entitled *De re metallica* (1556) by the German scholar Georgius Agricola has provided the best source of information on early mining techniques, many of which are still used or were used until relatively recently. These techniques included picks and hammers, ventilation and pumping systems, and cart-like "trucks" for hauling minerals. Later advances of great significance included the use of explosive gunpowder, which was replaced by dynamite in the mid-19th century and supplemented by ammonium nitrate fuel-blasting agents in the mid-20th century. Drilling techniques have also enhanced mining capability. The first rotary drill may have been used in England in 1813. Thirty years later mechanical piston drills came into use, and the air drill, powered by compressed air, appeared in Germany in 1853.

Modern mining is a costly and complicated business. It begins with the locating of probable mineral veins that can produce enough of the desired substance to justify the high cost of extraction. Prospecting and exploration require a vast body of knowledge in the earth sciences to find likely mining locations. Geological evidence relates the age of sample rocks to the long-term mineralization processes of the Earth's crust. Geochemical evaluations are made—as well as seismic tests, magnetic analyses, and electrical studies—to determine the geophysical character of a section of earth. Also commonly used is a hollow cylinder drill that brings up core sample materials from deep in the ground.

Once the approximate location and size of a vein or deposit are determined, mining engineers decide the best way to mine it. The familiar type of mine opening directly into the base of a hill or mountain on a horizontal plane is called an adit or crosscut tunnel. A straight vertical shaft may be drilled to one

side of a large deposit, with horizontal tunnels running at periodic levels into the deposit. The cavernous openings where minerals are excavated are called stopes. Many times a vein of ore will run from the surface, where it appears as an outcrop, deep into the ground on a diagonal. An inclined shaft runs parallel to the vein with horizontal levels connected to the vein at intervals. Ore that is found at the surface is mined from an open pit or from long strip excavations in a process called strip mining.

Excavating a mine and extracting mineral substances involves different combinations of drilling, blasting, hoisting, and hauling. Drilling a shaft itself may involve using a large circular bit that has a series of grinding wheels for cutting into rock. Drills are also commonly used for placing explosives. Drag-bit rotary drills use an abrasive, shaving action from diamond blades or steel shot, and the percussion drill pounds at the rock with a tungsten cutting edge that rotates at the same time. By carefully setting explosives in drilled holes, mining engineers can now use blasting agents of ammonium nitrate, which is effective at only 40 percent the strength of dynamite. In some hard rocks, heat applied through a flame-jet or jet-piercing drill causes the rock surface to chip or spall.

Careful consideration is given to the nature of the excavated sections to determine what support is needed in the mine. In some, the ceiling on an inclined shaft may not need support because of the lower ground weight from above in such a shaft. The ceilings of open stopes, the large cavities dug in the middle of deposits, may only need support from pillars of ore or waste rock. Rock ceilings with faults and fissures may be covered with shotcrete, a sprayed concrete that sets in and reinforces the cracks. Elsewhere, steel rods may be imbedded in the rock with large nuts threaded on the exposed end to hold up weakened segments of the ceiling. Where the span of the ceiling and the ground weight above dictate, structural support is provided. This may range from a variety of timber supports to collapsible steel arches. Timber arrangements include simple beams, or stulls, with diagonal supports into the side walls and a wood ceiling; an inclined beam against the hanging wall and wedged against the opposing foot wall with another beam; a four-piece set that consists of a complete beam frame (top, bottom, and sides); the timber square set linking frames together; and a post that supports the ceiling. In loose ground, ceiling sections are short and built at angles, and at the digging face a top section of planking called the breast boards keeps the earth from sliding backward. Supported stopes like these move slowly and produce a lower volume of ore. In unsupported stopes a number of methods help speed up production. These include slicing broad sections from the stope ceiling and also allowing large sections to cave in.

Removal of minerals from mines usually depends on trains of steel boxes drawn along tracks by an electric locomotive; vehicles running on treads or rubber wheels are also used. In some mines, large hoe-like scrapers pull rubble out by cable. Hand carrying, or mucking, is still practiced where mechanical means cannot be used.

A vital consideration in mining is how to ventilate the underground tunnels and caverns, not only to provide fresh air to miners but also to disperse harmful gases. Some mines become unbearably hot and need cooling. Sometimes ventilation ducts arranged in certain combinations can create natural drafting of air; usually, powerful fans are necessary. In addition, electric lighting must be provided. These two support systems often constitute a large part of mining costs.

mining, placer: *see* placer mining.

mining bee, also called DIGGER BEE, or SOLITARY BEE, any of several hundred species of bees in the family Andrenidae (order Hymenoptera), particularly those of the genus *Andrena.* Many species are medium-sized bees with reddish-golden hair and long, prominent abdomens. Females excavate tunnels in the soil that branch off to individual cells stocked with pollen balls, nectar, and eggs. There may be one or two generations per year. The adult has a relatively short and pointed "tongue," unsuitable for general foraging but, within each species, adapted to nectar-gathering from certain types of flowers.

ministère public, in France, the office of public prosecutor, with the responsibility for prosecuting criminal cases and representing the interests of society in civil litigation. The *ministère public* is represented by agents (*procureurs*) in most of the courts of France, except police courts.

The position of *procureur* goes back to the 13th century, when the king found it necessary to have representatives in the courts throughout the country to protect his interests and present his views on litigation that affected the public. In early times the *ministère public* was also responsible for making sure that officials did their jobs and punished those who were negligent or corrupt.

In modern times the position of the agents of the *ministère public* is somewhat different and presents something of a dichotomy to legal analysts. In theory the various *procureurs* are supposed to represent the interests of society as a whole rather than that of the state. Yet in criminal prosecutions they are clearly acting for the state. The decision to prosecute rests with the *procureur,* but he is ultimately under the control of the Ministry of Justice, a government department. Even with this underlying threat of political interference, the *procureurs* still have considerable freedom. Particularly in civil cases, in which the *procureur* may be acting as plaintiff in his own name or that of a government agency, or in which he may be merely an observer or an interested party, his main interest is that the law be correctly interpreted and applied. In addition, the *procureur général* attached to the Cour de Cassation (Supreme Court) is responsible for bringing to the attention of the court decisions of lower courts that ought to be reviewed because of possible faulty interpretation of the law. In all courts, the interpretations of the *procureurs* have considerable influence upon the judges.

ministry, in Christianity, the office held by persons who are set apart by ecclesiastical authority to be ministers in the church or whose call to special vocational service in a church is afforded some measure of general recognition. The type of ministry varies in the different churches. That which developed in the early church and is retained by the Roman Catholic, Eastern Orthodox, Old Catholic, Anglican, and some other churches is episcopal (*see* episcopacy) and is based on the three orders, or offices, of bishop, priest, and deacon.

Throughout much of the history of the church, the episcopal ministry was taken for granted, but the Protestant Reformation challenged the authority of the papacy and with it the authority of the episcopal ministry.

Martin Luther introduced the concept of the priesthood of all believers, which denied any special authority to the offices of the episcopacy. Luther intended to reassert the ministry of the whole church as a community with a mission to the world and no special restrictions on the priesthood. Ministers were encouraged to marry and were not considered a separate order in the church. Lutheran churches developed a variety of ministries, some retaining a modified episcopal form and others adopting congregational and presbyterian forms.

The presbyterian form of ministry, developed by John Calvin, is used in most Presbyterian and Reformed churches. Ministers are teaching elders and share with lay elders and collegial regional bodies (presbyteries) the governance of the church.

Congregational church government, adopted by Baptists, the United Church of Christ in the United States, and various others, accepted much of the Reformed theology but emphasized the authority of the particular congregation rather than any central or regional authority.

Methodism developed from the movement led by John Wesley, a priest of the Church of England. Although historical Methodism rejected episcopacy, in the United States a modified form was developed, retaining the office of bishop and strengthening congregational influence.

Pentecostal and evangelical groups consider charismatic gifts more important than ordination or any office as such. Some churches (*e.g.*, the Society of Friends) do not have an ordained ministry.

Minitari (people): *see* Hidatsa.

minivet, any of the 10 bird species of the Asian genus *Pericrocotus,* belonging to the family Campephagidae (*q.v.*). Males of most species are black and red, females yellowish and gray. Minivets live in forests from Afghanistan to Japan, the Philippines, and Malaysia. Small flocks, constantly chattering in loud, sweet tones, search the treetops for insects. A common and widespread species is the 23-centimetre (9-inch) scarlet minivet.

Orange, or flamed, minivet (*Pericrocotus flammeus*)

A.W. Ambler—The National Audubon Society Collection/Photo Researchers

mink, either of two weasel-like species of the genus *Mustela* (*M. vison,* New World mink, of forests in North America, and *M. lutreola,* Old World mink, of Eurasia) of the weasel family, Mustelidae, trapped and raised commercially for their prized pelts. Slightly larger than the European mink, the North American mink measures about 30–50 centimetres (12–20 inches) in length, exclusive of a 13–23-cm tail, and weighs 1.6 kilograms (3.5 pounds) or less. Both species have short legs, long necks, and broad heads with short, rounded ears. Their pelage is deep, rich brown, with or without white spots on the underparts, and consists of a dense, soft underfur overlaid with dark, glossy, almost stiff, guard hairs.

Mink are nocturnal and semi-aquatic, swimming, fishing, and foraging for various animal prey. A litter of up to 10 kits follows the gestation period of 39–76 days. Crossbreeding has led to the production of many mutant colours of fur; except for the rarer mutant colours, however, the fur of wild mink is more valuable than that of "ranch mink." The North American species of mink is found throughout North America except in the arid regions of the southwestern United States. The Eurasian species is absent from much of western Europe. The kolinsky (kolinski), or Siberian weasel (*M. sibirica*), is sometimes called the China, Japanese, or yellow mink.

New World mink (*Mustela vison*)

Karl H. Maslowski

Minkowski, Hermann (b. June 22, 1864, Aleksotas, Russian Empire [now in Kaunas, Lithuania]—d. Jan. 12, 1909, Göttingen, Ger.), German mathematician who developed the geometrical theory of numbers and who used geometrical methods to solve difficult problems in number theory, mathematical physics, and the theory of relativity. His idea of a four-dimensional space (since known as "Minkowski space"), combining the three dimensions of physical space with that of time, laid the mathematical foundation of Albert Einstein's general theory of relativity.

The son of German parents living in Russia (his brother was Oskar Minkowski), he returned to Germany with his parents in 1872 and spent his youth in the royal Prussian city of Königsberg, from whose university he received a doctorate in 1885. He taught mathematics at Bonn (1885–94), Königsberg (1894–96), Zürich (1896–1902), and the University of Göttingen (1902–09). His major work was *Raum und Zeit* (1907; "Space and Time"). His works were collected in David Hilbert (ed.), *Gesammelte Abhandlungen,* 2 vol. (1911; "Collected Papers").

Minkowski, Oskar (b. Jan. 13, 1858, Aleksotas, Russian Empire [now in Kaunas, Lithuania]—d. July 18, 1931, Fürstenberg an der Havel, Ger.), German physiologist and pathologist who introduced the concept that diabetes results from suppression of a pancreatic substance (later found to be the hormone insulin).

Minkowski taught medicine at the universities of Strassburg (1882–1904), Cologne (1904–05), Greifswald (1905–09), and Breslau (1909–26). At Strassburg he investigated the biochemical basis of diabetes and found (1884) that β-hydroxybutyric acid with a concomitant decrease in blood bicarbonate is the cause of diabetic acidosis (an acidification of the blood); he also proved that diabetic coma is accompanied by a decrease in the amount of carbon dioxide dissolved in the blood, and he introduced alkali therapy to counteract it. In 1889 he discovered (with the German physiologist Joseph von Mering) that dogs subjected to removal of the pancreas develop the symptoms of diabetes, leading Minkowski to postulate that the pancreas is the site of secretion of an "antidiabetic" substance, now known to be insulin. By removing the liver from birds, he demonstrated (1885) that the organ is responsible for the manufacture of bile pigments and is the site of uric acid formation.

Minna, town, capital of Niger State, west central Nigeria. Following the opening of the Kano-to-Baro railway (1911) and the extension of the Lagos-to-Jebba line (1915) to a junction in Minna, the town became a major collecting point for agricultural products, including peanuts (groundnuts), cotton, yams, and shea nuts. These remain its most important exports, but pigs are also railed to Lagos.

Local trade among its predominantly Gbari (Gwari) population is mainly in sorghum, yams, corn (maize), millet, peanuts, cotton, shea nuts, tobacco, indigo, kola nuts, cattle, goats, chickens, and guinea fowl. The town is known for its woven and dyed cotton cloth, raffia mats and baskets, pottery, and brass ware. Modern industry includes a brick-making plant and a nearby marble quarry.

Since becoming the capital of Niger State in 1976, Minna has developed as an administrative centre as well. It has teacher-training colleges and a hospital, and it is also the radio broadcasting centre for the state. The town is a hub for local roads serving southern Niger State. Pop. (1996 est.) 136,900.

Minnaert, Marcel Gilles Jozef (b. Feb. 12, 1893, Bruges, Belg.—d. Oct. 26, 1970, Utrecht, Neth.), Flemish astronomer and solar physicist who pioneered in solar spectrophotometry and showed how such a technique could reveal much about the structure of the Sun's outer layers.

Minnaert was first a botanist, but his desire to understand more fully the effect of light on plants led him to study physics at the University of Leiden, in The Netherlands. Exiled from Belgium for his support of the nationalist Flemish movement before and during World War I, he became a staff member of the solar observatory at Utrecht in 1921.

After the invention of the microphotometer about 1920, Minnaert undertook the measurement of the intensities of dark lines in the solar spectrum. With the help of two pupils, he prepared the monumental Utrecht *Photometric Atlas of the Solar Spectrum* (1940), still a standard reference, which includes measurements of the absorption lines from 3332 angstroms to 8771 angstroms. Other works on the Sun's spectrum followed, but perhaps his most noted work is *Die Natuurkunde van't Vrije Veld,* 3 vol. (1937–42; Eng. trans. of vol. 1, *Light and Color in the Open Air,* 1954), on optical phenomena associated with meteorology.

From 1937 until his retirement in 1963 Minnaert was director of the Sonnenborgh Observatory at Utrecht, but during most of World War II he was interned in a Nazi concentration camp.

Minneapolis, city, seat of Hennepin county, southeastern Minnesota, U.S., port of entry at the head of navigation on the Mississippi River, near the mouth of the Minnesota River. With adjoining St. Paul (*q.v.*) to the east, it forms the Twin Cities metropolitan area. The state's largest city, it has 22 lakes and some 170 parks within its limits.

Sioux and Ojibwa Indians were early inhabitants. The Franciscan missionary Louis Hennepin visited the area in 1680 and named St. Anthony Falls, which later provided power for grinding flour for Fort Snelling (1819; now a state park), a military outpost at the confluence of the rivers. The village of St. Anthony, which developed on the east side of the river, was incorporated in 1855. Settlers had begun occupying U.S. military-reservation land on the west side of the river in 1849, and the village of Minneapolis was incorporated in 1856. Its name was derived from the Sioux word *minne,* meaning "water," and the Greek *polis,* for "city." St. Anthony was chartered as a city in 1860 and Minneapolis in 1867; the two cities merged as Minneapolis in 1872. The falls were an important factor in the city's early economic growth as a lumber and flour-milling centre. By 1870 Minneapolis was the nation's top producer of flour. The lumber business reached its height in 1899, when logs from the forests of the north jammed the river. As wheat growing in the northwest increased, flour milling superseded lumbering as the leading industry (the last lumber mill closed in 1919). Railroads, multiplying connections with Chicago and the south, and with the east through Sault Ste. Marie, Mich., were completed in the late 19th century. After World War I, Great Lakes shipping shifted much of the export flour trade to Buffalo, N.Y., though Minneapolis remained the headquarters for some large milling companies. In the second half of the 20th century, the city remained one of the nation's primary wheat markets; the Minneapolis Grain Exchange is the largest cash exchange market in the world.

The Nicollet Mall in downtown Minneapolis, Minn.

Gregory K. Hunt

Minneapolis is now a commercial, industrial, transportation, distribution, health care, and financial centre. Highly diversified manufactures include metal products, electronics, precision instruments, medical devices, plastics, machinery, computers and computer equipment, chemicals, automotive parts, and agricultural products. Publishing, milling, food processing, graphic arts, insurance, and high-technology industries are also important. The Twin Cities area is a rail and trucking centre and has an international airport. The Skyway is a system of climate-controlled pedestrian walkways located on the second-floor level that connects various points around the city.

Minneapolis is the seat of the University of Minnesota (1851), Augsburg College (Lutheran; 1869), Dunwoody Institute (technical; 1914), Minneapolis College of Art and Design (1886), a campus of Metropolitan State University (1971), and North Central University (Pentecostal; 1930). Of historical and cultural interest are the Guthrie Theatre (home of the state repertory theatre), the Minnesota Opera, the Minnesota Orchestra, the American Swedish Institute, the Walker Art Center, the Minneapolis Public Library's planetarium, the Hennepin History Museum, the Minneapolis Institute of Arts, and the Bell Museum of Natural History. Minnesota's professional baseball (Twins) and football (Vikings) teams play in the city's Metrodome; the professional basketball team (Timberwolves) plays in the Target Center. The Minneapolis riverfront is part of the Mississippi National River and Recreation

Area. Pop. (2000) city, 382,618; Minneapolis–St. Paul MSA, 2,968,806.

Minnehaha Falls, waterfall in Minnehaha Park, Minneapolis, eastern Minnesota, U.S., formed by Minnehaha Creek, which flows to the Mississippi River from Lake Minnetonka. The falls have a drop of 53 feet (16 m) and were known earlier as Little Falls or Brown's Falls. They were immortalized as the "laughing water" in Longfellow's epic poem *The Song of Hiawatha* (1855).

> Where the Falls of Minnehaha
> Flash and gleam among the oak-trees,
> Laugh and leap into the valley.

A bronze statue by Jacob Fjelde of Minnehaha and Hiawatha stands above the falls.

Minnelli, Vincente (b. Feb. 28, 1910, Chicago, Ill., U.S.—d. July 25, 1986, Los Angeles, Calif.), American motion-picture director who infused a new sophistication and vitality into filmed musicals in the 1940s and '50s. Though his early work was for the Broadway stage, Minnelli, working with Arthur Freed and Gene Kelly, created successful film dramas, comedies, and musicals.

Raised by theatrical parents (an Italian-born father and French-born mother) who operated a traveling tent show, Minnelli worked in stage management and costume design from the age of 16, first in Chicago and then in New York City. After achieving success as a Broadway director—directing such successful Broadway shows as *At Home Abroad* (1935), *The Show Is On* (1936), and *Hooray for What!* (1937)—he was hired by Metro-Goldwyn-Mayer (MGM) and moved to Hollywood in 1940.

Minnelli combined daring use of colour with imaginative camera work, producing elegant and visually sophisticated movies. Adept at combining music and plot, he is best remembered for such films as *Meet Me in St. Louis* (1944) and *The Pirate* (1948), both of which starred Judy Garland. Minnelli married Garland in 1945, and their only child, Liza Minnelli, became a successful actress and singer.

In 1950 Minnelli and Kelly collaborated on *An American in Paris* (1951 release), an Academy Award-winning, innovative movie relying heavily on dance. Although he was recognized as a good dramatic director—directing such films as *The Clock* (1945), *Father of the Bride* (1950), *The Bad and the Beautiful* (1952), and *Lust for Life* (1956)—Minnelli's most popular films were his lavish musicals, most notably *The Band Wagon* (1953) and the Academy Award-winning *Gigi* (1958). In 1962 he left MGM studios and founded Venice Productions. Later films included *Goodbye Charlie* (1964), *On a Clear Day You Can See Forever* (1970), and *A Matter of Time* (1976). A volume of memoirs, *I Remember It Well,* was published in 1974.

minnesinger, German MINNESÄNGER, or MINNESINGER, any of certain German poet-musicians of the 12th and 13th centuries. In the usage of these poets themselves, the term *Minnesang* denoted only songs dealing with courtly love (*Minne*); it has come to be applied to the entire poetic-musical body, *Sprüche* (political, moral, and religious song) as well as *Minnesang.*

The songs of courtly love, like the concept, came to Germany either directly from Provence or through northern France. The minnesingers, like their Romance counterparts, the troubadours and trouvères, usually composed both words and music and performed their songs in open court, so that their art stood in an immediate relationship to their public. Some were of humble birth; at the other end of the social scale were men such as the emperor Henry VI, son of Frederick I Barbarossa. Most, however, were *ministeriales,* or members of the lower nobility, who depended on court patronage for their livelihood; from the vicissitudes of such an existence come many of the motifs in their poetry.

In form the music follows, in the main, the tripartite structure taken over from the Provençal *canso:* two identical sections, called individually *Stollen* and collectively *Aufgesang,* and a third section, or *Abgesang* (the terms derive from the later meistersingers); the formal ratio between *Aufgesang* and *Abgesang* is variable. The basic *aab* pattern was subject to much variation (*see* Bar form).

On a larger scale was the *Leich,* analogous to the French lai (*q.v.*). It was an aggregation of short stanzas (versicles), typically couplets, each line of which was sung to the same music and each versicle having its own music. The *Leiche* were often several hundred lines long, and many incorporated religious motifs (such as the veneration of the Virgin Mary), which are also found in the shorter lyrics. Musical unity in both the *Leich* and the shorter forms was often achieved by the recurrence and variation of brief motifs or even entire phrases.

Some of the early songs were probably sung to troubadour melodies, because their texts closely resemble Provençal models. Yet the German songs, in the main, differ in general musical character from the Romance songs. For example, the melodies are more often basically pentatonic (based on a five-tone scale). Popular song and Gregorian chant are other musical roots of the style.

The poems of the earliest minnesinger known by name, Kürenberger (fl. 1160), show only a tint of the troubadour, for his realistic verses show a proud, imperious knight with a woman pining for his love. But by the end of the century the courtly love themes of the troubadours and trouvères had taken control. In the 12th century the poetry of the Thuringian Heinrich von Morungen is marked by intensity of feeling and moral involvement, and the Alsatian Reinmar the Elder gives the courtly love lyric such an expression of social ideals that he was taken by his contemporaries as the most representative poet of "pure" *Minnesang.*

Walther von der Vogelweide, one of the greatest lyric poets of the European Middle Ages, absorbed much of his teacher Reinmar's craftsmanship, but he went far beyond the artificial conventions with which the *Minnesang* had been governed by introducing an element of practical realism, both in his love poetry and in his *Sprüche.* By the time of Neidhart von Reuenthal, a Bavarian squire (d. *c.* 1250), the knight had turned his attention from the ladies of the castle to the wenches of the villages; Neidhart's melodies likewise have a certain affinity with folk song.

Whereas poets like Ulrich von Lichtenstein strove to keep the conceits of chivalry alive, others—among them Reinmar von Zweter, the Marner, and Konrad von Würzburg (mid-13th century)—cultivated didactic poetry, which Walther von der Vogelweide, building on the work of earlier poets, had already raised to a high level. At the end of the 13th century stands Frauenlob (Heinrich von Meissen), who, by his versatility, his power of rhetoric, and his technical refinement, points to the stylized art of the later meistersingers.

Minnesota, constituent state of the United States of America, lying in the upper Midwestern region of the country.

Minnesota is bounded to the north by the Canadian provinces of Manitoba and Ontario, to the east by Lake Superior and Wisconsin, to the south by Iowa, and to the west by South and North Dakota. The state capital is St. Paul. Area 86,943 square miles (225,182 square km). Pop. (2000) 4,919,479.

A brief treatment of Minnesota follows. For full treatment, *see* MACROPAEDIA: United States of America: *Minnesota.*

Until the mid-19th century, two major Indian tribes occupied what is now Minnesota: the Ojibwa and the Sioux. The earliest verifiable Europeans in the area were 17th-century French explorers searching for a Northwest Passage. The area passed under U.S. control in 1803 as part of the Louisiana Purchase, but the first permanent U.S. settlement was not made until Fort Snelling was founded (1819). The first large wave of settlers came from New England to exploit the vast forestlands that covered about two-fifths of the state. Minnesota became the 32nd state in 1858.

Minnesota straddles three continental watersheds: the Mississippi River to the Gulf of Mexico, the Great Lakes to the Atlantic Ocean, and the Red and Rainy rivers to Hudson Bay. Glaciation carved more than 15,000 lakes out of the surface. Extreme southeastern Minnesota is the only unglaciated part of the state, where streams cut their ways through layers of limestone over many thousands of years and steep rocky bluffs rise 500 feet (150 m) or more above the valleys. Minnesota's vegetation makes a sharp transition from needle-leaf and hardwood forest zones to tallgrass prairie, although little of the pre-settlement vegetation remains.

Climate is extremely varied because the state stretches from the subarctic forest in the north to the Corn Belt in the south and from the Great Lakes storm belt in the east to the semiarid Great Plains in the west. July daily maximum temperatures range from 85° F (29° C) in the south to 70° F (21° C) along the shore of Lake Superior. Average daily January highs range from 25° F (−4° C) in the south to 15° F (−9° C) in the north. Average annual precipitation ranges from more than 30 inches (750 mm) in the southeast to less than 20 inches (500 mm) in the northwest. Many parts of Minnesota have continuous snow cover for at least 90 days, from about mid-December to mid-March.

Minnesota's first settlers from New England were followed by large numbers of Germans, Norwegians, and Swedes, who came to establish homesteads in the 1880s. There are Finns in the northeast, Poles in the southeast and centre, and Bohemians south of the "Twin Cities" of Minneapolis and St. Paul. The state is largely Lutheran and Roman Catholic. In the late 20th century there were some 35,000 Indians, mostly Ojibwa, nearly half of whom lived in the Twin Cities area. Some 90 percent of the population is white; the black population is about 3.5 percent of the total.

Agriculture and related businesses are Minnesota's economic mainstays. Grains, meat, and dairy products are the leading products. Mineral resources abound, especially iron ore and taconite, granite, and limestone. Manufacturing activities produce processed food, pulp and paper products, primary metals, and electronic equipment, but manufacturing employs only about one in four workers.

The Twin Cities, with service by road, rail, air, and water, are the centre of Minnesota's transportation network. Grain and ore are carried by rail to the Great Lakes ports of Duluth and Superior (in adjoining Wisconsin). The Minneapolis–St. Paul International Airport is the hub of air transportation.

The Twin Cities are also the cultural centre of Minnesota and of the region. They are home to the renowned Minnesota Orchestra, the Guthrie Theatre, the Walker Art Center, the University of Minnesota, and the Minnesota Dance Theatre. Outdoor recreation figures prominently in the state, and many residents take advantage of the state's numerous lakes and natural areas. The Mayo Clinic in Rochester is a world-renowned medical and health centre.

Minnesota Mining & Manufacturing Company (3M), diversified American corporation manufacturing a wide range of products, including abrasives, adhesive tape and related products, videocassettes, carbonless paper, and computer-synthesized graphics. It is headquartered in St. Paul, Minn.

The company was incorporated under its present name in 1902, and its first product was sandpaper. 3M grew steadily, adding waterproof sandpaper, adhesive cellophane tape, masking tape, and desktop copiers, among other goods, to its product line. The company is divided into four market groups—electronics and information technologies; graphics technologies, including graphic arts and services and products; industrial and consumer technologies, including photographic films and adhesive tapes; and life sciences, with health-care products and services.

The company is notable among diversified American corporations for its growth by largely internal means rather than by means of large-scale acquisitions.

Minnesota River, river rising at Ortonville, Minn., U.S., at the southern tip of Big Stone Lake, on the South Dakota–Minnesota boundary, and flowing south-southeast, then northeast from Mankato, Minn., to join the Mississippi River at Mendota, just south of St. Paul. The Minnesota (a Sioux name meaning "sky-tinted water") is approximately 332 miles (534 km) long. The river was once known as the St. Peter or St. Pierre and was important to early explorers and fur traders. Big Stone Lake Dam, near Ortonville, and Marsh Lake Dam, where the Pomme de Terre River joins the Minnesota, are part of a flood-control project.

minnow, in North America, any of various small fishes, especially those of the carp family, Cyprinidae. The name minnow is also applied to mud minnows (family Umbridae), killifishes (Cyprinodontidae), and, in a general way, the young of many large fishes. For topminnows, *see* live-bearer.

The North American cyprinid minnows comprise numerous species of small, freshwater fishes that are known by such names as shiner (genera *Notemigonus* and *Notropis*) and bluntnose and fathead minnow (*Pimephales*). Many are abundant, and a number are valuable as live bait; sometimes they are cultured for this purpose. One good bait species is the bluntnose minnow (*P. notatus*), an olive-coloured species up to 10 cm (4 inches) long. Others include the 6-centimetre fathead minnow (*P. promelas*) and the common shiner (*Notropis cornutus*), a blue and silver minnow up to 20 cm long. The golden shiner, or American roach (*Notemigonus cryseleucas*), a larger, greenish and golden minnow attaining a length of 30 cm and a weight of 0.7 kg (1.5 pounds), is both edible and valuable as bait.

The minnow of Europe and northern Asia is *Phoxinus phoxinus*, a slim, small-scaled fish typical of clean streams and rivers. Also a member of the carp family, it is usually about 7.5 cm long. It varies in colour from golden to green, and the male, like certain other male cyprinids, develops a bright red underside during the spring breeding season. This minnow, like many others, is a valuable source of food for fishes, birds, and other animals.

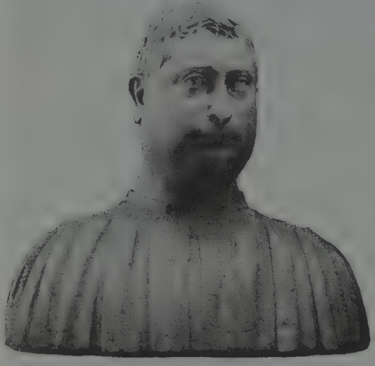
Red shiners (*Notropis lutrensis*)
Gene Wolfsheimer

Mino da Fiesole (b. 1429, Poppi, Republic of Florence [Italy]—d. 1484, Florence), early Renaissance sculptor notable for his well-characterized busts, which are among the earliest Renaissance portrait sculptures.

Mino was trained in Florence, probably in the studio of Desiderio da Settignano, and he executed monuments of Leonardo Salutati, bishop of Fiesole, and of Bernardo Giugni and Count Hugo of Andersburg. The latter work was begun in 1471 and completed after Mino's return from Rome in 1482.

Mino was active in Rome in 1454 and 1463 and from about 1473 to 1480. In that city he executed, among many other works, monuments of Cardinal Pietro Riario and Cardinal Cristoforo della Rovere. Much of Mino's work in Rome was undertaken in conjunction with Andrea Bregno.

Mino enjoyed popularity as a portrait sculptor. His earliest portrait bust, that of the wealthy and politically prominent Florentine merchant Niccolò Strozzi, was carved in Rome in 1454. Included among other of his major portrait busts are those of Astorgio Manfredi, Rinaldo della Luna (1461), and Diotisalvi Neroni (1464).



"Niccolò Strozzi," marble portrait bust by Mino da Fiesole, 1454; in the Staatliche Museen Preussischer Kulturbesitz, Berlin

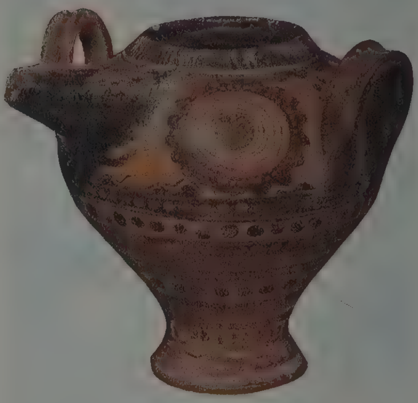
Though much admired in the 19th century, Mino's sculptures have come to occupy a place below those of the contemporary Desiderio da Settignano and Antonio Rossellino. In his larger works the treatment of form is frigid and mannered, and he appears to have lacked the technical proficiency of his great contemporaries.

Minoan civilization, Bronze Age civilization of Crete that flourished from about 3000 BC to about 1100 BC. Its name derives from Minos, either a dynastic title or the name of a particular ruler of Crete who has a place in Greek legend.

A brief treatment of Minoan civilization follows. For full treatment, *see* MACROPAEDIA: Greek and Roman Civilizations, Ancient: *Aegean civilizations*.

Crete became the foremost site of Bronze Age culture in the Aegean Sea, and in fact it was the first centre of high civilization in that area, beginning at the end of the 3rd millennium BC. Reaching its peak about 1600 BC and the later 15th century, Minoan civilization was remarkable for its great cities and palaces, its extended trade throughout the Levant and beyond, and its use of writing. Its sophisticated art included elaborate seals, pottery (especially the famous Kamáres ware with its light-on-dark style of decoration), and, above all, delicate, vibrant frescoes found on palace walls. These frescoes display both secular and religious scenes, such as magical gardens, monkeys, and wild goats or fancifully dressed goddesses that testify to the Minoans' predominantly matriarchal religion. Among the most familiar motifs of Minoan art are the snake, symbol of the goddess, and the bull; the ritual of bull-leaping, found, for example, on cult vases, seems to have had a religious or magical basis.



Bridge-spouted jar decorated in polychrome, Late Minoan period (*c.* 1400–*c.* 1100 BC); in the Ashmolean Museum, Oxford
By courtesy of the Ashmolean Museum, Oxford

By about 1580 BC Minoan civilization began to spread across the Aegean to neighbouring islands and to the mainland of Greece. Minoan cultural influence was reflected in the Mycenean culture of the mainland, which began to spread throughout the Aegean about 1500 BC.

By the middle of the 15th century the palace culture on Crete was destroyed by conquerors from the mainland. They established a new order on Crete, with centres at Knossos and Phaistos. Following the conquest, the island experienced a wonderful fusion of Cretan and mainland skills. The Late Minoan period (*c.* 1400–*c.* 1100 BC), however, was a time of marked decline in both economic power and aesthetic achievement.

Minobe Tatsukichi (b. May 7, 1873, Hyōgo prefecture, Japan—d. May 23, 1948, Tokyo), legal expert who reinterpreted the position of the imperial institution within the Japanese constitution as that of an "organ of state." This view of the emperor, who until that time had been considered the divine embodiment of the state, greatly altered Japanese political theory.

After doing graduate work in Germany, Minobe became a law professor at Tokyo University. He utilized German legal theory to set forth the view that the emperor, although symbolizing the unique character of the Japanese state as the nationalists claimed, was still merely the highest organ of the state invested with the authority to carry out the nation's executive functions. This idea in effect made the emperor subject to the laws of the state; imperial authority was no greater than that of elected organs of the government. In fact, Minobe maintained, true sovereign power could be vested only in the people. This argument weakened the sanction for autocratic rule (in the name of the emperor) and produced a theoretical basis for the growing democratic movement.

Since Minobe's works were prescribed reading for the government civil-service examinations required for higher bureaucratic positions, almost all leading officials held his views. Nevertheless, as Japan prepared for war in the xenophobic atmosphere of the 1930s, his theories came under increasing criticism from these same bureaucrats. In 1932 he retired from the university and was elevated to the House of Peers. Three years later nationalistic pressure forced him to resign. His books were then banned until the end of World War II.

After the war Minobe opposed the new U.S.-sponsored constitution on the grounds that it had reduced the emperor's power too much, making the imperial institution only a symbol of the state.

Minomura Rizaemon (b. Nov. 25, 1821, Edo [now Tokyo], Japan—d. Feb. 21, 1877, Tokyo), Japanese businessman responsible for making the house of Mitsui the largest of the *zaibatsu* ("financial clique") that dominated the economic life of Japan throughout the 19th and early 20th centuries. Under Minomura's leadership Mitsui became one of the few financial giants of the Tokugawa period (1603–1867) that were able to make the transition to modern industrial conditions.

An orphan, Minomura worked his way up, eventually becoming an exchange broker and developing close ties with the government. Invited to join the Mitsui firm, the largest exchange brokerage of the time, he soon rose to the top position in that house.

After the Meiji Restoration (1868), which overthrew feudal rule in Japan, Minomura instituted modern banking methods, becoming president of the Mitsui Bank, the first private institution of its type in Japan. He also helped launch Mitsui into other enterprises, laying the foundation for a great industrial empire.

minor, also called INFANT, person below the legal age of majority or adulthood. The age of majority varies in different countries, and even in different jurisdictions within a country. It also differs with the type of activity concerned, such as marrying, purchasing alcohol, or driving an automobile. Twenty-one years is a common division between minors and adults.

The concept of minority rests on the assumption that children are incapable of self-management. A minor also has special protection against strangers and irresponsible parents. A minor in most countries can acquire property but cannot sell it; and his acquisitions are controlled by his parents, subject always to review by the courts for abuses.

Similarly, minors—even if they misrepresent their age—cannot be bound to contracts they sign; these are said to be voidable but not void. Thus, if a minor contracts to buy a car, he can cancel the contract before the actual exchange of the car for the money. The contract is said to be voidable at his discretion.

Minors are, however, liable for harm they cause others—*e.g.,* injuries to another child. Formerly, minors who committed crimes were held liable as if they were adults. In the 20th century this practice changed. Although minors were still disciplined for crimes, the emphasis was increasingly placed on rehabilitation, not punishment (*see* juvenile court).

minor planet: *see* asteroid.

Minor Prophets, The (biblical literature): *see* Twelve, The.

Minorca, Spanish MENORCA, island and *comunidad autónoma* ("autonomous community"), Baleares *provincia,* Spain. It is the second largest of the Balearic Islands and lies in the western Mediterranean Sea. Most of the island's area of 258 square miles (668 square km) is dry, monotonous tableland with rugged hills rising in the north centre to Toro hill (1,175 feet [358 m]). Its northern coast has many capes and is deeply indented with inlets such as the bays of La Albufera, Addaya, and Fornells. The fine natural harbour of Mahón, the island's chief town, is the best port of the Balearics and was much prized for its strategic value in the wars of the 18th century. The south coast is more regular and has long stretches of cliffs.

Prehistoric *taula* (table), rectangular stone slab on Minorca; these structures were once probably central supports for ancient ceremonial halls

Shostal

Minorca's first inhabitants were probably cave dwellers. Prehistoric remains, dating from about the middle of the 2nd millennium BC and representing a culture that continued with little change until Roman times, include talayots and *taulas,* both structures of unknown purpose. The former, a type of tower, was roofed, generally with the aid of a central pillar composed of circular superimposed slabs, and faced with clay to produce a monolithic structure. The *taulas,* so-called "tables," may well have been used for ceremonial purposes but certainly formed a normal element of the habitations associated with the talayots. Both talayot and *taula* are usually contained within an enclosure, frequently of D-shaped plan, with the entrance in the straight side; within the area stands a *taula,* a rectangular slab of dressed stone set horizontally on a vertical shaft. The stone *naus,* or *navetas* (Catalan: "ships"), of Minorca, so termed from their resemblance to an upturned boat, were graves.

Many of the plateau limestone soils are suitable only for light grazing, but some of the higher districts are terraced and yield rich harvests, as do the few alluvial valleys, which run down to the south coast. The land irrigated by artesian wells is especially productive, and its windmills are a characteristic feature of the Minorcan landscape. The principal crops are cereals, potatoes, melons, pomegranates, figs, and almonds. Cattle, horses, sheep, and goats are kept, and cheese is exported to the mainland. The farming system is that of peasant proprietorship, and the domestic economy is supplemented by fishing, lobsters being plentiful off the north coast. The manufacture of leather shoes employs about 10 percent of the population in a number of small factories throughout the island. Minorca has many fine beaches, and its tourist business, formerly much inferior to that of Majorca and Ibiza, is expanding. Air and maritime services link the island with Barcelona and Majorca, and there are air services from London. Pop. (1981) 58,727.

minority, a culturally, ethnically, or racially distinct group living within a larger society. When used to describe such a group, the term carries with it a web of political and social implications.

As the term is used by politicians and social scientists, a minority is necessarily subordinate to the dominant group within a society. This subordinancy, rather than a numerical minority, is the chief defining characteristic of a minority group. In certain cases, as in South Africa, where the black population is considered a minority by dint of the dominance of the nation's whites, the "minority group" may be several times the size of the dominating group.

In sociological parlance, a minority must be a distinct social group. As such, it has specific rules of membership and proscribed guidelines of cultural behaviour that distinguish it from the majority. It must have specific, easily recognizable characteristics that mark it off from the rest of society.

In their separation from the dominant forces of a society, members of a minority group usually are cut off both from a full involvement in the workings of the society and from an equal share in the society's rewards. A minority group is typically poorer and politically less powerful than the dominant group, although certain exceptions exist.

The lack of significant distinguishing characteristics keeps certain groups from being classified as minorities. In modern American society, religion seldom defines a minority. The society as a whole is too secularized for differences in religious practice to be felt that keenly. Similarly, Freemasons, though they subscribe to beliefs different from those of most Western people, lack clear identifying features that would distinguish them, and they cannot be considered a coherent minority. A group assembled for primarily economic reasons is seldom considered a minority unless its activity is linked with unifying principles of kinship, race, or culture.

The role of minority groups varies from society to society, depending on the structure of the social system and the relative power of the minority group. In general, the society as a whole has two options when confronted with the presence of a minority group: the minority can be either eliminated or tolerated. A minority group can be eliminated through one of several methods. It can be ejected or suppressed. In the 17th century the dominant Roman Catholics forbade the practice of Protestantism in France. Protestants had the choice of changing religions, practicing Protestantism in secret, or leaving the country. Protestantism as a subculture was thus effectively eradicated. An extreme example of the suppression of minorities is the Nazi extermination of several million Jews.

A less violent means of minority elimination is assimilation. In this process the minority assumes the cultural attributes of the dominant majority. In the 19th and early 20th centuries the United States saw an influx of European immigrants. Rather than allowing them to maintain their original cultural characteristics, the dominant English-speaking, Protestant majority indoctrinated the immigrants in the prevailing culture. The immigrant groups adopted the dominant language and ideology. As a result, they did not establish autonomous social groups but rather became assimilated into American society.

Assimilation is seldom a process of pure elimination. In the course of assimilation, the dominant group usually acquires aspects of the minority culture while imposing its own culture. A society that makes a practice of assimilation usually evolves in the process, and the dominant culture becomes increasingly eclectic.

When a minority group is allowed to exist within the context of a larger society, the resulting social system is called pluralistic. The dominant forces in a pluralistic society opt to tolerate minorities for one of two reasons. The dominant majority may see no reason to rid themselves of the minority. On the other hand, even if the minority is disliked, there may be political, ideological, or moral impediments to a process of elimination. The commercial trade of certain European countries in the 12th and 13th centuries depended on Jewish merchants. This made it impossible, or at least suicidal, for the anti-Semitic rulers to drive the Jews out. Another example of toleration coerced from an unwilling dominant group can be seen in Britain in the 20 years following 1950, which saw an influx of immigrants from the Caribbean, Pakistan, and India. Many British did not like these new minority groups, but the nation's prevailing democratic ideology prevented any move to eject them.

The structure of the society as a whole affects the role that minority groups play in it. By definition, minority groups are ranked somewhere below the top rung of the social hierarchy. The degree of social mobility of a member of a minority group depends on whether the society in which he lives is closed or open. A closed society is one in which an individual's role and function can theoretically never be changed—*e.g.*, the traditional Hindu caste system. An open society, on the other hand, allows the individual to change his role, with corresponding changes in status. Unlike a closed society, which stresses hierarchical cooperation between social groups, an open society permits different social groups to vie for the same resources, so that their relations are competitive. In an open society the ranking of an individual according to his social group has less weight than the rank that the individual attains for himself.

Such a situation can be seen in the United States—an open society that allows the individual social mobility. Sociologists have suggested that part of the difficulty encountered by black people in being absorbed into American society has arisen because, unlike other groups, they are uniquely regarded as an autonomous social group. This stereotyped view, a holdover from notions of a closed society, has caused black people to be segregated from a society that is primarily open and devoid of such autonomous groups. The difficulties encountered by blacks in the United States can be seen as typical of the problems that minorities face in modern Western society.

minority carrier injection, in electronics, a process taking place at the boundary between *p*-type and *n*-type semiconductor materials, used in transistors. Each semiconductor material contains two types of freely moving charges: electrons (negative charges) and holes (positive charges). Electrons are the more abundant, or majority, carrier in *n*-type materials, holes being the less abundant, or minority, carrier. In *p*-type materials, however, holes are the majority carrier, and electrons the minority carrier. If a battery is properly connected to the semiconductor material, the *p*-type material may acquire additional electrons (minority carriers), injected into the *p*-type material from the *n*-type material by the flow of electrons from the battery. This is minority carrier injection.

As a newly injected electron moves through the *p*-type material, it is attracted by the oppositely charged holes. Collision between an electron and a hole stops the free motion of both charges. Thus only a fraction of the injected electrons are able to pass completely through the *p*-type material. In a transistor, those left over are collected by a second piece of *n*-type material.

minority education, the attempt of national educational systems to preserve the cultural identity of linguistic, religious, and racial or ethnic minorities while assimilating those minorities into the nation's economic and social mainstream.

In countries characterized by the use of several languages, such as Belgium, Switzerland, and India, careful compromises have been worked out to acknowledge cultural differences. Belgium, which recognizes three languages of instruction in the schools, has parallel ministries of education for French and Flemish speakers. India encourages the use of the official language of a particular Indian state in the early stages of education, and in upper secondary or higher education, the use of Hindi or English. Conversely, the Malaysian government insists on the use of Bahasa Malaysian as the language of schooling, with the stated aim of establishing national unity in a country characterized by sizable minority groups.

The problem of having several religious minorities within a country became pressing with the establishment of mass elementary education in the 19th century. Up until then, the church—whichever church it might be—had controlled education, but since the 19th century educational systems have been increasingly financed by national governments. One solution to the religious problem was to insist upon a state monopoly in education, as in the Soviet Union or China after their communist revolutions. Another solution was to insist upon a secularized public educational system, as in France or the United States, where religion is not permitted to be taught in the public schools, but where religious groups may establish their own private schools. In countries where there is a high degree of religious homogeneity, as in some Arab countries, religious teaching is encouraged in the schools, and the interests of church and state are deemed to coincide.

In many countries the problems posed by race and ethnicity have affected not only political stability but also educational policy. The UN Declaration of Human Rights has made it increasingly difficult for governments to base their educational policies explicitly on the category of race—as was done in South Africa. Most governments usually concede, in law, that equality of educational opportunity will be provided without reference to race or ethnicity. Because such equality of educational opportunity is rarely achieved in practice, some governments are moving toward educational policies of positive discrimination in favour of minority groups.

This policy takes different forms in different countries. China's constitution recognizes that China is a multinational state and that all nationalities are equal. Research institutes for the nationalities were established from the 1950s onward, and Chinese and minority teachers were trained for work in the autonomous regions, districts, and counties. Bilingualism became official policy, even where this occasionally meant the preparation of glossaries and dictionaries in the local languages. In its broadest aspects the Chinese problem was not dissimilar from that of the Soviet Union, where, although Russians made up half the population, more than 100 other nationalities existed. As in China, separate glossaries and dictionaries were developed. In both countries the difficulties were often practical: a certain density of population was required for the efficient organization of instruction in minority languages. The other difficulty with the policies was their long-term goal: Chinese and Soviet commentators tended to avoid the term assimilation.

In contrast, assimilation was the overt aim in educating minorities, mainly immigrants, in 19th- and early 20th-century United States and Canada. In recent years both countries have recognized the implications of sociological research on minority education and the political power of minority groups to enter claims at national, regional, and local levels for equal educational treatment. Changes in Canadian law have guaranteed the right to education in French in several provinces, and, where appropriate, in English as a minority language. In addition to the special provisions for Indians, Inuit, and Métis in some provinces and territories, the policies have been extended to permit initial instruction in "heritage languages," for example, Ukrainian in Edmonton and Winnipeg, or Italian and Chinese in Toronto.

Similar, though not identical, developments have occurred in the United States. Most notable was the removal by the Supreme Court in 1954 of the legal basis for racial discrimination in education. The Civil Rights Act of 1964 also provided a basis for improvements in several areas of minority education. Provisions for bilingual education entitle non-English-speaking students to special language assistance. These provisions are utilized mainly by Hispanic students.

Minos, legendary ruler of Crete; he was the son of Zeus, the king of the gods, and of Europa, a personification of the continent of Europe. Minos obtained the Cretan throne by the aid of the Greek god Poseidon, and from Knossos (or Gortyn) he gained control over the Aegean islands, colonizing many of them and ridding the sea of pirates. He married Pasiphae, the daughter of Helios, who bore him, among others, Androgeos, Ariadne, and Phaedra, and who was also the mother of the Minotaur (*q.v.*).

Minos successfully warred against Athens and Megara to obtain redress after his son Androgeos was killed by the Athenians. In Athenian drama and legend Minos became the tyrannical exactor of the tribute of children to feed the Minotaur. Minos was killed in Sicily by the daughters of King Cocalus, who poured boiling water over him as he was taking a bath. After his death he became a judge in Hades.

Although Athens preserved a hostile tradition, the general account shows Minos as a powerful, just ruler, very closely associated with religion and ritual. In light of excavations in Crete, many scholars consider that Minos was a royal or dynastic title for the priestly rulers of Bronze Age, or Minoan, Knossos.

Minot, city, seat of Ward county, northwestern North Dakota, U.S. It lies on the south bank of the Souris (Mouse) River, 50 miles (80 km) south of the Canadian border. The settlement originated in 1886 as a tent town of the Great Northern Railway. Incorporated in 1887, it was named to honour Henry D. Minot, an Eastern railroad investor. The city is now an important shipping point, a regional trade centre, and the site of the annual North Dakota State Fair. Its economy is based largely upon the processing and distribution of agricultural products. Lignite strip mines and a major oil field are in the vicinity. The city is the seat of Minot State College (1913) and Northwest Bible College (1934). Minot Air Force Base and the Upper Souris and J. Clark Salyer national wildlife refuges are nearby. Pop. (1990) 34,544.

Minot, George Richards (b. Dec. 2, 1885, Boston, Mass., U.S.—d. Feb. 25, 1950, Brookline, Mass.), American physician who received (with George Whipple and William Murphy) the Nobel Prize for Physiology or Medicine in 1934 for the introduction of a raw-liver diet in the treatment of pernicious anemia, which was previously an invariably fatal disease.

Minot received his medical degree at Harvard University in 1912. He did research at the Massachusetts General Hospital, Boston (1915–23), the Collis P. Huntington Memorial Hospital, Harvard University (1922–28), and the Peter Bent Brigham Hospital, Boston (1923–28). He served as director of the

Thorndike Memorial Laboratory, Boston City Hospital, from 1928 until his death.

Whipple had shown that anemia in dogs, induced by excessive bleeding, is reversed by a diet of raw liver, and in 1926 he and Murphy found that ingestion of a half pound of raw liver a day dramatically reversed pernicious anemia in human beings. With the American chemist Edwin Cohn, Minot succeeded in preparing effective liver extracts, which, taken orally, constituted the primary treatment for pernicious anemia until 1948, when a therapeutic factor was isolated and named vitamin B_{12}.

George Richards Minot

Boyer—H. Roger-Viollet

Minotaur, Greek MINOTAUROS ("Minos' Bull"), in Greek mythology, a fabulous monster of Crete that had the body of a man and the head of a bull. It was the offspring of Pasiphae, the wife of Minos (*q.v.*), and a snow-white bull sent to Minos by the god Poseidon for sacrifice. Minos, instead of sacrificing it, kept it alive; Poseidon as a punishment made Pasiphae fall in love with it. Her child by the bull was shut up in the Labyrinth created for Minos by Daedalus.

A son of Minos, Androgeos, was later killed by the Athenians; to avenge his death, Minos demanded that seven Athenian youths and seven maidens should be sent every ninth year (or, according to another version, every year) to be devoured by the Minotaur. When the third time of sacrifice came, the Athenian hero Theseus volunteered to go, and, with the help of Ariadne, daughter of Minos and Pasiphae, he killed the monster.

Minseitō, English DEMOCRATIC PARTY, or PROGRESSIVE PARTY, prominent pre-World War II Japanese political party that first came to power in 1929 and then vied with the more conservative Rikken Seiyūkai (*q.v.;* "Friends of Constitutional Government") for Cabinet control during the next 11 years.

Formed in 1927 by the merger of the former Kenseikai ("Constitutional Association") and a minor party, the Minseitō attempted to improve Japan's relations with the West and to lessen military control over the government. A centrist party, the Minseitō was controlled by politicians willing to deal with government bureaucrats for patronage and with business interests to gain funds.

In 1940 the government forced the Minseitō and the Rikken Seiyūkai to merge with the government-controlled Taisei Yokusankai ("Imperial Rule Assistance Association"). After 1945 a new Democratic Party was formed, which included many former Minseitō members.

Minshatō (Japan): *see* Democratic Socialist Party.

Minsk, *oblast* (province), central Belarus. It extends from the rolling, morainic hills of the Belorussian Ridge in the northwest across the Berezina plain, which slopes gently to the southeast. The natural vegetation is dense forest of pine, spruce, oak, and birch, and alder in wetter areas, but on the uplands most of the forest has been cleared for agriculture, with consequent gully erosion. In the south and east, grass marsh and peat bog are extensive. The economy is dominated by the capital city, Minsk. Apart from Borisov and the vehicle-making centre of Zhodino, the *oblast*'s towns are small and are engaged in processing timber and local farm produce. Cultivation of rye, wheat, buckwheat, barley, and flax is chiefly concentrated on the uplands and around Slutsk in the south; dairying is widespread. The chief industries are machine and instrument building (automobiles, tractors, lathes, motorcycles, televisions, and radio receivers). In the 1960s large deposits of potassium salts at Starobin began to form the base for fertilizer production in Soligorsk. This area has become one of the most important potash-producing centres in Europe. Area 15,500 square miles (40,200 square km). Pop. (1999) 1,558,600.

Minsk, Belarusian MANSK, city, capital of Belarus, and administrative centre of Minsk *oblast* (province). The city lies along the Svisloch River. First mentioned in 1067, it became seat of a principality in 1101. Minsk passed to Lithuania in the 14th century and later to Poland, being regained by Russia in the second partition in 1793. The city has suffered many disasters, including frequent destruction by fire, sacking by the Crimean Tatars in 1505, occupation and damage by French troops in 1812, German occupation in 1918, Polish occupation in 1919–20, and almost total destruction in World War II, especially during the Soviet advance in 1944. Nevertheless Minsk steadily increased in importance, first as a provincial centre after 1793 and later as an industrial centre after the building of the Moscow-Warsaw and Liepaja-Romny railways through Minsk in the 1870s. In 1919 it became the capital of the Belorussian republic.

Belarusians in traditional dress at a winter carnival, Minsk city, Belarus

© AFP/Corbis

The city's large Jewish community was systematically massacred during the German occupation (1941–44) in World War II. Minsk itself was almost completely demolished in the course of the war, and it was subsequently rebuilt with abundant parks, wide boulevards, and many blocks of multistory apartment buildings. Minsk grew in population faster than any comparable Soviet city in the period 1959–89, its inhabitants more than tripling from 500,000 to nearly 1,600,000 during that time. Minsk remained the capital when Belarus gained independence in 1991. That same year, the city became the administrative centre of the Commonwealth of Independent States.

The present-day city, sprawling over gently hilly relief, is almost entirely of new construction; most of the principal buildings in the centre are in the ponderous architectural style of the early Soviet period. The Mariinsky Cathedral and the church of the Bernadine monastery survive as relics of the past.

Minsk is the major industrial centre of Belarus. The economy is based on machine-building, particularly the manufacture of trucks and tractors. Other products include electric motors, bearings, machine tools, radio and television equipment, refrigerators, watches, textiles, and foodstuffs. The city is also a major educational, cultural, and printing centre, with the Academy of Sciences of Belarus, a university founded in 1921, and numerous other institutions of higher education. Minsk has a music conservatory, a palace of winter sports, and a number of theatres, including the Belarus State Theatre of Opera and Ballet. Pop. (2000 est.) 1,688,000.

minstrel (Old French and Provençal: *menestrel;* from Latin *ministerium,* "service"), between the 12th and 17th centuries, a professional entertainer of any kind, including juggler, acrobat, and storyteller; more specifically, a secular musician, usually an instrumentalist. In some contexts, "minstrel" more particularly denoted a player of wind instruments, and in the 15th century it was sometimes even used for an instrument that he played, the shawm (an early form of oboe). The word minstrel replaced the earlier jongleur (Provençal: *joglar*) about the 14th century.

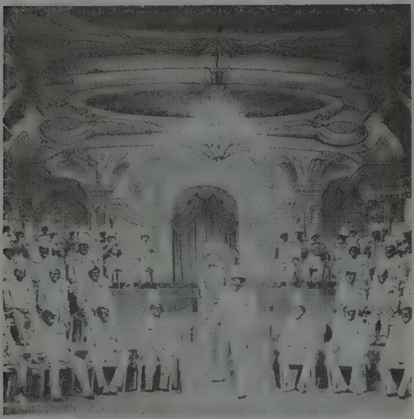
The minstrel profession antedates its name. In the 4th century the *glêoman* is heard of among the Angles, and in the 6th century the Germanic *scop* is referred to. The Old English poem "Widsith" (*q.v.*) describes the role of a fictitious *scop* in Germanic society. In the 12th century there emerges a clearer picture of the performance and social situation of the minstrel. Many were attached to courts, some as musicians. Others, the great majority, traveled widely, staying for short times at places of potential patronage. Most minstrels were unable to write their music down; their art was one of memory and improvisation. Consequently, little of their music survives, but it is not unlikely that the best minstrels, some of whom commanded large salaries, performed music equal in sophistication to surviving examples of the 12th- and 13th-century polyphony (part music) that was composed by clerics (those who could write).

The 14th and 15th centuries witnessed the development of minstrel guilds in towns all over Europe. The guilds made the minstrel more a part of his society, required that he be properly trained by another member of the guild, and saw to it that there was work for him. In the later 15th century, town ordinances in Flanders even stipulated that the minstrels practice together regularly and give concerts at specified times. Their performances were mostly outdoors or at large gatherings, and so the preferred instruments were the louder ones—shawms, pipes, trumpets, and drums.

The little surviving instrumental music from these centuries apparently comes not from the town guilds but from the musicians established in noble houses. At the accession of Philip the Good, duke of Burgundy, in 1419, his court included six trumpeters, four *menestrels,* and a harpist. Later the number of musicians was increased. The relative stability of musicians at that court (one stayed 34 years) suggests a high degree of group improvisational skill among minstrels. Similar groups of musicians were employed at many European courts, and there was a fair degree of contact between them. The Burgundian court records show that during Lent, when entertainment was not permitted, the minstrels were given a special allowance to visit "minstrel schools" in various parts of Europe so that they could learn new tunes and find out what their colleagues elsewhere were playing.

The later 15th century saw a marked increase in literacy among the laity as well as a more simplified musical notation (essentially that still in use). Sixteenth-century manuscripts of wind-band music often also contain church music, suggesting that the distinction between reading clerical musicians and nonreading minstrels was breaking down. Also, the popular dance forms were being used by composers as a framework for composition rather than for improvisation. This convergence of the hitherto distinct styles of minstrelsy and art music contributed to the decline of the minstrel profession. Though the guilds, town bands, and wandering musicians continued to exist, the importance of the minstrel as a separate part of the musical profession faded after the 16th century. The minstrel is related to such other medieval singers as the meistersinger, the minnesinger, the troubadour, and the trouvère (*qq.v.*).

minstrel show, indigenous American theatrical form comprising a group of blackfaced white minstrels whose material caricatured the singing and dancing of Negro slaves. It was popular in England as well as the United States, reaching its zenith between 1850 and 1870. The form gradually declined, eventually disappeared from the professional theatres, and became purely a vehicle for amateurs. Although its influence was evident in vaudeville, radio, television, and motion pictures in the 20th century, its chief impact came through its folk music and dances, which made permanent contributions to American culture.



An American minstrel show with interlocutor and performers, first half of the 20th century

Brown Brothers

The father of the American minstrel show was Thomas Dartmouth Rice, popularly known as "Jim Crow." He was an early Negro impersonator whose art created a vogue for blackfaced minstrelsy. The pioneer company, the Virginia Minstrels, a quartet headed by Daniel Decatur Emmett, first performed in 1843. Other noteworthy companies were Bryant's, Campbell's, and Haverly's, but the most important of the early companies was the Christy Minstrels, who played on Broadway for nearly 10 years; Stephen Foster wrote songs for this company.

The format of the minstrel show, usually in two parts, was established by the Christy company and changed little thereafter. In part one the performers were arranged in a semicircle, with the interlocutor in the centre and the end men—Mr. Tambo, who played the tambourine, and Mr. Bones, who rattled the bones—at the ends. The interlocutor, in whiteface, usually wore formal attire; the others, in blackface, wore gaudy swallow-tailed coats and striped trousers. The program opened with a chorus, often as a grand entrance, and at the conclusion of the song the interlocutor gave the command, "Gentlemen, be seated." Then followed a series of jokes between the interlocutor and end men, interspersed with ballads, comic songs, and instrumental numbers, chiefly on the banjo and violin. The second part, or olio (mixture or medley), consisted of a series of individual acts that concluded with a hoedown or walk-around in which every member did a specialty number while the others sang and clapped. Occasionally there was a third part consisting of a farce, burlesque, or comic opera.

mint, in botany, any fragrant, strong-scented herb of the *Mentha* genus, comprising about 25 species of perennial herbs, and certain related genera of the mint family (Lamiaceae, or Labiatae) and including peppermint, spearmint, oregano, marjoram, rosemary, and thyme (*qq.v.*). Native to Europe, Asia, and Australia, mints are naturalized in North America and are widely distributed throughout the temperate and subtropical areas of the world but principally in the temperate regions of the Old World. Many are used as flavourings for foods, but, in cookery, the term mint usually refers to peppermint or spearmint.

True mints belong to the *Mentha* genus. They have square stems, opposite, aromatic leaves, and small flowers usually of a pale purple, pink, or white colour arranged in clusters, either forming separate whorls or crowded together in a terminal spike. All *Mentha* abound in volatile oil, contained in resinous dots in the leaves and stems. Oils of mints are used as scents in perfumery and as flavouring in candy, liqueur, gum, dentifrices, and medicines. The mint of the Bible is presumed to be *Mentha longifolia* because it is extensively cultivated in the Middle East; it was one of the bitter herbs with which the paschal lamb was eaten. This plant has hairy leaves with silky undersides and dense flower spikes. The water mint, *Mentha aquatica,* grows in ditches and has rounded flower spikes and stalked, hairy leaves. Pennyroyal, *Mentha pulegium,* has small oval, obtuse leaves and flowers in axillary whorls and is remarkable for its creeping habit and pungent odour. It has been used in folk medicine to induce perspiration and menstruation.

Other members of the family Lamiaceae are also called mints: *Monarda,* the bergamots, are called horsemint; *Pycnanthemum* is called mountain mint; *Nepeta cataria* is called catnip, or catmint; *Cunila origanoides* is called stonemint, or Maryland dittany; *Prostanthera,* tender Australian shrubs, are called mint bushes.

mint, in economics, a place where coins are made according to exact compositions, weights, dimensions, and tolerances, usually specified by law.

The first state mint was probably established by the Lydians, an Anatolian people, in the 7th century BC. The Greeks of the Aegean Islands soon followed their example, and the art spread into Italy and other Mediterranean countries, as well as to Persia and India. The Romans, who probably began coining in the 4th century BC, laid the foundations of modern minting.

Coining originated independently in China in the 7th century BC and spread into Japan and Korea.

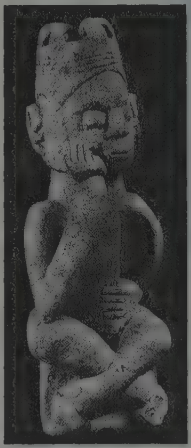
In medieval Europe, mints proliferated as commerce revived, and every feudal authority—kings, counts, bishops, and free cities—exercised the mint privilege; there were more than 50 mints in 13th-century France alone. The result was a wide variation in coinage that often handicapped commerce.

In the 16th century, mints were set up by the Spaniards in South America and Mexico to coin the gold and silver mined there.

Most modern countries operate only one mint (although in Great Britain the mint at Llantrisant, Wales, produces the vast bulk of coinage while the London mint at Tower Hill is largely an administrative centre). Of the seven coinage mints in operation at various times in the United States only two were active in the early 1980s, in Philadelphia and Denver; proof sets of coins for collectors were minted at San Francisco, however.

Countries in which the demand for coins is not sufficient to make a national mint economically feasible have their coins struck in foreign mints. The British mint has struck coins for other countries since the 16th century. Many mints perform functions other than minting, notably refining precious metals and manufacturing medals and seals.

mintadi, steatite (soapstone) figure from Angola. According to Italian documents, *mintadi* figures were brought to the Museo Preistorico Etnografico Luigi Pigorini (Luigi Pigorini Prehistoric Ethnographic Museum) in Rome by missionaries from Africa in the 17th century. Traditional *mintadi*, similar to those antique figures, were still being carved centuries later.



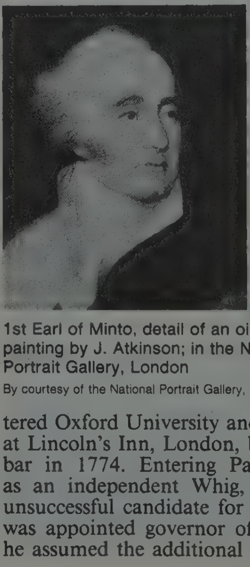
Kongo *mintadi*, steatite, from Angola; in the Musée de l'Homme, Paris

By courtesy of the Musee de l'Homme, Paris

Mintadi, kneeling or seated, were created for the purpose of guarding the graves of ancestors. They also served as portraits of the buried kings and chiefs, as evidenced by emblematic identifications carved on the headdresses.

Minto, Gilbert Elliot-Murray-Kynynmound, 1st earl of, Viscount Melgund of Melgund, also called (from 1797) baron Minto of Minto, original name Gilbert Elliot (b. April 23, 1751, Grey Friars, Edinburgh—d. June 21, 1814, Stevenage, Hertfordshire, Eng.), governor general of India (1807–13) who successfully restrained the French in the East Indies.

Gilbert and his brother Hugh studied in Paris under the supervision of the philosopher David Hume, then secretary to the British embassy. Returning to England, Gilbert entered Oxford University and then studied law at Lincoln's Inn, London, being called to the bar in 1774. Entering Parliament in 1776 as an independent Whig, he was twice an unsuccessful candidate for speaker. When he was appointed governor of Corsica in 1794, he assumed the additional names of Murray-



1st Earl of Minto, detail of an oil painting by J. Atkinson; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

Kynynmound (from his mother's family); he was created Baron Minto in 1798. After serving briefly as envoy extraordinary to Vienna and then president of the Board of Control, he became governor general of India in 1807.

Supporting a policy of nonintervention, Minto avoided major war in India; by a show of force he prevented the Pindari bandit leader Amīr Khān from interfering in Berār in 1809. His Treaty of Amritsar in 1809 with Ranjit Singh of the Punjab recognized the Sutlej River as the boundary between the Sikh state in the Punjab and the British Indian territories. He negotiated an end to the Franco-Russian threat to India in 1810 and in the same year conquered the French islands of Bourbon (now Réunion) and Mauritius in the Indian Ocean and Napoleon's Dutch East Indies possessions of Amboina and the Spice Islands (Moluccas), followed by the island of Java in 1811. He was created Viscount Melgund and Earl of Minto in 1813.

Minto, Gilbert John Elliot-Murray-Kynynmound, 4th earl of, VISCOUNT MELGUND OF MELGUND, BARON MINTO OF MINTO (b. July 9, 1845, London—d. March 1, 1914, Minto, Roxburgh, Scot.), governor general of Canada (1898–1905) and viceroy of India (1905–10); in India he and his colleague John Morley sponsored the Morley–Minto Reforms Act (1909). The act moderately increased Indian representation in government but was criticized by Indian nationalists because of its creation of separate electorates for Hindus and Muslims, which they believed fostered divisions among the Indian population in order to facilitate British rule.

Educated at Eton College and Trinity College, Cambridge, Minto served in the Scots Guards (1867–70), left for a brief career in riding, and then was a newspaper correspondent in Spain and Turkey (1874–77). He participated in the Second Afghan War (1879) and in the Egyptian campaign (1882) before going to Canada in 1883 as a military secretary. In 1886 he returned to England, where he succeeded to his father's titles in 1891. Appointed governor general of Canada in 1898, he moderated conflicts between Canadian prime minister Sir Wilfrid Laurier and British colonial secretary Joseph Chamberlain.

In 1905 Minto was appointed viceroy of India, with Morley as secretary of state. The two men agreed that certain political reforms were needed to satisfy educated Indians, to strengthen moderate leaders of the Indian National Congress Party, and to control rising nationalism. Consequently, two Indian members were appointed to the council of the secretary of state and one to the viceroy's executive council. Minto's desire to secure better representation for the landed and commercial interests and for Muslims in the legislative councils resulted in the establishment of separate Hindu and Muslim electorates. He also encouraged the foundation of the Muslim League as a rival organization to the Congress. His critics saw this as part of a "divide and rule" policy that has been blamed for the eventual partition of India.

Minto revived the government's power of deportation without trial in order to deal with the revolutionaries Lajpat Rai and Ajit Singh, and he instituted stringent measures against those who advocated armed resistance to British rule.

Mintoff, Dom(inic) (b. Aug. 6, 1916, Cospicua, Malta), leader of Malta's Labour Party who served twice as prime minister (1955–58; 1971–84).

Educated at the University of Malta and Hertford College, Oxford, Mintoff was general secretary of the Malta Labour Party in 1936–37 and worked as a civil engineer in Great Britain during the Italian–German siege of Malta in 1941–43. Back in Malta, he practiced as an architect and helped reorganize the Labour Party in 1944, becoming its leader in 1949. He served as Malta's prime minister and minister of finance from 1955 to 1958 but resigned in 1958 to lead the Maltese Liberation Movement, which spearheaded the drive for independence, achieved in 1964, within the Commonwealth of Nations.

From 1962 to 1971 Mintoff was leader of the opposition to the Nationalist government and then in 1971 again became prime minister. Aggressively proclaiming Malta's sovereignty, he posed financial and other demands to the British that forced British and NATO evacuation of the island's bases by March 1979. By the end of the 1970s he had expelled British journalists and many businessmen and drawn close to the leftist governments in Libya and Algeria. But relations with Libya suffered as a result of a dispute over the continental-shelf boundary. In the 1981 elections Mintoff's Labour Party kept its majority in spite of losing the popular vote. Mintoff resigned as prime minister in 1984.

Minton, Sherman (b. Oct. 20, 1890, near Georgetown, Ind., U.S.—d. April 9, 1965, New Albany, Ind.), associate justice of the United States Supreme Court (1949–56).

While at Yale Law School, Minton helped to organize the university's legal aid society. His law practice in New Albany in Indiana was interrupted by his service in World War I, and after his return home he joined a law firm in the same town. His political career began with his appointment in 1933 as counsel to the Indiana Public Service Commission, in which capacity he was responsible for reducing the state's utility rates.

Minton was a champion of New Deal programs in the U.S. Senate (1935–39) and as a special assistant to Pres. Franklin D. Roosevelt. In 1941 he was appointed to the seventh Circuit Court of Appeals, on which he served until named to the U.S. Supreme Court in 1949. The previous year he had served on a three-member board that investigated a coal strike called by mine-union leader John L. Lewis, who had violated an injunction and was subsequently fined for contempt.

On the court, Minton frequently demonstrated conservative points of view, consistently upholding actions taken by the federal government in cases involving free-speech claims or cases involving alleged subversives. In an important opinion in *United States* v. *Rabinowitz* (1950) Minton reversed a lower-court ruling that search warrants must be procured when "practicable," declaring that the 4th Amendment prohibited only "unreasonable searches." He retired from the court in 1956 for reasons of health.

Minton ware, cream-coloured and blue-printed earthenware maiolica, bone china, and Parian porcelain produced at a factory founded in 1793 in Stoke-upon-Trent, Staffordshire, Eng., by Thomas Minton, who popularized the famous so-called Willow pattern. In the 1820s he started production of bone china; this early Minton is regarded as comparable to French Sèvres, by which it was greatly influenced.

Minton pilgrim flask with pâte-sur-pâte decoration by Marc-Louis Solon, 1875; in the Victoria and Albert Museum, London

By courtesy of the Victoria and Albert Museum, London

Minton's was the only English china factory of the 19th century to employ a Sèvres technical process called pâte-sur-pâte (*q.v.*; painted decoration in white clay slip instead of enamel before glazing). Minton also produced Parian figures. The Minton factory was the most popular supply source in the 19th century of dinnerware made to order for embassies and for heads of state.

minuet (from French *menu:* "small"), elegant couple dance that dominated aristocratic European ballrooms, especially in France and England, from *c.* 1650 to *c.* 1750. Reputedly derived from the French folk dance branle de Poitou, the court minuet used smaller steps and became slower and increasingly etiquette-laden and spectacular. Dancers, in the order of their social position, often performed versions with especially choreographed figures, or floor patterns, and prefaced the dance with stylized bows and curtsies to partners and spectators. The basic floor pattern outlined by the dancers was at first a figure 8 and, later, the letter Z.

Minuet, "Fêtes vénitiennes," oil painting by Antoine Watteau (*c.* 1718); in the National Gallery of Scotland, Edinburgh

By courtesy of the National Gallery of Scotland, Edinburgh; photograph, Tom Scott

Musically, the minuet is in triple time (as $\frac{3}{4}$ or $\frac{3}{8}$) with two sections: minuet and trio (actually a second minuet, originally for three instruments; it derives from the ballroom practice of alternating two minuets). Each consists of two repeated phrases (AA–BB), but the repetition may be varied (AA′–BB′). The overall form is minuet–trio–minuet. The minuet frequently appears in 18th-century suites (groups of dance pieces in the same key), and in Mozart's opera *Don Giovanni* onstage musicians play a minuet in the fourth act. Typically, the third movement of a classical sonata or symphony is a minuet. In his symphonies Beethoven often replaced the minuet with a scherzo, similar or identical in form but much faster and more exuberant.

Minūfīyah, Al-, also spelled MUNUFIA, *muḥāfaẓah* (governorate) of Lower Egypt in the western part of the apex of the Nile River delta, between the Damietta (east) and Rosetta (west) branches of the Nile. Its 592 square miles (1,532 square km) of settled area includes some of the most productive land of the delta, supporting a rural population that reaches 2,500 persons per square mile (970 persons per square km). Agriculture is the principal occupation, employing more than three-fifths of the workers. Nearly one-third of the land is under corn (maize); other crops include cotton, wheat, clover, dates, and onions. Milk and dairy products also are produced. The major source of irrigation water is Al-Minūfīyah Canal, which flows from the Delta (Al-Khayrīyah) Barrage on the Nile via Shibīn and Baquriyah canals. Most of the population lives in villages and small towns. The principal centres are Shibīn al-Kawm (capital of the *muḥāfaẓah*), Minūf, and Ashmūn—all with cotton-ginning facilities. Pop. (1986 prelim.) 2,227,087.

Minuit, Peter, Minuit also spelled MINNEWIT (b. *c.* 1580, Wesel, Kleve [Germany]—d. June 1638, Caribbean Sea), Dutch colonial governor of New Amsterdam who is mainly remembered for his fabulous purchase of Manhattan Island (the nucleus of New York City) from the Indians for a mere 60 guilders.

Though probably of French or Walloon ancestry, Minuit wrote in Dutch and was a deacon in the local Dutch Church in his hometown of Wesel in Germany. In 1625 he left Wesel, perhaps in flight from the Spanish who had occupied the town, and from Holland he sailed to the Dutch colony of New Netherland. He apparently returned to Holland the same year, for in January 1626 he sailed westward again, arriving at the mouth of the Hudson River on May 4, 1626. On September 23 the Dutch West India Company named him director general of the colony on Manhattan. To legitimize European occupation of the territory, he called together the Indian sachems and persuaded them to sell the entire island for a handful of merchandise—mostly trinkets. On the southern tip he founded New Amsterdam, building a fort around which the early Dutch settlers could make their homes.

In 1631 Governor Minuit was recalled to Holland, presumably for granting privileges to the patroons at the expense of the Dutch West India Company. A few years later he entered Swedish service and was given command of two vessels of mainly Swedish colonists, who established (March 1638) New Sweden—the first settlement on the Delaware River. There Minuit again purchased land from the Indians and built Fort Christina (later Wilmington). On a trading expedition soon after to the island of Saint Christopher in the West Indies, Minuit was lost at sea in a hurricane.

Minuit, detail of a painting by an unknown artist

minuscule, in calligraphy, small, or lowercase, letter in most alphabets, in contrast to the majuscule, or uppercase, capital letter. Unlike capitals, minuscules are not fully contained between two real or hypothetical lines; the stems of such ascending letters as *b, d, f, h, k,* and *l* range above the upper line, and such descending letters as *p* and *q* go below the lower.

Carolingian minuscule was the first such style to emerge. This clear and manageable script was developed by Alcuin of York and his English monks at the Abbey of St. Martin's at Tours, Fr. Alcuin was the emperor Charlemagne's organizer of educational reforms between 781 and 790 AD. In order to carry out the enormous task assigned, Alcuin needed an easy-to-read script that could set a standard for the copying of the Vulgate Bible of St. Jerome.

inipſa autem hiſtoria ſic

Minuscule script from the Maurdramnus Bible, Corbie, Fr., Carolingian, *c.* 772–781; in the Bibliothèque Municipale, Amiens, Fr.

By courtesy of the Bibliotheque Municipale, Amiens, France

The beautiful and legible Carolingian minuscule that resulted introduced small, or lowercase, letters and, by beginning sentences with capital letters and ending them with periods, made possible the division of writing into sentences and paragraphs. The script was originally round and widely spaced. Over the years, however, it became laterally condensed, the strokes became heavier, and it took on Gothic characteristics. Gothic minuscule script originated in northern Europe and became popular throughout Europe in the 10th to the 15th century. It is an angular and compact letter form. *See also* black letter.

minute, in timekeeping, 60 seconds, now defined in terms of radiation emitted from atoms of the element cesium under specified conditions. The minute was formerly defined as the 60th part of an hour, or the 1,440th part (60×24 [hours] $= 1{,}440$) of a mean solar day—*i.e.,* of the average period of rotation of the Earth relative to the Sun. The minute of sidereal time (time measured by the stars rather than by the Sun) was a fraction of a second shorter than the mean solar minute. The minute of atomic time is very nearly equal to the mean solar minute in duration.

minute pirate bug (insect): *see* flower bug.

minuteman, in U.S. history, an American Revolution militiaman who agreed to be ready for military duty "at a minute's warning."

The first minutemen were organized in Worcester county, Massachusetts, in September 1774, when revolutionary leaders sought to eliminate Tories from the old militia by requiring the resignation of all officers and reconstituting the men into seven regiments with new officers. One-third of the members of each regiment were to be ready to assemble under arms at instant call and were specifically designated "minutemen." Other counties began adopting the same system, and, when Massachusetts' Provincial Congress met in Salem in October, it directed that the reorganization be completed. The first great test of the minutemen was at the Battles of Lexington and Concord on April 19, 1775. On July 18, 1775, the Continental Congress recommended that other colonies organize units of minutemen; Maryland, New Hampshire, and Connecticut are known to have complied.

Minuteman missile, intercontinental ballistic missile (ICBM) that constituted most of the land-based nuclear arsenal of the United States from the 1960s.

There have been three generations of the Minuteman missile. The Minuteman I was first deployed in 1962. This 56-foot (17-metre), three-staged missile was the first ICBM to use solid fuels (which are safer than the more volatile liquid fuels) and the first U.S. ICBM to be based in underground silos (previous missiles were stored on above-ground launch pads). Between 1966 and 1973 the Minuteman I was replaced by the Minuteman II. Improved propulsion gave this missile a longer range of about 8,000 miles (13,000 km), and its reentry vehicle, carrying a 1.2-megaton thermonuclear warhead, was equipped with electronic jammers and other devices designed to penetrate radar-directed antiballistic missile defenses around cities and military sites in the Soviet Union.

The Minuteman III was deployed between 1970 and 1975 with two or three independently targetable reentry vehicles, each carrying a 170-kiloton thermonuclear warhead. In the 1980s three 335-kiloton warheads were installed on some Minuteman IIIs, along with a more accurate guidance system that gave them a "hard-target kill" potential to destroy reinforced ICBM silos and command bunkers in the Soviet Union.

Beginning in 1986, some Minuteman IIIs were replaced by the Peacekeeper missile. By that time about 1,000 Minuteman II and III missiles had been deployed at air-force bases in Wyoming, North Dakota, South Dakota, Montana, and Missouri.

Minyā, Al-, *muḥāfaẓah* (governorate) in Upper Egypt, between Banī Suwayf governorate to the north and Asyūṭ governorate to the south. It occupies a settled area of 873 square miles (2,262 square km) in the floodplain of the Nile River and extends for about 75 miles (120 km) along the river but also includes a section of the Western Desert, extending out toward the oases. To the west and east it merges into desert terrain, and the cultivated floodplain on the eastern bank is very narrow. Iron ore is found in the desert west of the river valley, and limestone is quarried on the eastern bank, north of Al-Minyā city. The area is heavily agricultural, the chief crops being cotton, corn (maize), wheat, dates, sugarcane, millet, and onions. Industrial activities include cotton ginning and flour milling. Al-Minyā city, Abū Qurgaṣ, and Shaykh Faḍl have sugar mills. Other towns include Mallawī and Banī Mazār.

Sites with antiquities are located at Banī Ḥasan ash-Shurūq, Ash-Ashmūnein (ancient Hermopolis), and Tūnat al-Jabal, all south of Al-Minyā city. Mallawī has a regional museum with antiquities from sites in the governorate. Pop. (1986 prelim.) 2,648,043.

Minyā, Al-, also spelled MENIA, city and capital of Al-Minyā *muḥāfaẓah* (governorate), in the Nile River valley of Upper Egypt. Al-Minyā is linked to Cairo (140 miles [225 km] north-northeast) by rail; it is a trading and administrative centre on the west bank of the Nile. Besides serving as a market and financial centre for the governorate, Al-Minyā has cotton gins and flour mills, a sugar refinery, and a carpet- and rug-weaving industry. The city has a television station, a university, and an automobile ferry to the east bank of the Nile. Because of its road and rail links, it has become a transit point for tourists visiting Middle Egypt, and there are several hotels in the city. Across the Nile to the southeast, at Zāwiyat al-Amwāt, lie ruins of the ancient town Menat Khufu, from which Al-Minyā derives its name. It was the ancestral home of the pharaohs of the 4th dynasty (*c.* 2575–*c.* 2465 BC). Remains of the Gerzean prehistoric period have been found, and a small pyramid of the 3rd dynasty stands there. About half the population is Coptic Christian. Pop. (1996) 201,360.

minyan (Hebrew: "number"), plural MINYANIM, or MINYANS, in Judaism, the minimum number of males (10) required to constitute a representative "community of Israel" for liturgical purposes. A Jewish boy of 13 may form part of the quorum after his Bar Mitzvah (religious adulthood). When a minyan is lacking for synagogue services, those who have gathered merely recite their prayers as private individuals. There is thus no public reading from the Torah (first five books of the Bible) and no Hafṭarah (selection from the prophetic books of the Bible). Such invocations as the Kaddish and *qedusha* are likewise omitted, for none of these is considered appropriate unless the "Jewish community" prays as one.

Similarly, the recital of the seven benedictions (*sheva‘ berakhot*) at a wedding and their repetition on the seven succeeding days require a minyan—with one new member participating each day. During grace after meals, "Our God" is inserted into the introductory invitation when a minyan is present, indicating again that the prayer is communal rather than private. In cases of necessity, a boy nearing his Bar Mitzvah is sometimes counted as the 10th male member. Reform and Conservative Judaism have modified the custom by allowing women to complete a minyan.

Minyan ware, first wheel-made pottery to be produced in Middle-Bronze-Age Greece. It was first found at sites at Orchomenus. It was first introduced onto the mainland from Asia Minor in the third phase of the Early Helladic (2200–2000 BC); production continued during the Middle Helladic (*c.* 2000–*c.* 1600 BC). Uniformly gray in colour, the ware has a soaplike feeling, and its shapes are modeled after metal objects.

Miocene epoch, major worldwide division of the Tertiary period that extended from 23.7 to 5.3 million years ago. It is often divided into the Early Miocene epoch (23.7 to 16.6 million years ago), the Middle Miocene epoch (16.6 to 11.2 million years ago), and the Late Miocene epoch (11.2 to 5.3 million years ago). The Miocene may also be divided into six ages and their corresponding rock stages: from oldest to youngest these ages or stages are the Aquitanian, Burdigalian, Langhian, Serravallian, Tortonian, and Messinian. The Miocene epoch precedes the Pliocene epoch and follows the Oligocene epoch.

Important Miocene deposits occur in North and South America, southern Europe, India, Mongolia, East Africa, and Pakistan. Marine and terrestrial environments are represented in the Miocene stratigraphic record. The record of terrestrial life is extensive and varied, providing a rather complete view of the development of vertebrates, especially mammals.

Miocene mammalian faunas are essentially modern; many archaic groups were extinct by the end of the Oligocene, and fully half of the known modern families of mammals are present in the Miocene record. Some interchange of faunas occurred between the Northern Hemispheres of the Old and New Worlds. Free communication was possible between Africa and Eurasia, but South America and Australia remained isolated. The very fossiliferous Harrison Formation of Nebraska has produced an abundance of mammalian remains, including large, slender camels; strange deerlike creatures; bear dogs; foxes; peccaries; a small, archaic beaver that apparently had the habits of a ground squirrel; and the Miocene horse. During the Miocene, horse evolution occurred mainly in North America; forms such as *Parahippus, Miohippus* (a form carried over from the preceding Oligocene epoch), *Anchitherium, Hypohippus, Pliohippus,* and *Merychippus* are genera that represent great diversification and development. The first dogs and bears appeared; the bear dog *Hemicyon* is close to the origin of the bears. The first hyenas, springing from primitive civets, appeared in the Miocene, as did the early sabre-toothed cats. Primitive antelope, deer, and the earliest giraffids appeared in the Miocene of Eurasia. The early elephantlike forms, previously known only from the Oligocene of Africa, spread to the Eurasian continent in the Miocene and became more diverse.

In Argentina the Santa Cruz Formation of Middle Miocene time provides an excellent record of the unusual Miocene fauna of South America. Marsupial carnivores, aberrant edentates, litopterns, and toxodonts are among the odd groups represented. These forms were able to evolve because of South America's isolation from other regions. The evolution of the South American monkeys, the platyrrhines, was under way during the Miocene.

By the end of the Miocene epoch almost all the modern groups of whales had appeared, as had the early seals and walruses. Birds such as herons, rails, ducks, eagles, hawks, crows, sparrows, pheasants, owls, and partridges were present in the Miocene of Europe, where the uplifting of the Alps continued through Miocene time.

The Miocene epoch is of great importance in primate evolution. The last primate to occur in the fossil record of North America, a tarsier-like creature, is known in the United States. Elsewhere, the higher primates, especially the apes, underwent a great deal of evolution. The fossil evidence seems to indicate that advanced primates, including apes, were present in southern Europe. An early gibbon, *Pliopithecus,* as well as the dryopithecines, a group of advanced manlike apes that probably represent the stock from which modern apes and man originated, are found in Miocene rocks of Europe. The dryopithecines also are present in the Miocene of Africa, the region where manlike forms and the direct ancestors of man probably originated. *Ramapithecus,* a form known from the latest Miocene or, perhaps, the earliest Pliocene, represents an advancement over dryopithecines toward the human condition.

Miohippus, genus of extinct primitive horses that originated in North America during the middle Oligocene epoch (36.3 to 23.7 million years ago). *Miohippus* evolved from the earlier and more primitive genus *Mesohippus* and showed a tendency toward increased size and a more advanced dentition. The limbs of *Miohippus* were better adapted for running, although three functional toes were still present on all feet. *Miohippus* persisted into the succeeding Miocene epoch side by side with its more horselike and advanced descendants.

Miohippus intermedius

miqve, also spelled MIQWE (Judaism): *see* mikvah.

mir, in Russian history, a self-governing community of peasant households that elected its own officials and controlled local forests, fisheries, hunting grounds, and vacant lands. To make taxes imposed on its members more equitable, the mir assumed communal control of the community's arable land and periodically redistributed it among the households, according to their sizes (from 1720).

After serfdom was abolished (1861), the mir was retained as a system of communal land tenure and an organ of local administration. It was economically inefficient; but the central government, having made members of the commune collectively responsible for the payment of state taxes and the fulfillment of local obligations, favoured it. The system was also favoured by Slavophiles and political conservatives, who regarded it as a guardian of old national values, as well as by revolutionary Narodniki ("Populists"), who viewed the mir as the germ of a future socialist society. Despite the efforts of Prime Minister Pyotr A. Stolypin, who initiated a series of agricultural reforms encouraging peasants to assume private ownership, the peasantry universally reverted to communal landholding after the 1917 Revolution.

Mir, Soviet/Russian modular space station, the core module (base block) of which was launched into Earth orbit by the U.S.S.R. in 1986. Over the next decade additional modules were sent aloft on separate launch vehicles and attached to the core unit, creating a large habitat that served as a versatile space laboratory for more than 14 years.

Mir (Russian: "peace" or "world") was the third generation of space stations developed by the Soviet Union. Its core module resembled its simpler predecessors in the Salyut (*q.v.*) series but had additional docking ports (a total of six) that accommodated not only a succession of manned spacecraft and cargo ferries but also permanently attached expansion modules equipped for scientific research.

Mir's core module was launched on Feb. 20, 1986. It had the form of a stepped cylinder about 13 m (43 feet) long and 4.2 m (13.8 feet) in diameter at its widest point. The module had a docking port at each end and four ports sited radially at its forward end. Between March 1987 and April 1996 five expansion modules were added—Kvant 1, an astrophysics observatory; Kvant 2, containing supplementary life-support equipment and a large airlock; Kristall, a materials-sciences laboratory; and Spektr and Priroda, two science modules containing remote-sensing instruments for ecological and environmental studies of Earth.

Mir supported human habitation between March 14, 1986, and June 15, 2000, which included an uninterrupted stretch of occupancy of almost 10 years. It hosted more than 100 people from 12 countries, including a series of U.S. astronauts between 1995 and 1998 as part of a Mir-space shuttle cooperative endeavour. Designed for only a five-year life, the aging station suffered a series of equipment failures and accidents in 1996–97 but remained in service. On March 23, 2001, the abandoned Mir made a controlled reentry, with the surviving pieces falling into the Pacific Ocean.

Mīr Dāmād, original name MUḤAMMAD BĀQIR IBN AD-DĀMĀD (d. 1631/32, near Najaf, Iraq), philosopher, teacher, and leader in the cultural renascence of Iran during the Ṣafavid dynasty.

A descendant of a well-known Shī'ī family, Mīr Dāmād spent most of his life in Isfahan as a student and teacher. Mīr Dāmād's major contribution to Islāmic philosophy was his concept of time and nature. A major controversy as to whether the universe was created or eternal had engaged the attention of Western and Islāmic philosophers; Mīr Dāmād was the first to advance the notion of *ḥuduth-e dahrī* ("eternal origination") as an explanation of creation. He argued that, with the exception of God, all things, including the Earth and other heavenly bodies, are of both eternal and temporal origin. He influenced the revival of *al-falsafah al-yamanī* ("philosophy of Yemen"), a philosophy based on revelation and the sayings of prophets rather than the rationalism of the Greeks.

Mīr Dāmād's many works on Islāmic philosophy include *Taqwīm al-īmān* ("Calendar of Faith," a treatise on creation and God's knowledge). He also wrote poetry under the pseudonym of Ishrāq. As a measure of his stature, he was given the title *al-mu'allim ath-thālith* (*i.e.,* "third teacher"—the first two being Aristotle and al-Fārābī). His work was continued by his pupil Mullā Ṣadrā, who became a prominent Muslim philosopher of the 17th century.

Mīr Ja'far, in full MĪR MUḤAMMAD JA'FAR KHĀN (b. 1691?—d. Feb. 5, 1765, Bengal, India), first Bengal ruler (1757–60; 1763–65) under British influence, which he helped bring about by working for the defeat of Mughal rule there.

An Arab by birth, Mīr Ja'far assisted his brother-in-law, Gen. 'Alī Vardī Khān, in seizing the government of Bengal in 1740. Discontented, he conspired with others in 1756 to depose Sirāj-ud-Dawlah, the grandson and successor of 'Alī Vardī. In 1757 he assured Robert Clive, British governor of Madras, that he would enter into an alliance with the British to exclude the French from Bengal and pay £500,000 to the East India Company and £250,000 to the European inhabitants of Calcutta to compensate them for the loss of the city to Sirāj the previous year, provided that the British support his bid to be ruler of Bengal. He also promised large gratuities to British military and naval forces and to the Calcutta city council members. He and his fellow conspirators took no active role in the Battle of Plassey (June 1757), in which Sirāj was overthrown, but he was installed afterward as the nawab (Muslim ruler) of Bengal.

Although he found the Bengal treasury unexpectedly small, Mīr Ja'far undertook the fulfillment of his financial promises and issued free passes for the private trade of the English merchants, policies that led to the state's financial ruin and a demoralization of the East India Company's servants that marked the early years of British rule. After Clive's departure in 1760, he was deposed in favour of his son-in-law Mīr Qāsim. Reinstated in 1763 on the outbreak of war between the English and Mīr Qāsim, he made concessions to the English that led to his financial and political downfall. At his death he was addicted to opium and suffered from leprosy.

Mīr Sayyid 'Alī (fl. 16th century, India), Persian miniaturist who, together with his fellow countryman 'Abd-uṣ-Ṣamad, emigrated to India and helped to found the Mughal school of painting (*see* Mughal painting).

He was born probably in the second quarter of the 16th century in Tabrīz, the son of a well-known artist of the Ṣafavid school, Mīr Muṣawwir of Solṭānīyeh. He went to India at the invitation of the Mughal emperor Humāyūn, arriving first in Kābul about 1545 and from there going on to Delhi. He and 'Abd-uṣ-Ṣamad instructed the artists of the imperial atelier, most of them Indians, and superintended the production of the giant "miniatures" illustrating the *Dāstān-e Amīr Ḥamzeh* ("Stories of Amīr Ḥamzeh"), a colossal undertaking that consisted of some 1,400 paintings, each of unusually large size. The few of his paintings that have survived were for the most part painted before his arrival in India. They are sufficient, however, to denote him as a highly gifted painter, wielding an unusually delicate brush and possessed of great powers of observation.

"Mejnūn Being Brought by a Beggar Woman to Leylā's Tent," miniature by Mīr Sayyid 'Alī in the *Khamseh* of Neẓāmī done for Shāh Ṭahmāsp I, 1539–43; in the British Library (OR. MS. 2265 fol 157v)

Mīrā Bāī (b. 1450?, Kudaki, India—d. 1547?, Dwārkā, Gujarāt), Hindu mystic and poet whose lyrical songs of devotion to the god Krishna are widely popular in northern India.

Mīrā Bāī was a Rājput princess, the only child of Ratan Singh, younger brother of the ruler of Merta. Her royal education included music and religion as well as instruction in politics and government. An image of Krishna given her during childhood by a holy man began a lifetime of devotion to Krishna, whom she worshipped as her Divine Lover.

Mīrā Bāī was married in 1516 to Bhoj Rāj, crown prince of Mewar. Her husband died in 1521, probably of battle wounds, and thereafter she was the victim of much persecution and intrigue at the hands of her brother-in-law, Ratan Singh, when he ascended the throne, and by his successor, Vikram Singh. Mīrā Bāī was something of a rebel, and her religious pursuits did not fit the established pattern for a Rājput princess and widow. She spent most of her days in her private temple dedicated to Krishna, receiving *sādhus* (holy men) and pilgrims from all over India and composing songs of devotion. At least two attempts made on her life are alluded to in her poems. Once a poisonous snake was sent to her in a basket of flowers, but when she opened it, she found an image of Krishna; on another occasion she was given a cup of poison but drank it without harm.

Finally, Mīrā Bāī left Mewar and returned to Merta, but finding that her unconventional behaviour was not acceptable there either, she set out on a series of pilgrimages, eventually settling in Dwārkā. In 1546 Udai Singh, who had succeeded Vikram Singh as *rānā*, sent a delegation of Brahmans to bring her back to Mewar. Reluctant, she asked permission to spend the night at the temple of Ranchorji (Krishna) and the next morning was found to have disappeared. According to popular belief, she miraculously merged with the image of Ranchorji, but whether she actually died that night or slipped away to spend the rest of her years wandering in disguise is not known.

Mīrā Bāī belonged to a strong tradition of bhakti (devotional) poets in medieval India who expressed their love of God through the analogy of human relations—a mother's love for her child, a friend for a friend, or a woman for her beloved. The immense popularity and charm of her lyrics lies in their use of everyday images and in the sweetness of emotions easily understood by the common people of India.

Mira Ceti, also called OMICRON CETI, first variable star (apart from novae) to be discovered, lying in the southern constellation Cetus. There is some evidence that ancient Babylonian astronomers noticed its variable character. In a systematic study in 1638, a Dutch astronomer, Phocylides Holwarda, found that the star disappeared and reappeared in a varying cycle of about 330 days. It thus acquired the name Mira (Latin: Miraculous). Its brightness varies from cycle to cycle. In the 1960s a minimum apparent visual magnitude of 8.71 and a maximum of 3.42 were observed; in 1779 the star attained first magnitude. Mira is a binary; the red giant primary has a faint bluish white companion.

Mirabeau, André-Boniface-Louis Riqueti, vicomte de (viscount of) (b. Nov. 30, 1754, Paris—d. Sept. 15, 1792, Fribourg-en-Brisgau, Fr.), brother of the famous orator, the comte de Mirabeau, and one of the reactionary leaders at the opening of the French Revolution.

Sent to the army in Malta in 1776, he spent part of his two years there in prison for insulting a religious procession. During the War of American Independence he was in several sea fights with the English and was at the taking of Yorktown in 1781. In 1789, with his debts paid up by his father, he was elected by the noblesse of Limoges a deputy to the States General. He was a violent conservative and opposed everything that threatened the old regime. His drunkenness produced a corpulency which brought him the nickname Mirabeau Tonneau ("Barrel Mirabeau"), but he was not lacking in some of that insight that distinguished his brother. He shared fully in the eccentric family pride and boasted of his brother's genius even when bitterly opposing him. He emigrated about 1790 and raised a legion that was to bear his name; but his insolence alienated the German princes, and his command was taken from him.

Mirabeau, Honoré-Gabriel Riqueti, comte de (count of) (b. March 9, 1749, Bignon, near Nemours, Fr.—d. April 2, 1791, Paris), French politician and orator, one of the greatest figures in the National Assembly that governed France during the early phases of the French Revolution. A moderate and an advocate of constitutional monarchy, he died before the Revolution reached its radical climax.

Troubled youth. Mirabeau was the elder son of the noted economist Victor Riqueti, marquis de Mirabeau, by his unhappy marriage to Marie-Geneviève de Vassan. Disfigured by smallpox at the age of three, the precocious Honoré-Gabriel suffered even in early childhood the disfavour of his formidable father. At the age of 15 he was sent as a pupil to the strict Abbé Choquard in Paris, and at 18 he went as a volunteer to serve in a cavalry regiment at Saintes, where his father hoped that military discipline would curb him. His mis-

Giraudon—Art Resource/EB Inc.

behaviour, however, led to his imprisonment on the Île de Ré, under a *lettre de cachet,* a written order permitting imprisonment without trial. Released to serve in Corsica with the rank of sublieutenant in the army, he distinguished himself there in 1769.

Reconciled with his father, he married a rich Provençal heiress, Émilie de Marignane, in 1772, but his heavy spending and further misconduct led his father to have him imprisoned under another *lettre de cachet* in order to put him out of reach of his creditors. He was detained first at the Château d'If (1774), then at the Fort de Joux, near Pontarlier. Having obtained permission to visit the town of Pontarlier, he there met his "Sophie"—who, in fact, was the marquise de Monnier, Marie-Thérèse-Richard de Ruffey, the young wife of a very old man. He eventually escaped to Switzerland, where Sophie joined him; the couple then made their way to Holland, where Mirabeau was arrested in 1777.

The tribunal at Pontarlier had meanwhile sentenced him to death for seduction and abduction, but Mirabeau escaped execution by submitting to further imprisonment under a *lettre de cachet.* In the château of Vincennes he composed the *Lettres à Sophie,* some erotic works, and his essay *Des lettres de cachet et des prisons d'état* ("Of *Lettres de Cachet* and of State Prisons"). Released in December 1780, he finally had to surrender himself to arrest at Pontarlier in order to have the death sentence revoked, but by August 1782 he was entirely free. He now became involved in a lawsuit against his wife, who wanted a judicial separation. Pleading on his own behalf, he gained the sympathy of the public but lost his case (1783). Rejected by his wife and by his father, he had to renounce the aristocratic society into which he had been born.

For the next five years Mirabeau lived the life of an adventurer. He was employed sometimes as a hired pamphleteer, sometimes as a secret agent. He came into contact with Louis XVI's ministers Charles-Alexandre de Calonne; Charles Gravier, comte de Vergennes; and Armand-Marc, comte de Montmorin-Saint-Hérem. He also made an enemy of the Swiss banker Jacques Necker, at that time director of the finances, and engaged the playwright Pierre-Augustin Caron de Beaumarchais in controversy.

His activities necessitated much travelling. In London he was introduced into the best Whig society by Gilbert Elliot (later 1st earl of Minto), who had been his fellow pupil under the Abbé Choquard; he had to take refuge in Liège when his *Dénonciation de l'agiotage* (against stockjobbing) annoyed Calonne; and he undertook a secret mission to Berlin in 1786. With the active assistance of a Brunswick friend, Jakob Mauvillon, he wrote *De la monarchie prussienne sous Frédéric le Grand* (1788; "The Prussian Monarchy Under Frederick the Great"), which he dedicated to his father; but *Histoire secrète de la cour de Berlin* ("Secret History of the Court of Berlin"), in which he made unscrupulous use of material derived from his mission in Germany, created a scandal in 1789.

Election to the States General. Within France, affairs were moving toward a crisis. The country, bankrupted by its 18th-century wars, was burdened with an archaic system of taxation and social privilege. The States General, an assembly of the three estates of the realm—the clergy, the nobility, and the commons—was summoned to meet in Paris in May 1789 in an attempt to implement the necessary reforms. It was that meeting that set in motion the great French Revolution of 1789.

When the States General were summoned, Mirabeau hoped to be elected as a deputy for the nobility of Provence. For this he needed his father's support. Pleased by the book dedicated to him, the Marquis had summoned Mirabeau to Argenteuil in the autumn of 1788 but had not given him any real help. Mirabeau presented himself in the chamber of the nobility in the estates of Provence in January 1789 and uttered violent diatribes against the privileged classes but was not elected deputy, as he held no fief. Turning reluctantly to the Third Estate, he was elected to represent both Marseilles and Aix-en-Provence, choosing to represent Aix.

Mirabeau came to the States General without any precise constitutional doctrine. An avowed enemy of despotism (he had written *Essai sur le despotisme* ["Essay on Despotism"] before he was 25), he was, nevertheless, a firm supporter of the monarchy and of the executive power. Without expressly adhering to the English system, he wanted representative government. A nobleman rejected by his class, he opposed the idea of an aristocratic second chamber. Like most of his contemporaries, he had no political experience, but his intelligence and his knowledge of men made him supremely capable of acquiring such experience rapidly. Lack of money, however, exposed him to pressure and to temptation.

From May to October 1789 Mirabeau played a decisive part in the battle between the Third Estate and the privileged orders. His aim was to become the spokesman of the nation to the King and at the same time to moderate the expression of the nation's wishes. Thus, on June 15 and 16 he was careful not to suggest the name National Assembly, which was the rallying cry of the Third Estate in its revolutionary debate of June 17, when it set itself up as representative of the whole nation. Yet, at the ending of the "royal session" of June 23, when Henri Évrard, marquis de Dreux-Brézé, in the King's name ordered the assembled estates to return each to its separate chamber, Mirabeau's answer did much to confirm the deputies in their resolution to disobey and establish the National Assembly, and, in the feverish atmosphere of the early days of July, his speeches inspired the Assembly to demand the dispersal of the troops concentrated around Paris.

After the fall of the Bastille (July 14), he urged the Assembly to demand the dismissal of the ministers who were to blame for the disorders. His popularity in Paris was then considerable. On the other hand, he disapproved of the Assembly's precipitate action in abolishing feudalism (on the night of August 4) and of the abstract Declaration of Rights, and, while he was openly against a second chamber, he yet wanted the king to have an absolute veto. In October, when the Parisians marched on Versailles and took Louis XVI back to Paris, Mirabeau's attitude was ambiguous and gave rise to the suspicion that he might be plotting against the King. To clear himself and to keep open the door to the court's favour, he addressed a memorandum to the King, advising him to leave Paris for Rouen, to secure the support of a small army, and to appeal to the provinces.

Mirabeau's prime concern, however, was to win "the battle of the ministry." Ostensibly a supporter of Necker, Mirabeau, in fact, did his utmost to destroy him: his brilliant speech on the bankruptcy of the nation was a masterstroke against this minister. Furthermore, he tried skillfully to induce the Assembly to grant to the king the option of choosing members of it to be his ministers, but the Assembly's decree of Nov. 7, 1789, which precluded all deputies from the ministry for the duration of the session, frustrated his hopes of ministerial office for himself.

Intrigue with the court. From November 1789, notwithstanding his oratorical triumphs of January–April 1790 in the cause of the Revolution, Mirabeau was a prey to despondency and aimlessness until his friend Auguste, prince d'Arenberg, comte de La Marck, with the approval of Florimund, Graf Mercy d'Argenteau, Austrian ambassador to Paris and confidant of the queen, Marie-Antoinette, approached him with the proposal from Louis XVI and the Queen that he should become their secret counsellor. Mirabeau accepted with delight: "I shall make it my chief business to see that the executive power has its place in the constitution" (letter of May 10). Part of the promised remuneration was to be the paying off of his debts.

In May 1790, when the Assembly was debating the king's right to make war and peace, Mirabeau successfully opposed the left-wing orator Antoine Barnave, whom he challenged with the words: "Tell us that there should be no king, do not tell us that there should only be a powerless, superfluous king." He impeded the progress of the Jacobins but risked his own popularity, and a pamphlet accusing him of treason was circulated ("Trahison découverte du comte de Mirabeau" ["The Uncovered Treason of the Comte de Mirabeau"]).

From June to October he had to work to recapture his prestige. This was the more necessary because the King and the Queen, despite their secret interview of July 3 with Mirabeau at Saint-Cloud, took little notice of his advice and continued to be influenced by his rival for court favour, the Marquis de Lafayette, who had scorned Mirabeau's offer of alliance. In October 1790 the Assembly further disappointed Mirabeau by refusing, after more discussion, to revoke the decree of November 1789 on the noneligibility of its members for the ministry.

While the court was displeased by some of Mirabeau's outbursts and by his "incurable mania of running after popularity," Mirabeau, for his part, was enraged to see a new ministry formed under the influence of his rivals Lafayette and Alexandre, comte de Lameth. By the end of November 1790 his relations with the court were severely strained. He restored them by submitting to the King's adviser Montmorin a "Plan" concocted for bringing pressure to bear by various means on the Assembly, on Paris, and on the provinces so as to coordinate "the means of reconciling public opinion with the sovereign's authority."

The plan was perfect in theory but very difficult to put into practice. From January 1791 it was clear that Mirabeau had no intention of doing anything that might compromise his own popularity, though he was willing enough to sabotage the Assembly by getting it to adopt ill-considered measures of religious persecution and was eagerly and adroitly working to discredit Lameth's faction at court. His popularity rose to its zenith, and the eyes of all Europe were on him.

As spokesman of the diplomatic committee, on Jan. 28, 1791, he made a speech that bore the unmistakable stamp of statesmanship. Anxious to avoid anything that might compromise France's relations with neighbouring countries, particularly with England, he yet would not repudiate any of the Revolution's political victories or allow any necessary military precautions to be overlooked. On the following day he at last became president of the Assembly for a fortnight. In this office, from which he had been so long excluded, his control of the debates was masterly.

Mirabeau's problem was to know how and for how long his Machiavellian game could be continued before his intrigue with the court would be exposed. The people of Paris were restless, worried by rumours. Mirabeau's position was made difficult by his intervention on behalf of the King's aunts (who had fled from Paris), by his hostility to the law against the *émigrés,* and by his harsh words against the Lameths and their satellites in the Assembly ("Silence to the factious! Silence to the 33!"). On February 28 he was sorely pressed to justify himself to the Jacobins after a pitiless attack by Alexandre, comte de Lameth. The newspapers of the left redoubled their accusations of treason against him, and in March he experienced some notable reverses in the Assembly.

Death may have saved him from political defeat. Gravely ill since his presidency of the Assembly, he worsened his condition by excessive indulgence. He took to his bed on March 27, 1791, and died a week later. The people's grief for him was boundless; he was given a magnificent funeral; and it was for him that the new church of Sainte-Geneviève was converted into the Panthéon, for the burial of great men. In the insurrection of Aug. 10, 1792, however, papers proving Mirabeau's relations with the court were found in an iron chest in the Tuileries Palace, and on Sept. 21, 1794, his remains were dislodged from the Panthéon by order of the Convention.

Assessment. As a statesman, Mirabeau failed in his main object, that of reconciling the monarchy with the Revolution and a strong executive with national liberty. He was too much of a monarchist for the Revolution, too revolutionary for the monarchy. As an orator he was unsurpassed. Even though his eloquence was fed by material gathered from every quarter and by a "workshop" of collaborators, it was Mirabeau who found the striking images and expressions that give to his speeches their brilliant individuality. Generally bad at extemporizing, Mirabeau could be moved by anger or by injured pride to an impassioned tone that would carry the Assembly with him. (J.-J.C.)

BIBLIOGRAPHY. Still valuable are the 19th-century accounts of Étienne Dumont, *Souvenirs sur Mirabeau* (1832, new ed. 1951; *Recollections of Mirabeau,* 1832); M. Lucas de Montigny, *Mémoires biographiques, littéraires et politiques de Mirabeau,* 8 vol. (1834–35; Eng. trans. of vol. 1–4, 1835), an uncritical work by Mirabeau's adopted son that should be read with Louis de Lomenie, *Les Mirabeau,* new ed., 5 vol. (1889–91); and Alfred Stern, *Das Leben Mirabeaus,* 2 vol. (1889). Later accounts include Jean-Jacques Chevallier, *Mirabeau, un grand destin manqué* (1947); O.J.G. Welch, *Mirabeau: A Study of a Democratic Monarchist* (1951); Antonina Vallentin, *Mirabeau avant la révolution* and *Mirabeau dans la révolution* (1946–47; Eng. trans. 1948); René de la Croix, *Mirabeau: ou, l'échec du destin* (1960); and J.-J. Chevallier, "The Failure of Mirabeau's Political Ideas," *Review of Politics,* 13:88–107 (1951).

Mirabeau, Victor Riqueti, marquis de (b. Oct. 5, 1715, Pertuis, Fr.—d. July 13, 1789, Argenteuil), French political economist, the forerunner and later patron of the Physiocratic school of economic thought. He was the father of the renowned French revolutionary the Comte de Mirabeau.

After serving as an officer in the War of the Polish Succession (1733–38) and the War of the Austrian Succession (1740–48), Mirabeau left the army to devote himself to the study of political economy. In his first major work, *Mémoire concernant l'utilité des états provinciaux . . .* (1750; "Memorandum Concerning the Usefulness of the Provincial Estates . . ."), he criticized the highly centralized governmental system that had been set up by King Louis XIV and proposed that the provincial assemblies, which then existed in only a small part of France, be established throughout the kingdom. In his popular *Ami des hommes, ou Traité de la population* (1756–58; "The Friend of Man, or Treatise on Population"), Mirabeau borrowed heavily from the ideas of Richard Cantillon, an earlier 18th-century British writer, in stressing the primacy of agriculture over commerce as a source of wealth. Mirabeau's approach to economics had anticipated the doctrines that were being formulated by the Physiocratic school of François Quesnay, and the Marquis soon associated himself with the Physiocrats' attempts to reform France's antiquated, inefficient system of taxation. In his *Théorie de l'impôt* (1760; "Theory of Taxation") he attacked the tax farmers (financiers who purchased from the crown the right to collect indirect taxes) and proposed that they be replaced with a system of direct taxes on land and on personal income. Although the tax farmers pressured the government into exiling Mirabeau to his estates at Bignon, he continued to devote his efforts to the advancement of Physiocracy.

Where the same name may denote a person, place, or thing, the articles will be found in that order

Mirabéllo, Gulf of, Modern Greek KÓLPOS MIRABÉLLOU, deep gulf of the Aegean Sea on the northern coast of eastern Crete, the *nomós* (department) of Lasíthi, Greece. It separates Dhíkti massif on the west from a range of hills on the east that include Mt. Thriptís and Mt. Ornón. The gulf, named after the village of Mirabello, located north of the port of Áyios Nikólaos, is separated on the east from the Órmos (bay) Sitías by an indented and blunted promontory. Around the gulf are Olonte (Olus) and Lato, two ruined classical settlements; on the islets of Psíra and Mókhlos (Konídha) as well as at Gourniá at the head of the gulf are the remains of Late Minoan I (1600–1450 BC) settlements. Gourniá, excavated 1901–04 by the U.S. archaeologist Mrs. Boyd Hayes, is the only well-preserved Minoan town in Crete.

mirabilite, a widespread sulfate mineral, hydrated sodium sulfate ($Na_2SO_4 \cdot 10H_2O$), that forms efflorescences and crusts, particularly in arid regions. It occurs in deposits from salt lakes, springs, and playas, especially in the winter (its solubility decreases markedly at lower temperatures). It is abundant in California, Wyoming, and other areas of the western and southwestern United States; it also occurs in Austria, Spain, abundantly in Bohemia, and in the Kara-Bogaz-Gol Gulf of the Caspian Sea. For detailed physical properties, *see* sulfate mineral (table).

miracle, an extraordinary and astonishing happening that is attributed to the presence and action of a supernatural or divine power. Belief in miraculous happenings occurs in all cultures and is a feature of practically all religions.

A brief treatment of miracles follows. For full treatment, *see* MACROPAEDIA: Doctrines and Dogmas, Religious.

Although members of nonliterate cultures lack a fully developed scientific conception of natural causality—and hence also the notion of a "supernatural" miracle—they know of extraordinary events, forces, and operations. These are integrated in various ways, such as by ritual, magic, or shamanism, with the more ordinary modes of behaviour. Similarly the religions of the ancient world (*e.g.,* Babylonia and Egypt) had few formal miracles, precisely because certain kinds of divine action or cosmic operation (*e.g.,* oracles) were accepted as part of the normal order of things.

Ancient Indian mythology, like all mythologies, abounds in fantastic accounts of the doings of the gods, but the *Upaniṣad*s and *Brāhmaṇa*s evince an increasing indifference to miracles. Like other expressions of higher mysticism, they consider the spiritual experience of religious insight and transformation as the only "miracle" worth talking about. Nevertheless Hindu popular religion sets no bounds to the miraculous powers of ascetic yogis, and India has become the classic land of wonders.

There is little room for the miraculous element in Confucianism, but Taoism has produced a rich crop of thaumaturgy and magic on all levels of Chinese folk religion. Miracles are taken for granted throughout the Old Testament: God "does wondrous things" especially in the history of his people Israel (*e.g.,* the ten plagues of Egypt). In the Greco-Roman world miracles were not uncommon; there were miraculous cures (*e.g.,* at the sanctuary of Asclepius in Epidaurus), moving statues of gods, resurrections of the dead, virgin births, and the like, though philosophical criticism too was articulate: Cicero in the *De divinatione* denied the possibility of miracles.

According to the earliest Buddhist accounts, Gautama Buddha deprecated the miraculous powers that he possessed as a matter of course, being "the greatest of all yogis," as utterly devoid of spiritual significance. Nevertheless, miraculous accounts of his birth and life (and those of later Buddhist saints), as well as miracles in connection with his relics, proliferated as time went on, particularly in the Mahāyāna tradition.

The Christian New Testament records various miracles of healing and of providing abundantly for specific human needs performed by Jesus Christ, and miracles did not cease after the New Testament period. They form part of the career, in life as well as after death, of the Christian saints, and their occurrence continues (*e.g.,* Lourdes); duly established miracles are among the requirements for a process of canonization.

Muḥammad was the only great founder who renounced miracles and miraculous powers as a matter of principle—the Qur'ān was the great miracle—but subsequent hagiography invested his life with superlatively miraculous details. Muslim popular religion, particularly under Ṣūfī influence, abounds in miracles, pilgrimages to the tombs of wonder-working saints, and the like.

miracle play, also called SAINT'S PLAY, one of three principal kinds of vernacular drama of the European Middle Ages (along with the mystery play and the morality play). A miracle play presents a real or fictitious account of the life, miracles, or martyrdom of a saint. The genre evolved from liturgical offices developed during the 10th and 11th centuries to enhance calendar festivals. By the 13th century they had become vernacularized and filled with unecclesiastical elements. They had been divorced from church services and were performed at public festivals. Almost all surviving miracle plays concern either the Virgin Mary or St. Nicholas, the 4th-century bishop of Myra in Asia Minor. Both Mary and Nicholas had active cults during the Middle Ages, and belief in the healing powers of saintly relics was widespread. In this climate, miracle plays flourished.

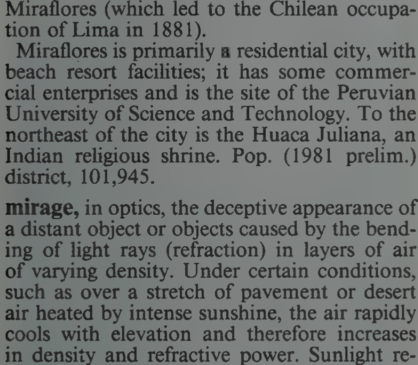
The Mary plays consistently involve her in the role of deus ex machina, coming to the aid of all who invoke her, be they worthy or wanton. She saves, for example, a priest who has sold his soul to the devil, a woman falsely accused of murdering her own child, and a pregnant abbess. Typical of these is a play called *St. John the Hairy*. At the outset the title character seduces and murders a princess. Upon capture, he is proclaimed a saint by an infant. He confesses his crime, whereupon God and Mary appear and aid John in reviving the princess, which done, the murderer saint is made a bishop.

The Nicholas plays are similar, an example being Jean Bodel's *Le Jeu de Saint Nicolas* (*c.* 1200), which details the deliverance of a crusader and the conversion of a Saracen king. Few English miracle plays are extant, because they were banned by Henry VIII in the mid-16th century and most were subsequently destroyed or lost.

Miraflores, city and district of the Lima–Callao metropolitan area of Peru, south of central Lima on the Pacific coast. The city abounds in bougainvillea for most of the year; thus, in the mid-16th century, while still an Inca Indian village, it came to be known by its present name (meaning "look at the flowers"). Although an 1850 census mentioned it as a district of Lima, it was not legally declared such until 1866. It was involved in the battles of La Palma (a civil war engagement in 1855 that led to Ramón Castilla's victory) and of Miraflores (which led to the Chilean occupation of Lima in 1881).

Miraflores is primarily a residential city, with beach resort facilities; it has some commercial enterprises and is the site of the Peruvian University of Science and Technology. To the northeast of the city is the Huaca Juliana, an Indian religious shrine. Pop. (1981 prelim.) district, 101,945.

mirage, in optics, the deceptive appearance of a distant object or objects caused by the bending of light rays (refraction) in layers of air of varying density. Under certain conditions, such as over a stretch of pavement or desert air heated by intense sunshine, the air rapidly cools with elevation and therefore increases in density and refractive power. Sunlight reflected downward from the upper portion of an object—*e.g.,* the top of a tree as shown in the figure (top)—will be directed through the cool air in the normal way; although the light would not be seen ordinarily because of the angle, it curves upward after it enters the rarefied hot air near the ground, thus being refracted to the observer's eye as though it originated below the heated surface. A direct image of the tree is seen also because some of the reflected rays enter the eye in a straight line without being refracted. The double image seems to be that of the tree and its upside-down reflection in water. When the sky is the object of the mirage, the land is mistaken for a lake or sheet of water.



(Top) mirage; (bottom) looming

From F.W. Sears, *Optics*, Third Edition, 1949, Addison-Wesley, Reading, Mass.

Sometimes, as over a body of water, a cool, dense layer of air underlies a heated layer. An opposite phenomenon will then prevail (*see* figure [bottom]), in which light rays will reach the eye that were originally directed above the line of sight. Thus, an object ordinarily out of view, like a ship below the horizon, will be apparently lifted into the sky. This phenomenon is called looming.

Mirage, any member of a family of combat aircraft produced by the Dassault-Breguet aeronautics firm of France. These relatively inexpensive, simple, durable aircraft were adopted by many of the world's smaller air forces from the 1960s. The first Mirage aircraft was the single-engine, delta-wing Mirage III. This craft was first flown in 1956 but subsequently underwent significant development. One variant of it became a basic interceptor, another a fighter-bomber, and a third a reconnaissance aircraft. During the 1960s the Mirage III was the basic air superiority fighter of the Israeli air force, and it performed spectacularly in the Six-Day War of 1967. Other countries whose air forces adopted the Mirage III included Brazil, Lebanon, South Africa, Argentina, Pakistan, Spain, Australia and Switzerland.

An export version of the Mirage III, called the Mirage 5, was adapted for ground attack and equipped with simplified avionics. It was first flown in 1967 and was sold to Belgium (in a coproduction arrangement), Pakistan, Peru, Colombia, Libya, Abu Dhabi, and Venezuela. The Mirage F-1, a multipurpose fighter developed as a replacement for the Mirage III in the French air force, entered service in 1973. This aircraft lacked the delta-wing design that had characterized all previous Mirages. F-1s were purchased by Greece, Morocco, South Africa, Spain, Jordan, and Iraq, among other countries. The French air force's F-1 was replaced by a newer multipurpose fighter, the Mirage 2000, beginning in 1984. This aircraft once again had a delta-wing design.

miʿrāj, in Islāmic legend, the ascension of the Prophet Muḥammad into heaven. In this legend, Muḥammad is prepared for his meeting with God by the archangels Jibrīl and Mīkāl one evening while he is asleep in the Kaʿbah, the sacred shrine of Mecca. They open up his body and purify his heart by removing all traces of error, doubt, idolatry, and paganism and by filling it with wisdom and belief. In the original version of the *miʿrāj,* the prophet is then transported by Jibrīl directly to the lowest heaven. But early in Muslim history the story of the ascension came to be associated with the story of Muḥammad's night journey (*isrāʾ*) from the "sacred place of worship" (Mecca) to the "further place of worship" (Jerusalem). The two separate incidents were gradually combined so that chronologically the purification of Muḥammad in his sleep begins the sequence; he is then transported in a single night from Mecca to Jerusalem by the winged mythical creature Burāq (*q.v.*), and from Jerusalem he ascends to heaven, possibly by ladder (*miʿrāj*), accompanied by Jibrīl.

Muḥammad and Jibrīl enter the first heaven and proceed through all seven levels until they reach the throne of God. Along the way they meet the prophets Adam, Yaḥyā (John), ʿĪsā (Jesus), Yūsuf (Joseph), Idrīs, Hārūn (Aaron), Mūsā (Moses), and Ibrāhīm (Abraham) and visit hell and paradise. Mūsā alone of all the inhabitants of heaven speaks at any length to the visitors; he says that Muḥammad is more highly regarded by God than himself and that Muḥammad's following outnumbers his own. Once Muḥammad appears before God—there is some question as to whether he actually saw him—he is told to recite the salat (ritual prayer) 50 times each day. Mūsā, however, advises Muḥammad to plead for a reduction of the number as being too difficult for believers, and the obligation is eventually reduced to five prayers each day.

Muḥammad's *miʿrāj* has been a constant source of speculation among Muslims. Some state that the ascension was merely a dream; others speculate that only Muḥammad's soul entered heaven, while his body remained on earth. Parallels have been drawn between the *miʿrāj* and the manner in which a dead man's soul will progress to judgment at God's throne; and the Ṣūfīs (Muslim mystics) claim it describes the soul's leap into mystic knowledge. Popularly the ascension is celebrated with readings of the legend on the 27th day of Rajab, called *Laylat al-Miʿrāj* ("Night of the Ascension"). *See also* isrāʾ.

Mirambo (d. 1884, Tanganyika [now Tanzania]), Nyamwezi warlord of central Africa whose ability to unite the many hitherto separate Nyamwezi clans into a powerful kingdom by the 1870s gave him strategic control of Arab trade routes and threatened the preeminence of the Arabs' colony in Unyanyembe (near present Tabora, Tanzania). His capital, Urambo (now in Tanzania), became a major rival trading centre.

Mirambo's success lay partly in his ability to get large supplies of firearms (often from Arab traders) and in his skillful use of the *ruga-ruga* (Ngoni mercenary warriors from the south). Between 1876 and 1880 he gained control of the major routes northwest to Buganda and west to Ujiji, on Lake Tanganyika. According to one source, in 1880 the Arabs asked for peace and even agreed to pay tribute.

In the 1870s Mirambo received support from the Arab sultan of Zanzibar, Barghash, who was then trying to extend his influence into the interior. In 1880, however, when two members of an expedition sponsored by the Belgian king Leopold II were killed by one of Mirambo's client chiefs, the sultan, already in a precarious position with Europeans, dropped the alliance. After Mirambo's death his kingdom rapidly disintegrated.

Miramón, Miguel (b. Sept. 29, 1832, Mexico City—d. June 19, 1867, near Querétaro, Mex.), Mexican soldier and politician, the leader of the forces that briefly established Maximilian as the emperor of Mexico.

Educated at a military school, Miramón served in the Mexican army in the battles against the United States in 1847 and rose to the rank of colonel in 1855. The next year he participated in the struggle against the Liberal forces led first by the provisional president Ignacio Comonfort and later by Comonfort's successor, Benito Juárez. In the bitter, three-year civil war (1857–60) that ensued, Miramón succeeded Félix Zuloaga as leader and as temporary president of Mexico.

When Liberal troops took Mexico City in December 1860, Miramón fled to Cuba and then to Europe. There he entered into negotiations with Napoleon III of France, who, for imperialistic reasons, persuaded Archduke Maximilian of Austria to assume the crown of Mexico. Miramón returned to Mexico in 1863 as the grand marshal of Maximilian's empire. He served as the Mexican minister to Germany (1864–66) but rushed back to Mexico when it appeared that Maximilian would abdicate his tottering throne. Miramón was instrumental in persuading the Emperor to continue the struggle and was appointed one of the leaders of the imperial army. Defeated by the forces of Juárez at Querétaro, he was taken prisoner and executed on a nearby hill with the Emperor.

Miranda, state, northern Venezuela, bounded on the northeast by the Caribbean Sea, by the Venezuelan states of Guárico on the south and Aragua on the west, and by the Distrito Federal on the north. The mountainous northern and southern parts of the territory of 3,070 square miles (7,950 square km) are separated by the Tuy River, which flows eastward to the Caribbean. Miranda ranks high among Venezuelan states in agricultural and pastoral production, and government irrigation projects have resulted in the expansion of its large-scale farming and in the diversification of its agriculture. Almost half of the nation's cacao is grown around the Barlovento region of Miranda and neighbouring Anzátegui, in the Tuy valley. Coffee plantations cover the higher elevations; sugarcane and citrus trees thrive on the valley floor. The state also produces bananas, corn (maize), peanuts (groundnuts), cassava, and coconuts. Miranda has a high rural population density, and the city of Caracas has expanded into neighbouring parts of northwestern Miranda. The highway network is extensive; Los Teques (*q.v.*), the state capital and major industrial centre, lies on the Pan-American Highway. Pop. (1986 est.) 1,771,680.

Miranda, innermost and smallest of the major satellites of Uranus. It was discovered in 1948 by the American astronomer G.P. Kuiper. Miranda's orbit is elliptical, and on the average it lies about 129,390 km (80,220 miles) from the centre of Uranus. Its orbital period is 1.4135 days. Its estimated diameter is 484 km (300 miles), and its mass is about 0.2×10^{-5} that of Uranus. Like the other major Uranian satellites, Miranda appears to be composed largely of water ice probably intermixed with frozen methane and rocky material. Photographs taken by the U.S. Voyager 2 space probe in 1986 indicate that Miranda's surface is a patchwork of winding valleys, parallel grooves, fault scarps, and cratered highlands. Such topographical features point to extensive tectonic activity during Miranda's past.

Miranda, Bartolomé de: *see* Carranza, Bartolomé de.

Miranda, Francisco de (b. March 28, 1750, Caracas—d. July 14, 1816, Cádiz, Spain), Venezuelan revolutionary who helped to pave the way for independence in Latin America. His own plan for the liberation of Spain's American colonies with the help of the European powers failed, but he remains known as El Precursor—*i.e.,* "the forerunner" of Bolívar and other more effective revolutionaries.

Educated in Caracas, Miranda purchased a captaincy in the Spanish Army at the age of 22. He was imprisoned for disobedience but was released in 1780 and sent to Cuba to fight against Great Britain. There he was accused of misuse of funds. Protesting his innocence, he fled to the United States in 1783.

There he met many of the leaders of the American Revolution and formed his plans for the liberation of South and Central America from Spanish domination. Hounded by Spanish agents, he fled to London, where he tried to enlist the aid of Prime Minister William Pitt in his plan of revolution. Pitt, realizing that Spain would eventually lose its grip on its American colonies, thought that Miranda was useful for Britain's purposes and provided him with limited support and protection. Miranda envisioned an independent empire, stretching from the Mississippi to Cape Horn, under the leadership of a hereditary emperor from the Incan royal family and with a legislature of two houses.

The French Revolution delayed Miranda's plans for a few years. He served as a French Revolutionary general and was jailed for suspected treason and then acquitted. Returning once again to London, he became the leader of all the exiled plotters against Spain. He embarked on an invasion of Venezuela in 1806, but he was forced to turn back when the peasants failed to rally to his side. In 1810 he met Simón Bolívar, who was in London attempting to get British support for the revolution that had finally begun in South America. Bolívar persuaded Miranda to return to Venezuela, where he was made a general in the revolutionary army. When the country formally declared independence on July 5, 1811, he assumed dictatorial powers.

The Spanish forces counterattacked, and Miranda, fearing a brutal and hopeless defeat, signed an armistice with them in July 1812 at San Mateo. The other revolutionary leaders, including Bolívar, believed his surrender was treasonable and thwarted Miranda's attempt to escape; they allowed him to be handed over to the Spanish. Transported in chains to Cádiz, he eventually died in his prison cell.

Miranda de Ebro, city, Burgos province, in the autonomous community (region) of Castile-León, northern Spain. It lies south of Bilbao on a plain straddling the Ebro River. Although historians ascribe Roman origins to Miranda ("Admirable Place"), it is probably older and named after local dolmens. Reconquered from the Moors by Alfonso I, Miranda later (1076) was reunited with Castile and given *fueros* (charters of privileges) by Alfonso VI in 1099. The community prospered under the Catholic and Austrian kings until it was ruined by floods and epidemics in the 18th century. Active in resisting the French invasion (1795), it was later the scene of a Popular Front demonstration that destroyed the church of San Nicolás in 1936; the Romanesque structure, once a mosque, has been restored. Miranda was declared a city in 1907. A rail junction between Madrid and the north, Miranda produces beet sugar, chocolate, and synthetic fibres. Pop. (1981) 36,812.

Miranda v. Arizona, 384 U.S. 436 (1966), U.S. Supreme Court case which resulted in a ruling that specified a code of conduct for police interrogations of criminal suspects held in custody. Chief Justice Earl Warren, writing for the five-to-four majority of the justices, ruled that the prosecution may not use statements made by a person under questioning in police custody unless certain minimum procedural safeguards were followed. The court established new guidelines to ensure "that the individual is accorded his privilege under the Fifth Amendment" not to be compelled to incriminate himself. Known as the Miranda warnings, these guidelines include informing arrested persons prior to questioning that they have the right to remain silent, that anything they say may be used against them as evidence, and that they have the right to the counsel of an attorney.

The Miranda decision was one of the most controversial decisions of the Warren Court, which under Chief Justice Warren had become increasingly concerned about the methods used by local police to obtain confessions. In an earlier (1964) case, *Escobedo* v. *Illinois*, 378 U.S. 478, the court had ruled that criminal suspects must be advised of their right to consult an attorney. But that decision had failed to specify the precise procedures police must follow to ensure that the suspect's rights in this regard are not violated.

In *Miranda* v. *Arizona* the court reversed an Arizona court's conviction of Ernesto Miranda on charges of kidnapping and rape. After being identified in a police lineup, Miranda had been questioned by police; he confessed and then signed a written statement without first being told that he had the right to have a lawyer present to advise him or that he had the right to remain silent. Miranda's confession was later used at his trial to obtain his conviction. The court held that the prosecution could not use his statements obtained by the police while the suspect was in custody unless the police had complied with several procedural safeguards to secure the Fifth Amendment privilege against self-incrimination.

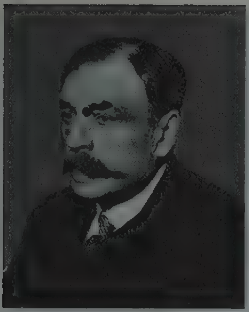
The Miranda ruling shocked the law-enforcement community and was hotly debated. Critics of the Miranda decision said that the court, in seeking to protect the rights of individuals, had seriously weakened law-enforcement agencies. Under Chief Justice Warren Burger, a more conservative Supreme Court later issued several decisions that limited the scope of the Miranda safeguards.

Mirandola, town, Modena province, Emilia-Romagna region, north central Italy. It has automobile assembly, footwear, food-canning, and hemp industries. The Romanesque-Gothic church of S. Francesco is a historic landmark. The town was the birthplace of Pico della Mirandola, the 15th-century scholar. Pop. (1984 est.) mun., 21,979.

Mirandola, Giovanni Pico della: *see* Pico della Mirandola, Giovanni.

Mirbeau, Octave(-Henri-Marie) (b. Feb. 16, 1850, Trévières, Fr.—d. Feb. 16, 1917, Paris), French writer of novels and plays who unsparingly satirized the clergy and social conditions of his time and was one of the 10 original members of the Académie Goncourt, founded in 1903.

His first work was as a journalist for Bonapartist and Royalist newspapers. He made his reputation as a storyteller with tales of the Norman peasantry, *Lettres de ma chaumière* (1886; "Letters from My Cottage") and *Le Calvaire* (1887; "The Calvary"), a chapter of



Mirbeau

H. Roger-Viollet

which, on the French defeat of 1870, aroused much rancour. In 1888 he wrote the story of a mad priest, *L'Abbé Jules* ("The Priest Jules"), and, in 1890, *Sébastien Roch,* a merciless picture of the Jesuit school he had attended. All his novels, from *Le Jardin des supplices* (1899; "The Garden of Torture") and *Le Journal d'une femme de chambre* (1900; "Journal of a Lady's Maid") to *La 628-E8* (1907) and *Dingo* (1913), were bitter social satires. His dramatic work was of high quality, and *Les Mauvais Bergers* (1897; "The Bad Shepherds") was compared to the work of Henry Becque. His greatest success as a playwright was achieved with *Les Affaires sont les affaires* (1903; "Business Is Business").

Mirbel, Charles-François Brisseau de (b. March 27, 1776, Paris, France—d. Sept. 12, 1854, Champerret), French botanist whose book *Traité d'anatomie et de physiologie végétale,* 2 vol. (1802; "Treatise on Plant Anatomy and Physiology"), earned him recognition as a founder of plant cytology and plant physiology. His most notable contribution to plant cytology was his observation (1809) that each plant cell is contained in a continuous membrane.

In 1798 Mirbel joined the staff of the National Museum of Natural History in Paris. Four years later the first volume of his *Histoire naturelle des végétaux classés par familles* ("Natural History of Plants Classified by Families") appeared. In 1803 he became director of the gardens of La Malmaison, where he studied the structure of plant tissue and the evolution of plant organs. The results were published in *Eléments de physiologie végétale et de botanique* (1815; "Elements of Plant Physiology and Botany").

Miri, port town, East Malaysia, on the South China Sea coast of northwestern Borneo. It lies south of Baram Point in a rubber- and rice-growing region. The town began in 1911, when nearby oil fields were opened. Peak production came in the 1930s; the fields declined, but there were later discoveries offshore at Salbiah. Lutong, 7 miles (11 km) north, has a refinery and is linked by pipeline to Brunei's Seria field. Because of site obstruction, the oil is transferred to tankers 3 miles offshore by a submarine pipe. About half the town's population is Chinese. Pop. (1991) 87,230.

Mirim Lagoon, Portuguese LAGOA MIRIM, Spanish LAGUNA MERÍN, shallow Atlantic tidewater lagoon on the border between Brazil (Rio Grande do Sul state) and Uruguay. It is approximately 118 miles (190 km) long and 30 miles across at its widest point, covering an area of 1,542 square miles (3,994 square km). A low, marshy bar, 10 to 35 miles wide and containing smaller lagoons, separates the Mirim Lagoon from the ocean. It drains northeastward into the Patos Lagoon through the São Gonçalo Canal and is navigable by shallow-draft vessels.

Mīrkhwānd, also spelled MIRKHOND, byname of MUḤAMMAD IBN KHĀVANDSHĀH IBN MAḤMŪD (b. 1433, Balkh [now in Afghanistan]—d. June 22, 1498, Herāt), one of the most important Persian chroniclers of Iran under the Timurid dynasty (15th century).

He was a member of an old family of sayyids (those who claim descent from the Prophet Muḥammad) established in Bukhara. Spending most of his life in Herāt in the court of the last Timurid sultan, Ḥusayn Bayqarah (1469–1506), Mīrkhwānd enjoyed the protection of Ḥusayn's renowned minister, ʿAlī Shīr Navāʾī, a celebrated patron of literature and himself a writer of great distinction. At the request of his patron, he began about 1474 his general history, *Rowzat oṣ-ṣafāʾ* (Eng. trans. begun as *History of the Early Kings of Persia,* 1832; continued as *The Rauzat-us-Safa; or, Garden of Purity,* 1891–94). The work is composed of seven large volumes and a geographic appendix, sometimes considered an eighth volume. The history begins with the age of the pre-Islāmic Persian kings and surveys the major Muslim rulers of Iran up to the events of 1523. The seventh volume may have been finished by Mīrkhwānd's grandson, the historian Khwāndamīr (Khondamir), and in the 19th century Rezā Qolī Khān Hedāyat wrote a supplement to the work.

Mīrkhwānd is often criticized for his highly embellished and bombastic style and for his uncritical approach to the sources, but his history preserves sections from earlier works that have since been lost. Volumes 5 and 6 are particularly reliable, for they utilize the abundant historiographic materials of the Mongol and Timurid periods and furnish independent information on the events that are contemporary or nearly contemporary with the author's lifetime.

mirliton, pseudomusical instrument or device in which sound waves produced by the player's voice or by an instrument vibrate a membrane, thereby imparting a buzzing quality to the vocal or instrumental sound. A common mirliton is the kazoo, in which the membrane is set in the wall of a short tube into which the player vocalizes. Mirlitons are also set in the walls of some flutes (*e.g.,* the Chinese *ti*) and xylophone resonators to colour the tone. The mirliton is one of the few membranophones (membrane instruments) not sounded by percussion.

Miró, Gabriel (b. July 28, 1879, Alicante, Spain—d. May 27, 1930, Madrid), Spanish writer distinguished for the finely wrought but difficult style and rich, imaginative vocabulary of his essays, stories, and novels.

Miró studied law at the universities of Granada and Valencia and in 1922 became secretary of the Concursos Nacionales de Letras y Artes in Madrid. His many novels include *Nuestro padre San Daniel* (1921; *Our Father, Saint Daniel*) and *El obispo leproso* (1926; "The Leprous Bishop"), both of which are critical of religious customs. Among his nonfictional works are *Figuras de la pasión del Señor* (1916; *Figures of the Passion of Our Lord*) and a series of books describing the life of his region whose protagonist is Sigüenza, Miró's literary alter ego.

Miró, Joan (b. April 20, 1893, Barcelona, Spain—d. Dec. 25, 1983, Palma, Majorca, Spain), Catalan artist, one of the foremost exponents of abstract art and Surrealist fantasy. The influence of Paul Klee is apparent in his "dream pictures" and "imaginary landscapes" of the late 1920s. His mature style evolved from the tension between this fanciful, poetic impulse and his vision of the harshness of modern life. He worked extensively in lithography and produced numerous murals, tapestries, and sculptures for public spaces.

Miró's father was a watchmaker and goldsmith. Both the artisan tradition and the austere Catalan landscape were of great importance to his art.

Miró's artistic development did not progress with the directness of his countryman Picasso, who could draw like a master while still a boy. Instead of being allowed to go to an art school, Miró was expected to complete high school, though he failed to do so. He then attended a commercial college and worked for two years as a clerk in an office, until he had a mental and physical breakdown. His parents took him for convalescence to an estate, Montroig, near Tarragona, which they bought especially for this purpose, and finally allowed him to attend an art school in Barcelona. His teacher at this school, Francisco Galí, showed a great understanding of his 18-year-old pupil, advising him to touch the objects he was about to draw, a procedure that strengthened Miró's feeling for the spatial quality of objects. Galí also introduced his pupil to examples of the latest schools of modern art from Paris as well as to the buildings of Antonio Gaudí, Barcelona's famous Art Nouveau architect.

Miró, photograph by Yousuf Karsh, 1966

Whereas artists of the contemporary Fauve and Cubist schools deliberately attempted to destroy the canons of tradition in order to attain a new kind of pristine vision, Miró possessed such a vision naturally. In his paintings and drawings he sought above all to establish means of metaphorical expression—that is, to discover signs that stand for concepts of nature in a transcendent, poetic sense. He wanted to depict nature as it would be depicted by a primitive man or a child equipped with the intelligence of a 20th-century adult; in this respect, he had much in common with the Surrealists and Dadaists, two other schools of modern artists who were striving to achieve similar aims by more intellectual means than Miró used. Miró's art developed slowly from his first clumsy attempts at expression to the apparently playful masterpieces of his later period. His fanatical honesty and his conscientious craftsmanship compelled him to work on many of his pictures for years.

From 1915 to 1919 Miró worked in Barcelona, at Montroig, and on Majorca, painting landscapes, portraits, and nudes in which his interest centred on the rhythmic interplay of volumes and areas of colour. His colours were still dark and heavy, though he delineated details as if superimposing on a heavy earthly ground a filigree of luminous leaves and blossoms. His manner was the same in landscapes, portraits, and nudes.

From 1919 onward Miró lived alternately in Spain and Paris. In the paintings he produced in the period between World Wars I and II—the great still lifes, landscapes, and phantasmagorias set free from both space and time—he gradually removed the objects he portrayed from their natural context and reassembled them as if in accordance with a new, mysterious grammar, creating a ghostly, eerie impression.

From 1925 to 1928, under the influence of the Dadaists, Surrealists, and Paul Klee, he painted "dream pictures" and "imaginary landscapes" in which the linear configurations and patches of colour look almost as though they were set down randomly. After a trip to The Netherlands, where he studied the 17th-century Dutch realist painters in the museums, the figurative elements in his pictures once more assumed a firmer shape. But, when a tendency toward beautiful, tasteful forms emerged in his works, he countered it with more brutal signs, collages, and objects made up of the waste products of industry.

By the 1930s Miró's artistic horizons were expanding. He designed decor for ballets. His paintings began to be exhibited regularly in French and American galleries. In 1934 he designed tapestries, and that led to an interest in the monumental and in murals.

At the time of the Spanish political turmoil and Civil War in the late 1930s, Miró was living in Paris. In their demonic expressiveness, his pictures of this period mirrored the fears and horrors of those years. At the Paris World Exhibition of 1937, he painted for the pavilion of the Spanish Republic a mural, "The Reaper," containing a strong element of social criticism.

During World War II Miró returned to Spain, where he painted his "Constellations," a series of small works that constitute symbols of the happy collaboration of everything creative, of the elements and the cosmos. They represent a challenge to the anonymous powers of corruption in social and political life, the cause of misery and wars. During the last year of the war, Miró, together with his potter friend Artigas, produced ceramics that revealed a new impetuosity of expression.

From 1948 onward he once more divided his time between Spain and Paris. That year saw the start of the series of very poetic works the symbols of which were based on the theme of woman, bird, and star. Pictures wildly spontaneous in character came into being alongside others whose forms were executed with punctilious craftsmanship. Both approaches were also combined in Miró's sculptures; in them all his earlier figurations were happily amalgamated to form erotic fetishes or signals towering into space.

In the years following World War II, Miró became world famous; his sculptures, drawings, and paintings were exhibited in many countries. In 1950 he painted a wall for Harvard University. His ceramic experiments were crowned by the great ceramic wall in the UNESCO building in Paris (1958), for which he received the Great International Prize of the Solomon R. Guggenheim Foundation. In 1962 Paris honoured him with the first major exhibition of his collected works in the National Museum of Modern Art. The architect José Luis Sert built for him on Majorca the large studio of which he had dreamed all his life. Among his later works were several monumental sculptures, such as those executed for Chicago and for Houston, Texas. In 1980, in conjunction with his receipt of Spain's Gold Medal of Fine Arts, a plaza in Madrid was named in Miró's honour.

In spite of his fame, however, Miró continued to devote himself exclusively to looking and creating. A taciturn, introverted man of short stature, Miró had not found it easy to attain the wisdom permeated by irony that ultimately characterized his work. From his youth, he had felt compelled by an almost anarchic obstinacy to keep his eyes firmly fixed on his goal despite the resistance he met from society or from the prevailing artistic theories. His late works manifest an even greater simplification of figure and background than his early ones. In order to realize his inner visions, it had become enough for Miró to set down a dot and a sensitive line on a sea-blue surface; in this the spectator could still find himself in a state of total enchantment. His early works anticipated the representational techniques of his later style; thus, although the former playful or aggressive irony gave way to a quasi-religious meditation, all of his works form a coherent whole manifested by a common quality of rejuvenation and deepening. (W.Er./Ed.)

BIBLIOGRAPHY. James Johnson Sweeney, *Joan Miro* (1941, reprinted 1969), a brief work, was the first comprehensive presentation of Miró's life and work. Walter Erben, *Joan Miró* (1959), reproduces many different examples of the artist's work at his home and studio on Majorca. Jacques Dupin, *Miró* (1962), is a standard work written by an art historian and longtime friend of the painter and containing a detailed (though now dated) bibliography of writings on Miró as well as a catalog of his pictorial and sculptural works. Roland Penrose, *Miró* (1970, reissued 1985), is also by a longtime friend. Works written since the artist's death include Pere A. Serra, *Miró and Mallorca* (1986); and Guy Weelen, *Miró* (1989).

Mīrpur Khās, town, southern Sindh province, Pakistan. It lies on the Let Wāh Canal and is connected by rail and road with Hyderābād (40 miles [65 km] west-southwest) and by road with Umarkot. Founded in 1806 by Mīr ʿAlī Murād Tālpur, it remained the capital of the Tālpur rulers until their defeat by British forces under Sir Charles James Napier in 1843. The town increased in importance after the Jāmrao Canal was opened in 1900 and is now a trade centre for grain, fabrics, and cotton products. It was constituted a municipality in 1901. Pop. (1981) 124,371.

Mirrlees, James A., in full JAMES ALEXANDER MIRRLEES (b. July 5, 1936, Minnigaff, Scot.), Scottish economist known for his analytic research on economic incentives in situations with incomplete, or asymmetrical, information. He shared the 1996 Nobel Prize for Economic Sciences with William Vickrey of Columbia University.

Mirrlees studied mathematics at the University of Edinburgh (M.A., 1957) and Trinity College, Cambridge (Ph.D., 1963). He taught at the University of Oxford (1969–95) and at Cambridge. Mirrlees's groundbreaking models and equations, published in the 1970s, illustrated the "optimal income taxation" (a progressive tax that included incentives for earning) and "moral hazard" (increasing the care taken by insurance policyholders) problems often treated in Vickrey's books. Mirrlees's methodology became the standard in the economics of asymmetrical information and was used by later economists in a variety of applications.

mirror, any polished surface that diverts a ray of light according to the law of reflection.

The typical mirror is a sheet of glass that is coated on its back with aluminum or silver that produces images by reflection. The mirrors used in Greco-Roman antiquity and throughout the European Middle Ages were simply slightly convex disks of metal, either bronze, tin, or silver, that reflected light off their highly polished surfaces. A method of backing a plate of flat glass with a thin sheet of reflecting metal came into widespread production in Venice during the 16th century; an amalgam of tin and mercury was the metal used. The chemical process of coating a glass surface with metallic silver was discovered by Justus von Liebig in 1835, and this advance inaugurated the modern techniques of mirror making. Present-day mirrors are made by sputtering a thin layer of molten aluminum or silver onto the back of a plate of glass in a vacuum. In mirrors used in telescopes and other optical instruments, the aluminum is evaporated onto the front surface of the glass rather than on the back, in order to eliminate faint reflections from the glass itself.

When light falls on a body some of the light may be reflected, some absorbed, and some transmitted through the body. In order for a smooth surface to act as a mirror, it must reflect as much of the light as possible and must transmit and absorb as little as possible. In order to reflect light rays without scattering or diffusing them, a mirror's surface must be perfectly smooth or its irregularities must be smaller than the wavelength of the light being reflected. (The wavelengths of visible light are on the order of 5×10^{-5} cm.) Mirrors may have plane or curved surfaces. A curved mirror is concave or convex depending on whether the reflecting surface faces toward the centre of curvature or away from it. Curved mirrors in ordinary usage have surfaces that are spherical, cylindrical, paraboloidal, ellipsoidal, and hyperboloidal. Spherical mirrors produce images that are magnified or reduced—exemplified, respectively, by mirrors for applying facial makeup and by rearview mirrors for automobiles. Cylindrical mirrors focus a parallel beam of light to a line focus. A paraboloidal mirror may be used to focus parallel rays to a real focus, as in a telescope mirror, or to produce a parallel beam from a source at its focus, as in a searchlight. An ellipsoidal mirror will reflect light from one of its two focal points to the other, and an object situated at the focus of a hyperboloidal mirror will have a virtual image.

Mirrors have a long history of use both as household objects and as objects of decoration. The earliest mirrors were hand mirrors; those large enough to reflect the whole body did not appear until the 1st century AD. Hand mirrors were adopted by the Celts from the Romans and by the end of the Middle Ages had become quite common throughout Europe, usually being made of silver, though sometimes of polished bronze.

The use of glass with a metallic backing commenced in the late 12th and early 13th centuries, and, by the time of the Renaissance, Nürnberg and Venice had established outstanding reputations as centres of mirror production. The mirrors produced in Venice were famous for their high quality. Despite the strictures of the doges, Venetian workmen succumbed to the temptation to carry the secrets of their craft to other cities, and, by the middle of the 17th century, mirror making was practiced extensively in London and Paris. Generally, mirrors were extremely expensive—especially the larger variety—and the wonderment created at the time by the royal palace at Versailles was due in part to the profusion of mirrors that adorned the state rooms.

From the late 17th century onward, mirrors—and their frames—played an increasingly important part in the decoration of rooms. The early frames were usually of ivory, silver, ebony, or tortoiseshell or were veneered with marquetry of walnut, olive, and laburnum. Needlework and bead frames were also to be found. Craftsmen such as Grinling Gibbons (1648–1721) often produced elaborately carved mirror frames to match a complete decorative ensemble. The tradition soon became established of incorporating a mirror into the space over the mantelpiece: many of the early versions of these mirrors, usually known as overmantels, were enclosed in glass frames. The architectural structure of which these mirrors formed a part became progressively more elaborate; designers such as the English brothers Robert and James Adam cre-

ated fireplace units stretching from the hearth to the ceiling and depending largely for their effect on mirrors. On the whole, mirror frames reflected the general taste of the time and were often changed to accommodate alterations in taste, frames usually being cheaper and hence more easily replaced than the mirror itself.

By the end of the 18th century, painted decoration largely supplanted carving on mirrors, the frames being decorated with floral patterns or classical ornaments. At the same time, the French started producing circular mirrors, usually surrounded by a Neoclassical gilt frame that sometimes supported candlesticks, which enjoyed great popularity well into the 19th century. Improved skill in mirror making also made possible the introduction of the cheval glass, a freestanding full-length mirror, supported on a frame with four feet. These were mainly used for dressing purposes, though occasionally they had a decorative function.

New, cheaper techniques of mirror production in the 19th century led to a great proliferation in their use. Not only were they incorporated into pieces of furniture, such as wardrobes and sideboards, but they were also used extensively in decorative schemes for public places.

mirror nucleus, atomic nucleus that contains a number of protons and a number of neutrons that are mutually interchanged in comparison with another nucleus. Thus, nitrogen-15, containing seven protons and eight neutrons, is the mirror nucleus of oxygen-15, comprising eight protons and seven neutrons. Study of mirror nuclei has aided in showing that the nuclear force binding protons and neutrons in the nucleus remains nearly the same when a neutron is replaced by a proton.

MIRV, abbreviation of MULTIPLE INDEPENDENT REENTRY VEHICLE, any of several nuclear warheads carried on the front end, or "bus," of a ballistic missile. Each MIRV allows separately targeted nuclear warheads to be sent on their independent ways after the main propulsion stages of the missile launch have shut down. The warheads can be released from the bus at different speeds and on different trajectories. MIRV technology was first developed by the United States. By the late 20th century both the United States and the Soviet Union had many intercontinental and submarine-launched ballistic missiles equipped with MIRVs.

Mirzachul (Uzbekistan): *see* Gulistan.

Mirzāpur-Vindhyāchal, city, southeastern Uttar Pradesh state, northern India, southwest of Vārānasi (Benares), on the Ganges River. Mirzāpur was probably founded in the 17th century; by 1800 it had become the greatest trading centre in northern India. When the railway to Allahābād was opened in 1864, Mirzāpur began to decline, but it became increasingly important in local trade. Located at a road junction on a major rail line, it is also a centre of industry, including cotton milling, sandstone dressing, and brassware and carpet manufacture. There are temples and *ghāṭ*s, or bathing stairs, along the river; in Vindhyāchal is an old temple of Kālī, visited by pilgrims.

The surrounding region includes part of the Ganges alluvial plain to the north and some of the Vindhya Range to the south. The area to the south is drained by the Son River; its tributary, the Rihand, has been dammed to create a large reservoir and provide hydroelectric power. Most of the land is irrigated by canals, and rice, barley, and wheat are grown. Pop. (1991 prelim.) city, 169,368.

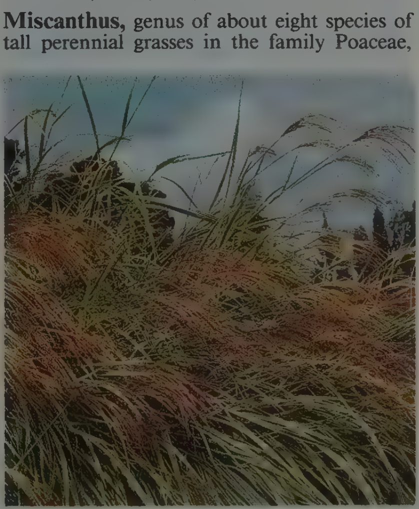
Misau, also spelled MISSAU, or MESSAU, town and traditional emirate, northern Bauchi state, northern Nigeria, 5 miles (8 km) northwest of the Misau River, the upper stretch of the Komadugu Gana. Originally inhabited by Hausa people, the town was captured in 1827 by the emirs Yakubu of Bauchi and Dan Kauwa of Katagum. The ensuing dispute between them led the sultan of Sokoto to place (1831) the town and its surrounding area under the jurisdiction of Mamman Manga (the son of Gwani Mukhtar, the Fulani warrior who had conquered Birni Ngazargamu, capital of the Bornu kingdom, in 1808 during the Fulani jihad, or holy war). He is credited with founding Misau emirate.

During Emir Ahmadu's reign (1833–50) the town wall was constructed. The military exploits of Emir Sale (ruled 1860–86) led the sultan to enlarge the emirate. The second emir Ahmadu (1900–03) fled before the advance of the British, who placed the emirate under Katagum in 1904 but restored its independence as a separate emirate of Kano province in 1907. Enlarged by minor additions in 1915, the emirate of 713 square miles (1,847 square km) was transferred to Bauchi province in 1926. The emir, now a traditional and religious leader, retains the historical title of *sarkin Bornu ta gabas* (king of eastern Bornu).

Most of Misau's Muslim inhabitants, mainly Fulani and Hausa, are now farmers who cultivate millet, sorghum, peanuts (groundnuts), cotton, cowpeas, and indigo and who raise cattle, goats, sheep, donkeys, and horses. Cotton weaving and dyeing are important local activities. The town is the site of the Alhapri Farm Institute. It is served by a secondary school and a hospital. Misau is located on the northern branch of the main highway network and is at a local highway crossroads. Pop. (latest census) town, 105,416.

Miscanthus, genus of about eight species of tall perennial grasses in the family Poaceae, native primarily to southeastern Asia. Eulalia (*M. sinensis*) and two other species sometimes are grown as lawn or border ornamentals for their silvery or white, plumelike flower clusters.

The leaves of several varieties have yellow or white stripes or bands. The dried heads often are used in decoration. *Eulalia* also is the botanical name for a genus of perennial grasses that includes browntop (*E. fulva*), an important forage plant in Australia, Malaysia, and Southeast Asia.



Eulalia (*Miscanthus sinensis*)

miscarriage, also called SPONTANEOUS ABORTION, spontaneous expulsion of the embryo or fetus from the uterus before it has developed sufficiently to live without maternal support. The most common cause, accounting for more than 60 percent of miscarriages, is an inherited defect in the fetus, which might result in a deformed or otherwise abnormal child. An acute infectious disease may play a role in causing some miscarriages, particularly if it reduces the oxygen supply to the fetus. Certain uterine tumours or other uterine abnormalities also may induce a miscarriage. Death of the fetus stemming from external trauma or from knotting of the umbilical cord is another cause of miscarriage. Physical traumas (such as blows to or falls of the mother) and psychic traumas are rarely implicated in miscarriage.

Endocrine disorders such as the deficient secretion of the hormone progesterone may cause poor development of the decidua (the mucal lining of the uterus) or an abnormally irritable uterus and may thus sometimes result in miscarriage. The principal sign of an impending or threatened miscarriage is vaginal bleeding.

miscegenation, marriage or cohabitation by persons of different race. Theories of anatomical disharmony resulting from miscegenation have been largely discredited by 20th-century genetics and anthropology. Although it is now accepted that modern populations are the result of continuous racial crossing since prehistoric times, taboos on miscegenation—in some instances legally enforced—have existed and continue to exist in many biracial societies. In South Africa the official policy of apartheid for many years included legal prohibitions on miscegenation. In the United States many states had laws against interracial marriage until the Supreme Court declared them unconstitutional in 1967.

misch metal, alloy consisting of about 50 percent cerium, 25 percent lanthanum, 15 percent neodymium, and 10 percent other rare-earth metals and iron. Misch metal has been produced on a relatively large scale since the early 1900s as the primary commercial form of mixed rare-earth metals. Misch metal alloyed with iron is the flint (spark-producing agent) in cigarette lighters and similar devices. Misch metal is also used as a deoxidizer in various alloys and to remove oxygen in vacuum tubes. As an alloying agent in magnesium, it contributes to high strength and creep resistance.

misdemeanour (law): *see* felony and misdemeanour.

mise, in medieval England, any outlay of money and in particular the payment of taxation. The mise rolls (*rotuli misae*) of King John's reign (1199–1216), which record payments made from the Exchequer to various departments of the royal household, illustrate the general meaning of the word. It was used to denote taxation in the document known as the Confirmatio Cartarum granted by Edward I in 1297, when the king promised not to treat as customary certain "aids, mises and prises" recently levied. The word was also used to indicate the settlement of a dispute by arbitration. Louis IX's judgment (1264) on the quarrel between Henry III and the rebel English barons is known as the Mise of Amiens; after Henry's defeat at Lewes in May 1264, an agreement known as the Mise of Lewes, of which the text is lost, was made between victors and vanquished.

Misenum, ancient port of Campania, Italy, located about 3 miles (5 km) south of Baiae at the west end of the Gulf of Puteoli (Pozzuoli). Until the end of the Roman Republic it was a favourite villa resort dependent on Cumae. Agrippa made the fine natural harbour into the main naval station of the Mediterranean fleet (31 BC). Pliny the Younger was stationed in Misenum, from which he witnessed (and wrote about) the eruption of Mount Vesuvius in AD 79. In 890 it was destroyed by the Saracens. The harbour consisted of the outer basin, or Porto di Miseno, protected by moles (mounds of large stones used as a breakwater), of which remains still exist, and the present Mare Morto, separated from it by a comparatively modern embankment. The town lay on the south side of the outer harbour, near the village of Miseno, where remains of a theatre and baths have been found. Remains of villas can also be traced; the largest of these, which occupied the summit of the promontory, belonged first to Marius, then to Lucullus, and then to the imperial house. Tiberius died in it.

Mises, Ludwig (Edler) von (b. Sept. 29, 1881, Lemberg, Austria-Hungary [now Lviv, Ukraine]—d. Oct. 10, 1973, New York City), Austrian-American libertarian economist known for his contribution to liberalism in economic theory and his belief in the power of the consumer.

Von Mises was a professor at the University of Vienna (1913–38) and at New York University (1945–69). In *The Anti-Capitalistic Mentality* (1956), an examination of American socialism, he dealt with the opposition of a variety of intellectuals to the free market; in his view, these persons bear an unwarranted resentment toward the necessity of obeying mass demand, which is the basis of prosperity in big business. Among his other books are *Planned Chaos* (1947), concerning socialist totalitarianism, and *Human Action* (1949; rev. ed. 1966), a treatise on economics.

Mises, Richard von (b. April 19, 1883, Lemberg, Austria-Hungary [now Lviv, Ukraine]—d. July 14, 1953, Boston), Austrian-born American mathematician and aerodynamicist who notably advanced statistics and the theory of probability.

Von Mises' scientific and mathematical contributions range widely. His early work centred on aerodynamics, in which he made fundamental advances in boundary-layer-flow theory and airfoil design. In 1915 he constructed a 600-horsepower airplane for the Austrian army and served in it as a pilot during World War I.

Von Mises was a professor of applied mathematics at the University of Strassburg (1909–18), and in 1920 he became professor of applied mathematics and director of the Institute for Applied Mathematics at the University of Berlin. After the Nazi Party gained power, he left Germany in 1933 to accept a post with the University of Istanbul. In 1939 he joined the staff of Harvard University, where in 1944 he became Gordon McKay professor of aerodynamics and applied mathematics.

Von Mises' primary work in statistics concerned the theory of measure and applied mathematics. He also wrote a philosophical work, *Positivism: A Study in Human Understanding* (1951), summarizing his views on science and life.

Mishawaka, city, St. Joseph county, northern Indiana, U.S. It lies along the St. Joseph River, just east of South Bend. Laid out in 1833, it probably derived its name from the Potawatomi word for "country of dead trees." Discoveries of bog iron immediately following the initial settlement attracted industry and workers to the site. Several thousand Belgian immigrants after World War I formed a substantial Flemish-speaking community in the city. Mishawaka is an industrial centre with manufactures including rubber, plastic, food products, power-transmission units, electrical and heavy machinery, structural steel, foundry equipment, and missiles. Bethel College (1947) is operated by the Missionary Church. There are recreation facilities on the St. Joseph River and nearby lakes. Inc. 1899. Pop. (1990) city, 42,608; South Bend–Mishawaka MSA, 247,052.

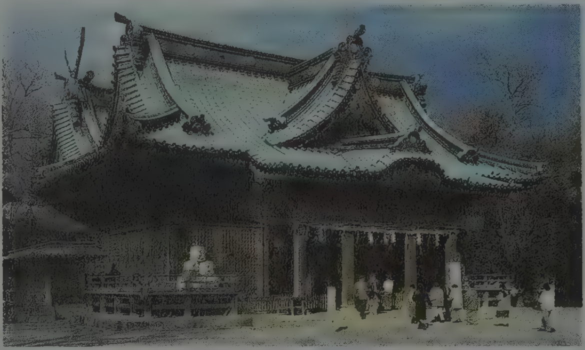
Mishima, city, Shizuoka *ken* (prefecture), Honshu, Japan. It is situated on the Izu Peninsula at the western foot of Mount Hakone. In early historic times it was the capital of Izu province (now part of Shizuoka prefecture), and at the beginning of the Tokugawa period (1603–1867) it became a major post town on the Tōkaidō (Eastern Sea Highway). The city's scenic spots include the well-known Mishima Shrine with its beautiful landscaped gardens.

Mishima is now an important railway and highway hub, serving as the gateway to many of the spas on the Izu Peninsula, such as Nagaoka and Shuzenji. Dairy cattle are raised in the surrounding area, and there are several dairy-processing plants in the city. Abundant groundwater fed by Mount Fuji has attracted many other manufactures to the city, including paper, machinery, textiles, and rubber. Pop. (1990) 105,419.



Mishima Shrine, Mishima, Honshu, Japan

JTB Photo Library, Tokyo

mishima: *see* punch'ŏng pottery.

Mishima Yukio, pseudonym of HIRAOKA KIMITAKE (b. Jan. 14, 1925, Tokyo—d. Nov. 25, 1970, Tokyo), prolific writer who is regarded by many critics as the most important Japanese novelist of the 20th century.

Mishima was the son of a high civil servant and attended the aristocratic Peers School in Tokyo. During World War II, having failed to qualify physically for military service, he worked in a Tokyo factory and after the war studied law at the University of Tokyo. In 1948–49 he worked in the banking division of the Japanese Ministry of Finance. His first novel, *Kamen no kokuhaku* (1949; *Confessions of a Mask*), is a partly autobiographical work that describes with exceptional stylistic brilliance a homosexual who must mask his abnormal sexual preferences from the society around him. The novel gained Mishima immediate acclaim, and he began to devote his full energies to writing.

He followed up his initial success with several novels whose main characters are tormented by various physical or psychological problems or who are obsessed by unattainable ideals that make everyday happiness impossible for them. Among these works are *Ai no Kanaki* (1950; *Thirst for Love*), *Kinjiki* (1954; *Forbidden Colours*), and *Shiosai* (1954; *The Sound of Waves*). *Kinkaku-ji* (1956; *The Temple of the Golden Pavilion*) is the story of a troubled young acolyte at a Buddhist temple who burns down the famous building because he himself cannot attain to its beauty. *Utage no Ato* (1960; *After the Banquet*) explores the twin themes of middle-aged love and corruption in Japanese politics. In addition to novels, short stories, and essays, Mishima also wrote plays in the form of the Japanese Nō drama, producing reworked and modernized versions of the traditional stories. His plays include *Sado kōshaku fujin (*1965; *Madame de Sade*) and *Kindai nōgaku shu* (1956; *Five Modern Nōh Plays*).

Mishima's last work, *Hōjō no umi* (1965–70; *The Sea of Fertility*), is a four-volume epic that is regarded by many as his most lasting achievement. Its four separate novels, *Haru no yuki* (*Spring Snow*), *Homma* (*Runaway Horses*), *Akatsuki no tera* (*The Temple of Dawn*), and *Tennin gosui* (*The Decay of the Angel*), are set in Japan and cover the period from about 1912 to the 1960s. Each of them depicts a different reincarnation of the same being: as a young aristocrat in 1912, as a political fanatic in the 1930s, as a Thai princess before and after World War II, and as an evil young orphan in the 1960s. These books effectively communicate Mishima's own increasing obsession with blood, death, and suicide, his interest in self-destructive personalities, and his rejection of the sterility of modern life.

Mishima's novels are typically Japanese in their sensuous and imaginative appreciation of natural detail, but their solid and competent plots, their probing psychological analysis, and a certain understated humour helped make them widely read in other countries.

Mishima Yukio

By courtesy of Mrs. Mishima Yukio

The short story "Yukoku" ("Patriotism") from the collection *Death in Midsummer, and Other Stories* (1966) revealed Mishima's own political views and proved prophetic of his own end. The story describes, with obvious admiration, a young army officer who commits seppuku, or ritual disembowelment, to demonstrate his loyalty to the Japanese emperor. Mishima was deeply attracted to the austere patriotism and martial spirit of Japan's past, which he contrasted unfavourably with the materialistic, Westernized people and the prosperous society of Japan in the postwar era. Mishima himself was torn between these differing values. Although he maintained an essentially Western life-style in his private life and had a vast knowledge of Western culture, he raged against Japan's imitation of the West. He diligently developed the age-old Japanese arts of karate and kendo and formed a controversial private army of about 80 students, the Tate no Kai (Shield Society), with the idea of preserving the Japanese martial spirit and helping protect the emperor (the symbol of Japanese culture) in case of an uprising by the left or a Communist attack.

On Nov. 25, 1970, after having that day delivered the final installment of *The Sea of Fertility* to his publisher, Mishima and four Shield Society followers seized control of the commanding general's office at a military headquarters near downtown Tokyo. He gave a 10-minute speech from a balcony to a thousand assembled servicemen in which he urged them to overthrow Japan's post-World War II constitution, which forbids war and Japanese rearmament. The soldiers' response was unsympathetic, and Mishima then committed seppuku in the traditional manner, disemboweling himself with his sword, followed by decapitation at the hands of a follower. This shocking event aroused much speculation as to Mishima's motives, and regret that his death had robbed the world of such a gifted writer.

Mishmi, tribal people mostly of Arunachal Pradesh (formerly North East Frontier Agency) in extreme northeastern India, near Tibet and Assam, speaking dialects of the Tibeto-Burman linguistic family. Numbering about 35,000 in the late 20th century, the Mishmi live along the valleys of the Dibang (where they are known as Midu) and Luhit rivers. Those of the Luhit Valley are divided into two groups, the Miju on the upper Luhit and the Digaru on that river's lower reaches.

The Mishmi trace their descent through the paternal line, and young people are expected to marry outside the paternal clan. Settlements are small and frequently shifted. There are no chiefs. Each family group is virtually autonomous and inhabits a longhouse built on piling.

Mishmi agriculture is extremely primitive; corn (maize) and buckwheat are the staple crops; barley and wheat are grown at higher altitudes, rice in the foothills. Cattle are kept for slaughter and are also used as currency. Other pursuits include hunting and fishing. The Mishmi carry on considerable barter with peoples living in Tibet and Assam, trading musk, medicinal herbs, paper bark, and aconite poison in exchange for clothing, salt, copperware, and swords. They worship their tribal gods with animal sacrifices and offerings, and some Tibetan influence is evident. Slavery and headhunting are no longer practiced.

Mishna, also spelled MISHNAH (Hebrew: "Repeated Study"), plural MISHNAYOT, the oldest authoritative postbiblical collection and codification of Jewish oral laws, systematically compiled by numerous scholars (called tannaim) over a period of about two centuries. The codification was given final form early in the 3rd century AD by Judah ha-Nasi. The Mishna supplements the written, or scriptural, laws found in the Pentateuch. It presents various interpretations of selective legal traditions that had been preserved orally since at least the time of Ezra (*c.* 450 BC).

Intensive study of the Mishna by subsequent scholars (called amoraim) in Palestine and Babylonia resulted in two collections of interpretations and annotations of it called the Gemara, or Talmud. In the broader sense of the latter terms, the Mishna and Gemara together make up the Talmud (*q.v.*).

The Mishna comprises six major sections, or orders (*sedarim*), that contain 63 tractates (*massekhtaot*) in all, each of which is further divided into chapters.

Zeraʿim ("Seeds"), the first order of the Mishna, has 11 tractates. It begins by discussing daily prayer and then devotes 10 tractates to religious laws involving agriculture. *Zeraʿim* discusses the prescription that fields must periodically lie fallow, the prohibition on plant hybridization, and regulations governing what portion of a harvest is to be given to priests, to Levites (a priestly clan), and to the poor.

The second order, *Moʿed* ("Festival"), consists of 12 tractates that deal with ceremonies, rituals, observances, and prohibitions related to the Sabbath, to religious festivals, to fast days, and to such other days as are marked by regular religious observance—*e.g.*, periodic contributions to the Temple of Jerusalem.

Nashim ("Women"), the third order of the Mishna, discusses married life in seven tractates. It thus explains religious laws concerning betrothals, marriage contracts, divorce, bills of divorce, and certain ascetic vows that affect married life.

The fourth order, *Neziqin* ("Damages"), has 10 tractates covering civil and criminal law as related to damages, theft, labour relations, usury, real estate, partnerships, tenant relations, inheritance, court composition, jurisdiction and testimony, erroneous decisions of the Sanhedrin (high court), and physical punishments, including death. Idolatry, which is punishable by death, is also discussed. The tractate *Avot* ("Fathers") seems to have been included in the fourth order to teach a moral way of life that would preclude serious transgressions of the law and thereby diminish the necessity of punishment. It became one of the most popular pieces of Talmudic literature; in English translations it is usually called *The Ethics of the Fathers.*

Qodashim ("Holy Things"), the fifth order, provides a detailed description of the Temple of Jerusalem complex and discusses laws regulating Temple sacrifices, other offerings, and donations. It has 11 tractates.

The last of the Mishna orders is *Ṭohorot* ("Purifications"), divided into 12 tractates. It considers laws regarding the ritual purity of vessels, dwellings, foods, and persons and deals with various rituals of purification. The text also provides considerable information on ritual objects.

Mishne Torah, extensive commentary on the Talmud, composed in the 12th century by the renowned Jewish philosopher and scholar Moses Maimonides. Each of its 14 volumes deals with a group of laws covering one subject. Among the subjects are ethical conduct, civil laws, torts, marriage and divorce, and gifts to the poor.

Maimonides intended the Mishne Torah to combine religious law and philosophy and to serve as a code of laws that teaches as well as prescribes conduct. He attempted to make the Mishne Torah accessible to as many readers as possible, rather than restricting it for use only by scholars. Readers are encouraged to probe into the rationale underlying the laws. Like the Talmud that is its base, the Mishne Torah contains instruction in secular subjects, such as physics, astronomy, dietetics, and psychology.

Misima Island, also called SAINT AIGNAN, volcanic island of the Louisiade Archipelago in Papua New Guinea. It is situated 125 miles (200 km) southeast of the island of New Guinea in the southwestern Pacific. The island measures 25 miles by 6–7 miles (40 by 10–11 km) and has a total land area of 100 square miles (260 square km). The terrain is mountainous, rising to 3,400 feet (1,050 m) at Mount Oiatau. The site of gold discoveries in the late 1890s and of gold mining in the early 20th century, Misima now produces some copra. The largest settlement on the island is Bwagaoia, in the southeast. Pop. (1980 prelim.) 7,230.

Misiones, isolated province of northeastern Argentina. Misiones lies between the Paraná River and Paraguay to the west, the Iguaçu (Iguazú) River (and tributaries) and Brazil to the north, the Uruguay River (and tributaries) and Brazil to the east and southeast, and the Corrientes province of Argentina to the southwest. Its area of 11,506 square miles (29,801 square km) is mostly a 650–2,600-foot- (200–800-metre-) high basalt continuation of the Paraná Plateau of Brazil. The province's rough terrain is covered mostly by subtropical evergreen rain forest and is accented by canyons, rivers, and low ranges of the Victoria, Imán, and Misiones mountains. The province contains Iguazú National Park, which, with an area of 121,600 acres (49,200 hectares), includes part of Iguaçu Falls. One of the world's largest and most impressive cataracts, Iguaçu Falls descends 269 feet (82 m) over a distance of 1.7 miles (2.7 km).

The region received its name from the Jesuit missions established among the Guaraní Indians there in the 17th and 18th centuries. It became an Argentine territory after years of dispute with Paraguay and Brazil and the Paraguayan War of 1864–70. In 1882 it received territorial status and acquired its capital, Posadas (*q.v.*), from Corrientes province. Colonization of the land, beginning in the 1880s by assorted ethnic groups (including Poles, Ukrainians, Japanese, Brazilians, German-Brazilians, and Germans), continued into the mid-20th century. In 1953 the territory gained provincial status.

The principal economic staple is maté (Paraguayan tea), followed by lumber, tung oil, tea, and cassava (manioc). Industry, centred in Posadas, deals primarily with wood processing. Jesuit mission ruins and Iguaçu Falls are popular tourist attractions. Pop. (1999 est.) 972,672.

Miskito, also spelled MOSTIQUE, or MOSQUITO, Central American Indians of the lowlands along the Caribbean coast of northeastern Nicaragua. They were encountered by Columbus on his fourth voyage and have been in steady European contact since the mid-17th century. In the late 20th century five subgroups existed, with a total population of perhaps 70,000.

The modern Miskito are agricultural, their staple crop being cassava. They also keep poultry, cattle, and other farm animals. The Miskito culture has been strongly influenced by European contacts and by intermarriage with Africans brought to the area as slaves. In colonial times it was very similar to that of the neighbouring Sumo. Many Miskito Indians fled to neighbouring Honduras in the 1980s after conflicts developed between them and the Sandinista government of Nicaragua, and some Miskitos joined rebel groups seeking to overthrow the Sandinistas.

Miskito Coast (Nicaragua): *see* Mosquito Coast.

Miskolc, town with county status, in Borsod-Abaúj-Zemplén *megye* (county), northeastern

Hungary. It lies in the valley of the Szinva, a small tributary of the Sajó River, on the eastern margin of the Avas Hills, which form part of the Bükk limestone plateau. Caves in the limestone hills were inhabited from prehistoric times, and Germanic tribes, Sarmatians, and Avars later lived in the area. From the time of the Hungarian conquest in the 10th century, its history has been linked with a small iron field and with Diósgyőr, farther up the Szinva River valley, which in the 14th and 15th centuries was a regular retreat for royalty; its splendid castle is now largely in ruins. The long-established wealth and importance of Miskolc are apparent in some fine old buildings, including St. Stephen's, a 13th-century Gothic church, the National Theatre, the Protestant church, a Minorite church and monastery, and the Reformed Church of Avas and its belltower. Miskolc is also the site of a university founded in 1949, which offers instruction in engineering, law, and economics.

Liberty Square in Miskolc, Hung.
Interphoto—FPG

The chief town of the Borsod-Miskolc industrial region, it is after Budapest the second industrial town of Hungary. Industries include cement, glass, textiles, and food processing, and there is a large food refrigeration plant. Wine making is important, notably in the limestone caves of Mount Avas, which are used as cellars.

The Miskolc town-county administrative district extends for several miles up the Szinva valley to the boundary with Heves *megye.* Newer residential districts in Miskolc are located on the Sajó River plain.

The Borsod industrial district follows the Sajó River valley and includes several important settlements. Diósgyőr, which developed rapidly in the late 19th and early 20th centuries, now part of Miskolc proper, has been modernized since World War II; it has a large iron- and steelworks, produces heavy machinery and machine tools, and has a large cement and lime works. Kazincbarcika, a new town comprising several villages, especially Kazinc and Barcika, has a heavy chemicals industry and also produces iron and steel. At Borsodnádasd are sheet metal and plating works. Miskolc has rail and road connections with Budapest, 90 miles (145 km) to the southwest, and with eastern Hungary, Slovakia, Romania, and Ukraine. Pop. (1991 est.) 194,033.

Misnagid (Judaism): *see* Mitnagged.

Misool Island, Indonesian PULAU MISOOL, island in the Raja Ampat group in the Ceram Sea, Irian Jaya *provinsi* ("province"), Indonesia. Misool is located about 40 miles (64 km) southwest of the Doberai (Vogelkop) Peninsula on Irian Jaya. Flat lowlands cover the coastal regions except in the south, which is hilly and mountainous; the hills in the central part of the island reach an elevation of 3,250 feet (991 m). The climate is hot, with heavy rainfall; seasonal streams flow seaward from the central highlands, where there are dense hardwood forests. The island is sparsely populated by Papuans, who engage in seminomadic hunting and gathering. Some produce sago and fish, which are exported to the Irian Jaya ports of Inanwatan and Taminabuan. The chief settlements are Adua on the western tip of the island and Lelintah on the southeastern part of the island.

Misore Islands (Indonesia): *see* Schouten Islands.

mispickel (mineral): *see* arsenopyrite.

misprision, in law, criminal misconduct of various types. Concealment of a serious crime by one who knows of its commission but was not a party to it is misprision. Similarly, the failure of a citizen to attempt to prevent the perpetration of an offense can be characterized as misprision. (*See also* accomplice; accessory; and abettor.)

The term misprision also embraces the conduct of government officials charged with maladministration in public office. A third kind of misprision includes contempt for the sovereign or seditious conduct against the government or the courts.

Miṣrātah, also spelled MISURATA, town, northwestern Libya. It is separated from the Mediterranean Sea by a band of sand dunes and occupies a coastal oasis above an underground water table. The town originated about the 7th century as a caravan supply centre. By the 12th century, as Thubactis, it was engaged in interregional commerce. International trade developed through the port of Qaṣr Aḥmad, or Misurata Marina (now closed), lying 7 miles (11 km) east on Cape Miṣrātah, but the town reverted to a local market under Ottoman Turkish rule. By the 20th century, irrigation had greatly increased agricultural production, and the town, on the federal coastal road, became a main market and administrative centre.

Part of the modern section of Miṣrātah, Libya
Kay Muldoon

Old Miṣrātah is characterized by Arab architecture and narrow arched or covered streets. The modern town, however, is a mixture of Turkish and European buildings with a public garden and tree-lined avenues. The town's market economy is supplemented by light manufactures (textiles and hardware) and handicrafts (carpets, basketry, and pottery). It is linked by the coastal highway that connects Tripoli with Banghāzī and Cairo. Miṣrātah is an educational centre with several seminaries, a technical college, and a primary-teacher-training institute and hospital facilities. Pop. (1988 est.) 121,669.

misrepresentation, in law, any representation by words or other means made by one person to another that, under the circumstances, amounts to an assertion not in accordance with the facts. A misrepresentation is an assertion not in accord with the facts that is made with the intent to mislead or deceive; as such it can constitute fraud (*q.v.*).

Misrepresentation most commonly occurs in insurance and real-estate contracts; in such cases, a false statement regarding a matter of fact may be material to the contract and even influential in producing it. In many such cases, the injured party relies upon the false statement because it is the business of the other party to know all of the facts pertaining to it.

When a person has been induced to enter into a contract by misrepresentation, the contract is usually rendered void and the representee may even recover damages. In some jurisdictions, the representee may affirm the contract and insist that the misrepresentation be made good. The injured party in any case avoids contractual liability, either by instituting an action to rescind the contract or by using the misrepresentation as a defense in the event that he is sued for failure to perform his side of the contract.

Misrule, Lord of, also called ABBOT OF MISRULE, or KING OF MISRULE, official of the late medieval and early Tudor period in England, who was specially appointed to manage the Christmas festivities held at court, in the houses of great noblemen, in the law schools of the Inns of Court, and in many of the colleges at the universities of Cambridge and Oxford. During his reign, which lasted anywhere from 12 days to 3 months, the Lord of Misrule was responsible for arranging and directing all Christmas entertainment, including elaborate masques and processions, plays, and feasts. The lord himself usually presided over these affairs with a mock court and received comic homage from the revelers.

Scotland had an official similar to the Lord of Misrule, known as the Abbot of Unreason (suppressed in 1555), and both are thought by scholars to be descended from the "king" or "bishop" who presided over the earlier Feast of Fools. Another related functionary was the Boy Bishop, the leader of children's Christmas festivities in the choir schools.

After the death of Edward VI in 1553, the English court ceased to appoint a Lord of Misrule. *See also* Master of the Revels.

missal, type of book containing the prayers, important chants, and necessary instructions for the celebration of the mass (Latin: *missa*) in the Roman Catholic church throughout the year.

The missal developed from various books used in the early church, for by the 5th century a separate mass book had been developed for the use of each participant in the liturgy. The priest at the altar, for instance, used the sacramentary, a book containing the orations and prefaces that vary from feast to feast. The fixed prayers that form the ordinary of the mass were contained in the sacramentary. For Scripture readings, a Bible with marked passages had originally been used, but after about 1000, a special book, the lectionary, was developed that contained only the Epistles and Gospels to be read at each feast. The soloist who led the congregation in responsive singing of the Psalms used a book called the cantatorium. The chants to be sung by the choir were contained in the antiphonary. Finally, a separate book, the ordo (Ordines Romani), gave the directions for the proper carrying out of the liturgical functions.

All these books were gradually combined into one volume, the *Missale plenum* ("full missal"), which by the 13th century had replaced the older books. All modern missals are of this type. The *Missale plenum* existed in various forms; the most popular was the missal of the Roman Curia, which had evidently developed primarily during the time of Pope Innocent III (1198–1216). This missal was adopted by the Franciscan friars and spread by them throughout Europe.

The Council of Trent (1545–63) proposed that the Roman liturgy be reformed, and in 1570 Pope Pius V promulgated a new missal, which was adopted throughout the Latin rite.

This missal was frequently, though not radically, revised. The liturgical movement in the 20th century was influential and led to the revision of the liturgy of Holy Week under Pius XII in 1955 and culminated in the decree of the second Vatican Council (1963) that allowed the introduction of the vernacular in the variable parts of the liturgy and ordered a complete revision of the missal to be carried out by a postconciliar commission.

The Eastern church has never adopted one book to be used by the celebrant of the liturgy. The Anthologion, an Eastern book similar to the Western missal, was used by some beginning in the 13th century, and an edition was published in Athens as late as 1882. Small hand missals are commonly used by the worshipers in the Eastern church.

Missau (Nigeria): *see* Misau.

missi dominici, emissaries of some Frankish kings and emperors who supervised provincial administration. *See* missus dominicus.

missile, a rocket-propelled weapon designed to deliver an explosive warhead with great accuracy at high speed. Missiles vary from small tactical weapons that are effective out to only a few hundred feet to much larger strategic weapons that have ranges of several thousand miles. Almost all missiles contain some form of guidance and control mechanism and are therefore often referred to as guided missiles. An unguided military missile, as well as any launch vehicle used to sound the upper atmosphere or place a satellite in space, is usually referred to as a rocket. A propeller-driven underwater missile is called a torpedo, and a guided missile powered along a low, level flight path by an air-breathing jet engine is called a cruise missile.

A brief treatment of military missiles follows. For full treatment, *see* MACROPAEDIA: War, The Technology of.

Propulsion, control, and guidance. Although missiles can be propelled by either liquid-fueled or solid-fueled rocket engines, solid fuel is preferred for military uses because it is less likely to explode and can be kept ready-loaded for quick launch. Such engines commonly propel tactical guided missiles—*i.e.,* missiles intended for use within the immediate battle area—toward their targets at twice the speed of sound. Strategic missiles (weapons designed to strike targets far beyond the battle area) are either of the cruise or ballistic type. Cruise missiles are jet-propelled at subsonic speeds throughout their flights, while ballistic missiles are rocket-powered only in the initial (boost) phase of flight, after which they follow an arcing trajectory to the target. As gravity pulls the ballistic warhead back to Earth, speeds of several times the speed of sound are reached.

Almost all missiles are steadied in flight by stabilizing fins. In addition, guided missiles contain control systems to adjust their flight paths. The simplest control systems are aerodynamic, making use of movable vanes or flaps that alter the flow of air past the stabilizing fins. A more complicated system—used especially in ballistic missiles, which often travel beyond the Earth's atmosphere—is thrust vectoring. In this system the stream of gases from the rocket engine is deflected by placing vanes within the exhaust nozzle or by swiveling the entire engine.

The guidance system is the most important and sophisticated part of the missile. In tactical missiles, electronic sensors locate the target by detecting energy emitted or reflected from it. For example, heat-seeking missiles carry infrared sensors that allow them to "home" onto the hot exhaust of jet engines. Antiradiation missiles home onto radar emissions, while one type of optically homing missile may "lock" onto an image of the target that is captured by a television camera. Upon receiving information through its sensor, the guidance system relays instructions for course correction to the control mechanism through some type of autopilot contained within the missile or through commands transmitted from the launch platform.

Ballistic missiles contain some type of inertial guidance system (*q.v.*), which compares the missile's actual speed and position to the positions that it must assume in order to hit the target. The guidance system then generates correcting commands to the control system. Inertial guidance has become so accurate that the United States' MX Peacekeeper ballistic missile, with a range of more than 6,000 miles (more than 9,650 km), has a 50-percent chance of delivering its 10 nuclear warheads within 400 feet (120 m) of its target.

Types. Tactical guided missiles are generally categorized according to the location of the launch platform and target. There are five types, air-to-air, air-to-surface, surface-to-air, antiship, and antitank, or assault.

Ballistic missiles are most often categorized as short-range, medium-range, intermediate-range, and intercontinental ballistic missiles (SRBMs, MRBMs, IRBMs, and ICBMs). SRBMs are effective to 300 miles (480 km), MRBMs from 300 to 600 miles (480 to 965 km), IRBMs from 600 to 3,300 miles (965 to 5,310 km), and ICBMs more than 3,300 miles (5,310 km).

ICBMs are usually launched from silos, which are reinforced canisters sunk into the ground for protection. Shorter-range ballistic missiles and some ICBMs are launched from railroad cars or wheeled trailers that offer the protection of mobility. "Hot-launched" ballistic missiles are launched directly from their canisters, while "cold-launched" missiles are ejected from the canisters by compressed gas before the rocket engines ignite. Submarine-launched ballistic missiles (SLBMs) are ejected in this manner to the ocean surface from tubes within the submerged vessel. *See also* cruise missile; rocket; smart bomb; torpedo.

Missile Defense Alarm System (series of reconnaissance satellites): *see* Midas.

missing link, hypothetical extinct creature halfway in the evolutionary line between modern human beings and their anthropoid progenitors. In the latter half of the 19th century, a common misinterpretation of Darwin's work was that humans were lineally descended from existing species of apes. To accept this theory and reconcile it with the hierarchical "great chain of being," some fossil ape-man or man-ape seemed necessary in order to complete the chain. *Pithecanthropus erectus* (now *Homo erectus*), *Eoanthropus dawsoni* (the "Piltdown man" later discovered to have been a hoax), and even the modern Khoikhoi (then called Hottentots) of southern Africa (when newly discovered) were suggested as the missing link. Today it is recognized that man's relationship to the present anthropoid apes (*e.g.,* chimpanzees) is through common ancestors rather than through direct descent. These ancestors have yet to be identified, but ape–hominid divergence may have occurred 6 million to 10 million years ago.

Articles are alphabetized word by word, not letter by letter

Mission, city, Hidalgo county, southern Texas, U.S., part of the McAllen–Edinburg–Mission metropolitan area, in the Lower Rio Grande valley. A settlement was made in 1908 near a mission established (1824) by Oblate Fathers of the Franciscan order. It developed as a shipping and packing centre for citrus fruits and is the site of the annual Texas Citrus Fiesta (a salute to the Texas Ruby Red Grapefruit). The American Poinsettia Society has its national headquarters in Mission. Inc. 1910. Pop. (1990) city, 28,653; McAllen-Edinburg-Mission MSA, 383,545.

mission, in Christianity, an organized effort for the propagation of the Christian faith.

During the early years, Christianity expanded through the communities of the Jewish dispersion. Soon the separate character of Christianity was recognized, and it was freed from the requirements of Hebrew law. Paul, the greatest and the prototype of all missionaries, evangelized much of Asia Minor and the chief Greek cities and was also active in Rome. Because of his work and that of other missionaries, the new religion spread rapidly along the trade routes of the Roman Empire into all the great centres of population.

By the time of Constantine (reigned AD 306–337), Christianity had spread to all parts of the Roman Empire, both East and West. Although paganism lingered, by about AD 500 the population of the Roman Empire was predominantly Christian. During this period, missionary endeavour moved to the empire's borders and beyond.

The advance of Christianity slowed after 500 as the Roman Empire, with which it had become identified, disintegrated. In the 7th and 8th centuries, Arab invasions established Islām as the dominant religion in about half the area in which Christianity had been dominant. During this time, however, Celtic and British missionaries spread the faith in western and northern Europe, while missionaries of the Greek church in Constantinople worked in eastern Europe and Russia.

From about 950 to 1350 the conversion of Europe was completed, and Russia became Christian. Missions to Islāmic areas and to the Orient were begun.

From 1350 to 1500 Christianity suffered a serious recession. The new empire of the Ottoman Turks replaced the Arab state and destroyed the Byzantine Empire. The old Eastern Christian churches declined; and in addition the Black Death killed hundreds of missionaries, who were not replaced.

The Roman Catholic church, reformed and revitalized after the Council of Trent (1545–63), sent missionaries into the newly discovered and conquered territories of three Catholic empires: Spain, Portugal, and France. As a result, Christianity was established in Central and South America, in the Caribbean, and in the Philippines. Jesuits established missions in Japan, China, and India. Central direction to the whole vast enterprise was provided by the establishment at Rome in 1622 of the Congregation for the Propagation of the Faith. From 1750 to 1815 was a period of decline: missionary interest diminished, the empires disintegrated, and the Society of Jesus was suppressed. Subsequently, mission work by Roman Catholics revived, and native clergy and bishops were ordained to serve new churches in Asia, Africa, and throughout the world. A radical new direction was given to the missions by the second Vatican Council (1962–65): missions were to be directed only to non-Christians; and, although the aim of conversion was not disavowed, the main approach was to be through dialogue.

The Protestant churches were slow to undertake foreign missions, but their emphasis on a personal gospel and their recovery of the Scriptures prepared the way for a massive outreach once the Protestant nations acquired colonies from the 16th to the 19th century. In the 19th and early 20th centuries there developed a great upsurge of Protestant mission activity, and many more agencies and boards were formed. Many were voluntary and unofficial, but most denominations also established official organizations for missions. Early missionary activities of the various denominations were often very competitive and even disruptive, but eventually a cooperative spirit developed that helped lead to the ecumenical movement. By the mid-20th century, as former colonies won independence, the new states sharply restricted mission activities, often forbidding such efforts as conversions and permitting only nonproselytizing educational and medical service—both of which had been important elements in most Christian mission programs.

Missionary efforts in the Orthodox churches during the 19th and 20th centuries were limited to the Russian church, and this activity ceased with the establishment of the Soviet regime in Russia.

Mission, Congregation of the, a community of priests and brothers that was founded by Saint Vincent de Paul. *See* Vincentian.

Mission Indians, the coastal Indians of southern and central California among whom Spanish Franciscans established 21 missions between 1769 and 1823. The major groups were, from south to north, the Diegueño, Luiseño, Juaneño, Gabrielino, Chumash, and Costanoan (*qq.v.*).

The role of the missions, in addition to spreading the Roman Catholic faith, was to act as "civilizing agents" for the Spanish monarchy; however, beyond some instruction in the Spanish language, Christian dogma, and hymn singing, the Indians seem to have received little formal education. They were discouraged from leaving the mission area and encouraged to tend farms, to herd, and to learn trades. Many were converted, many died of European diseases, and many became fatally dependent upon the missions. When the authority of the missions was officially ended by the Mexican government in 1834, many of the Indians were left adrift. By law they were promised rights of citizenship and one-half of all former mission property; but, shorn of protection, many were exploited and despoiled by speculators. A few, however, became successfully assimilated within the Mexican system. A few, like the Agua Caliente band, became relatively wealthy in the 20th century, selling and leasing land for the elite resort of Palm Springs.

Missionaries of Africa, Society of, Roman Catholic international missionary society of priests and brothers who work in Africa. *See* White Father.

Missionary Ridge, Battle of, in the American Civil War, battle that ended the Confederate siege of Union troops at Chattanooga, Tenn. *See* Chattanooga, Battle of.

Mississauga, city, regional municipality of Peel, southeastern Ontario, Canada. It lies at the western end of Lake Ontario, immediately southwest of Toronto. First settled in the early 19th century on land purchased from the Mississauga Indians, the township of Toronto gave rise to the villages of Port Credit (incorporated 1934) and Streetsville (incorporated 1958), both of which became towns in the early 1960s. On Jan. 1, 1968, the entire township, exclusive of Port Credit and Streetsville, was incorporated as a town, one of the largest and most densely populated in Canada, and in 1974 Mississauga became a city.

Mississauga is both a residential suburb of Toronto and an important industrial centre in its own right. Its manufactures include aircraft, engines and turbines, motor vehicles, chemicals and pharmaceuticals, petroleum, rubber and steel products, construction materials and equipment, plastics, cement, household appliances, and printed material. The city has port facilities and is on major expressways and railway lines. It is also the site of Toronto International Airport, Canada's busiest air terminal, and Erindale College, an affiliate of the University of Toronto. Pop. (2001) 612,925.

Mississippi, constituent state of the United States of America lying in the south-central part of the country.

A brief treatment of Mississippi follows. For full treatment, *see* MACROPAEDIA: United States of America: *Mississippi.*

Mississippi is bounded on the north by Tennessee, on the east by Alabama, and on the south by the Gulf of Mexico and Louisiana; on the west it is separated by the Mississippi River from Louisiana and Arkansas. The state capital is Jackson.

The Mississippi Territory was created by Congress in 1798. After several boundary changes, it entered the United States in 1817 as the 20th state. A plantation-based economy using slave labour developed in the 1820s and '30s. Mississippi seceded from the Union in 1861 and gave the Confederacy its president, Jefferson Davis. The Union capture of Vicksburg, on the Mississippi River, in 1863, proved a turning point in the American Civil War. Mississippi was readmitted to the Union in 1870. Reconstruction was followed by a segregationist entrenchment that did not begin to ease until the 1960s.

Mississippi is divided into a number of physiographic regions that encompass hills, plains, prairies, river lowlands, and pine woods. There are five major river systems with a host of smaller ones. Most of the state is low-lying, the highest point reaching only 806 feet (246 m) above sea level. Climatically, the growing season is long, rainfall is abundant, and extreme temperatures are unusual. Summers are warm and humid, with temperatures sometimes exceeding 95° F (35° C). January temperatures average from 42° to 50° F (6° to 10° C). The annual average precipitation is more than 50 inches (1,270 mm).

The white population of Mississippi is predominantly of British, Scots-Irish, and northern European ancestry. Blacks were in the majority until 1940, when waves of emigration to Northern cities occurred. In 1990 they constituted one-third of the population. There are some 8,000 Indians (mostly Choctaw). Most Mississippians are either Baptists or United Methodists.

Mississippi still grows substantial amounts of cotton, but soybeans now exceed cotton in value of production. Minor quantities of rice and wheat are also grown. Poultry and cattle are important. Petroleum and natural gas account for most of Mississippi's minerals. Iron ore has been mined intermittently, and there is unexploited bauxite. More than half the land area is commercial forest, producing lumber, paper pulp, and naval stores. The state's largest employers include the apparel and textile, lumber- and wood-products, food-processing, electrical-equipment, and transportation-equipment industries.

Water transportation is important. There are two major ports on the Gulf of Mexico, and the Mississippi, Pearl, and Yazoo rivers are all navigable. The state also is served by major highways and railroads.

Mississippi is well known for its writers, who, in the 20th century, have included William Faulkner, Eudora Welty, and Tennessee Williams. In music, the Mississippi Delta blues tradition greatly influenced both urban blues and rock music. The University of Mississippi at University, near Oxford, dates from 1844. Area 47,689 square miles (123,514 square km). Pop. (2000) 2,844,658.

Mississippi Bubble, a financial scheme in 18th-century France that triggered a speculative frenzy and ended in financial collapse. The scheme was engineered by John Law, a Scottish adventurer, economic theorist, and financial wizard who was a friend of the regent, the Duke d'Orléans. In 1716 Law established the Banque Générale, a bank with the authority to issue notes. A year later he established the Compagnie d'Occident ("Company of the West") and obtained for it exclusive privileges to develop the vast French territories in the Mississippi River valley of North America. Law's company also soon monopolized the French tobacco and African slave trades, and by 1719 the Compagnie des Indes ("Company of the Indies"), as it had been renamed, held a complete monopoly of France's colonial trade. Law also took over the collection of French taxes and the minting of money; in effect, he controlled both the country's foreign trade and its finances.

Given the potential for profits involved, public demand for shares in the Compagnie des Indes increased sharply, sending the price for a share from 500 to 18,000 livres, which was out of all proportion to earnings. By 1719 Law had issued approximately 625,000 stock shares, and he soon afterward merged the Banque Générale with the Compagnie des Indes. Law hoped to retire the vast public debt accumulated during the later years of Louis XIV's reign by selling his company's shares to the public in exchange for state-issued public securities, or *billets d'état,* which consequently also rose sharply in value. A frenzy of wild speculation ensued that led to a general stock-market boom across Europe. The French government took advantage of this situation by printing increased amounts of paper money, which was readily accepted by the state's creditors because it could be used to buy more shares of the Compagnie. This went on until the excessive issue of paper money stimulated galloping inflation, and both the paper money and the *billets d'état* began to lose their value. Meanwhile the expected profits from the company's colonial ventures were slow to materialize, and the intricate linking of the company's stock with the state's finances ended in complete disaster in 1720, when the value of the shares plummeted, causing a general stock market crash in France and other countries. Though the crash was not directly attributable to Law, he was the obvious scapegoat and was forced to flee France in December 1720. The enormous debts of his company and bank were soon afterward consolidated and taken over by the state, which raised taxes in order to retire it.

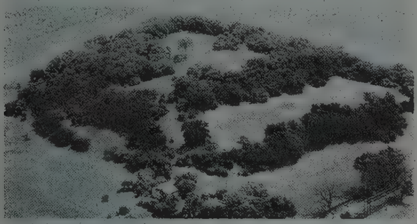
Mississippi River, the largest river of North America, draining with its major tributaries an area of approximately 1,200,000 square miles (3,100,000 square km), or about one-eighth of the entire continent. The Mississippi River lies entirely in the United States. Rising in Lake Itasca in Minnesota, it flows almost due south across the continental interior, collecting the waters of its major tributaries, the Missouri and the Ohio, approximately halfway along its journey to the Gulf of Mexico. It enters the Gulf through a vast delta southeast of New Orleans, a total distance of 2,350 miles (3,780 km) from its source. With its tributaries, the Mississippi drains all or part of 31 U.S. states and two Canadian provinces.

A brief treatment of the Mississippi River follows. For full treatment, *see* MACROPAEDIA: North America.

The character and physical appearance of the Mississippi divide it into three stages. From its source to the head of navigation at St. Paul, Minn., it is a clear stream, winding irregularly through low countryside dotted with lakes and marshes. From St. Paul to the mouth of the Missouri it grows into the powerful, dominating river immortalized in Mark Twain's *Tom Sawyer* and *Huckleberry Finn* as it gathers in the streams and rivers of Minnesota, Wisconsin, Illinois, and Iowa. Its union with the Missouri at St. Louis changes the Mississippi completely. The turbulent, sediment-laden Missouri, especially when in flood, adds impetus as well as enormous quantities of silt to the already muddy Mississippi. Beyond the junction with the Ohio at Cairo, Ill., the Mississippi swells to its full grandeur. Often a mile and a half from bank to bank, it becomes a brown flood, descending with deceptive quiet toward the Gulf of Mexico. Its annual average discharge rate is greater than 600,000 cubic feet per second (17,000 cubic m per sec), less than one-tenth that of the Amazon River and only about half that of the Congo River.

As the central river artery of the United States, the Mississippi has become one of the busiest commercial waterways in the world. Leading cargoes, by bulk, are petroleum and petroleum products, coal and coke, iron and steel, chemicals, sand and gravel, and sulfur. Its role as a transportation route has been strengthened in the second half of the 20th century through the operation of a complicated flood-control system. The Mississippi's unique contribution to the history and literature of the United States has woven it like a bright thread through the folklore and national consciousness of North America.

Mississippian culture, the last major prehistoric cultural development in North America, lasting from about AD 800 to the time of the arrival of the first European explorers. It spread over a great area of the Southeast and the mid-continent, in the river valleys of what are now the states of Mississippi, Alabama, Georgia, Arkansas, Missouri, Kentucky, Illinois, Indiana, and Ohio, with scattered extensions northward into Wisconsin and Minnesota and westward into the Great Plains. The culture was based on intensive cultivation of corn (maize), beans, squash, and other crops, which resulted in large concentrations of population in towns along riverine bottomlands. Politically and culturally each large town or village dominated a satellite of lesser villages; government was in the hands of priest-rulers. Thus the complexes might be called theocratic village-states. Moreover, warfare, which was apparently frequent, produced larger alliances and even confederacies.



Mississippian culture mound in the Cahokia Mounds State Park, near Cahokia, Ill.

By courtesy of the Illinois Division of Parks and Memorials

A central ceremonial plaza provided the nucleus of a Mississippian town, and each settlement had one or more pyramidal or oval earth mounds, surmounted by a temple or chief's residence, grouped around the plaza. This settlement pattern was typical of most of Middle America (central and southern Mexico and Guatemala) since as early as 850 BC, but it had not diffused into North America until the advent of the Mississippian culture. The scale of public works in the Mississippian culture can be estimated from the largest of the earthworks, Monk's Mound, near Cahokia, Ill., which is approximately 1,000 feet (300 m) long, 700 feet (200 m) wide, and 100 feet (30 m) high. The magnitude of such public works and the distribution of temples suggest a dominant religious cult and a cadre of priest-rulers who could command the services of a large, stable, and docile population, as well as several artist-craftsman guilds.

Craftwork was executed in copper, shell, stone, wood, and clay and in such forms as elaborate headdresses, ritual weapons, sculptured tobacco pipes, effigy pottery, effigies, and masks of wood or copper-jacketed wood. The elaborate designs included feathered serpents, winged warriors, swastikas, spiders, human faces with weeping or falcon eyes, as well as human figures and many geometric motifs. These elements were delicately engraved, embossed, carved, and molded.

The Mississippian culture had begun to decline by the time European explorers first penetrated the Southeast and described the customs of the aboriginals. The last remnant seems to have been the Natchez, whose decline and dispersal were caused, and described, by the French between 1698 and 1731.

Mississippian period, in North America, interval of geologic time roughly equivalent to what is internationally designated the Early Carboniferous epoch (360 to 320 million years ago). Because the rocks associated with this period are typified by those in the Mississippi valley region (where the strata consist largely of very fossiliferous marine limestones), some American geologists prefer the designation Mississippian to Early Carboniferous, which was introduced in Europe. *See* Carboniferous period.

Missolonghi (Greece): *see* Mesolóngion.

Missoula, city, seat (1866) of Missoula county, western Montana, U.S. It is situated on Clark Fork of the Columbia River, at the mouth of the Bitterroot River, near the Bitterroot Mountains in a broad valley (elevation 3,223 feet [982 m]). The first white settler in the area was Father Pierre Jean de Smet, who founded (1841) St. Mary's Mission at nearby Stevensville. Missoula originated in the 1860s as a trading post on the Mullan Road, a wilderness trail between Fort Benton and Walla Walla, Wash. It was formerly called Hellgate; the etymology of its present name is uncertain. Its development was stimulated after 1883, when it became a division point on the Northern Pacific Railway, and with the founding there of the University of Montana in 1893.

Missoula's economy centres on lumber and paper milling, beet-sugar refining, dairying, agricultural marketing, tourism, and educational facilities. An entry point to Lolo National Forest (headquartered at Missoula) and Clearwater, Bitterroot, and Flathead national forests, it is the regional headquarters for the U.S. Forest Service and Montana State Forest Service. It is also the site of the Northern Forest Fire Laboratory and is the training centre for the smoke-jumping crews of forest-fire fighters. Fort Missoula (a pioneer stockade) and the Flathead Indian Reservation are nearby. Inc. 1885. Pop. (1990) 42,918.

Consult the INDEX *first*

Missouri, extinct North American Indian people of the Chiwere branch (including the Oto and Iowa) of the Siouan linguistic family. In their historic past the Missouri, together with the Iowa and the Oto, separated from the Winnebago and moved southwest. The Missouri settled at the mouth of the Grand River, while the Oto continued to follow the Missouri River. Jacques Marquette and Louis Jolliet encountered them on the Missouri in 1673. Defeated in a war with the Sauk and Fox in 1798, the remnants of the tribe scattered to live with the Osage, Kansa, and Oto. By 1805 some of the tribe had reassembled, but another defeat, by the Osage, dispersed them among the Oto and Iowa.

Missouri, constituent state of the United States of America situated in the Middle Western region of the country. It is bounded on the north by Iowa, on the east by Illinois, Kentucky, and Tennessee, on the south by Arkansas, and on the west by Oklahoma, Kansas, and Nebraska. The state capital is Jefferson City.

A brief treatment of Missouri follows. For full treatment, *see* MACROPAEDIA: United States of America: *Missouri.*

The state was originally settled by a diverse group of American Indian peoples, one of which, the Missouri, gave the state its name. Numerous mounds and other archaeological remains indicate a large, prosperous settled populace. The first permanent white settlement in Missouri was made in 1735 at Ste. Genevieve by French lead miners and hunters. St. Louis was founded in 1764. Missouri became a U.S. possession in 1803 as part of the Louisiana Purchase. At that time its population was about 10,000, most of whom were French. The great rush of American settlers occurred after the War of 1812. Missouri entered the Union in 1821 as the 24th state, but only after the Missouri Compromise allowed its admission as a slave state.

The 1850s were years of increasing dissension in Missouri that pitted slave- and free-state advocates against one another, but Missouri was already moving toward a free economy, and a wave of immigrants from the Northeast and from Europe was influential in keeping the state within the Union. Missourians fought on both sides during the American Civil War, but its Union soldiers outnumbered Confederates by nearly four to one.

North of the Missouri River, the state's landscape is characterized by gently rolling hills, open, fertile plains, and well-watered prairie country. South of the Missouri, except in the extreme southeastern corner of the state and along the western boundary, the land is rough and hilly, with some deep, narrow valleys and clear, swift streams. Much of the land lies 1,000 to 1,400 feet (300 to 425 m) above sea level, though the alluvial plain of southeastern Missouri is less than 500 feet (150 m) in elevation. Maximum January temperatures in Missouri range from about 36° F (2° C) in the north and northwest to 48° F (9° C) in the southeast. Summer temperatures above 100° F (38° C) with high humidity may occur in any part of the state. Rainfall varies from about 34 inches (864 mm) in the north and northwest to 50 inches (1,270 mm) or more in the extreme southeast. Tornadoes average 27 a year.

After the early French settlers, immigration came largely from other, especially Southern, U.S. states. Immigration from abroad, especially German, Irish, and English, accelerated after 1820. Migration of blacks to the state increased after 1940, and by 1980 blacks comprised more than 10 percent of the state's population, although they constituted nearly half of the population of St. Louis and more than a quarter of Kansas City. The population of St. Louis declined by nearly one-third from 1970 to the mid-1980s, the largest percentage decline of any large American city.

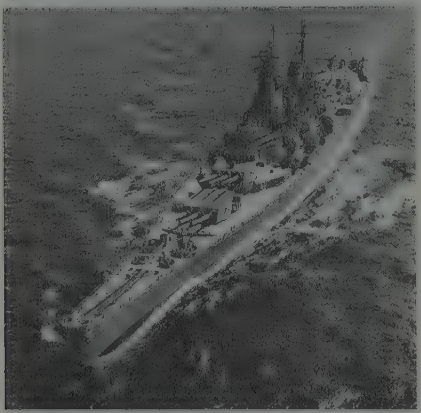
Drainage and soil conditions permit farming in all of Missouri's counties. Livestock, mostly cattle and sheep, account for a higher proportion of farm marketings than crops. Soybeans, corn (maize), and wheat are the major crops. Missouri leads the nation in lead production, mainly from the Ozarks region. It also has significant deposits of iron ore and limestone. Almost a third of the state remains forested, and timber is becoming an increasingly important resource. Manufacturing is one of the major components of the economy. Production of aerospace and transportation equipment is the leading activity, followed by the processing of food and kindred products and the production of chemicals.

Missouri has an extensive highway system that includes six interstate highways. Its railroads are linked with most of the nation's major trunk lines. The Mississippi and Missouri rivers, providing more than 1,000 miles (1,600 km) of navigable waterways within the state, connect waterborne traffic with New Orleans and the Gulf of Mexico. St. Louis and Kansas City are regional air hubs.

Diversity characterizes Missouri's cultural milieu, from the centres of fine art, music, and theatre along the St. Louis–Kansas City axis to the folk culture and native crafts of the Ozarks. The St. Louis Symphony Orchestra is the second oldest in the country. Independence is the home of the Harry S. Truman Library and Museum. Both Kansas City and St. Louis have professional sports teams. Artists George Caleb Bingham and Thomas Hart Benton and writers Mark Twain and T.S. Eliot were all from Missouri. The *St. Louis Post-Dispatch* was founded by Joseph Pulitzer, and the University of Missouri had the world's first school of journalism. Area 69,697 square miles (180,516 square km). Pop. (2000) 5,595,211.

Missouri, flagship of the U.S. Pacific Fleet in World War II and scene of the Japanese surrender. One of the four battleships of the Iowa class that were completed during the war, the USS *Missouri* numbered among the largest warships afloat, displacing 58,000 tons, carrying a main battery of nine 16-inch guns, and capable of a speed of 35 knots. The ship participated in combat action in the Pacific theatre throughout the later stages of the war.

Chosen by General Douglas MacArthur, the Allied commander in chief, for the surrender ceremony, the *Missouri* entered Tokyo Bay flying the flag that had flown over the White House on Dec. 7, 1941. On Sunday morning, Sept. 2, 1945, the nine-man Japanese delegation arrived on board, and, at MacArthur's invitation, Foreign Minister Shigemitsu Mamoru and General Umezu Yoshijiro signed two copies of the document proclaiming "unconditional surrender . . . of all Japanese armed forces."



USS *Missouri*

By courtesy of the U.S. Navy

The *Missouri* was occasionally recommissioned for service in the latter half of the 20th century.

Missouri Botanical Garden, also called SHAW'S GARDEN, botanical garden in St. Louis, Mo., most notable for its Climatron, a geodesic-dome greenhouse in which 1,500 species of plants from different environments are grown under computer-controlled conditions simulating four major climates. The 26-hectare (65-acre) garden also has special collections of orchids and tropical plants. The herbarium contains 1,700,000 dried specimens. Privately administered, the garden was established in 1859 as the gift of Henry Shaw, a merchant. The garden's periodical *Missouri Botanical Gardens Bulletin* contains material of interest to the general public.

Missouri Compromise (1820), in U.S. history, measure worked out between the North and the South and passed by the U.S. Congress that allowed for admission of Missouri as the 24th state (1821). It marked the beginning of the prolonged sectional conflict over the extension of slavery that led to the American Civil War.

The territory of Missouri first applied for statehood in 1817, and by early 1819 Congress was considering enabling legislation that would authorize Missouri to frame a state constitution. When Representative James Tallmadge of New York attempted to add an antislavery amendment to that legislation, however, there ensued an ugly and rancorous debate over slavery and the government's right to restrict slavery. The Tallmadge amendment prohibited the further introduction of slaves into Missouri and provided for emancipation of those already there when they reached age 25. The amendment passed the House of Representatives, controlled by the more populous North, but failed in the Senate, which was equally divided between free and slave states. Congress adjourned without resolving the Missouri question.

When it reconvened in December 1819, Congress was faced with a request for statehood from Maine. The Senate passed a bill allowing Maine to enter the Union as a free state and Missouri to be admitted without restrictions on slavery. Senator Jesse B. Thomas of Illinois then added an amendment that allowed Missouri to become a slave state but banned slavery in the rest of the Louisiana Purchase north of latitude 36°30′. Henry Clay then skillfully led the forces of compromise, and on March 3, 1820, the decisive vote in the House admitted Maine as a free state, Missouri as a slave state, and made free soil all western territories north of Missouri's southern border.

When the Missouri constitutional convention empowered the state legislature to exclude free blacks and mulattoes, however, a new crisis was brought on. Enough northern congressmen objected to the racial provision that Henry Clay was called upon to formulate the Second Missouri Compromise. On March 2, 1821, Congress stipulated that Missouri could not gain admission to the Union until it agreed that the exclusionary clause would never be interpreted in such a way as to abridge the privileges and immunities of U.S. citizens. Missouri so agreed and became the 24th state on Aug. 10, 1821; Maine had been admitted the previous March 15.

Although slavery had been a divisive issue in the United States for decades, never before had sectional antagonism been so overt and threatening as it was in the Missouri crisis. Thomas Jefferson described the fear it evoked as "like a firebell in the night." The compromise measures appeared to settle the slavery-extension issue, however, and the sectional conflict did not grow to the point of civil war until after the Missouri Compromise was repealed by the Kansas-Nebraska Act (1854) and was declared unconstitutional in the Dred Scott decision (*q.v.*) of 1857.

Missouri fox-trotting horse, breed of horse that originated in Missouri and the Ozark Mountains region and is characterized by the "fox trot" gait, a broken gait that occurs when the horse walks briskly with the front feet while trotting with the back feet. Developed from light horses taken to the Ozarks by settlers, the fox-trotting horse was originally a general utility horse but now is a show and riding horse. Sorrel is the usual colour; height varies from 14 to 16 hands (56 to 64 inches, or 142 to 163 cm), and weight averages about 1,000 pounds (450 kg). The Missouri Fox Trotting Horse Breed Association was organized in 1948.

Missouri gourd: *see* calabazilla.

Missouri Pacific Railroad Company, formerly (1849–72) PACIFIC RAILROAD, American railroad founded to build the first rail line west of the Mississippi River. Ground was broken in 1851 and the first section of track completed in 1852. It was the first railroad to serve Kansas City, reached in 1865, after construction was interrupted by the American Civil War.

In 1872 the line was reorganized as the Missouri Pacific Railway, and in 1879 it came under the control of New York financier Jay Gould, who developed a system extending through Colorado, Nebraska, Arkansas, Texas, and Louisiana. In 1917 the line was merged with the St. Louis, Iron Mountain and Southern Railway Company and reorganized as the Missouri Pacific Railroad. Later it acquired other lines in the Gulf area and in Texas, extending its operating area to several midwestern and southwestern states.

The line's passenger operations were turned over to the National Railroad Passenger Corporation (Amtrak) in 1971. In 1982 the Missouri Pacific merged with the Union Pacific and Western Pacific Railroad companies to form the "Union Pacific System," under the holding company Union Pacific Corporation. Missouri Pacific, however, maintained its own corporate and commercial identity.

Missouri Plan, method of selecting judges that originated in the state of Missouri and subsequently was adopted by other U.S. jurisdictions. It involves the creation of a nominating commission that screens judicial candidates and submits to the appointing authority (such as the governor) a limited number of names of individuals considered to be qualified. The appointing authority chooses from the list, and any one so chosen assumes the judgeship for a probationary period. After this period the judge stands for popular election for a much longer term, not competing against other candidates but basing his candidacy on previous judgments. Under the Missouri Plan, voters decide whether or not to retain the judge in office.

Missouri River, longest tributary of the Mississippi River, formed by the confluence of the Jefferson, Madison, and Gallatin rivers in the Rocky Mountain area of southwestern Montana (Gallatin county), U.S., about 4,000 feet (1,200 m) above sea level. The Missouri flows eastward to central North Dakota, where it turns southward across South Dakota to form a section of the South Dakota–Nebraska boundary, the Nebraska–Iowa boundary, the Nebraska–Missouri boundary, and the northern section of the Kansas–Missouri boundary. Then it meanders eastward across central Missouri to join the Mississippi River, about 10 miles (16 km) north of St. Louis, after traveling a course of 2,315 miles (3,726 km).

Its drainage basin occupies about 529,400 square miles (1,371,100 square km) of the Great Plains, of which 2,550 square miles (16,840 square km) are in Canada. Elevations within its basin are extreme: from 14,000 feet (4,300 m) above sea level in the Rockies near the Continental Divide to 400 feet (120 m) where it joins the Mississippi. The flow of the Missouri and of most of its tributaries is exceedingly varied—the minimum flow being 4,200 cubic feet (120 cubic m) per second and the maximum 900,000 cubic feet (25,500 cubic m) per second. With unprotected slopes and with such violent fluctuations in flow, erosion and silting are major problems.

Chief tributaries include the Cheyenne, Kansas, Niobrara, Osage, Platte, and Yellowstone rivers, flowing in on the south and west sides, and the James and Milk rivers, entering from the north. Other tributaries are the Bad, Blackwater, Cannonball, Gasconade, Grand, Heart, Judith, Knife, Little Missouri, Moreau, Musselshell, and White rivers, which enter from the south and west. The Big Sioux, the Chariton, Little Platte, Marias, Sun, and Teton rivers enter from the north and east.

The Missouri was named Peki-tan-oui on some early French maps and, later, Oumessourit; it has been nicknamed "Big Muddy" because of the amount of solid matter it carries in suspension. Its mouth was discovered in 1673 by the French explorers Jacques Marquette and Louis Jolliet while they were canoeing down the Mississippi River. In the early 1700s French fur traders began to navigate upstream. The first exploration of the river from its mouth to its headwaters was made in 1804–05 by Meriwether Lewis and William Clark. For many years commerce on the river was restricted to the fur trade, and the river was little used by the earliest American settlers moving west. The American Fur Company began to use steamers on the river in 1830. Steamboat traffic on the river reached its height in 1858 but began to decline in the following year with the completion of the Hannibal and St. Joseph Railway to St. Joseph, Mo.

For the first 150 years after settlement along the river, little was done to develop the Missouri as a useful waterway or as a source of irrigation and power. In 1944 the U.S. Congress authorized a comprehensive program for flood control and water-resource development in the Missouri River basin. It envisioned a system of more than 100 dams and reservoirs on the Missouri and certain of its tributaries. Local flood protection, involving levees and bank stabilization, and a deeper river channel were provided on the Missouri itself from Sioux City, Iowa, to the Mississippi, a distance of 760 miles (1,220 km). By the time an even more ambitious plan, the Missouri River Basin program, or simply the Pick-Sloan program, was adopted in the 1950s, channel maintenance had enabled commercial barge lines to begin operating on the Missouri in 1953. The major dams built on the Missouri were Fort Peck (near Glasgow, Mont.), Garrison (N.D.), and Gavin's Point, Fort Randall, and Oahe (S.D.). The Fort Peck Dam is one of the largest earthfill dams in the world. The entire system of dams and reservoirs has greatly reduced flooding on the Missouri and provides water to irrigate millions of acres of cropland along the main river and its tributaries. Hydroelectric installations along the river generate electricity for many communities along the river's upper course.

The chief cities along the Missouri are Great Falls, Mont.; Williston and Bismarck, N.D.; Pierre, S.D.; Sioux City and Council Bluffs, Iowa; Omaha and Nebraska City, Neb.; Atchison, Leavenworth, and Kansas City, Kan.; and St. Joseph, Kansas City, Columbia, Jefferson City, and St. Charles, Mo.

missus dominicus (Latin: "envoy of the lord"), plural MISSI DOMINICI, officials sent by some Frankish kings and emperors to supervise provincial administration. Used sporadically by Merovingian and early Carolingian rulers, the *missi* became a normal part of the administrative machinery under Charlemagne (reigned 768–814). From about 802 onward almost all of his empire was periodically divided into *missatica,* or inspection circuits; these were visited—in theory for four months out of every year but often in practice less regularly—by at least two *missi,* one a bishop or abbot, the other a layman, probably a count. The *missi* were powerful men protected with a wergild (price paid to a slain man's relatives) equal to that of a member of the sovereign's family. They had full investigatory powers and were to rectify all error and injustice. *Missi* administered the oath of allegiance exacted from all freemen on the occasion of a new sovereign, informed local communities of the content of imperial decrees, and reported back on local conditions and needs. The difficulties that beset the Carolingian empire after about 830 paralyzed and finally virtually destroyed the system of *missi dominici* by the end of the 9th century.

mist, suspension in the atmosphere of very tiny water droplets (50–200 microns in diameter) or wet hygroscopic particles that reduces horizontal visibility to 1 km (0.6 mile) or more; if the visibility is reduced below 1 km, the suspension is called a fog. Mist appears to cover the landscape with a thin, grayish veil. In the United States the term mist is sometimes used loosely to designate a drizzle, a very light precipitation composed of small water droplets (200–500 microns in diameter) falling to the ground. In Scotland and parts of England, a combination of thick mist or fog and heavy drizzle is called Scotch mist.

Mistassini Lake, French LAC MISTASSINI, largest lake in Quebec province, Canada. It is located in Nord-du-Québec region in west-central Quebec and forms the headwaters of the Rupert River, which drains into James Bay. Bisected by a chain of islands, the lake is about 100 miles (160 km) long, 12 miles (19 km) wide, and 902 square miles (2,335 square km) in area. The lake was discovered in 1672 by the French missionary-explorer Charles Albanel. Its Indian name means "great stone," referring to a large rock in the lake. Mistassini Post and an Anglican mission are located at its south end.

Misti Volcano, Spanish VOLCÁN MISTI, also called VOLCÁN DE AREQUIPA, or EL MISTI, volcano of the Andes mountains of southern Peru. It is flanked by Chachani and Pichupichu volcanoes and rises to 19,098 feet (5,821 m) above sea level, towering over the city of Arequipa. Its perfect, snowcapped cone is thought to have had religious significance for the Incas and has inspired both legends and poetry. Now dormant, Misti last erupted during an earthquake in 1600.

Mistinguett, original name JEANNE-MARIE BOURGEOIS (b. April 5, 1875, Enghien-les-Bains, France—d. Jan. 5, 1956, Bougival), popular French comedienne noted especially for her beautiful legs and stage personality.

The name Mistinguett (Miss Tinguett), derived from a song in a musical show, *Miss Helyett,* was suggested by her allegedly English-looking, protruding front teeth. Her greatest fame was achieved in Paris in spectacular revues at the Moulin Rouge and the Casino de Paris. She often appeared with Maurice Chevalier, and her best-remembered songs are "Mon Homme" ("My Man") and "J'en ai marre" ("I've Had Enough of It"). Her long career included appearances in London and the Americas.

Mistinguett was not highly talented as a dancer, nor did she have a good voice; but she had vitality and conviction, and even in old age she was able to play young parts. She wrote *Toute ma vie* (1954; *Mistinguett, Queen of the Paris Night*).

mistletoe, any of many species of semiparasitic green plants of the families Loranthaceae and Viscaceae, especially those of the genera *Viscum, Phoradendron,* and *Arceuthobium,* all members of the Viscaceae. *Viscum album,* the traditional mistletoe of literature and Christmas celebrations, is distributed throughout Eurasia from Great Britain to northern Asia. Its North American counterpart is *Phoradendron serotinum.* Species of the genus *Arceuthobium,* parasitic primarily on coniferous trees, are known by the name dwarf mistletoe (*q.v.*).

The legendary mistletoe was known for centuries before the Christian era. It forms a drooping yellowish evergreen bush, 0.6 to 0.9 m (about 2 to 3 feet) long, on the branch of a host tree. It has thickly crowded, forking branches with oval to lance-shaped, leathery leaves about 5 cm (2 inches) long, arranged in pairs, each opposite the other on the branch. The flowers, in compact spikes, are bisexual, unisexual, or regular. They are yellower than the leaves and appear in the late winter and soon give rise to one-seeded, white berries, which when ripe are filled with a sticky, semitransparent pulp. These berries, and those of other mistletoes, contain toxic compounds poisonous to animals and to humans.

Leaves and berries of American mistletoe (*Phoradendron serotinum*)

John H. Gerard

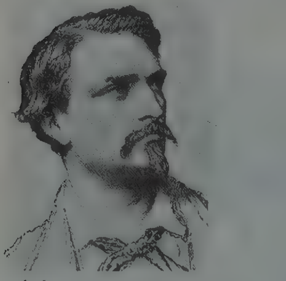
Most tropical mistletoes are pollinated by birds, most temperate species by flies and wind. Fruit-eating birds distribute the seeds in their droppings or by wiping their beaks, to which the seeds often adhere, against the bark of a tree. After germination a modified root (haustorium) penetrates the bark of the host tree and forms a connection through which water and nutrients pass from host to parasite. Mistletoes contain chlorophyll and can make some of their own food. Most mistletoes parasitize a variety of hosts, and some species even parasitize other mistletoes, which, in turn, are parasitic on a host. The Eurasian *Viscum album* is most abundant on apple trees, poplars, willows, lindens, and hawthorns. Species of *Phoradendron* in America also parasitize many deciduous trees, including oaks. In some parts of Europe the midsummer gathering of mistletoe is still associated with the burning of bonfires, a remnant of sacrificial ceremonies performed by ancient priests, or druids. Mistletoe was once believed to have magic powers as well as medicinal properties. Later, the custom developed in England (and, still later, the United States) of kissing under the mistletoe, an action that once was believed to lead inevitably to marriage.

Mistletoes are slow-growing but persistent; their natural death is determined by the death of the hosts. They are pests of many ornamental, timber, and crop trees and are the cause of abnormal growths called "witches' brooms" that deform the branches and decrease the reproductive ability of the host. The only effective control measure is complete removal of the parasite from the host.

mistral, also spelled MAESTRALE, cold and dry, strong wind in southern France that blows down from the north along the lower Rhône River valley toward the Mediterranean Sea. It may blow continuously for several days at a time, attain velocities of about 100 km (60 miles) per hour, and reach to a height of 2 to 3 km. It is strongest and most frequent in winter, and it sometimes causes considerable damage to crops. The velocity of the wind is intensified as it blows down from the highlands to the coast and by the "jet effect" that results as it is funneled through the narrow Rhône valley.

Mistral, Frédéric (b. Sept. 8, 1830, Maillane, France—d. March 25, 1914, Maillane), poet who led the 19th-century revival of Occitan (Provençal) language and literature and shared the Nobel Prize in 1904 for his contributions in literature and philology.

Mistral's father was a well-to-do farmer in the former French province of Provence. He attended the Royal College of Avignon (later renamed the Frédéric Mistral School). One of his teachers was Joseph Roumanille, who had begun writing poems in the vernacular of Provence and who became his lifelong friend. Mistral took a degree in law at the University of Aix-en-Provence in 1851.



Frédéric Mistral, etching, 1864

Wealthy enough to live without following a profession, he early decided to devote himself to the rehabilitation of Provençal life and language. In 1854, with several friends, he founded the Félibrige, an association for the maintenance of the Provençal language and customs, extended later to include the whole of southern France (*le pays de la langue d'oc,* "the country of the language of *oc,*" so called because the Provençal language uses *oc* for "yes," in contrast to the French *oui*). As the language of the troubadours, Provençal had been the cultured speech of southern France and was used also by poets in Italy and Spain. Mistral threw himself into the literary revival of Provençal and was the guiding spirit and chief organizer of the Félibrige until his death in 1914.

Mistral devoted 20 years' work to a scholarly dictionary of Provençal, entitled *Lou Tresor dóu Félibrige,* 2 vol. (1878). He also founded a Provençal ethnographic museum in Arles, using his Nobel Prize money to assist it. His attempts to restore the Provençal language to its ancient position did not succeed, but his poetic genius gave it some enduring masterpieces, and he is considered one of the greatest poets of France.

His literary output consists of four long narrative poems: *Mirèio* (1859; *Mireio: A Provencal Poem*), *Calendau* (1867), *Nerto* (1884), and *Lou Pouèmo dóu Rose* (1897; Eng. trans. *The Song of the Rhône*); a historical tragedy, *La Reino Jano* (1890; "Queen Jane"); two volumes of lyrics, *Lis Isclo d'or* (1876; definitive edition 1889) and *Lis Oulivado* (1912); and many short stories, collected in *Prose d'Armana,* 3 vol. (1926–29).

Mistral's volume of memoirs, *Moun espelido* (*Mes origines,* 1906; Eng. trans. *Memoirs of Mistral*), is his best-known work, but his claim to greatness rests on his first and last long poems, *Mirèio* and *Lou Pouèmo dóu Rose,* both full-scale epics in 12 cantos.

Mirèio, which is set in the poet's own time and district, is the story of a rich farmer's daughter whose love for a poor basketmaker's son is thwarted by her parents and ends with her death in the Church of Les Saintes-Maries-de-la-Mer. Into this poem Mistral poured his love for the countryside where he was born. *Mirèio* skillfully combines narration, dialogue, description, and lyricism and is notable for the springy, musical quality of its highly individual stanzaic form. Under its French title, *Mireille,* it inspired an opera by Charles Gounod (1863).

Lou Pouèmo dóu Rose tells of a voyage on the Rhône River from Lyon to Beaucaire by the barge *Lou Caburle,* which is boarded first by a romantic young prince of Holland and later by the daughter of a poor ferryman. The romance between them is cut short by disaster when the first steamboat to sail on the Rhône accidentally sinks *Lou Caburle*. Though the crew swims ashore, the lovers are drowned. Although less musical and more dense in style than *Mirèio,* this epic is as full of life and colour. It suggests that Mistral, late in life, realized that his aim had not been reached and that much of what he loved was, like his heroes, doomed to perish.

Mistral, Gabriela, pseudonym of LUCILA GODOY ALCAYAGA (b. April 7, 1889, Vicuña, Chile—d. Jan. 10, 1957, Hempstead, N.Y., U.S.), Chilean poet, the first Latin-American woman to win the Nobel Prize for Literature (1945).

Of Spanish, Basque, and Indian descent, Mistral grew up in a village of northern Chile and became a schoolteacher at 15, advancing later to the rank of college professor. Throughout her life she combined writing with a career as an educator, cultural minister, and diplomat; her diplomatic assignments included posts in Madrid, Lisbon, Genoa, and Nice.

Gabriela Mistral, 1941

By courtesy of the Library of Congress, Washington, D.C.

Her reputation as a poet was established in 1914 when she won a Chilean prize for three "Sonetos de la muerte" ("Sonnets of Death"). They were signed with the name by which she has since been known, which she coined from those of two of her favourite poets, Gabriele D'Annunzio and Frédéric Mistral. A collection of her early works, *Desolación* (1922; "Desolation"), includes the poem "Dolor," detailing the aftermath of a love affair that was ended by the suicide of her lover. Because of this tragedy she never married, and a haunting, wistful strain of thwarted maternal tenderness informs her work. *Ternura* (1924, enlarged 1945; "Tenderness"), *Tala* (1938; "Destruction"), and *Lagar* (1954; "The Wine Press") evidence a broader interest in humanity, but love of children and of the downtrodden remained her principal themes.

Mistral's extraordinarily passionate verse, which is frequently coloured by figures and words peculiarly her own, is marked by warmth of feeling and emotional power. A selection translated into English by Langston Hughes was published in 1957 and another selection by Doris Dana in 1971.

mistrial, in law, a trial that has been terminated and declared void before a judge can hand down a decision or a jury can render a verdict. It has the effect of nullifying all the preceding proceedings as if they had not taken place. Therefore, should another trial on the same charges, with the same defendants, be ordered, that trial would start all over again, with the previous testimony or other findings not reckoned as necessarily relevant in the newer court proceedings.

There are several factors that can result in a mistrial, including the death of an attorney or juror (if the latter is not replaceable by one of the alternates); a remark that would be highly prejudicial to the defendant and that the judge may feel cannot, in spite of instructions, be ignored by the jury; or the discovery that members of the jury had discussed the case contrary to court instructions or that a sequestered jury was able to read or hear newspaper or other media reports of the trial. Most often, a mistrial may be declared if the jury itself cannot arrive at a verdict after repeated attempts—*i.e.,* if it is a hung jury.

Misurata (Libya): *see* Miṣrātah.

MIT: *see* Massachusetts Institute of Technology.

mita (Spanish land system): *see* repartimiento.

Mitaka, city, Tokyo *to* (metropolis), Honshu, Japan. It lies on the western border of Tokyo city. The city developed from settlements in the rice paddies of the Musashino plateau during the Tokugawa period (1603–1867). It served as a hawking field, and its name is Japanese for "three hawks." The Mitaka station on the Chūō Line (railway) was opened in 1931, and industry subsequently developed there. Mitaka's major products are electrical machinery and transport equipment. The city, now a residential suburb of the Tokyo-Yokohama metropolitan area, is the site of the International Christian University (1953) and an astronomical observatory of the University of Tokyo. Pop. (1993 est.) 166,473.

mitama (Shintō spirit): *see* tama.

Mitanni, Indo-Iranian empire centred in northern Mesopotamia that flourished from about 1500 to about 1360 BC. At its height the empire extended from Kirkūk (ancient Arrapkha) and the Zagros Mountains in the east through Assyria to the Mediterranean Sea in the west. Its heartland was the Khābūr River region, where Wassukkani, its capital, was probably located.

Mitanni was one of several kingdoms and small states (another being Hurri) founded by the Indo-Iranians in Mesopotamia and Syria. Although originally these Indo-Iranians were probably members of Aryan tribes that later settled in India, they apparently broke off from the main tribes on the way and migrated to Mesopotamia instead. There they settled among the Hurrian peoples and soon became the ruling noble class, called *maryannu.*

The foreign policy of Mitanni during its early years was based largely on competition with Egypt for control of Syria, but amicable relations were established with the Egyptian king Thutmose IV (reigned 1425–17 BC). Perhaps the most outstanding Mitannian king was Saustatar (Shaushshatar; reigned *c.* 1500–*c.* 1450 BC), who is said to have looted the Assyrian palace in Ashur. The last independent king of Mitanni was Tushratta (died *c.* 1360 BC), under whose reign Wassukkani was sacked by the Hittite king Suppiluliumas I. Tushratta was later assassinated, and dynastic struggles ensued until Mattiwaza, a son of Tushratta, was aided by Suppiluliumas against Shuttarna of Hurri; thereafter Mitanni became part of the Hittite empire and was called Hanigalbat. Shortly afterward, however, it was captured by the Assyrian Adad-nirari I (reigned *c.* 1307–*c.* 1275 BC) and again by Shalmaneser I (reigned *c.* 1275–*c.* 1245 BC), who turned the territory east of the Euphrates River into an Assyrian province. *See also* Hurrian.

Mitau, also spelled MITAVA (Latvia): *see* Jelgava.

Mitchell, city, seat of Davison county, southeastern South Dakota, U.S., in the James River valley by Firesteel Creek (there dammed to form Lake Mitchell). Established in 1879 as a railroad town, it was named for Alexander Mitchell, president of the Chicago, Milwaukee, and St. Paul Railroad. Its farm-based economy (corn [maize], livestock, and dairying) is supplemented by light manufacturing and tourism (chiefly in the pheasant-hunting season). The Mitchell Corn Palace (built 1921, replacing an original built in 1892) is a unique Byzantine structure decorated annually with corn and distinguished by minarets and towers. Dakota Wesleyan University (1885) is in the city. Inc. 1883. Pop. (1991 est.) 13,936.

The Corn Palace, Mitchell, S.D.
Milt and Joan Mann from CameraMann

Mitchell, Arthur (b. March 27, 1934, New York, N.Y., U.S.), American dancer, choreographer, and director of the Dance Theatre of Harlem.

Mitchell attended the High School for the Performing Arts in New York City and began performing in Broadway musicals and with the companies of Donald McKayle and John Butler. In 1956 Mitchell became the only black dancer in the New York City Ballet. He soon became a principal with the company, and George Balanchine created several roles for him, notably those in *A Midsummer Night's Dream* (1962) and *Agon* (1967).

Mitchell was sensitive to the prejudice against blacks in the world of ballet and determined to form an all-black ballet company. In 1968 he and Karel Shook founded an integrated school, whose associated company made its debut in 1971 in New York City and at the Spoleto Festival in Italy. Mitchell choreographed a number of ballets for the Dance Theatre of Harlem.

Mitchell, Charles E(dwin) (b. Oct. 6, 1877, Chelsea, Mass., U.S.—d. Dec. 14, 1955, New York, N.Y.), American banker and chairman of the National City organization.

Mitchell took his first job with the Western Electric Company in Chicago and became the president's assistant in 1903. Three years later he left the firm and became assistant to the president at The Trust Company of America in New York City, a position he held for five years. Mitchell formed his own investment house, C.E. Mitchell & Co., in 1911. Five years later he took part in the reorganization of the National City Company, which oversaw investments for the National City Bank, and he soon became its president. The company was capitalized at $55,000,000 and had 50 offices throughout the world. Mitchell also became president of the National City Bank of New York and maintained both positions until 1929. He resigned them to head the National City organization, the parent company for several banks and financial institutions.

After the collapse of the stock market in 1929, Mitchell became a major target for government investigations. He left his posts at National City when it was disclosed that he had made illegal stock transactions, speculated in his own bank's securities, and engaged in income tax evasion. The passage of the Securities Act of 1933 and the Banking Acts of 1933 and 1935 was largely in response to Mitchell's example of financial chicanery.

After resigning from the National City organization, Mitchell founded his own financial consulting firm, C.E. Mitchell, Inc. At the same time, he assumed the position of chairman of the board for the investment banking firm of Blyth & Co.

Mitchell, Edgar D(ean) (b. Sept. 17, 1930, Hereford, Texas, U.S.), American astronaut who took part in the Apollo 14 mission (Jan. 31–Feb. 10, 1971), in which the uplands region north of the Fra Mauro crater on the Moon was explored by Mitchell and Commander Alan B. Shepard, Jr.

Mitchell entered the U.S. Navy upon graduation from the Carnegie Institute of Technology, Pittsburgh, Pa. He was awarded an engineering degree by the Navy Postgraduate School, Monterey, Calif., in 1961 and a doctorate in aeronautics and astronautics by the Massachusetts Institute of Technology in 1964. He joined the manned space program in 1966.

Edgar D. Mitchell, 1970
By courtesy of the National Aeronautics and Space Administration

He retired from the Navy and the space program in 1972, and, interested in parapsychology, he founded the Institute of Noetic Sciences in Palo Alto, Calif.

Mitchell, James Leslie (novelist): *see* Gibbon, Lewis Grassic.

Mitchell, Joan (b. Feb. 12, 1926, Chicago, Ill., U.S.—d. Oct. 30, 1992, Paris, Fr.), American painter who was a member of the second generation of Abstract Expressionists.

Mitchell attended Smith College (1942–44), Northampton, Mass., U.S., and then studied at the Art Institute of Chicago, receiving a bachelor of fine arts degree (1947) and, after scholarship study in France, a master of fine arts degree (1950). In the early 1950s she studied art briefly at Columbia University and New York University and gained membership in the Eighth Street Club, or The Club, founded by the Abstract Expressionists of the New York school.

In the 1950s she painted heroic-sized slashes of lines—sometimes calligraphic—in vivid colours. She visited France regularly and in 1959 set up a studio in Paris, later moving to the country village of Vétheuil. During the 1960s she added to her linear images various clusters or blocks of colours. Her canvases were generally huge, some extending as much as 20 feet (8 m) or more and some divided into panels to be viewed sequentially. Though completely abstract, her paintings evoke associations of landscapes, foliage, and flowers, and her lavish brushwork has a quality of robust and tumultuous lyricism.

Mitchell, John Newton (b. Sept. 5, 1913, Detroit, Mich., U.S.—d. Nov. 9, 1988, Washington, D.C.), U.S. attorney general during the Nixon administration who served 19 months in prison (1977–79) for his participation in the Watergate Scandal (*q.v.*).

Mitchell played semiprofessional hockey while working his way through Fordham University (New York City) and Fordham law school. During World War II he served in the Navy as a torpedo boat commander.

It was for his expertise in state and municipal bonds that Mitchell achieved fame while an attorney with a prominent New York law firm. He became acquainted with Richard M. Nixon early in 1967, when their respective law firms merged. Mitchell quickly became a close political adviser to Nixon, and in 1968 he managed Nixon's successful campaign for the presidency.

Appointed attorney general, Mitchell took office in January 1969 and remained there until March 1972, when he resigned to head Nixon's reelection committee. During his tenure at the Justice Department, Mitchell became controversial for his backing of two of President Nixon's nominees to the Supreme Court who were rejected as unqualified by the Senate, his approval of wiretaps without court authorization (declared unconstitutional by the Supreme Court), his prosecutions of antiwar protesters, and his suit to block publication of the so-called Pentagon Papers (rejected by the Supreme Court).

Mitchell resigned as head of the Committee for the Reelection of the President in July 1972, shortly after the arrest of several men discovered burglarizing the headquarters of the Democratic National Committee in the Watergate apartment complex in Washington, D.C. In 1974 he was indicted on charges that he had conspired to plan the break-in and that he had obstructed justice and perjured himself during the subsequent cover-up of the affair. He was convicted in 1975 and sentenced to 2½ to 8 years in prison; he entered prison in 1977 and was released on parole in 1979.

Mitchell, John Thomas Whitehead (b. Oct. 18, 1828, Rochdale, Lancashire, Eng.—d. March 16, 1895, Rochdale), dominant figure in the 19th-century English consumers' cooperative movement.

At an early age, Mitchell joined the Rochdale Society of Equitable Pioneers and was appointed its secretary in 1857. He shaped the policy of the Co-operative Wholesale Society, established in 1863, and was its chairman from 1874 until his death. Mitchell emphasized the fundamental importance of the consumer in the economy. His ideas provided the theoretical and practical basis of the cooperative movement in Great Britain. An essential feature of the Rochdale system, which was subsequently adopted in many other countries, was the return of dividends to members based on the total amount of their purchases in consumer-owned stores.

Mitchell, Margaret (b. 1900, Atlanta, Ga., U.S.—d. Aug. 16, 1949, Atlanta), U.S. author of the enormously popular novel *Gone with the Wind.*

Mitchell attended Washington Seminary in Atlanta and Smith College, Northampton, Mass. She wrote for *The Atlanta Journal* from 1922 until 1926, when an ankle injury forced her retirement from the newspaper.

Margaret Mitchell
By courtesy of the Trust Company of Georgia

She then began to write her one book, *Gone with the Wind,* a novel about the American Civil War and the Reconstruction as seen from a Southern point of view, featuring a strong-willed coquette and jezebel, Scarlett O'Hara. She worked on the book for 10 years; it was published in June 1936. The motion-picture rights were sold for $50,000, and the film that premiered in 1939 in Atlanta, starring Vivien Leigh and Clark Gable and produced by David O. Selznick, won nine major Oscars and two special Oscars at the Hollywood Academy Awards in 1940.

Gone with the Wind was almost certainly the largest selling novel in the history of U.S. publishing to that time. In the first six months after publication 1,000,000 copies were sold, 50,000 of them in one day. By 1939 sales had reached 2,000,000 copies in the United States, and before the author's death they had totaled 8,000,000 in 40 countries. The motion picture held the record for gross earnings for more than two decades. Four decades after Mitchell's death, her estate permitted the writing of a sequel by Alexandra Ripley, *Scarlett: The Sequel to Margaret Mitchell's "Gone with the Wind"* (1991), which was generally unfavourably appraised by critics.

Mitchell, Maria (b. Aug. 1, 1818, Nantucket Island, Mass., U.S.—d. June 28, 1889, Lynn, Mass.), first professional woman astronomer in the United States.

Mitchell was a self-taught astronomer, reading mathematics and science while a librarian at the Nantucket (Mass.) Atheneum (1836–56). In 1847, while helping her father, William Mitchell, survey the sky for the U.S. Coast Survey, she discovered a comet, for which she received worldwide attention. In 1848 she became the first woman elected to the American Academy of Arts and Sciences.

In 1865 Mitchell was appointed professor of astronomy at Vassar College, where she taught such future scientists as Christine Ladd-Franklin and Ellen Swallow Richards. In 1873 her concern with the status of professional women led her to help found the Association for the Advancement of Women.

Mitchell pioneered in the daily photography of sunspots; she was the first to find that they were whirling vertical cavities, rather than clouds, as had been earlier believed. She also studied comets, nebulae, double stars, solar eclipses, and the satellites of Saturn and Jupiter.

Mitchell, Mount, highest peak (6,684 feet [2,037 m]) in North Carolina and in the United States east of the Mississippi River. It is located 20 miles (30 km) northeast of Asheville in the Black Mountains. The peak, covered with a mantle of hardwoods, pine, spruce, and balsam, is within Mount Mitchell State Park and the Pisgah National Forest. Formerly called Black Dome, it was renamed for a University of North Carolina professor, Elisha Mitchell, who, in 1835, surveyed it as the highest point in the eastern United States and who, in 1857, fell to his death on the mountain and is buried at its top.

Mitchell, Peter Dennis (b. Sept. 29, 1920, Mitcham, Surrey, Eng.—d. April 10, 1992, Bodmin, Cornwall), British chemist who won the 1978 Nobel Prize for Chemistry for formulating the chemiosmotic theory that explained the mechanisms by which energy is generated in the mitochondria of living cells.

Mitchell received his Ph.D. from the University of Cambridge in 1950. He served as director of the chemistry and biology unit in the department of zoology of the University of Edinburgh from 1955 to 1963. In 1964 he joined the Glynn Research Laboratories as director of research.

Mitchell, R.J., in full REGINALD JOSEPH MITCHELL (b. May 20, 1895, Talke, near Stoke-upon-Trent, Staffordshire, Eng.—d. June 11, 1937, Southampton, Hampshire), British aircraft designer, developer of the Spitfire, one of the best-known fighters in World War II.

After secondary schooling Mitchell was an apprentice at a locomotive works and attended night classes at technical colleges. In 1916, before the age of 22, he went to work at Supermarine Aviation Works in Southampton, where he remained the rest of his life, serving as the company's director for his last 10 years. He designed seaplanes (used largely for racing) between 1922 and 1931 and by 1936 had designed and developed the Spitfire, more than two dozen versions of which were eventually created before and after his death and which was known for its aerodynamic sleekness and maneuverability.

Mitchell, S. Weir, in full SILAS WEIR MITCHELL (b. Feb. 15, 1829, Philadelphia, Pa., U.S.—d. Jan. 4, 1914, Philadelphia), American physician and author who excelled in novels of psychology and historical romance.

After study at the University of Pennsylvania and Jefferson Medical College (M.D., 1850), Mitchell spent a year in Paris specializing in neurology. As an army surgeon during the American Civil War, he became well known for his "rest cure." His war experiences were the basis for "The Case of George Dedlow" (1866), a story about a quadruple amputee notable for its psychological insights and realistic war scenes. He wrote some 170 medical monographs on topics ranging from snake venom to neurasthenia and published short stories, poems, and children's stories anonymously. Of later novels perhaps his most notable are: *Roland Blake* (1886), *Hugh Wynne* (1898), *The Adventures of François* (1898), *Circumstance* (1901), *Constance Trescott* (1905), and *The Red City* (1908).

Mitchell, Sir Thomas Livingstone (b. June 15, 1792, Craigend, Stirlingshire, Scot.—d. Oct. 5, 1855, Sydney, N.S.W. [Australia]), surveyor general of New South Wales who explored and surveyed widely in Australia.

As a soldier in the Peninsular War in Spain (1811–14), Mitchell worked in topographical intelligence. He became a major in 1826 but was placed on half pay. In 1827 he went to New South Wales as assistant surveyor general to John Oxley at Sydney. He succeeded Oxley in 1828, assuming responsibility for roads and bridges in 1829 and in 1830 sole responsibility for the whole department. By 1830 he had established permanent routes from Sydney to Parramatta and to Liverpool and through the Blue Mountains.

In 1831–32 Mitchell explored between the Castlereagh and Gwydir rivers. In 1835 he traced the Darling River from the point at which Charles Sturt had left off in 1828 to the junction with the Murray. In 1836 his exploration of land around the Murray River led him to call the area Australia Felix (Happy Australia; later, Victoria state). The area was settled rapidly thereafter.

In 1837 Mitchell went on leave to England and wrote *Three Expeditions into Eastern Australia* (1838) and began a campaign for knighthood (granted in 1839). He also published his Peninsular War battle plans in 1840.

Mitchell returned to Australia in 1841 and in 1844 was elected to the legislative council. His fourth expedition (1845–46) sought in vain an overland route to Port Essington, but he surveyed a vast area.

Again on leave in England (1847–48), Mitchell wrote *Journal of an Expedition into the Interior of Tropical Australia* (1848) and *The Australian Geography* (1850), used as a textbook in Australian schools.

BIBLIOGRAPHY. J.H.L. Cumpston, *Thomas Mitchell, Surveyor General & Explorer* (1955).

Mitchell, W.O., in full WILLIAM ORMOND MITCHELL (b. March 13, 1914, Weyburn, Sask., Can.—d. Feb. 25, 1998, Calgary, Alta.), writer of stories that deal humorously with the hardships of western Canadian prairie life.

Mitchell received favourable notice for his first novel, *Who Has Seen the Wind?* (1947), a sensitive picture of a grim prairie town seen from the point of view of a small boy. Mitchell's *Jake and the Kid* (1961) was later developed into a popular, long-running radio and television series. His novel *The Kite* (1962) is about a newsman's interview with "Daddy Sherry," supposedly the oldest and wisest man in western Canada. Another novel, *The Vanishing Point* (1973), deals with a teacher's involvement with Indians in southwest Alberta.

Mitchell, Wesley C., in full WESLEY CLAIR MITCHELL (b. Aug. 5, 1874, Rushville, Ill., U.S.—d. Oct. 29, 1948, New York, N.Y.), American economist, the world's foremost authority of his day on business cycles.

Mitchell was educated at the University of Chicago, where he came under the influence of Thorstein Veblen and John Dewey. He taught at numerous universities, including the University of Chicago (1900–02), the University of California (1902–12), Columbia University (1913–19; 1922–44), and the New School for Social Research, New York City (1919–21). Despite his extensive teaching, Mitchell was primarily devoted to economic research.

Wesley C. Mitchell
By courtesy of Columbia University

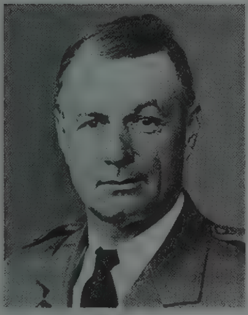
In 1920 he helped to organize the National Bureau of Economic Research and was its director of research until 1945. He served as chief of the price section of the War Industries Board during World War I, as chairman of President Herbert Hoover's Research Committee on Social Trends, and as a member of the National Planning Board (1933) and of the National Resources Board (1934–35). Under Mitchell's leadership, the Social Science Research Council, of which he was chairman (1927–30), and the Bureau of Educational Experiments greatly influenced the development of quantitative studies of economic behaviour in the United States and abroad.

Among his publications are *Business Cycles* (1913), *Business Cycles: The Problem and Its Setting* (1927), *The Backward Art of Spending Money* (1937), and *Measuring Business Cycles* (1946), written with A.F. Burns.

Mitchell, William, byname BILLY MITCHELL (b. Dec. 29, 1879, Nice, France—d. Feb. 19, 1936, New York, N.Y., U.S.), U.S. Army officer who early advocated a separate U.S. air force and greater preparedness in military aviation. He was court-martialed for his outspoken views and did not live to see the fulfillment during World War II of many of his prophecies: strategic bombing, mass airborne operations, and the eclipse of the battleship by the bomb-carrying airplane.

After serving as a private in the infantry during the Spanish-American War (1898), Mitchell received a commission as a second lieutenant in the signal corps. He served in Cuba, the Philippines, and Alaska and in 1909 graduated from the Army Staff College at Fort Leavenworth, Kan. In 1915 he was assigned to the aviation section of the signal corps. During World War I Mitchell became the outstanding U.S. combat air commander, advancing to the rank of brigadier general. In September 1918 he commanded a French-U.S. air armada of almost 1,500 planes—the largest concentration of air power up to that time. In the Meuse-Argonne campaign he used formations of up to 200 planes for mass bombing of enemy targets.

After the war Mitchell was appointed assistant chief of the air service. He became a strong proponent of an independent air force and of unified control of air power, both of which were opposed by the army general staff and the navy. As a result, he became increasingly outspoken in his criticism of the military hierarchy, and, when his term ended in April 1925, he was sent to the remote post of San Antonio, Texas. The climax came in September 1925, when the loss of the navy dirigible *Shenandoah* in a storm inspired him publicly to accuse the War and Navy departments of "incompetency, criminal negligence, and almost treasonable administration of the national defense." In December an army court-martial convicted him of insubordination. Sentenced to suspension from rank and duty for five years, he resigned from the army (Feb. 1, 1926).



Billy Mitchell, 1925

By courtesy of the Library of Congress, Washington, D.C.

Nevertheless, Billy Mitchell was awarded many decorations and honours during his lifetime, and in 1946 the U.S. Congress authorized a special medal in his honour; it was presented to his son in 1948 by the chief of staff of the newly created U.S. Air Force.

BIBLIOGRAPHY. Accounts of Mitchell's life and career include Isaac Don Levine, *Mitchell: Pioneer of Air Power* (1943, reissued 1972), including a list of his writings; Roger Burlingame, *General Billy Mitchell* (1952, reprinted 1978); Ruth Mitchell, *My Brother Bill* (1953); and Burke Davis, *The Billy Mitchell Affair* (1967).

Mitchell River, river in northern Queensland, Australia. It rises near Rumula on the Atherton Plateau section of the Eastern Highlands, 30 miles (48 km) northwest of Cairns, and flows for 350 miles (560 km) northwest across Cape York Peninsula to the Gulf of Carpentaria. Although the stream, fed by the Palmer, Walsh, and Lynd rivers, has the state's largest discharge, it is intermittent and may be dry for three months each year. The river was explored in 1845 by Ludwig Leichhardt and was named for Sir Thomas Mitchell, surveyor general for New South Wales. The river flows through country covered with wild scrub, and crocodiles abound along its banks.

mite, any of about 20,000 species of tiny arthropod invertebrates belonging to the subclass Acari (sometimes Acarina, or Acarida) of the class Arachnida.

A brief treatment of mites follows. For full treatment, *see* MACROPAEDIA: Arachnids.

Mites live in varied habitats: in brackish water, in fresh water, in hot springs, in soil, on plants, and as parasites on and in animals. Parasitic forms may live in the nasal passages, lungs, stomach, or deeper body tissues of animals. Some mites are carriers of human and animal diseases. Plant-feeding mites cause damage by feeding on leaf tissues or by transmitting viral diseases.

Red velvet mite (*Dinothrombium;* magnified about five times)

Anthony Bannister from Natural History Photographic Agency

Mites are small, often microscopic in size—the smallest being about 0.1 mm (0.004 inch) in length and the largest being about 6 mm (0.25 inch)—and they usually have four pairs of legs. In general, they breathe by means of tracheae, or air tubes; in many species, however, respiration takes place through the skin.

Mites of the suborder Mesostigmata (order Parasitiformes) include the chicken mite, the northern fowl mite, and the rat mite (all of which attack humans); nasal mites of dogs and birds; lung mites of monkeys; and predatory mites, which are sometimes of benefit in controlling plant-feeding mites.

The suborder Oribatida (oribatid, or beetle, mites) of the order Acariformes occur in soil and humus and occasionally on tree trunks and foliage. In general, they are not harmful and may play a role in the breakdown of organic matter. A few species transmit tapeworms to cattle or other ruminants.

Mites of the suborder Astigmata (order Acariformes) include the grain and cheese mites (Acaridae), itch mites (Sarcoptidae) of humans and animals, scab mites (Psoroptidae), feather mites of birds, mites associated with insects, and many free-living forms. Grain mites (Glycyphagidae) not only damage stored products but also cause skin irritations in those who handle such products. Itch mites burrow into the layers of the skin of humans, as well as into the hides of dogs, pigs, sheep, and goats, causing injury. Scab mites are found on sheep and cattle, sometimes causing serious injury. Others are found in the air sacs of birds' lungs or in the nasal passages and stomachs of bats. Some mite larvae of the suborder Prostigmata (order Acariformes) are parasitic on insects.

miter (headdress): *see* mitre.

Mitford, Jessica, in full JESSICA LUCY MITFORD (b. Sept. 11, 1917, Gloucestershire, Eng.—d. July 23, 1996, Oakland, Calif., U.S.), English-born writer and journalist noted for her witty and irreverent investigations of various aspects of American society.

The fifth daughter of the 2nd Baron Redesdale, Mitford grew up in England with her brother and five sisters, one of whom was the novelist Nancy Mitford. She moved to the United States in 1939, became a naturalized U.S. citizen in 1944, and began to write in the late 1950s. Her first published book, the autobiography *Hons and Rebels* (1960; U.S. title *Daughters and Rebels*), is an entertaining account of her childhood, her eccentric family, and her early adult life. Mitford's second book, *The American Way of Death* (1963), a caustic examination of unscrupulous practices in the American funeral industry, became a best-seller. Her long-standing interest in civil-rights cases found expression in the book *The Trial of Dr. Spock* (1969), an account of the famous pediatrician's trial on conspiracy charges for antiwar activities during the Vietnam War. *Kind and Usual Punishment: The Prison Business* (1973) is Mitford's critical examination of the American prison system. *A Fine Old Conflict* (1977) is mainly an account of her experiences as a member of the U.S. Communist Party in the 1940s and '50s.

Mitford, Mary Russell (b. Dec. 16, 1787, Alresford, Hampshire, Eng.—d. Jan. 10, 1855, Swallowfield, near Reading), dramatist, poet, and essayist, chiefly remembered for her delightful sketches of English village life.

She was the only daughter of George Mitford, a dashing, irresponsible character whose extravagance compelled the family, in 1820, to leave their house in Reading (built when Mary, at the age of 10, won £20,000 in a lottery) for a labourer's cottage in the nearby village of Three Mile Cross. Thereafter, until his death in 1842, his daughter struggled to provide for him and to pay his gambling debts out of her literary earnings.

In 1810 she published *Miscellaneous Poems,* and other volumes of mildly romantic verse followed. Her narrative poem *Christina* (1811) was revised by Samuel Taylor Coleridge, who inserted a number of lines. She then turned to the theatre, with some success, most notably in the blank-verse tragedy *Rienzi,* which had 34 performances at London's Drury Lane in 1828.

Her reputation, however, rests on the sketches, started in *The Ladies Magazine* (1819), that fill the five volumes of *Our Village*. Based on her observation of life in and around Three Mile Cross, they catch the pleasant atmosphere of the English countryside and the quaintness of village characters.

Mitford, Nancy, married name HONOURABLE MRS. PETER RODD (b. Nov. 28, 1904, London, Eng.—d. June 30, 1973, Versailles, France), English writer noted for her witty novels of upper-class life.

Nancy Mitford was one of six daughters (and one son) of the 2nd Baron Redesdale; the family name was actually Freeman-Mitford. The children were educated at home and were all highly original. Nancy's sister Unity (d. 1948) was notorious in Great Britain for her admiration of Adolf Hitler, and her sister Diana married Sir Oswald Mosley, leader of the British Union of Fascists, while Deborah became the wife of the 11th Duke of Devonshire. Her sister Jessica became a well-known writer on American society.

Mitford's chief satirical novels are the quasi-autobiographical *The Pursuit of Love* (1945), *Love in a Cold Climate* (1949), *The Blessing* (1951), and *Don't Tell Alfred* (1960). These books chronicle the antics and attitudes of a family of eccentric English aristocrats headed by "Uncle Matthew," who is a lively caricature of Mitford's own father, Lord Redesdale. Several biographies that Mitford wrote exhibit her Francophilia: *Madame de Pompadour* (1954), *Voltaire in Love* (1957), and *The Sun King* (1966), about Louis XIV. One of Mitford's most widely read books was *Noblesse Oblige: An Enquiry into the Identifiable Characteristics of the English Aristocracy* (1956), a volume of essays of which she was coeditor and which brought to the attention of the world the distinction between linguistic usages that are U (upper class) and those that are non-U (not upper class).

mithan, cattle species also known as gayal (*q.v.*).

Mithra, also spelled MITHRAS, Sanskrit MITRA, in ancient Indo-Iranian mythology, the god of light, whose cult spread from India in the east to as far west as Spain, Great Britain, and Germany. (*See* Mithraism.) The first written mention of the Vedic Mitra dates to 1400 BC. His worship spread to Persia and, after the defeat of the Persians by Alexander the Great, throughout the Hellenic world. In the 3rd and 4th centuries AD, the cult of Mithra, carried and supported by the soldiers of the Roman Empire, was the chief rival to the newly developing religion of Christianity. The Roman emperors Commodus and Julian were initiates of Mithraism, and in 307 Diocletian consecrated a temple on the Danube River to Mithra, "Protector of the Empire."

According to myth, Mithra was born, bearing a torch and armed with a knife, beside a sacred stream and under a sacred tree, a child of the earth itself. He soon rode, and later killed, the life-giving cosmic bull, whose blood fertilizes all vegetation. Mithra's slaying of the bull was a popular subject of Hellenic art and became the prototype for a bull-slaying ritual of fertility in the Mithraic cult.

As god of light, Mithra was associated with the Greek sun god, Helios, and the Roman Sol Invictus. He is often paired with Anahita, goddess of the fertilizing waters.

Mithradates, also spelled MITHRIDATES, name of rulers grouped below by country and indicated by the symbol •.

Parthia

• **Mithradates I,** also called ARSACES VI (fl. 2nd century BC), king of Parthia (reigned 171–138 BC); he succeeded his brother Phraates I.

Before 160 Mithradates I seized Media from the Seleucid ruler Timarchus. Turning to the east, he won two provinces, Tapuria and Traxiana, from the Bactrian king Eucratides. Mithradates then captured the province of Elymais (ancient Elam) and invaded Babylonia (142 or 141). The Seleucid king Demetrius II Nicator recaptured Babylon (141 or 140) but was defeated and held by Mithradates in honourable captivity. Generally, Mithradates was regarded as a mild ruler, and his epithet Philhellene ("Greek-loving") indicates that he tried to conciliate his Greek subjects.

• **Mithradates II** (d. 88 BC), king of Parthia (reigned 123–88 BC); he was the son and successor of Artabanus II.

Mithradates recovered the eastern provinces that had been overrun by invading Śaka nomads during his father's reign. In the west he conquered Mesopotamia and defeated the Armenian king Artavasdes, whose son Tigranes (later Tigranes II) became a Parthian hostage and was redeemed only for the cession of 70 valleys. One of the most successful of the Parthian kings, Mithradates concluded the first treaty between Parthia and Rome in 92 BC.

Pontus

• **Mithradates VI** EUPATOR, byname MITHRADATES THE GREAT (d. 63 BC, Panticapaeum [now in Ukraine]), king of Pontus in northern Anatolia (120–63 BC). Under his energetic leadership, Pontus expanded to absorb several of its small neighbours and, briefly, contested Rome's hegemony in Asia Minor.

Mithradates VI, bust in the Louvre, Paris

Cliche Musees Nationaux, Paris

Life. Mithradates the Great was the sixth—and last—Pontic ruler by that name. Mithradates (often misspelled Mithridates and meaning "gift of [the god] Mithra") was a common name among Anatolian rulers of the age. When Mithradates VI succeeded his father, Mithradates Euergetes, in 120 BC, he was then only a boy, and for a few years his mother ruled in his place. About 115 BC, she was deposed and thrown into prison by her son, who thereafter ruled alone. Mithradates began his long career of conquest by dispatching successful expeditions to the Crimea and to Colchis (on the eastern shore of the Black Sea). Both districts were added to the Pontic kingdom. To the Greeks of the Tauric Chersonese and the Cimmerian Bosporus (Crimea and Straits of Kerch), Mithradates was a deliverer from their Scythian enemies, and they gladly surrendered their independence in return for the protection given to them by his armies. In Anatolia, however, the royal dominions had been considerably diminished after the death of Mithradates V: Paphlagonia had freed itself, and Phrygia (*c.* 116 BC) had been linked to the Roman province of Asia. Mithradates' first move there was to partition Paphlagonia and Galatia between himself and Nicomedes III of Bithynia, but next he quarreled with Nicomedes over Cappadocia. Successful at first on two occasions, he was on both deprived of his advantage by Roman intervention (*c.* 95 and 92). While appearing to acquiesce, he resolved to expel the Romans from Asia. A first attempt to depose Nicomedes IV of Bithynia, who was completely subservient to the Romans, was frustrated (*c.* 90). Then Nicomedes, instigated by Rome, attacked Pontic territory, and Mithradates, after protesting in vain to the Romans, finally declared war (88).

Nicomedes and the Roman armies were defeated and flung back to the coasts of the Propontis and the Aegean. The Roman province of Asia was occupied, and most of the Greek cities in western Asia Minor allied themselves with Mithradates, though a few held out against him, such as Rhodes, which he besieged unsuccessfully. He also sent large armies into Greece, where Athens and other cities took his side. But the Roman generals, Sulla in Greece and Fimbria in Asia, defeated his forces in several battles during 86 and 85. In 88 he had arranged a general massacre of the Roman and Italian residents in Asia (80,000 are said to have perished), in order that the Greek cities, as his accessories in the crime, should feel irrevocably committed to the struggle against Rome. As the war turned against him, his former leniency toward the Greeks changed to severity; every kind of intimidation was resorted to—deportations, murders, freeing of slaves. But this reign of terror could not prevent the cities from deserting to the victorious side. In 85, when the war was clearly lost, he made peace with Sulla in the Treaty of Dardanus, abandoning his conquests, surrendering his fleet, and paying a large fine.

In what is called the Second Mithradatic War, the Roman general Lucius Licinius Murena invaded Pontus without provocation in 83 but was defeated in 82. Hostilities were suspended, but disputes constantly occurred, and in 74 a general war broke out. Mithradates defeated Marius Aurelius Cotta, the Roman consul, at Chalcedon, but Lucullus worsted him outside Cyzicus (73) and drove him, in 72, to take refuge in Armenia with his son-in-law Tigranes. After scoring two great victories at Tigranocerta (69) and Artaxata (68), Lucullus was disconcerted by the defeat of his lieutenants and by mutiny among his troops. In 66 Lucullus was superseded by Pompey, who completely defeated both Mithradates and Tigranes.

Mithradates then established himself in 64 at Panticapaeum (Kerch) on the Cimmerian Bosporus and was planning an invasion of Italy by way of the Danube when his own troops, led by his son Pharnaces II, revolted against him. After failing in an attempt to poison himself, Mithradates ordered a Gallic mercenary to kill him. His body was sent to Pompey, who buried it in the royal sepulchre at Sinope, the Pontic capital.

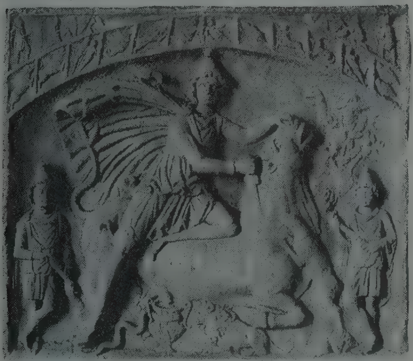
Assessment. Mithradates was a man of great stature and physical strength, a brave fighter, and a keen hunter. He also had some of the worst traits often associated with the Oriental despot—cruelty and sensuality, in particular. But it cannot be denied that Mithradates was a ruler of astonishing energy and determination, or that he possessed political skill of a high order. That he was one of the few men to offer a serious challenge to the Roman Republic is sufficient testimony to his ability. He organized the forces at his disposal very effectively, and he had a good grasp of strategy. He was unlucky in having to face three exceptionally brilliant Roman generals; unlucky, too, in coming to power at a time when the Hellenistic world was in the final stage of its collapse. It is quite conceivable that had he been born a century earlier he could have constructed an enduring Greco-Asiatic empire. A cunning, brutal tyrant, he concerned himself solely with maintaining and strengthening his own power. He posed as the champion of Hellenism, but this was mainly to further his political ambitions; it is no proof that he was deeply imbued with Greek culture or that he felt a mission to promote its extension within his domains. Hellenism made advances in Pontus during his reign, as it had under his predecessors, but this was a natural process. He treated all alike;

Greek, Roman, and Asiatic were welcome at his court provided that they could be of use to him (his military subordinates were mostly Greeks, though in later years he employed several Roman renegades), but he trusted no one. Just as it is impossible to speak of his favouring one religion or culture above another, so it is impossible to believe that he had any notion of bringing Greeks and Asiatics closer together in a new kind of political and social system. His posing as a liberator of the Greeks from Roman oppression and, later, his encouragement of social revolution in the Greek cities of the province of Asia can only be interpreted, in both cases, as the actions of an opportunist seeking immediate political advantages. (R.H.S.)

BIBLIOGRAPHY. T. Reinach, *Mithridate Eupator, roi de Pont* (1890; in French), gives a full account and analysis of the historical sources for Mithradates' life. M. Rostovtzeff in the *Cambridge Ancient History*, vol. 9, ch. 5 (1932), describes the Pontic kingdom, its institutions, and its history; the available evidence derives mainly from Mithradates' own reign. Volume 1 of D. Magie, *Roman Rule in Asia Minor* (1950), provides a narrative account of Mithradates' reign; vol. 2 consists of critical footnotes—an examination of the literary and archaeological evidence. See especially chapters 9, 14, and 15.

Mithraism, the worship of Mithra, the Iranian god of the sun, justice, contract, and war in pre-Zoroastrian Iran. Known as Mithras in the Roman Empire during the 2nd and 3rd centuries AD, this deity was honoured as the patron of loyalty to the emperor. After the acceptance of Christianity by the emperor Constantine in the early 4th century, Mithraism rapidly declined.

History. Before Zoroaster (6th century BC or earlier), the Iranians had a polytheistic religion, and Mithra was the most important of their gods. First of all, he was the god of contract and mutual obligation. In a cuneiform tablet of the 15th century BC that contains a treaty between the Hittites and the Mitanni, Mithra is invoked as the god of oath. Furthermore, in some Indian Vedic texts the god Mitra (the Indian form of Mithra) appears both as "friend" and as "contract." The word *mitra* may be translated in either way, because contracts and mutual obligation make friends. In short, Mithra may signify any kind of communication between men and whatever establishes good relations between them. Mithra was called the Mediator. Mithra was also the god of the sun, of the shining light that beholds everything, and, hence, was invoked in oaths. The Greeks and Romans considered Mithra as a sun god. He was probably also the god of kings. He was the god of mutual obligation between the king and his warriors, and, hence, the god of war. He was also the god of justice, which was guaranteed by the king. Whenever men observed justice and contract, they venerated Mithra.



Mithra slaying the bull, bas-relief, 2nd century AD; in the Städtisches Museum, Wiesbaden, Ger.

Bavaria-Verlag

The most important Mithraic ceremony was the sacrifice of the bull. Opinion is divided as to whether this ceremony was pre-Zoroastrian or not. Zoroaster denounced the sacrifice of the bull, so it seems likely that the ceremony was a part of the old Iranian paganism. This inference is corroborated by an Indian text in which Mitra reluctantly participates in the sacrifice of a god named Soma, who often appears in the shape of a white bull or of the moon. On the Roman monuments, Mithra reluctantly sacrifices the white bull, who is then transformed into the moon. This detailed parallel seems to prove that the sacrifice must have been pre-Zoroastrian. Contract and sacrifice are connected, since treaties in ancient times were sanctioned by a common meal.

Beginning with Darius (522–486), the Persian kings of the Achaemenid dynasty were Zoroastrians. But Darius and his successors did not intend to create political difficulties by attempting to eradicate the old beliefs still dear to the heart of many nobles. Thus, the religion of Zoroaster was gradually contaminated with elements of the old, polytheistic worship. Hymns (the Yashts) were composed in honour of the old gods. There is a Yasht dedicated to Mithra, in which the god is depicted as the all-observing god of heavenly light, the guardian of oaths, the protector of the righteous in this world and the next, and, above all, as the archfoe of the powers of evil and darkness—hence, the god of battles and victory.

In the mixed religion of the later Achaemenid period, however, the Zoroastrian aspects clearly dominate the heathen aspects. The sacrifice of the bull, abhorred by every Zoroastrian, is never mentioned. When Alexander the Great conquered the Persian Empire in about 330 BC, the old structure of society appears to have broken down completely and about the worship of Mithra in Persia no more is heard.

Local aristocrats in the western part of the former Persian Empire retained their devotion to Mithra. The kings and nobles of the border region between the Greco-Roman and the Iranian world still worshipped him. When Tiridates of Armenia acknowledged the Roman emperor Nero as his supreme lord, he performed a Mithraic ceremony, indicating that the god of contract and of friendship established good relations between the Armenians and the mighty Romans. The kings of Commagene (southeast of Turkey) venerated Mithra. Mithradates VI of Pontus may have been a worshipper of the god, and his allies, the Cilician pirates, are known to have performed Mithraic ceremonies (67 BC). The worship of Mithra, however, never became popular in the Greek world, because the Greeks never forgot that Mithra had been the god of their enemies the Persians.

There is little notice of the Persian god in the Roman world until the beginning of the 2nd century, but, from the year AD 136 onward, there are hundreds of dedicatory inscriptions to Mithra. This renewal of interest is not easily explained. The most plausible hypothesis seems to be that Roman Mithraism was practically a new creation, wrought by a religious genius who may have lived as late as *c.* AD 100 and who gave the old traditional Persian ceremonies a new Platonic interpretation that enabled Mithraism to become acceptable to the Roman world.

Roman Mithraism, like Iranian Mithraism, was a religion of loyalty toward the king. It seems to have been encouraged by the emperors, especially Commodus (180–192), Septimius Severus (193–211), and Caracalla (211–217). Most adherents of Mithra known to us from inscriptions are soldiers of both low and high rank, officials in the service of the emperor, imperial slaves, and freedmen (who quite often were very influential people)—persons who probably knew which god would lead them to quick promotion.

Mithraic sanctuaries and dedications to Mithra are numerous at Rome and Ostia, along the military frontier, in Britain, and on the Rhine, the Danube, and the Euphrates. Few dedications are found in peaceful provinces; when they do occur the dedicator is usually a provincial governor or an imperial official. Within a few generations, the Roman world had completely assimilated the Persian god. When Diocletian attempted a renewal of the Roman state and religion, he did not forget Mithra. In AD 307, in a dedication from Carnuntum (at the Danube, near Vienna), Diocletian and his colleagues dedicated an altar to Mithra, as the patron of their empire (*fautori imperii sui*). But in 312, Constantine won the battle at the Milvian Bridge under the sign of the cross. Instantaneously, the dedications to Mithra ceased, even though there was no immediate public interdiction of Mithraic ceremonies. The worship seems to have collapsed quite suddenly when imperial favour ceased to be with the Mithraists. Dedications to Mithra appear again between about 357 and 387, but only at Rome. The dedicators all come from the old pagan aristocracy of the city of Rome, which in this period was in open opposition to the new Christian emperor at Constantinople. In these inscriptions, however, Mithra is only one of many traditional pagan gods. The Mithraic mysteries had gradually faded long before. And when the Roman opposition was defeated, pagan worship was suppressed altogether.

Mythology and theology. The creation of the world is the central episode of Mithraic mythology. According to the myths, the sun god sent his messenger, the raven, to Mithra and ordered him to sacrifice the bull. Mithra executed the order reluctantly; in many reliefs he is seen turning aside his face in sorrow. But at the very moment of the death of the bull, a great miracle happened. The white bull was metamorphosed into the moon; the cloak of Mithra was transformed into the vault of the sky, with the shining planets and fixed stars; from the tail of the bull and from his blood sprang the first ears of grain and the grape; from the genitals of the animal ran the holy seed which was received by a mixing bowl. Every creature on earth was shaped with an admixture of the holy seed. One Mithraic hymn begins: "Thou hast redeemed us too by shedding the eternal blood." The plants and the trees were created. Day and Night began to alternate, the Moon started her monthly cycle, the Seasons took up their round dance through the Year, and thus Time was created. But, awakened by the sudden light, the creatures of the dark emerged from earth. A serpent licked the bull's blood. A scorpion tried to suck the holy seed from the genitals. On the reliefs, a lion often is also seen. With the bull's death and the creation of the world, the struggle between Good and Evil began: thus is the condition of man's life. The raven symbolizes Air, the lion Fire, the serpent Earth, and the mixing bowl Water. So the four elements (air, fire, earth, and water) came into being, and from them all things were created. After the sacrifice, Mithra and the sun god banqueted together, ate meat and bread, and drank wine. Then Mithra mounted the chariot of the sun god and drove with him across the ocean, through the air to the end of the world.

The myth was interpreted by the Roman Mithraists in terms of Platonic philosophy. The sacrifice took place in a cave, an image of the world, as in the simile of the cave in Plato's *Republic.* Mithra himself was equated with the creator (demiurge) of the *Timaeus:* he was called "demiurge and father of all things," like the Platonic demiurge. The four elements, the mixing bowl, the creation of Time, and the attack of the wicked animals upon the newborn creature are well-known features of the *Timaeus.* The Mithraic doctrine of the soul is intimately linked with the myth of creation and with Platonic philosophy. As in the *Timaeus,* the soul of man came down from heaven. It crossed the seven spheres of the planets, taking on their vices (*e.g.,* those of Mars and of Venus) and was finally caught within the body. The task of man is to liberate his divine part (the soul) from the shackles of the body and to reascend through the seven spheres to the eternal, unchanging realm of the fixed stars. This ascension to the sky was prefigured by Mithra himself, when he left the earth in the chariot of the sun god.

Worship, practices, and institutions. The Mithraic sanctuaries were subterranean caverns, which presented obvious limitations of size. None of the many excavated shrines could receive more than a hundred persons, and most even fewer. All ceremonies were of necessity enacted in artificial light. The cavern always contained a well. Access to the cavern often consisted of a system of subterranean passages, which were used in the initiation ceremonies. Men only were admitted to this religion of soldiers, and no organizational hierarchy seems to have existed.

The initiates were organized in seven grades: *corax,* Raven; *nymphus,* Bridegroom; *miles,* Soldier; *leo,* Lion; *Perses,* Persian; *heliodromus,* Courier of (and to) the Sun; *pater,* Father. To each rank belonged a particular mask (Raven, Persian, Lion) or dress (Bridegroom). The rising of the Mithraist in grade prefigured the ascent of the soul after death. The series of the seven initiations seems to have been enacted by passing through seven gates and climbing a ladder of seven steps. Each grade was attributed to one of the seven planetary gods. The zealous Mithraist gradually passed the spheres of these minor deities and finally reached the region of the fixed stars.

Little is known about initiation ceremonies. Ancient texts refer to ablutions (baptism) and purifications and chastisements, to fetters and liberation, and to certain ceremonial passwords. Frescoes at Capua (Italy) show the initiates blindfolded, kneeling, and prostrated. A simulated death and resurrection was probably part of the ceremony. Tertullian, the 2nd-century North African Christian theologian, describes the test of courage to which the *miles* was subjected. Weapon in hand, he had to force his way—probably by a sham duel—to a wreath. When he had succeeded, an officiant offered to crown him with the wreath. But the candidate had to decline, saying that Mithra alone was his wreath; and throughout the rest of his life, he never again bore a wreath.

The Mithraic caverns were decorated with frescoes, reliefs, and statues of minor deities and of the planetary gods. A narrow aisle was flanked on both sides by a broad, raised bench on which the worshippers kneeled or reclined. At one end of the aisle (often apselike) there was always a relief or fresco representing the sacrifice of the bull. Sometimes, the relief could be turned on a pivot; the back of the stone represented the repast of Mithra and the sun god. While it is unlikely that the ceremony of the bull's sacrifice was frequently performed, the common meal of the initiates was a regular feature of Mithraic worship.

Mitiaro, island in the lower Cook Islands, a dependency of New Zealand, southwest Pacific Ocean. It is a raised coral atoll, with a land area of 8.6 sq mi (22.3 sq km), and is encircled by a reef. Its interior of fertile volcanic soil, ringed by swamps and limestone, supports copra and citrus fruits. Stands of sandalwood occur. Pop. (1981) 256.

miticide, also called ACARICIDE, any chemical substance used to control mites or ticks (especially species that damage ornamental or food plants), which are not susceptible to commonly used insecticides. Azobenzene, dicofol, ovex, and tetradifon are commonly used miticides. Many miticides kill eggs and larval stages as well as adult animals. Some are also toxic to honeybees and other beneficial insects.

Mitilíni (island, Greece): *see* Lesbos.

Mitilíni (town, Greece): *see* Mytilene.

Mitla, Meso-American archaeological site, Oaxaca state, southern Mexico. One of Mexico's best known ruins, Mitla lies at an elevation of 4,855 ft (1,480 m) on the eastern edge of one of several cold, high valleys surrounded by the mountains of the Sierra Madre del Sur, 24 mi (38 km) southeast of Oaxaca city. It is generally believed that Mitla (Nahuatl: Place of the Dead) was established as a sacred burial site long before the Christian Era, probably by the Zapotecs, whose influence was predominant until about AD 900. Between 900 and 1500 the Mixtecs moved down from northern Oaxaca and took possession of Mitla; it is the Mixtec influence that is most pronounced on the existing ruins. The Spaniards arrived at Mitla in 1521, and the first European account of the area was given by Diego García de Palacio in 1576.

The archaeological zone of Mitla includes five main groups of structures—Grupo de las Columnas (Columns Group), Grupo de las Iglesias (Churches Group), Grupo del Arroyo (Arroyo Group), Grupo de los Adobes (Adobe Group), and Grupo del Sur (Southern Group)—of which only the first two had been fully excavated and restored by the early 1980s. Each group has several rectangular patios (some connected by long, winding passages and others separate) bordered by long, narrow rooms. The patios in the Grupo de los Adobes and those in the Grupo del Sur are also bordered by rooms, as well as by stepped pyramids.

The method of above-ground wall construction appears to have been the same for all groups: a core of mud and stone covered with plaster or well-cut trachyte. The door frames are decorated with mosaics of intricately worked small stones perfectly fitted into stepped fret (geometric) patterns. Cruciform lithic tombs have been discovered beneath both the Grupo de las Columnas and the Grupo del Sur.

The modern village of Mitla, composed mainly of thatched huts and adobe houses situated on the hillside below the ruins, is the operation base for the Regional Studies Centre of the Universidad de las Americas. The Museo Frissell de Arte Zapoteca (Frissell Museum), located in the village, contains a collection of artifacts from the state of Oaxaca.

Mitnagged, also spelled MISNAGID (Hebrew: Opponent), plural MITNAGGEDIM, or MISNAGIDIM, member of a group of tradition-minded Jews who vigorously opposed the mid-18th-century Hasidic movement of eastern Europe when it threatened to encompass large numbers of Jews. Under the leadership of Elijah ben Solomon, called the Vilna Gaon, the Mitnaggedim excommunicated all Hasidic groups from Orthodox Jewish communities. The Hasidim were accused of espousing doctrines tinged with pantheism and were severely criticized for establishing independent synagogues with Sefardic (Spanish-rite) liturgy. The Mitnaggedim were further incensed that Hasidic religious leaders (*tzaddiqim*) were looked upon as mediators between man and God and that undue emphasis on religious emotionalism undermined the traditional authority of the rabbis by downgrading serious study of the Torah. The controversy subsided in the 19th century, when the two sides turned their attention to combatting Haskala, a secularizing movement.

Mito, capital, Ibaraki Prefecture (*ken*), Honshu, Japan, on the left bank of the Naka-gawa (Naka River). During the Heian era (794–1185) Mito developed around a Yoshida shrine, and its first castle was built during the Kamakura era (1192–1333). The city changed hands several times during the 15th and 16th centuries; in 1609 it became a fief of the Mito branch of the Tokugawa family, one of the three branches of that clan (*sanke*) from which the shogun could be chosen. The Kasawara Aqueduct was constructed by the scholar and ruler Tokugawa Mitsukuni in 1663 and is still in use.

During the Tokugawa era (1603–1867) Mito was an important commercial and cultural centre, known for its administrative and agrarian reforms. Its political support of the reestablishment of secular Imperial rule led to the Meiji Restoration in 1868.

Since the opening of the Mito railway in 1889, the city has been a major transport centre. Industrialization was slow before the 1960s, consisting mainly of traditional manufactures including furniture, paper, and handicrafts. Since then, new industries have begun operation in the city, manufacturing electrical machinery, iron and steel products, and chemicals.

Mito Park, in the city centre, contains the ruins of the Tokugawa castle; the Kodokan, an educational institution founded in the 19th century; and Shintō and Confucian shrines. Kairaku-en (Tokiwa Park) is one of Japan's most visited gardens, graced with numerous plum trees. Pop. (1983 est.) 223,740.

mitosis, a process of cell duplication, or reproduction, during which one cell gives rise to two genetically identical daughter cells. Strictly applied, the term mitosis is used to describe the duplication and distribution of chromosomes, the structures that carry the genetic information.

A brief treatment of mitosis follows. For a full treatment, *see* MACROPAEDIA: Cells: Their Structures and Functions.

Prior to the onset of mitosis, the chromosomes have replicated and the proteins that will form the mitotic spindle have been synthesized. Mitosis begins at prophase with the thickening and coiling of the chromosomes. The nucleolus, a rounded structure, shrinks and disappears. The end of prophase is marked by the beginning of the organization of a group of fibres to form a spindle and the disintegration of the nuclear membrane.

The chromosomes, each of which is a double structure consisting of duplicate chromatids, line up along the midline of the cell at metaphase. In anaphase each chromatid pair separates into two identical chromosomes that are pulled to opposite ends of the cell by the spindle fibres. During telophase, the chromosomes begin to decondense, the spindle breaks down, and the nuclear membranes and nucleoli re-form. The cytoplasm of the mother cell divides to form two daughter cells, each containing the same number and kind of chromosomes as the mother cell. The stage, or phase, after the completion of mitosis is called interphase.

Mitosis is absolutely essential to life because it provides new cells for growth and for replacement of worn-out cells. Mitosis may take minutes or hours, depending upon the kind of cells and species of organisms. It is influenced by time of day, temperature, and chemicals.

Mitra, in the pantheon of Vedic Hinduism, one of the gods in the category of Ādityas, or sovereign principles of the universe. He represents friendship, integrity, harmony, and all else that is important in the successful maintenance of order in human existence. He is usually paired with the god Varuṇa, the guardian of the cosmic order, whose powers he complements as guardian of the human order. As spirit of the day he is sometimes attributed with solar characteristics. His Iranian counterpart is Mithra, who eventually came to be worshipped as the god of one of the great mystery cults, Mithraism.

mitral insufficiency, also called MITRAL REGURGITATION, inability of the mitral valve to prevent the flow of blood back from the left ventricle, or lower chamber of the heart, into the left atrium, or upper chamber. Normally, the valve permits blood to flow from the atrium to the ventricle but prevents its return. Most often, the inability of the mitral valve to close adequately is caused by scarring from rheumatic heart disease; it may also be due to a congenital defect of the valve or may arise from defects in the muscles and tendons (the papillary muscles and chordae tendineae) that operate the valve. Less frequently it may be due to endocarditis (inflammation of the heart lining) or cardiac tumour. The condition is recognized from characteristic heart sounds and from patterns that show up in echocardiography or electrocardiography.

Persons with mitral insufficiency may not be conscious of any effect of the condition or may be easily fatigued and may experience difficulty in breathing after exertion or while lying down. The left atrium may become greatly enlarged, and left ventricular failure eventually develops.

Medical treatment is restriction of vigorous exercise, reduction of sodium intake and increase in sodium excretion, and administration of anticoagulants to avoid the formation of blood clots in the veins. Some persons with severe defects are treated surgically by replacement of the valve.

To make the best use of the Britannica, consult the INDEX *first*

---

mitral stenosis, narrowing of the mitral valve, the function of which is to permit blood to flow from the atrium, or upper chamber, to the ventricle, or lower chamber, of the left side of the heart and to prevent its backflow. Narrowing of the mitral valve is usually a result of rheumatic fever; rarely, the narrowed valve is a congenital defect. The condition, most common in women under 45, is diagnosed by recognition of typical heart sounds and confirmed by certain patterns that appear in echocardiography or electrocardiography.

Narrowing of the valve increases pressure in the left atrium and in the pulmonary veins and capillaries (oxygenated blood from the lungs enters the left atrium by way of the pulmonary veins). The increased pressure in the pulmonary vessels may lead to congestion of the lungs and the collection of fluid in the pulmonary tissues. Difficulty in breathing, particularly after exercise, is one consequence. If the small vessels of the lungs develop resistance, possibly by the thickening of their walls, accumulation of fluid in the lungs decreases, but increased back pressure in the right ventricle of the heart (from which blood is pumped to the lungs) may lead to early failure of the right side of the heart.

Atrial fibrillation, or uncontrolled and irregular twitching of the upper chambers of the heart, occurs in most persons who have mitral stenosis. Another possible complication is the development of blood clots in the left atrium; these may break loose and travel through the arteries to the kidneys, the spleen, the legs, or the brain, obstructing blood flow at those points with consequent death of tissue.

Medical treatment includes the regulation of exercise so as to avoid fatigue and to minimize difficulty in breathing; reduction of sodium intake and increase in sodium excretion to reduce accumulation of fluids in the tissues; and administration of anticoagulants to reduce the possibility of clot formation. Surgical treatment is replacement of the valve with one of Dacron, stainless steel, or some other special material, or with a transplant of a valve from a pig heart.

mitre, also spelled MITER, liturgical headdress worn by Roman Catholic bishops and abbots and some Anglican and Lutheran bishops. It has two shield-shaped stiffened halves that face the front and back. Two fringed streamers, known as lappets, hang from the back. It developed from the papal tiara and came into use in the 11th century.

Contemporary mitre
Algimantas Kezys, S.J.

Three types of mitres are worn in the Roman Catholic Church. The *simplex* is made of undecorated white linen or silk and is worn at funerals, Good Friday, and some other services. The *auriphrygiata* is made of plain gold cloth or white silk with gold or silver embroidered bands and is worn during penitential seasons and at some other times. The *pretiosa* is decorated with precious stones and gold and worn on Sundays and feast days.

The Greek *mitra* worn by bishops and some Russian clergy in the Eastern churches is similar to a closed crown with a cross on top.

Mitre, Bartolomé (b. June 26, 1821, Buenos Aires—d. Jan. 18, 1906, Buenos Aires), politician, soldier, and author, who as president of Argentina was instrumental in uniting a war-torn nation and inaugurating an era of peace and economic progress in the last half of the 19th century.

Growing up in Buenos Aires under the dictatorship of Juan Manuel de Rosas, Mitre began a 15-year exile in 1837. Travelling to Uruguay, Bolivia, and Peru, he served in military campaigns, edited the newspaper *El Mercurio,* and wrote constantly against the Rosas regime. In 1852 he returned to Argentina as the leader of the Uruguayan forces in the Battle of Caseros, which led to the downfall of Rosas.

The next year Mitre became the leader of secessionist Buenos Aires province, whose citizens had refused to accept the new federal constitution, which minimized the role of their city in Argentine affairs. He held a number of offices in the provincial government and was the governor when the province defeated the federal forces in 1861. The national capital was moved again to Buenos Aires, and he was elected president of a united Argentina. Establishing an efficient administration, he suppressed the rural *caudillos* (bosses), extended the postal service and telegraph lines, organized public finances, and established new courts. He fostered increased foreign trade and encouraged immigration. When Paraguay declared war in 1864, he assumed command of the Argentine forces.

At the end of his presidential term in 1868, he was elected to the Senate, in which he served as leader of the middle-class interests in the nation. In 1874 he ran for president again, only to claim that his defeat was fraudulent and to lead an unsuccessful rebellion against the victor. He tried for the presidency again in 1891 but withdrew in favour of the Conservative candidate. Throughout these years and until his death, he stood as a symbol of Argentine unity and as a spokesman for economic development.

Mitre's contributions to the cultural life of Argentina were also of the first importance. He was founder of the newspaper *La Nación* (1870) and the Argentine Academy of History. He wrote much poetry and many prose works and did considerable translating (including Dante) and numerous historical studies, including the multi-volume *Historia de Belgrano* (1858–59) and *Historia de San Martín* (1887–88).

mitre shell, any of several marine snails constituting the family Mitridae (subclass Prosobranchia of the class Gastropoda), in which the thick shell typically is bullet shaped, vaguely resembling a bishop's headdress, or mitre. Mitres are most common in the Indo-Pacific region, where one of the largest species occurs: the 10-centimetre (4-inch) episcopal mitre (*Mitra mitra*), which has an orange-checked shell.

Episcopal mitre (*Mitra mitra*)

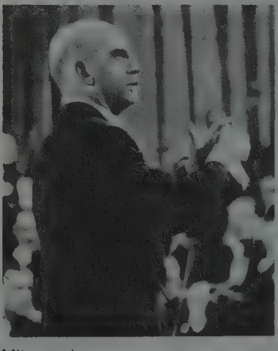
Mitropoulos, Dimitri (b. March 1, 1896, Athens—d. Nov. 2, 1960, Milan), conductor known for his performances of 20th-century works.

Mitropoulos studied in Athens, where his opera *Soeur Béatrice* (after Maeterlinck) was performed in 1919. Later in Berlin he studied piano under the brilliant pianist, composer, and teacher Ferruccio Busoni. An excellent



Mitropoulos
UPI—EB Inc.

pianist, Mitropoulos sometimes conducted from the keyboard (*e.g.,* in 1930 and 1932 with Sergey Prokofiev's *Third Piano Concerto*). He did not use a baton, and even in rehearsal he conducted from memory. He was one of the earliest conductors to perform twelve-tone works of Arnold Schoenberg, Alban Berg, and others.

Mitropoulos conducted at the Berlin State Opera (1921–24) and directed the Athens Conservatory until 1930. From 1937 to 1949 he directed the Minneapolis Symphony Orchestra. Although he rejected the traditional social obligations of the position, he won a devoted following. He was musical director of the New York Philharmonic (1951–58), where he introduced concert performances of contemporary operas. From 1954 he conducted at the Metropolitan Opera, becoming principal conductor in 1958. He died while rehearsing with the orchestra of La Scala in Milan.

Mitscher, Marc A., in full MARC ANDREW MITSCHER (b. Jan. 26, 1887, Hillsboro, Wis., U.S.—d. Feb. 3, 1947, Norfolk, Va.), U.S. naval officer who commanded the aircraft carriers of Task Force 58 in the Pacific area during World War II.

Mitscher

By courtesy of the U.S. Navy

A graduate of the U.S. Naval Academy at Annapolis, Md. (1910), Mitscher qualified as the 33rd naval pilot in 1916. In the years that followed, he played an important part in the development of naval aviation and its integration into the fleet.

Early in World War II, Mitscher commanded the aircraft carrier *Hornet* in the Battle of Midway (June 1942), the first important U.S. victory after the Japanese attack on Pearl Harbor the previous December. As a rear admiral, he was in charge of all aircraft in the Solomon Islands during the bitter fighting there in 1943. He next commanded the fast carriers of Task Force 58, leading the air strikes on Truk (now Chuuk) Islands in the Carolines (February 1944); in the Battle of the Philippine Sea (June); in the Battle of Leyte Gulf (October); and in the capture of Iwo Jima and Okinawa (February–June 1945).

Mitscher was made admiral in 1946 and served as commander in chief of the U.S. Atlantic Fleet until his death.

Mitscherlich, Eilhardt (b. Jan. 17, 1794, Neuende, duchy of Oldenburg [Germany]—d. Aug. 28, 1863, Berlin, Prussia), German chemist who promulgated the theory of isomorphism, a relationship between crystalline structure and chemical composition.

From 1818 to 1820 Mitscherlich worked in the Berlin laboratory of the German botanist Heinrich F. Link, where he first undertook the study of arsenates and phosphates. In 1819 he discovered from this study that compounds with similar composition often have the same crystalline structure. In 1821 he became professor of chemistry at the University of Berlin. He continued his studies of isomorphism and also made other important discoveries, including selenic acid (1827) and the monoclinic crystal form of sulfur (1823). He also named benzene, became the first to synthesize nitrobenzene in 1832, and was one of the first to recognize contact action, now known as catalytic action.

Mitsiwa (city, Eritrea): *see* Massawa.

Mitsotakis, Konstantinos, also called CONSTANTINE MITSOTAKIS (b. Oct. 18, 1918, Khaniá, Crete, Greece), prime minister of Greece from 1990 to 1993.

Mitsotakis came from a political family; his father and grandfathers were members of parliament, and the statesman Eleuthérios Venizélos was his uncle. Mitsotakis studied law and economics in Athens. Active in the resistance during the Nazi occupation of Crete (1941–44), he was twice arrested and sentenced to death.

Mitsotakis was first elected to parliament in 1946 as a member of the Liberal Party. In the early 1960s he joined the new Centre Union, a centre-left coalition organized by Georgios Papandreou, and he became minister of finance in Papandreou's government. In July 1965 Papandreou became involved in a power struggle with Greece's King Constantine II. Mitsotakis, with other Centre Union deputies, defected from the party and joined the promonarchist forces in a series of coalition governments. His actions incurred the lasting animosity of Papandreou's son, Andreas (later to become prime minister himself), and the government crises that followed led in April 1967 to the imposition of a military dictatorship. This government arrested Mitsotakis, who eventually fled to Paris, where he was active in the opposition to the regime.

Mitsotakis returned to Greece in 1973. In 1974, after the fall of the military government, he stood for parliament as an independent liberal but failed to be elected. He founded the centrist New Liberal Party in 1977, and in that same year he was elected to parliament. In the following year Mitsotakis accepted a cabinet post in the government of Konstantinos Karamanlis, and shortly afterward he joined Karamanlis' centre-right New Democracy Party. In 1984 Mitsotakis became party leader, and in 1990 he became prime minister. His government's economic-reform policies attracted opposition, however, as did its foreign policy, and in 1993 New Democracy lost its majority in parliament. Mitsotakis stepped down as prime minister and resigned as leader of the party.

Mitsubishi GROUP, loose consortium of independent Japanese companies that were created out of the giant, family-owned Mitsubishi business combine, or zaibatsu, which was broken up after World War II.

The first of the Mitsubishi companies was a trading and shipping concern, Mitsubishi Commercial Company (Mitsubishi Shōkai), formed in 1873 by Iwasaki Yatarō out of a government-operated shipping company he had purchased in 1871. In its effort to promote Japanese commerce and industry, the government gave Iwasaki considerable financial assistance for several years, and the company grew to be Japan's largest shipping firm.

At the same time, Iwasaki began to diversify the company, first into mining and then finance, warehousing, shipbuilding, and real estate; banking was soon added. In 1893 these interests were organized into a family-owned holding company, Mitsubishi, Ltd. (Mitsubishi Gōshi Kaisha). During and after World War I, several subsidiaries were created out of Mitsubishi, Ltd., which in addition to the earlier interests included iron and steel, insurance, oil refining, aircraft production, and chemicals. By the 1930s Mitsubishi was the second largest zaibatsu in the country.

Mitsubishi was also one of the major military contractors during the 1930s and '40s; it built many of Japan's warships, but probably its best-known product was the Zero fighter airplane. Because of its war production, Mitsubishi grew to enormous size, controlling some 200 companies by the end of World War II. After Japan's defeat the Mitsubishi zaibatsu was broken up by the U.S. occupation authorities. Mitsubishi, Ltd., was dissolved, and the stock of the former subsidiary firms was sold to the public.

At the end of the occupation in 1952, the independent Mitsubishi companies began to reassociate. The new grouping that emerged was significantly different from the old zaibatsu in that there was no central, family-controlled holding company; instead, it was characterized by informal policy coordination among the various company presidents and by a degree of financial interdependency among the corporations.

The Mitsubishi group consists of more than a dozen independent companies. The major firms of the group are all large multinational corporations that are based in Tokyo and have offices and subsidiaries overseas; some of these firms are engaged in joint ventures with foreign companies.

Mitsubishi Heavy Industries Ltd. (Mitsubishi Jūkōgyō KK) is one of the largest manufacturers of heavy machinery in Japan. The company acquired its present name in 1934 and became one of the major subsidiaries of the Mitsubishi zaibatsu. It was an important munitions maker during World War II. After the war the company was divided into three firms by the U.S. occupation authorities, but these were reunited in 1964. The company manufactures such products as thermal and nuclear power plants, machine tools, aircraft, construction and agricultural equipment, and rolling stock. It also builds and maintains ships and constructs factories. In 1970 the automotive division of the company was split off to form Mitsubishi Motors Corporation.

The Mitsubishi Bank Ltd. (Mitsubishi Ginkō) was at first part of the financial arm of the Mitsubishi combine, but it became independent of the parent firm under its present name in 1919; between 1948 and 1953 it was called the Chiyoda Bank. In 1996 the bank completed a merger with the Bank of Tokyo. (*See* Tokyo-Mitsubishi, Bank of.)

Mitsubishi Kasei Corporation (formerly Mitsubishi Chemical Industries Limited; Mitsubishi Kasei Kōgyo KK) was established in 1934 as Japan Tar Industries and emerged in its present form in 1950. Originally a manufacturer of tar products, coke, fertilizers, and dyestuffs, the company added the production of petrochemicals in the 1960s and has since diversified into such products as pharmaceuticals and medical equipment, pesticides, analytical instruments, and electronics materials.

The Mitsubishi Corporation (Mitsubishi Shōji KK), one of Japan's largest trading companies, grew out of the original shipping and trading firm. The company was split into numerous small firms by the occupation authorities, but these firms reunited in the mid-1950s; it took its present name in 1971. The company acts primarily as an agent for other companies, financing trading and other business ventures, handling orders and arranging shipping for thousands of types of goods and commodities, and maintaining a worldwide telecommunications network to monitor its own activities.

The Mitsubishi Electric Corporation (Mitsubishi Denki KK) was established in 1921 and acquired its present name in 1963. At first the company was primarily a manufacturer of such heavy equipment as generators, transformers, railroad equipment, and elevators, but it began producing more consumer goods (such as refrigerators and television sets) after World War II. The company also started making a wide variety of electronic equipment, including semiconductors and computers, and has added such diverse products as videocassette recorders and telecommunications equipment.

Mitsubishi Trust & Banking Corporation (Mitsubishi Shintaku Ginkō KK) is one of the leading trust banks in Japan. Known as the Asahi Trust Bank for the period during which Japan was occupied, it resumed its former name after 1952. Reunited with the other members of the Mitsubishi group, the trust became a major multiservice financial institution, fully enmeshed in the combine's domestic business.

Other members of the combine include Mitsubishi Oil Company, Ltd., one of Japan's leading oil importers and refiners; Mitsubishi Materials Corporation, which makes cement and other building materials, imports oil and coal, and engages in the overseas mining of gold, silver, and copper; and Mitsubishi Rayon Company, Ltd., which produces plastics and resins, acrylic fibres, polyester filaments, and acetate fibres.

Mitsubishi A6M (aircraft): *see* Zero.

Mitsui GROUP, loose consortium of independent Japanese companies that were created out of the giant, family-owned Mitsui business combine, or *zaibatsu,* which was broken up after World War II. That *zaibatsu,* in turn, grew out of the House of Mitsui (Mitsui-ke), the largest Japanese merchant house of the Tokugawa period (1603–1867).

The original enterprise dates from 1673, when Mitsui Takatoshi (1622–94), the son of a sake brewer, opened textile shops in Kyōto and Edo (modern Tokyo). The success of these and subsequent shops allowed him to expand into moneylending and other financial services. Starting in 1691, members of the Mitsui family were designated chartered merchants (*goyō shōnin*) by the shogunate. These appointments were lucrative for Mitsui and gave it considerable influence in the government. The cultivation of close ties with the government became a great asset to Mitsui, especially during the Meiji period (1868–1912), when the government was encouraging rapid economic development.

In the late 19th century the interests of the emerging Mitsui combine were centred on banking, trading, and mining, activities that Mitsui came to dominate. The family council that had been established in the early 18th century to oversee operations soon became inadequate, and in 1909 it was replaced by a family-controlled holding company. The Mitsui combine underwent tremendous expansion and diversification in the 20th century, becoming the largest *zaibatsu* in Japan; by the end of World War II it comprised some 270 companies. After Japan's defeat, the Mitsui *zaibatsu* was split up by U.S. occupation authorities. The holding company was dissolved, and the stock of the former subsidiary companies was sold to the public.

The independent Mitsui companies began to reassociate in the 1950s. In contrast to the structuring of the former *zaibatsu,* in which the family-dominated holding company had complete control of the combine, the new grouping was characterized by informal policy coordination among the various company presidents and by a degree of financial interdependency among the corporations.

The Mitsui group comprises several dozen companies, including cement, petrochemicals, commerce, construction, energy, engineering, finance and insurance, food, machinery, mining, nonferrous metals, real estate, and shipping industries. All of the major firms are large multinational corporations that are based in Tokyo or Ōsaka and have offices and subsidiaries overseas; some are engaged in joint ventures with foreign companies.

Mitsui and Company, Ltd. (Mitsui Bussan KK), is one of Japan's largest general trading companies and is a major component of the Mitsui group. The company was established as the trading subsidiary of the Mitsui combine in 1876. In the 1950s several of the small trading firms that emerged from the dissolved *zaibatsu* subsidiary regrouped around the Daiichi Trading Company (Daiichi Bussan Kaisha); the company took its present name in 1959. The firm acts primarily as an agent for other companies, handling orders and arranging shipping for thousands of industrial, agricultural, and consumer goods and commodities. As a leader of the Mitsui group, the company coordinates the domestic and overseas activities of affiliated companies.

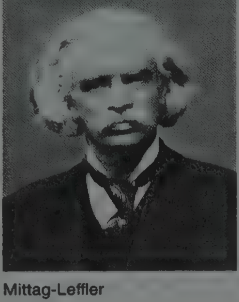
Mitsui Taiyo Kobe Bank, Ltd. (Mitsui Taiyo Kobe Ginkō KK), was formed from the merger (1990) of Taiyo Kobe Bank, Ltd., and Mitsui Bank Ltd. (1876), the first private bank in Japan. Mitsui Bank, formed by merger with another bank during World War II, was reestablished as a separate bank in 1948. Taiyo Kobe was formed by merger in 1973. Mitsui Taiyo Kobe is the major financial institution of the Mitsui group, its activities centring on securities and foreign exchange.

Other members of the combine include Mitsui Real Estate Development Company, Ltd., a leading home builder and developer of office and commercial buildings in Japan; Mitsui Mutual Life Insurance Company, one of Japan's major life insurers; Mitsui Mining & Smelting Company, Ltd., engaged in the smelting and processing of zinc, copper, and other nonferrous metals; and Mitsui Mining Company, Ltd., which produces domestic coal, coke, and cement.

Mittag-Leffler, Magnus Gösta (b. March 16, 1846, Stockholm, Swed.—d. July 7, 1927, Stockholm), Swedish mathematician who founded the international mathematical journal *Acta Mathematica* and whose contributions to mathematical research helped advance the Scandinavian school of mathematics.

In 1872 Mittag-Leffler became a lecturer in mathematics at the University of Uppsala, Swed., and five years later was appointed professor of mathematics at the University of Helsinki. In 1881 he became professor of mathematics at the University of Stockholm. With the financial patronage of King Oscar II of Sweden, he founded *Acta Mathematica* in 1882, set up an editorial staff from the four Scandinavian countries, and served as chief editor for 45 years.

Mittag-Leffler made numerous contributions to mathematical analysis (concerned with limits and including calculus, analytic geometry, and probability theory). He worked on the general theory of functions, concerning relationships between independent and dependent variables, and in 1875 gave a proof of the French mathematician Augustin-Louis Cauchy's theorem (a theorem that is largely the basis for the modern theory of functions of a complex variable). His best-known work concerned the analytic representation of a one-valued function; this work culminated in the Mittag-Leffler theorem. His estate and his mathematical library now form part of the Mittag-Leffler Mathematical Institute at Djursholm, Swed.



Mittag-Leffler

Archiv fur Kunst und Geschichte, Berlin

Mittelfranken, English MIDDLE FRANCONIA, *Regierungsbezirk* (administrative district), west-central Bavaria *Land* (state), southern Germany. Mittelfranken is bordered by Baden-Württemberg *Land* to the west and the *Regierungsbezirke* of Unterfranken (Lower Franconia) and Oberfranken (Upper Franconia) to the north, Oberpfalz (Upper Palatinate) to the east, and Oberbayern (Upper Bavaria) and Schwaben (Swabia) to the south. The district is coextensive with the larger historic region of Franconia (*q.v.*). The Bavarian *Regierungsbezirke* of Mittelfranken, Oberfranken, and Unterfranken were first created as provinces of the kingdom of Bavaria in 1837 by King Louis I.

The Franconian Terrace, composed of the Steiger Forest and the Franconian Heights in western Mittelfranken, is a prominent north-south sandstone scarp averaging 1,600 feet (500 m) in elevation. Many rivers originate in the Franconian Heights and traverse the terrace through broad flat valleys, most importantly the southeast-flowing Altmühl. Coniferous forest is dominant on the sandstone surface that slopes gradually to the east and merges into the Middle Franconian Basin. Ansbach, located on the Rezat River, is the chief centre of the thinly populated terrace slopes and serves as the administrative seat of the *Regierungsbezirk.* The city is an important rail-and-road junction and produces electronics equipment, foodstuffs, and plastic articles.

The Rednitz River rises in the mountainous Franconian Jura near the district's southern border and flows northward across the Middle Franconian Basin of eastern Mittelfranken. The cities of Nürnberg, Erlangen, and Fürth are located on a wide plain of glacial deposits at the confluence of the Rednitz and the westward-flowing Pegnitz River. Sheltered by the hills of the Franconian Terrace to the west, the basin receives only 28 inches (700 mm) of rain per year, and its climate is almost continental. Cultivated land predominates over woodland, and the most important agricultural area of the basin is the Rangau, an intensive hop-growing district centred between the towns of Schwabach and Weissenburg. Wheat, barley, and rye also are produced, and intensive market gardening is found immediately outside Nürnberg.

Along the eastern border of Mittelfranken, the steep limestone scarp of the Franconian Jura plateau faces west toward the Middle Franconian Basin. The town of Hersbruck, situated at the base of the scarp in the sharply indented Pegnitz River valley, is well known for its beautiful scenery.

Nürnberg, Erlangen, and Fürth form Bavaria's second largest urban agglomeration and are exceeded in regional importance only by Munich. Industry in Mittelfranken is heavily concentrated in the three cities and radiates south and east along the Rednitz and Pegnitz rivers. Nürnberg is one of Germany's leading centres of electrical manufacture and also produces many types of machinery, from heavy equipment to precision instruments. The Nürnberg toy industry enjoys an international reputation for quality and selection. Fürth specializes in the electrical and chemical industries and manufactures toys, clothing, and metal products. Electrical engineering is the leading industry in Erlangen. Each city has a modern port facility that is on or linked to the Rhine-Main-Danube Canal.

The small medieval towns of Rothenburg and Dinkelsbühl have surrounding walls and watchtowers that are almost completely preserved. Nürnberg also has a picturesque circuit of medieval walls surrounding the old city, which is home to an imperial castle where the German kings resided from 1050 to 1571.

The people of Mittelfranken speak Franconian, one of the three main German dialects in Bavaria. The population is predominantly Protestant. Higher education in the *Regierungsbezirk* is centred at the Friedrich Alexander University of Erlangen-Nürnberg (founded 1743). Area 2,798 square miles (7,246 square km). Pop. (1994 est.) 1,652,236.

Mittelland Canal, also called EMS-WESER-ELBE CANAL, German waterway begun in 1905 and completed in 1938. It extends from the Dortmund-Ems Canal east of Rheine, Ger., eastward along the northern border of the Central Uplands, to the Elbe River north of Magdeburg (a distance of about 199 miles [321 km]), linking there with the Havel Canal eastward to Berlin. Side canals connect it with Osnabrück, Hannover, Salzgitter, and Hildesheim. Peine, between Hannover and Braunschweig (Brunswick), and Wolfsburg are both on the main canal, which carries barges of up to 1,000 tons. Locks connect it with the Weser and Elbe rivers. Coal and iron ore make up a large part of the barge traffic.

Mittenwald, village, Bavaria *Land* (state), southern Germany. It lies along the Isar River, at the foot of the Karwendel Mountains, at the Austrian border. Chartered in 1307, it was an important trading centre in the 15th and 16th centuries. The village has been famous for its violins since the 17th century, and it has a museum and school of violin making. Zithers and guitars are also made. Mittenwald is a health and vacation resort and a winter sports centre with a chair lift up the nearby Höher Kranzberg (4,564 feet [1,391 m]). Pop. (1994 est.) 8,480.

Mitterrand, François, in full FRANÇOIS-MAURICE-MARIE MITTERRAND (b. Oct. 26, 1916, Jarnac, France—d. Jan. 8, 1996, Paris), politician who served two terms (1981–95) as president of France, leading his country to closer political and economic integration with western Europe. The first socialist to hold the office, Mitterrand abandoned leftist economic policies early in his presidency and generally ruled as a pragmatic centrist.

The son of a stationmaster, Mitterrand studied law and political science in Paris. On the outbreak of World War II, he enlisted in the infantry and in June 1940 was wounded and captured by the Germans. After escaping from a prison camp in late 1941, he worked with the collaborationist Vichy government—a fact that did not become publicly known until 1994—before joining the Resistance in 1943.

In 1947 he became a cabinet minister of the Fourth Republic in the coalition government of Paul Ramadier, having been elected to the National Assembly the previous year. Over the next 12 years, Mitterrand held cabinet posts in 11 short-lived Fourth Republic governments.

Originally somewhat centrist in his views, he became more leftist in politics, and from 1958 he crystallized opposition to the regime of Charles de Gaulle. In 1965 he stood against de Gaulle as the sole candidate of the socialist and communist left for the French presidency, collecting 32 percent of the vote and forcing de Gaulle into a runoff election.

After his election as first secretary of the Socialist Party in 1971, Mitterrand began a major party reorganization, which greatly increased its electoral appeal. Although Mitterrand was defeated in his second presidential bid, in 1974, his strategy of making the Socialist Party the majority party of the left while still allied with the Communist Party led to the upset Socialist victory of May 10, 1981, when he defeated the incumbent president, Valéry Giscard d'Estaing. Mitterrand called legislative elections soon after his victory, and a new left-wing majority in the National Assembly enabled his prime minister, Pierre Mauroy, to effect the reforms Mitterrand had promised. These measures included nationalizing financial institutions and key industrial enterprises, raising the minimum wage, increasing social benefits, and abolishing the death penalty. In foreign policy Mitterrand advocated a relatively hard stance toward the Soviet Union and cultivated good relations with the United States.

Mitterrand
Camera Press—Globe Photos

Mitterrand's socialist economic policies caused increased inflation and other problems, so in 1983 the government began to cut spending. By the end of Mitterrand's first term in office, the Socialist Party had abandoned socialist policies in all but name and essentially had adopted free-market liberalism. In 1986 the parties of the right won a majority of seats in the National Assembly, and so Mitterrand had to ask one of the leaders of the right-wing majority, Jacques Chirac, to be his prime minister. Under this unprecedented power-sharing arrangement, known as "cohabitation," Mitterrand retained responsibility for foreign policy. He soundly defeated Chirac in the presidential elections of 1988 and thus secured to another seven-year term.

The newly reelected Mitterrand again called elections, and the Socialists regained a working majority in the National Assembly. His second term was marked by vigorous efforts to promote European unity and to avoid German economic domination of France by binding both countries into strong European institutions. Mitterrand was thus a leading proponent of the Treaty on European Union (1991), which provided for a centralized European banking system, a common currency, and a unified foreign policy.

Mitterrand was less successful in domestic matters, particularly in coping with France's persistently high unemployment rate, which had risen to 12 percent by 1993. In 1991 he appointed the socialist Edith Cresson to be prime minister; she became the first woman in French history to hold that office. The Socialist Party suffered a crushing defeat in the legislative elections of 1993, and Mitterrand spent the last two years of his second term working with a centre-right government under Prime Minister Edouard Balladur.

mitzvah, also spelled MITSVAH (Hebrew: "commandment"), plural MITZVOTH, MITZVOT, MITZVAHS, MITSVOTH, MITSVOT, or MITSVAHS, any commandment, ordinance, law, or statute contained in the Torah (first five books of the Bible) and, for that reason, to be observed by all practicing Jews.

The Talmud mentions 613 such mitzvahs, 248 mandatory (*mitzwot ʿase*) and 365 prohibitive (*mitzwot lo taʿase*). Many more (some virtually equated with divine law) have been added throughout the ages on the authority of outstanding rabbinical leaders, such as reciting the Hallel (specific psalms) at prescribed times, reading the Book of Esther on Purim, washing the hands before meals, and lighting candles on certain festivals. Though nonobservance of a mitzvah constitutes a transgression (*ʿavera*), it is understood that not all mitzvahs are of equal importance; circumcision, for instance, is a direct response to a divine command, while the wearing of a skullcap (yarmulke) in public is not. In a broader context, Jews consider all good deeds as the fulfillment of mitzvahs, for such actions express God's will.

Miura, city, Kanagawa *ken* (prefecture), east-central Honshu, Japan. It lies on the southwestern part of the Miura Peninsula, with the city of Yokosuka farther north on the peninsula. Miura was first mentioned in the 8th century. Its port of Misaki is a base for commercial deep-sea fishing, especially of tuna. Besides tuna, the city is well known for its locally grown radishes, and cabbages and watermelons are also produced. Jōga Island, in Aburatsubo Bay, is linked to the mainland at Miura by a large bridge. The island and bay, together with the Aburatsubo Marine Park and local beaches, help make Miura a popular tourist and recreational centre. The city also serves as a dormitory suburb for the expanding Tokyo-Yokohama metropolitan area to the north. Pop. (1990) 52,440.

Miura Baien, original name MIURA SUSUMU (b. Sept. 1, 1723, Tominaga, Bungo province [modern Ōita prefecture], Japan—d. April 9, 1789, Tominaga), Japanese economist and Confucianist philosopher during the Tokugawa period (1603–1867). He formulated the *jōrigaku* ("rationalist studies") doctrine, which was a precursor to modern scientific and philosophical thought in Japan.

Although schooled in the Chinese Classics, Miura studied scientific methods of approaching physics, medicine, and economics. Influenced by Western ideology, he wrote *Kagen* ("Source of Value"), discussing wealth and poverty, and his key philosophical works, *Gengo* ("Abstruse Language"), *Zeigo* ("Superfluous Language"), and *Kango* ("High-flown Language"), in which he appealed to reason and nature, rather than written doctrine or tradition, as the sources of knowledge. He opposed the Buddhist view of emptiness and preferred a dynamic eternal universe in which death is organic change but not extinction. His traditional views of religion and authority were evident in *Samidare-shō* ("Early Summer Rain Collection"), a book criticizing Christianity while advocating loyalty to a supreme being. Miura's works in Japanese were collected in *Baien zenshū,* 2 vol. (1912; "Collected Works of Baien").

Mivart, Saint George Jackson (b. Nov. 30, 1827, London, Eng.—d. April 1, 1900, London), British biologist, a leading critic of Charles Darwin's theory of natural selection.

Unable to enter the University of Oxford after his conversion to Roman Catholicism (1844), Mivart continued his studies at St. Mary's, Oscott (1844–46). His research into the anatomy of carnivores and insectivores, conducted while he was lecturing at the medical school of St. Mary's Hospital (1862–84), greatly increased knowledge of the subject. In 1881 he published *The Cat: An Introduction to the Study of Backboned Animals,* which is considered to rank with T.H. Huxley's *Crayfish* for its accuracy, detail, and clarity.

Mivart supported the general concept of evolution but minimized the contribution of natural selection, preferring to believe that the appearance of new species resulted from an innate plastic power that he called individuation. He also denied the evolution of human intellect, insisting that it was conferred by divine power. His publication of *On the Genesis of Species* (1871), *Nature and Thought* (1882), and *The Origin of Human Reason* (1889) alienated both Darwin and Huxley.

Miwok, California Indians speaking languages of Penutian stock and originally comprising seven dialectally and territorially discrete branches: the Coast Miwok in an area just north of what is now San Francisco; the Lake Miwok in the Clear Lake Basin; the Bay Miwok (or Saclan), living along the delta of the San Joaquin and Sacramento rivers; the Plains Miwok, living farther up the lower Sacramento and San Joaquin rivers; and, just eastward, three groups of Sierra Miwok—Northern, Central, and Southern—in the western foothills of the Sierra Nevada. The Sierra branches constituted by far the bulk of the Miwok and had more than 100 villages at the time of European contact.

The groups near or on the coast—the Coast, Lake, and Bay Miwok—gathered acorns, fished, and hunted deer and other game with bow and arrow. They lived in semisubterranean pole- and earth-covered lodges and produced watertight basketry ornamented with beads or feathers.

The interior Miwok—those of the Sierra and Plains—remained in the foothills or lowlands and moved into the high sierras only in summer or for hunting. Their main abodes were semisubterranean earth-covered houses, but summer mountain shelters were mere lean-tos of bark. Their chief food staple was acorns, which were stored in basketlike granaries. Various baskets were made but apparently no pottery.

Society was organized into lineages and contrasting halves, or moieties, governing such matters as descent and marriage; and it was seemingly ranked. There were chiefs and subchiefs, and women could acquire such titles through the male line. The interior Miwok followed the so-called Kuksu cult, which included various rituals, costumed dances using animal skins, and impersonations of spirits.

There remained in the late 20th century more than 100 coastal Miwok and more than 100 interior Miwok.

Mix, Tom, byname of THOMAS HEZIKIAH MIX (b. Jan. 6, 1880, Mix Run, Pa., U.S.—d. Oct. 12, 1940, near Florence, Ariz.), American film actor, a celebrated star of western cowboy films during the silent era.

Mix worked as a cowhand in Texas, Arizona, Wyoming, and Montana and served in the U.S. Army in the Spanish-American War and in the pursuit of Pancho Villa during the Mexican Revolution. He was also a deputy sheriff in Oklahoma and served in the Texas Rangers. In 1906 he joined a Wild West show and, three years later, the Sells-Floto Circus. He began to act in motion pictures in 1910, playing the part of a roughriding hero, defender of right and justice. Over the years his horse "Tony" became almost as famous as Mix himself. Mix appeared in more than 200 one- and two-reelers and feature films, many of which he also produced or directed.

After gaining riches and worldwide fame during the silent era, Mix suffered a decline with the coming of sound, appearing in only a few pictures after 1929. In 1933 he organized Tom Mix's Circus and Wild West Show, but, by the time of his death in an automobile accident seven years later, his wealth had largely disappeared.

Mixe-Zoque languages, family of North American Indian languages spoken in southern Mexico. There are seven languages in the family, divided into two branches, or divisions—Zoquean and Mixean. Zoque is spoken in the Mexican states of Chiapas, Tabasco, and Oaxaca. Sierra Popoluca and Texistepec Popoluca, spoken in Veracruz, are the other Zoquean languages. Mixe, spoken in eastern Oaxaca, and Sayula and Oluta (both sometimes called Popoluca), spoken in Veracruz, are Mixean languages. An extinct language, Tapachultec, formerly spoken along the southeast coast of Chiapas, is also classified as a Mixean language.

Mixe-Zoquean, group of Middle American Indian peoples inhabiting territories in southern Mexico. The Mixe-Zoquean peoples today comprise the Mixe, living in northeastern Oaxaca; the Zoque, primarily inhabiting northwestern Chiapas; and the Popoluca (not to be confused with the Popoloca), who live in eastern Veracruz and Oaxaca, about midway between the Mixe and Zoque. The languages of these people are closely related, and their cultures share a common origin.

The Mixe live in a rugged mountainous area and are quite traditional in culture and language. The Zoque live in a lower, more tropical region and are becoming rapidly assimilated into modern Mexican culture. There are several distinct Zoque dialects, but many Zoque have intermarried with the general population and may speak only Spanish. The Popoluca live in scattered highland villages and three lowland towns (Oluta, Sayula, and Texistepec); those of the highlands are more remote and more likely to retain their native language and culture than are the town Popoluca. Each of these Popoluca groups—highland (or Sierra), Oluta, Sayula, and Texistepec—speaks a distinct language.

All the traditional Mixe-Zoquean peoples are agricultural, growing the Middle American staples of corn (maize), beans, and squash. The digging stick is their chief agricultural implement, and they clear their land by burning the underbrush. Most Mixe-Zoquean groups live in central villages of thatched or adobe huts surrounded by their fields. Crafts are generally poor and undeveloped, but cotton weaving is of high quality. Traditional costume is still worn by many women, but ready-made clothing is replacing it in less remote areas. The traditional woman's costume consists of a long wraparound skirt and an overblouse, or tunic (*huipil*).

The Mixe-Zoquean religious tradition shows many parallels with that of the Maya. Nominally Roman Catholic, modern Mixe-Zoqueans still practice many of their former rituals and ceremonies, including hunting and agricultural fertility rites. The *compadrazgo,* a system of ritual kinship established with godparents, is important among them.

Mixolydian mode, in music, seventh of the eight medieval church modes. *See* church mode.

Mixtec, Middle American Indian population living in the northern and western sections of the state of Oaxaca and in neighbouring parts of the states of Guerrero and Puebla in southern Mexico. Historically the Mixtec possessed a high degree of civilization in Aztec and pre-Aztec times.

The modern Mixtec are primarily farmers who practice slash-and-burn cultivation and use the hoe and digging stick or oxen and the plow. Corn (maize), beans, and squash are the staple crops. Other subsistence activities are hunting, fishing, herding, gathering wild foods, and producing and selling items of woven palm fibre. Settlement patterns vary; there are central villages (which may be vacant except during fiestas or market days, the families living on their farms most of the time), and there are dispersed villages with family groups living scattered over the countryside.

Weaving (of cloth and palm fibre) and ceramics are common crafts. Dress is largely traditional or semitraditional. Men wear a white cotton shirt and trousers, straw hat, and sandals. Women wear a wraparound skirt, a long tunic (*huipil*), and a shawl (*rebozo*). Women generally are barefoot and may go without the *huipil,* nude above the waist, in the coastal areas.

Although nominally Christian, most Mixtec believe in an assortment of pre-Christian spirits and deities, and in some areas they worship stone idols representing the rain god. Hills, caves, streams, springs, and swamps may also be sacred. Agricultural rituals and the harvest feast are important, and *curanderos* (shaman-healers) are common. Christian fiestas and masses for patron saints are also celebrated, with church brotherhoods (*cofradías*) organizing the festivities.

Miya-shima, also spelled MIYA-JIMA (Japan): *see* Itsuku-shima.

Miyagawa Chōshun, Chōshun also rendered NAGAHARU, original name KIHEIJI, also called CHŌZAEMON (b. 1682, Owari province [now in Aichi prefecture], Japan—d. Dec. 18, 1752, Edo [now Tokyo]), Japanese painter of the ukiyo-e style of popular, colourful art based on everyday life. He was the founder of the Miyagawa school of painting.

By courtesy of the International Society for Educational Information, Tokyo

Chōshun went to Edo about 1700 and fell under the influence of the works of Hishikawa Moronobu (d. *c.* 1694), who established the basic ukiyo-e style in both painting and wood-block printing. Chōshun concentrated on painting, rather than on print designs, and drew his pictures with fluid lines and subtle colouring. He was also adept at depicting crowds.

At one time, when some painters were commissioned to repair the family shrine of the Tokugawa shogunate at Nikkō, the artist Kanō Shunga invited Chōshun, famous as a colourist, to participate. But in a dispute over fees, Chōshun was insulted and physically hurt at Shunga's home. Chōshun's son and pupils retaliated by attacking and wounding members of the Kanō clan. Chōshun was then expelled from Edo for two years.

Among Chōshun's notable paintings are the picture scroll "Engeki zukon" ("Theatre Scenes") and "Fūzoku zukan" ("Panorama of Contemporary Life").

Miyagi, *ken* (prefecture), northern Honshu, Japan, its indented coastline forming Sendai Bay of the Pacific Ocean. Much of its area is mountainous. The Sendai Plain in the south contains the prefectural capital, Sendai. To the north is the beautiful Matsushima Bay, long celebrated for its more than 200 islands covered with pines. Agricultural products of the area include rice, vegetables, and cattle. The fishing industry yields herring and sardines. Other industries produce lumber, foodstuffs, pulp, electrical machinery, and transport equipment.

Sendai, the largest city in Tohoku (northern Honshu) region, is an industrial, administrative, and transportation centre. Tohoku University (1907) is located there. Ishinomaki and Shiogama, on Sendai Bay, are important seaports. Area 2,815 square miles (7,292 square km). Pop. (1991 est.) 2,263,998.

Miyako, city, Iwate *ken* (prefecture), Honshu, Japan, on the estuary of the Hei River, facing Miyako Bay. The city has been an important fishing port since the Tokugawa period (1603–1867) and is known for its salmon, trout, and mackerel. The manufacture of fertilizer, metal, and construction materials was introduced after World War II. The port was enlarged in the 1950s, and Miyako is now a major importer of timber for its lumber industry. Nearby Jōdoga Beach, renowned for its blowhole, is part of Rikuchu-kaigan National Park. Pop. (1990) 58,505.

Miyakonojō, city, Miyazaki *ken* (prefecture), Kyushu, Japan, on the upper Ōyodo River. The city developed around the castle built by the Shimazu family in the early 11th century. During the Tokugawa period (1603–1867), sericulture and silk manufacture were prominent activities. The weaving and textile industries developed after the Meiji Restoration (1868), and synthetic textiles were introduced after World War II.
